13. D1259: Standard Test Methods for Nonvolatile Content of Resin Solutions.

14. D1752: Specification for Preformed Sponge Rubber and Cork Expansion Joint Fillers for Concrete Paving and Structural Construction.

15. D2240: Standard Test Method for Rubber Property – Durometer Hardness

B. Environmental Protection Agency (EPA):

1. 40 CFR 59: National Volatile Organic Compound Emission Standards for Consumer and Commercial Products.

C. Corps of Engineers:

1. CRD-C 572: Specifications for Polyvinylchloride Waterstop.

D. Federal Specifications:

1. TT-S-00230C: Sealing Compound: Elastomeric Type, Single Component

1.03 SUBMITTALS:

A. Submit following shop drawings in accordance with Section 01 33 00.

1. Manufacturer's printed data and application instructions for specified materials and locations where materials are to be used.

2. Submit material one samples of each type of water stops.

3. Submit layouts for joints for approval by Engineer of Record (EOR).

4. Certification that materials used within the joint system are compatible with each other.

1.04 QUALITY ASSURANCE:

A. Comply with requirements in Section 01 45 00 and as specified.

B. See Section 03 35 01 for additional joint requirements identified in Table 03 35 01-1 which may exceed the requirements of this section.

C. Do not add, relocate or omit joints without written permission from the Engineer.

D. Reject material exceeding expiration date for use.

E. Clean concrete surfaces to receive expansion joint compound in accordance with the printed instructions of the joint compound manufacturer.

1.05 DELIVERY, STORAGE AND HANDLING:

A. Comply with the requirements in APWA Section 01 66 00.

B. Transport, handle and deliver materials to the job site in the manufacturer's sealed bags, unopened containers or banded pallets.

C. Store materials off the ground on a platform or skids and protect with covers from snow, rain and ground splatter.

D. Store expansion joint compounds in a dry location where they cannot freeze.

E. Store plastic products under cover in a dry location, out of direct sunlight.

1.06 MANUFACTURER'S SERVICES:

A. Prior to joint preparation for joints receiving sealant materials, require joint manufacturer's technical representative to demonstrate, on site, joint preparation, priming, and sealant materials application for the Contractor's personnel performing joint work.

PART 2 - PRODUCTS

2.01 PVC WATERSTOP:

A. Waterstops shall be extruded from a PVC compound and shall be lock-rib, center-bulb, retro-fit or flat-strip type. Water stop shall comply with Corps of Engineers Specification CRD-C-572.

B. PVC waterstops for construction joints: flat ribbed type, 6 inches wide unless otherwise noted on the Contract Drawings, with a minimum thickness of 3/8-inches.

1. Products:

a. Sika Greenstreak; Model 679

b. BoMetals, Inc.; Model FR-638

c. Vinylex; Model R638

C. PVC waterstop for contraction joints shall be ribbed with a center bulb, 6 inches wide with a minimum thickness of 3/8-inches. The center bulb shall have an O.D. not less than 7/8-inches.

1. Products:

a. Sika Greenstreak; Model 732

b. BoMetals, Inc.; Model RCB-638LB

c. Vinylex; Model RB638H

D. PVC waterstop for expansion joints shall be ribbed with a center bulb, 9 inches wide with a minimum thickness of 3/8-inches . The center bulb shall have an O.D. not less than 1-3/8 inches.

1. Products:

a. Sika Greenstreak; Model 738

b. BoMetals, Inc.; Model RCB-938VLB

c. Vinylex; Model RB938H

E. PVC waterstops for sealing existing concrete structures and new concrete placement shall be retro-fit type, 6 inches wide and 3-3/16 inches height with a minimum thickness of 3/8-inches. Attach waterstop to existing concrete using 1/4-inch by 2-1/4 inch stainless steel sleeve expansion bolt with stainless steel batten bars.

1. Products:

a. Sika Greenstreak; Model 609

b. BoMetals, Inc.; Model RF-638

F. Provide waterstops resistant to chemical action with Portland cement, alkalies, acids, and not affected by mildew or fungi. It shall show no effect when immersed for 10 days in a 10 percent solution of sulfuric or hydrochloric acid, saturated lime solution or salt water. Water stops shall be such that any cross section will be dense, homogeneous, and free from porosity and other imperfections. They shall be symmetrical in shape. When tested in accordance with Federal Standard No. 601, the material shall meet the requirements in Table 03 15 10-1.

Table 03 15 10-1

Requirement	ASTM Spec.
Tensile strength, 2,000 psi	D638
Hardness, Shore durometer, 60-70	D2240
Elongation, ultimate, 280	D638
Water absorption, dry weight, maximum (48 hours) 0.32 percent	D570
Specific gravity, 1.3	D792
Stiffness in flexure, 920 psi	D747
Cold brittleness, -35 degrees F	D746
Tear resistance, 290 lbs/inch	D624

2.02 HYDROPHILIC RUBBER WATERSTOP:

A. Provide a bentonite free rubber waterstop. Waterstop shall expand by a minimum of 80 percent of dry volume in the presence of water to form a watertight joint seal without damaging the concrete in which it is cast. Provide minimum concrete cover as recommended by the waterstop manufacturer.

1. Products:

a. Adeka; Ultraseal MC-2010MN

b. Sika; Hydrotite

2.03 ELASTOMERIC JOINT SEALANT:

A. Federal Specification TT-S-00230C Type 1, Class A, single component, cold applied, pourable, polyurethane.

1. Products:

a. The Euclid Chemical Company; Eucolastic 1

b. Tremco; Vulkem 45SSL

2.04 JOINT SEALANT FOR CONCRETE STRUCTURES:

A. Joint sealant shall be a multipart, gray, non-staining, non-sagging, gun grade polyurethane sealant, which cures at ambient temperature to a firm, flexible, resilient, tear-resistant rubber. Sealant shall comply with ASTM C920, Type M, Grade P, Class 25 for horizontal joints and Grade NS, Class 25 for vertical joints and be recommended by the manufacturer for continuous immersion in water. Troweling of sealants into joints will not be permitted. Sealant shall meet requirements in Table 03 15 10-2.

Table 03 15 10-2

Characteristic or Parameter	Technical Requirements
Pot life	1 to 3 hours
Hardness	35 Shore A, +/- 5
Elongation	650 percent, ASTM D412
Tensile strength	200 psi, ASTM D412
Peel strength on concrete	No adhesion loss at 25 pounds
Temperature service range	40 to 167 degrees F
Immersion in water	Continuous

B. Products:

1. Tremco; Vulkem 227 or Vulkem 245 (for Type M, Grade P, Class 25)

2. Sika Corporation; Sikaflex-2CNS (for Grade NS, Class 25), Sikaflex-2CSL

C. For submerged applications, use multi-component chemical resistant polysulfide sealant conforming to ASTM C920, Type M, Grade NS, Class 25.

1. BASF; Sonolastic Two-part

2. The Euclid Chemical Company; Tammsflex NS

2.05 EPOXY JOINT SEALANT:

A. 100 percent solids per ASTM D1259, two-part epoxy with an instantaneous Shore D hardness of 50 to 65 per ASTM D2240.

1. Metzger-McGuire Co.; MM80 or Edge Pro50

2. The Euclid Chemical Company; Euco700

2.06 BACKING ROD FOR EXPANSION JOINTS:

A. Provide an extruded closed-cell polyethylene foam rod. The rod shall be 1/4-inch larger in diameter than the joint width. Where possible, provide full-length sections for the joint; minimize splices.

1. Industrial Systems Department; Minicel backer rod

2. Hercules, Inc.; Plastic Products Group

2.07 BOND BREAKER TAPE:

A. Provide an adhesive-backed glazed butyl or polyethylene tape that will adhere to the premolded joint material or concrete surface. The tape shall be the same width as the joint. The tape shall be compatible with the sealant.

2.08 PREMOLDED JOINT FILLER FOR PAVEMENTS AND SLABS:

A. Joint filler shall be pre-formed, non-extruded type constructed of closed-cell neoprene conforming to ASTM D1752, Type I.

B. Bituminous-type preformed expansion joint filler conforming to ASTM D994.

2.09 PREMOLDED JOINT FILLER FOR LIQUID CONTAINMENT STRUCTURES:

A. Self-expanding cork per ASTM D1752, Type III.

B. Sponge Rubber per ASTM D1752, Type I. Preformed, non-extruded type constructed of closed-cell neoprene.

2.10 EXPANSION JOINT DOWELS:

A. Stainless steel bar dowels conforming to ASTM A276, Type 316.

B. Alternate to steel bar dowels may be diamond shaped plates.

C. Thoroughly grease expansion joint dowels prior to placing adjoining wall or slab concrete.

2.11 STYROFOAM FILLER BLOCK:

A. Styrofoam filler blocks for future construction and expansion joints.

1. Products:

a. Dow Chemical Company; Styrofoam SM brand

2.12 BOND BREAKER FOR JOINT COMPOUNDS:

A. Provide polyethylene tape.

PART 3 - EXECUTION

3.01 PVC WATERSTOPS:

A. Heat splice at ends and intersections. Provide waterstops that provide a continuous, uninterrupted watertight diaphragm throughout the entire joint system below the high water level and below grade.

B. Construct forms for construction joints to prevent injury to water stops. Hold water stops securely in position in the construction joints by wire ties, continuous bars, and rings as shown on contract drawings. Install water stops in construction, contraction and expansion joints in liquid containment structures and shown on contract drawings.

C. Use factory-made crosses, tees and ells. Make field splices with a thermostatically controlled heating iron in conformance with the manufacturer's current recommendations. Allow at least 10 minutes before pulling or straining the new splice in any way. The finished splices shall provide a cross section that is dense and free of porosity with tensile strength of not less than 80 percent of the unspliced materials.

D. Provide waterstops with an integral fastening system consisting of grommets or pre-punched holes.

3.02 JOINTS:

A. Make joints only at locations shown on the contract drawings or as permitted by the Engineer. Any addition or relocation of construction joints proposed by the Contractor, must be submitted to the Engineer for written permission.

B. Relocate additional joints where they least impair strength of the member. In general, locate joints within the middle third of spans of slabs, beams and girders. If a beam intersects a girder at the joint, offset the joint a distance equal to twice the width of the member being connected. Locate joints in walls and columns at the underside of floors, slabs, beams or girders and at tops of footing or floor slabs.

C. Cast structural slabs and beams monolithically without horizontal joints unless specifically indicated on the drawings.

D. Do not use horizontal joints within foundation mats, base slabs, footings, pile caps, slabs on grade or elevated beams and slabs.

E. Provide joints in concrete fills and toppings at the same location as the joints in the supporting concrete.

F. Provide waterstops in all wall and slab joints in liquid containment structures and at locations shown on the contract Drawings. Do not provide metal waterstops unless permitted by Engineer.

G. Construction Joints:

1. Provide flat ribbed waterstops at construction joints where shown on contract drawings and specified herein.

2. Allow 48 hours between pours of adjacent slabs.

3. Where joint key ways are shown on contract drawings form keyways by beveled strips or boards placed at right angles to the formed face. Except where otherwise shown on contract drawings or specified, keyways shall be at least 1-1/2 inches in depth over at least 25 percent of the width of the section.

4. After the pour has been completed to the construction joint and the concrete has hardened, thoroughly clean the entire surface of the joint of surface laitance, loose concrete, foreign material, and expose clean aggregate by sandblasting or waterblasting the surface of construction joints before placing the new concrete. Care shall be taken to protect any exposed joint material, such as PVC waterstops.

5. In case of emergency, place additional construction joints. (An interval of 45 minutes between two consecutive batches of concrete shall constitute cause for an emergency construction joint.)

H. Contraction Joints:

1. Provide center-bulb waterstop at contraction joints where shown on contract drawings and specified herein.

2. Where specifically noted on the Drawings, coat the concrete surface with a bond breaker prior to placing new concrete against it. Avoid coating reinforcement or waterstops with bond breaker at these locations.

3. Full Contraction Joints:

   a. Do not extend reinforcement or other embedded items bonded to the concrete (except dowels bonded on only one side of joint) continuously through any expansion joint.

   b. Where shown on contract drawings provide stainless steel expansion joint dowels. Secure tightly stainless steel expansion joints in forms with rigid ties. Orient dowels to permit joint movement.

4. Partial Contraction Joints:

   a. Extend every other bar of reinforcement steel through partial contraction joints or as indicated on the drawings.

I. Control Joints:

1. Do not use control joints in liquid contain structures unless specifically indicated on the Contract Drawings.

2. Locate control joints as shown on the Contract Drawings.

3. Form control joints with control joint inserts or sawcuts.

4. For sawcutting:

   a. Using early entry saws, saw joints in slabs before the formation of uncontrolled cracking (i.e., cracking that occurs at locations other than construction, control, or contraction joints) and as soon as the concrete has hardened sufficiently to permit cutting without chipping, spalling, or tearing.

   b. Fill saw cut to full depth with elastomeric joint sealant for joints not exposed to vehicular traffic. Fill joints to full depth with epoxy joint sealant for joints exposed to vehicular traffic.

5. Unless noted otherwise on the Contract Drawings, total reduction in concrete member thickness shall be at least 1/4 the member thickness.

J. Expansion Joints:

1. Size and location of expansion joints shall be as shown on the Contract Drawings.

2. Provide center-bulb waterstop at expansion joints where shown on contract drawings and specified herein.

3. Do not extend reinforcement or other embedded items bonded to the concrete except dowels bonded on only one side of joint continuously through any expansion joint.

4. Secure tightly stainless steel expansion joint in forms with rigid ties. Orient dowels to permit joint movement.

3.03 INSTALLATION OF JOINT SEALANTS:

A. Immediately before installing the joint sealant, clean the joint cavity by sandblasting or power wire brushing. Install bond breaker tape per manufacturer's instructions.

B. Apply masking tape along the edges of the exposed surface of the exposed joints.

C. Application criteria for the sealant materials, such as temperature and moisture requirements and primer cure time, shall be in accordance with the recommendations of the sealant manufacturer.

D. After the joints have been prepared as described above, apply the joint sealant. Apply the primer, if required, and joint sealant only with the equipment and methods recommended by the joint sealant manufacturer.

E. Trowel the joints smooth with a tuck pointing tool wiped with a solvent recommended by the sealant manufacturer.

F. After the sealant has been applied, remove the masking tape and any sealant spillage.

G. Sealants used in water retaining structures shall achieve final cure at least seven days before the structure is filled with water.

3.04 LEAKAGE TESTING:

A. Test hydraulic structures in accordance with Section 03 05 10.

3.05 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 03 15 20

ANCHORAGE IN CONCRETE

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide specified anchor bolts complete with washers and nuts as indicated and in compliance with Contract Documents. Unless otherwise specified, anchor bolts shall be hot-dip galvanized or Type 304 or 316 stainless steel.

1.02 SPECIAL INSPECTION:

A. Special inspection of anchor bolts shall be performed by the Special Inspector and in accordance with the IBC and the Statement of Special Inspections.

C. International Building Code (IBC):

1. International Building Code, 2018 Edition

1.04 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. A copy of this specification section, with addenda updates, with each paragraph check marked to show specification compliance or marked to show deviations.

1. Data indicating load capacities

2. Chemical resistance

3. Temperature limitations

4. Installation instructions

5. Manufacturer's data and catalogue numbers

C. All post installed anchors, adhesive and expansion type anchors shall be listed with at least one of the following agencies, ICC & ICC (ES). Submit ICC evaluation reports for

adhesive and expansion type anchors as specified in paragraph 3.02 of this specification section.

D. Design calculation in accordance with paragraph 2.04 of this specification section.

1.05 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.06 SPARE PARTS:

A. Comply with the requirements specified in Section 01 61 00.

1.07 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

1.08 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

PART 2 - PRODUCTS

2.01 GENERAL:

A. Anchor bolt holes in equipment support frames shall not exceed the bolt diameters by more than 25 percent, up to a limiting maximum oversizing of 1/4 inch. Minimum anchor bolt diameter shall be 1/2 inch. Anchor bolts shall be furnished with leveling nuts, the faces of which shall be tightened against flat surfaces as shown to not less than 10 percent of the bolt's safe tensile stress.

B. Tapered washers shall be provided where mating surface is not square with the nut.

C. Expansion, wedge or adhesive anchors set in holes drilled in the concrete after the concrete is placed will not be permitted in substitution for anchor bolts except where otherwise specified. Upset threads shall not be acceptable.

2.02 MATERIALS:

A. Anchor bolt materials shall be as specified in Table 03 15 20-1 unless otherwise specified on the contract drawings.

2.03 ANTI-SEIZE COMPOUND:

A. All stainless steel embedded bolts, expansion anchors, and adhesive anchors shall be assembled with a stainless steel anti-seize compound such as molycote.

2.04 DESIGN:

A. Anchor bolts for equipment frames and foundations shall be designed in accordance with the IBC. The contractor designed anchor bolts are differed approval, and the "stamped" calculations and drawing shall be submitted to the engineer of record for review of general compliance with design intent. Calculations and shop drawings shall be submitted with the equipment submittal in accordance with the Section 01 33 00 for all anchorage details. All calculations must be made and signed by a civil or structural engineer currently registered in the State of Utah.

B. All anchor bolts resisting seismic forces shall be design based on cracked concrete requirement in ACI 318.

Table 03 15 20-1
Anchor Bolt Materials

Material	Specification
Stainless Steel Anchor Bolts	ASTM A193, Grade B8M Class 1, AISI 316 or ASTM A320, Grade B8M Class 1, AISI 316
Stainless Steel Threaded Rods at Adhesive Anchors	ASTM F593 CW1 (1/4 inches to 5/8 inches Rod) ASTM F593 CW2 (3/4 inches to 1 1/2 inches Rod)
Stainless Steel Nuts and Washers	ASTM A194 Grade 8M, SS316 Nuts with Type 316 SS Washers (ASTM F594 Group 2 Type 316 SS Nuts at Adhesive Anchors)
Carbon Steel Anchor Bolts	ASTM F1554 (Grade 36) – Hot Dip Galvanized unless noted otherwise
High-Strength Carbon Steel Anchor Bolts	ASTM F1554 (Grade 55 Weldable per Supplementary Requirement S1) – Hot Dip Galvanized unless noted otherwise
Carbon Steel Nuts and Washers	ASTM A563 and ASTM F844
Concrete Expansion Anchors	Stainless Steel HILTI "KWIK BOLT TZ"; SIMPSON STRONG-TIE STRONG BOLT 2
Concrete Adhesive Anchoring System	HILTI HIT-HY 200; SIMPSON STRONG-TIE SET-XP
Stainless Steel Headed Anchor Studs	ASTM A276 or A493; Nelson Stud Welding, Inc.

Table 03 15 20-1 Anchor Bolt Materials	
Material	**Specification**
Carbon Steel Headed Anchor Studs	ASTM A108; Nelson Stud Welding, Inc.

PART 3 - EXECUTION

3.01 GENERAL:

A. Fieldwork, including cutting and threading, shall not be permitted on galvanized items. Dissimilar metals shall be protected from galvanic corrosion by means of pressure tapes, coatings or isolators. Grouting of anchor bolts with nonshrink or epoxy grouts, where specified, shall be in accordance with Section 03 60 00. All stainless steel anchor bolts and fasteners shall be assembled with stainless steel anti-seize compound.

3.02 INSTALLATION:

A. Cast-In-Place Anchor Bolts:

1. Anchor bolts to be embedded in concrete shall be placed accurately and held in correct position while the concrete is placed. Only where specifically shown on the contract plans recesses or blockouts shall be formed in the concrete and the metalwork shall be grouted in place in accordance with Section 03 60 00 after strength is attained. The surfaces of metalwork in contact with concrete shall be thoroughly cleaned.

2. After anchor bolts have been embedded, their threads shall be protected by grease and the nuts run on.

3. For grouting of anchor bolts, use non-shrink, non-metallic grout as specified in Section 03 60 00.

B. Adhesive Anchors:

1. Use of adhesive or capsule anchors shall be as shown on the contract drawings and shall be subject to the following conditions:

a. Use shall be limited to locations where exposure, on an intermittent or continuous basis, to acid concentrations higher than 10 percent, to chlorine gas, or to machine or diesel oils, is extremely unlikely.

b. Use shall be limited to applications where exposure to fire or exposure to concrete or rod temperature above 120 degrees F is extremely unlikely. Overhead applications (such as pipe supports), because of the above concerns, shall be disallowed.

c. Anchor diameter and grade of steel shall be per contract documents or per equipment supplier specifications. Anchor shall be threaded or deformed full length of embedment and shall be free of rust, scale, grease, and oils.

d. Embedment depth shall be as specified on the drawings. Adhesive capsules of different diameters may be used to obtain proper volume for the embedment, but no more than two capsules per anchor may be used. When installing different diameter capsules in the same hole, the larger diameter capsule shall be installed first. Any extension or protrusion of the capsule from the hole is prohibited.

e. All installation recommendations by the anchor system manufacturer shall be followed carefully, including, but not limited to, maximum hole diameter, minimum embedment, and minimum edge distance.

f. Holes shall have rough surfaces, such as can be achieved using a rotary percussion drill.

g. Holes shall be blown clean with compressed air and be free of dust or standing water prior to installation.

h. Anchor shall be left undisturbed and unloaded for full adhesive curing period.

i. Concrete temperature (not air temperature) shall be compatible with curing requirements of adhesives per adhesive manufacturer. Anchors shall not be placed in concrete below 25 degrees F.

2. The Contractor shall supply the Engineer with the current ICC evaluation report from the ICC Evaluation Services for the particular brand of adhesive anchors to be used.

3.03 EXPANSION ANCHORS:

A. Use of expansion anchors shall be as shown on the contract drawings and shall be subject to Conditions c, e, f, g, and h specified in paragraph 3.02-B.1 of this specification section.

3.04 FIELD QUALITY CONTROL:

A. Testing: 10 percent of each type and size of drilled-in anchor shall be proof loaded by the independent testing laboratory. Adhesive anchors and capsule anchors shall not be torque tested unless otherwise directed by the Engineer. If more than 10 percent of the tested anchors fail to achieve the specified torque or proof load within the limits as defined on the Drawings, all anchors of the same diameter and type as the failed anchor shall be tested, unless otherwise instructed by the Engineer.

1. Tension testing should be performed in accordance with ASTM E488.

2. Torque shall be applied with a calibrated torque wrench.

3. Proof loads shall be applied with a calibrated hydraulic ram. Displacement of adhesive and capsule anchors at proof load shall not exceed D/10, where D is the nominal anchor diameter.

3.05 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

Page Intentionally Left Blank

SECTION 03 21 00

REINFORCEMENT BARS

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide concrete reinforcement as indicated and in compliance with Contract Documents:

1. Section Includes:

a. Reinforcement bars

b. Welded wire reinforcement

c. Reinforcement accessories

1.02 REFERENCES:

A. ASTM International (ASTM):

1. A82: Standard Specification for Steel Wire, Plain, for Concrete Reinforcement.

1. 301: Standard Specification for Structural Concrete.

2. 315: Details and Detailing of Concrete Reinforcement.

3. 318: Building Code Requirements for Structural Concrete.

4. 350: Building Code Requirements for Environmental Engineering Concrete Structures

5. SP-66: ACI Detailing Manual.

C. Concrete Reinforcing Steel Institute (CRSI):

1. Manual of Standard Practice.

2. Placing Reinforcing Bars.

D. American Welding Society (AWS):

1. D1.4: Structural Welding Code, Reinforcement Steel.

E. Where reference is made to one of the above standards, the version in effect at the time of bid opening shall apply.

1.03 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.04 SUBMITTALS:

A. Unless otherwise acceptable to the Engineer, each submittal shall include reinforcement only for the individual structure to which it pertains.

B. Shop Drawings:

1. Submit bar lists and placing drawings for all reinforced concrete and masonry structures in accordance with Section 01 33 00.

2. Detail reinforcement in conformance with ACI SP-66.

3. Clearly indicate bar sizes, spacings, locations and quantities of reinforcement steel and wire reinforcement, bending schedules, and supporting and spacing devices. Show joints, with applicable joint reinforcement.

4. Coordinate bar splicing and placement with Contractor’s concrete placing schedule and joint locations. Do not add or delete joints without permission from the Engineer.

5. Show wall reinforcement in elevation.

6. Show slab reinforcement in plan view.

7. Show location and size of all penetrations greater than 12-inches in diameter or least dimension of the opening with the corresponding added reinforcement around the penetrations.

8. Clearly show marking for each reinforcement item.

9. Indicate locations of reinforcement bar cut-offs, splices and development lengths.

C. Submit Certificates: Submit AWS qualification certificates for welders employed on the Work for the appropriate electrode and class of material. Submit certified copies of mill test reports of reinforcement analysis for each shipment of reinforcement with specific lots in shipments identified.

D. Chemical composition of reinforcement steel: Ladle analysis indicating percentage of carbon, phosphorous, manganese and sulfur present in steel.

E. Where mechanical couplers are required or permitted to be used to splice reinforcement steel, submit Manufacturer's literature that contains instructions and recommendations for installation for each type of coupler used; certified test reports that verify the load

capacity of each type and size of coupler used; and Shop Drawings that show the location of each coupler with details of how they are to be installed in the formwork.

1.05 QUALITY ASSURANCE:

A. Comply with requirements in Section 01 45 00 and as specified.

B. Do not fabricate reinforcement until shop and placement drawings have been reviewed and accepted by the Engineer.

C. Perform concrete reinforcement work in accordance with CRSI Manual of Practice, ACI 301, ACI SP-66 and ACI 318.

D. An independent testing agency shall be retained by the Owner to visually inspect and test reinforcing steel welds in accordance with AWS D1.4.

E. An independent testing agency shall be retained by the Owner to inspect each mechanical coupler and verify each component is installed in accordance with Manufacturer's instructions and ICC Evaluation Services Report or equivalent code agency report.

1.06 QUALIFICATIONS:

A. Welders: AWS qualified within previous 12 months.

1.07 INSPECTION AND TESTING:

A. In no case shall any reinforcement steel be covered with concrete until the installation of the reinforcement has been observed by the Engineer and the Engineer's authorization to proceed with the concreting has been obtained. The Engineer shall be given 24 hours minimum prior notice of the readiness of placed reinforcement for observation. The forms shall be kept open until the Engineer has finished observations of the reinforcement steel.

1.08 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements in APWA Section 01 66 00.

B. Ship and store reinforcement steel with bars of the same size and shape fastened in bundles with durable tags, marked in a legible manner with waterproof markings showing the same "mark" designations as those shown on the submitted placing drawings.

C. Store reinforcement steel off the ground, protected from standing water and kept free from free from mill scale, rust, dirt, grease or other foreign matter.

PART 2 - PRODUCTS

2.01 REINFORCEMENT STEEL:

A. Reinforcement Steel: ASTM A615, 60 ksi yield grade; deformed billet steel bars, unfinished.

B. Reinforcement Steel: ASTM A706, 60 ksi yield strength; deformed low-alloy steel bars, unfinished.

C. Spiral reinforcement shall be cold-drawn steel wire conforming to the requirements of ASTM A82.

D. Welded Wire Reinforcement:

1. Provide welded wire reinforcement conforming to ASTM A185 in flat sheets.

2. Provide deformed welded wire reinforcement conforming to ASTM A497 in flat sheets.

3. Provide support bars and reinforcement bar supports as specified herein to obtain the concrete cover indicated.

4. Provide welded wire reinforcement heavier than W2.9 in flat sheets.

2.02 ACCESSORY MATERIALS:

A. Tie Wire: Minimum 16 gage annealed type.

B. Chairs, Bolsters, Bar Supports, and Spacers: Sized and shaped for strength and support of reinforcement during concrete placement.

C. Special Chairs, Bolsters, Bar Supports, and Spacers Adjacent to Weather Exposed Concrete Surfaces: Plastic type; size and shape.

D. Provide 3-inch by 3-inch plain precast concrete blocks, precast concrete doweled blocks or concrete brick for support of bottom reinforcement in foundation mats, base slabs, footings, pile caps, grade beams and slabs on grade. Provide block thickness to produce concrete cover of reinforcement as indicated.

E. Mechanical Couplers:

1. Reinforcement Tension Bar Splicers:

a. Manufacturers: Cadweld or Lenton rebar splicers by Erico Products, Inc. and Dayton Barsplice, Inc.

b. Manufacturers: DB-SAE splicer system by Richmond Screw Anchor Company, Inc., C2D rebar flange coupler by Williams Form Engineering Corporation and Lenton Form Saver by Erico Products, Inc.

c. Develop minimum 125 percent of yield capacity of bars spliced in tension when tested as assembly in accordance with ASTM A370 and A615.

F. Reinforcement Compression Bar Splicers:

1. Manufacturers:

a. G-Loc splicers by Gateway Building Products Division

b. Speed-Sleeve by Erico Products, Inc.

G. Provide epoxy for grouting reinforcement bars specifically formulated for such application for the moisture condition, application temperature, and orientation of the hole to be filled.

H. Epoxy grout shall meet the requirements in Section 03 60 00.

2.03 FABRICATION:

A. Fabricate concrete reinforcement in accordance with CRSI Manual of Standard Practice.

B. Weld reinforcement in accordance with AWS D1.4 only when permitted by the Engineer.

C. Locate reinforcement splices not indicated on Drawings, at point of minimum stress. Review location of splices with Engineer.

D. Cold bend bars. Do not straighten or rebend bars.

E. Do not heat reinforcement steel to bend or straighten.

F. Bend bars around a revolving collar having a diameter of not less than that recommended by the ACI 318.

G. Cut bar ends that are to be butt spliced or threaded by saw cutting. Terminate such ends in flat surfaces within 1-1/2 degrees of a right angle to the axis of the bar.

PART 3 - EXECUTION

3.01 INSTALLATION:

A. Place, support and secure reinforcement against displacement. Do not deviate from required position. Place reinforcement a minimum of 2 inches clear of any metal pipe or fittings.

B. Position dowels accurately. Rigidly support, align and securely tie dowels normal to the concrete surface before concrete placement. Setting dowels into wet concrete is prohibited.

C. Position wall dowels projecting from base slabs on grade with templates or guides held in place above the concrete placement line. Position the templates to obtain the required clearance between the dowels and the face of the walls.

D. Bars additional to those indicated that may be found necessary or desirable by the Contractor for the purpose of securing reinforcement in position shall be provided by the Contractor at no additional cost to the Owner.

E. Do not extend continuous reinforcement or other fixed metal items through expansion joints. Provide 2 inches clearance from each face of expansion joint.

F. Provide additional reinforcement bars to support top reinforcement in slabs. Do not shift reinforcement bars from positions in upper layers to positions in lower layers as a substitute for additional support bars.

G. Support reinforcement steel in accordance with CRSI “Placing Reinforcement Bars” with maximum spacing of 4 feet-0 inches.

H. Tie reinforcement steel at intersections in accordance with CRSI “Placing Reinforcement Bars”:

1. Maximum tie spacing for footings, walls and columns: every third intersection or 3 feet-0 inches.

2. Maximum spacing for slabs and other work: every fourth intersection or 3 feet-0 inches.

3. Tie a minimum of 25 percent of all intersecting bars in foundation mats, base slabs, footings, pile caps, slabs on grade and elevated slabs.

4. Secure all dowels in place before placing concrete.

5. Tie wires shall be bent away from the forms and from finished concrete surfaces in order to provide the required concrete coverage.

I. Locate reinforcement to avoid interference with items drilled in later, such as concrete anchors as identified on the Contract Drawings.

J. Extend welded wire reinforcement to within 2 inches of edges of slab or section. Lap sheets at least 12 inches or two wire spaces, whichever is greater, at ends and edges and wire tightly together. Stagger end laps.

K. Unless shown otherwise on Drawings, place welded wire reinforcement in slabs on grade between the upper third point and mid-point of slab. Placing welded wire reinforcement on the subgrade and pulling it up during concrete placement is not permitted.

L. Support welded wire reinforcement placed over the ground on wired concrete blocks (dobies) spaced not more than 3 feet on centers in any direction.

M. Support welded wire reinforcement placed over horizontal forms on slab bolsters spaced not more than 30 inches on center.

N. Mechanical coupler systems may be substituted for dowels at Contractor's option when permitted by Engineer.

O. Provide additional reinforcement bars to support ties and stirrups in beams where top reinforcement is not continuous.

P. Securely support and tie reinforcement steel to prevent movement during concrete placement.

Q. Ship, handle and place stainless steel reinforcement bars such that they do not come into direct contact with carbon steel. Use stainless steel or non-metallic tie wires and bar chairs. Use nylon, PVC, or polyethylene spacers where stainless steel bar must be attached to carbon steel, to maintain a minimum 1-inch clearance.

R. Unless otherwise shown on the Drawings or permitted by the Engineer, do not bend reinforcement bars that project from in-place concrete.

S. Do not weld reinforcement steel bars (including tack welded) either during fabrication or erection unless specifically shown on the Drawings or specified herein, or unless prior written permission has been obtained from the Engineer. Immediately remove bars that have been welded, including tack welds, without such permission from the work. Comply with AWS D1.4 when welding of reinforcement is or called for.

T. Reinforcement steel interfering with the location of other reinforcement steel, conduits or embedded items may be moved within the specified tolerances or one bar diameter, whichever is greater. Make greater displacement of bars to avoid interference only with the permission of the Engineer. Do not cut reinforcement to install inserts, conduits, mechanical openings or other items without the prior permission from the Engineer.

U. Reinforcement shall be clean and free from loose mill scale, dirt, grease, oil, form release agent, dried concrete or any material reducing bond with concrete.

V. Setting bars and welded wire reinforcement on layers of fresh concrete as the work progresses or adjusting reinforcement during the placement of concrete is prohibited.

W. Provide and place safety caps on all exposed ends of vertical reinforcement that pose a danger to injury or life safety.

3.02 CONCRETE COVER OVER REINFORCEMENT BARS:

A. Conform to ACI 318 for concrete cover over reinforcement.

3.03 REINFORCEMENT AROUND OPENINGS AND PENETRATIONS:

A. Accommodate placement of formed openings and penetrations.

B. Unless specific additional reinforcement around openings and penetrations is shown on the Drawings, provide additional reinforcement steel on each side of opening or penetration equivalent to one half of the cross-sectional area of the reinforcement steel interrupted by an opening or penetration. The bars shall have sufficient length to be fully developed at each end beyond the opening or penetration.

C. Refer to details on Drawings for additional diagonal bars around openings or penetrations and bar extension length on each side of openings or penetrations.

D. Where welded wire fabric is used provide extra reinforcement using fabric or deformed bars around opening or penetration.

3.04 SPLICING OF REINFORCEMENT:

A. Splices may be used to provide continuity due to bar length limitations. Minimum length of bars spliced for this reason is 30 feet. Do not splice reinforcement that is detailed to be continuous in the Drawings.

B. Stagger bar splices.

C. Provide tension lap splices at all laps in compliance with ACI 318. Use Class B splices at all locations, unless otherwise noted.

D. Except as otherwise indicated on the Drawings, stagger splices in circumferential reinforcement in circular walls using Class B tension splices. Do not splice adjacent bars within the required lap length.

E. Make reinforcement continuous through construction joints.

F. Reinforcement may be spliced at construction joints provided that entire lap is placed within only one concrete placement.

3.05 ACCESSORIES:

A. Provide accessories such as chairs, chair bars and the like in sufficient quantities and strength to adequately support the reinforcement and prevent its displacement during the erection of the reinforcement and the placement of concrete.

B. Use precast concrete blocks where the reinforcement steel is to be supported over soil.

C. Provide stainless steel bar supports or steel chairs with plastic tips where the chairs are set on forms for a concrete surface that will be exposed to weather, high humidity or liquid (including bottom of slabs over liquid containing areas) unless otherwise noted on contract documents.

D. Do not use metal chairs, ferrous clips, nails, etc. that extend to the surfaces of the concrete. Do not use stones, brick or wood block supports.

E. Do not use alternate methods of supporting top steel in slabs, such as steel channels supported on the bottom steel or vertical reinforcement steel fastened to the bottom and top mats unless permitted by the Engineer.

F. Mechanical Couplers:

1. Couplers that are located at a joint face can be a type that can be set either flush or recessed from the face as indicated.

2. Seal couplers during concrete placement to completely eliminate concrete or cement paste from entering.

3. Recess couplers intended for future connections a minimum of 1/2 inch from the concrete surface. After the concrete is placed, plug the coupler with plastic plugs that have an O-ring seal and the recess filled with sealant to prevent any contact with water or other corrosive materials.

4. Unless indicated otherwise, provide mechanical coupler spacing and size to match the spacing and size of the reinforcement indicated for the adjacent section.

3.06 FIELD QUALITY CONTROL:

A. Remove reinforcement with kinks or bends not shown on shop or placement drawings. Remove such reinforcement from job site and replace with new fabricated steel. Do not field bend reinforcement unless reinforcement is indicated or specified to be field bent.

B. Protect reinforcement from rusting, deforming, bending, kinking and other injury. Clean in-place reinforcement that has rusted or been splattered with concrete using sand or water blasting prior to incorporation into the Work.

3.07 CONTRACT CLOSEOUT:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

Page Intentionally Left Blank

SECTION 03 30 00

CAST-IN-PLACE CONCRETE

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide cast-in-place concrete as indicated and in compliance with Contract Documents.

1.03 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Product Data:

1. Manufacturer's specifications and instructions including Material Safety Data Sheets (MSDS) for admixtures and curing materials. Manufacturer’s certification of compatibility of all admixtures.

C. Shop Drawings:

1. Prior to placing concrete provide all submittal requirements of Section 03 35 01.

2. Provide certificate that cement used complies with ASTM C150 and these specifications.

3. Provide certificates that aggregates comply with ASTM C33 and contain less than 1 percent asbestos by weight or volume. Submit gradation analysis with concrete mix designs.

4. Provide certificate of compliance with these specifications from the manufacturer of the concrete admixtures.

5. For each formulation of concrete proposed, prepare mix designs in accordance with ACI 318, Chapters 4 and 5, except as modified herein. Submit mix design for review by the Engineer at least 15 days before placing of any concrete.

6. Proposed special procedures for protection and curing of concrete under hot and cold weather conditions.

7. Proposed special procedures for protection of concrete under wet weather placement conditions.

8. ACI 301, Section 8 applies for all concrete elements thicker than 48 inches.

9. Provide in mix designs gradation of aggregate. Gradation shall be performed within 4 months prior to submittal.

    a. Gradation:

        (1) List gradings and percent passing through each sieve for coarse, fine, and combined aggregates.

        (2) Testing shall be performed within 4 months prior to submittal.

    b. Provide evidence not more than 120 days old showing compliance with the requirements of Article Materials, Paragraph B, including the following:

        (1) Deleterious substances in fine aggregate per ASTM C33, Table 2.

        (2) Deleterious substances in coarse aggregate per ASTM C33, Table 4.

    c. Alkali Aggregate Reactivity: Aggregate shall be classified as non-potentially reactive in accordance with ASTM C33, Table 3 as tested using methods from ASTM C227. Include documentation of test results per applicable standards.

10. Admixtures: Manufacturer's catalog cut sheets and product data sheets for each admixture used in proposed mix designs.

D. Informational Submittals:

1. Preinstallation Conference minutes.

2. Statement of Qualification:

    a. Batch Plant: Certification under National Ready Mix Concrete Association (NRMCA) Program for Certification of Ready-Mixed Concrete Production Facilities or approved equal.

    b. Mix designer. NRMCA Concrete Technologist Level 2 or licensed professional engineer.

    c. Testing agency credentials according to ASTM C1077 and ASTM E329

(1) Field tester(s): ACI Concrete Field Testing Technician, Grade 1

(2) Laboratory staff: ACI Concrete Strength Testing Technician and Concrete Laboratory Testing Technician, Grade I with supervisor being Grade II.

3. Field test reports.

4. Recorded temperature data from concrete placement where specified.

5. Concrete Delivery Tickets:

a. For each batch of concrete before unloading at Site.

b. In accordance with ASTM C94, including requirements 14.2.1. through 14.2.10.

c. Indicate amount of mixing water withheld and maximum amount that may be permitted to be added at Site.

E. Test and Evaluation Reports:

1. Provide results of drying shrinkage tests from trial concrete mixes by the Contractor's testing laboratory firm.

F. Manufacturer’s Instructions:

1. Provide epoxy bonding compound manufacturer's specific instructions for use. Provide manufacturer's data sheets as to suitability of product to meet job requirements with regard to surface, pot life, set time, vertical or horizontal application, and forming restrictions.

G. Shrink Test Results:

1. Provide shrink test results for Class A concrete mixes in accordance with ASTM C157 as modified herein

H. Field Quality Control Submittals:

1. Provide delivery tickets for ready-mix concrete or weighmasters certificate per ASTM C94, including weights of cement and each size aggregate and amount of water added at the plant and record of pours. Record the amount of water added on the job on the delivery ticket. Water added at the plant shall account for moisture in both coarse and fine aggregate.

1.04 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.05 SHRINKAGE TESTS:

A. The testing laboratory shall perform drying shrinkage tests for the trial batches as specified herein.

B. Fabricate, cure, dry, and measure specimens in accordance with ASTM C157 modified as follows:

1. Remove specimens from molds at an age of 23 hours plus or minus 1 hour after trial batching, place immediately in water at 70 degrees F, plus or minus 3 degrees F for at least 30 minutes, measure within 30 minutes thereafter to determine original length, and then submerge in saturated lime water at 73 degrees F plus or minus 3 degrees F. At age seven days, make measurement to determine expansion, expressed as a percentage of original length. This length at age seven days shall be the base length for drying shrinkage calculations (zero days' drying age).

2. Then, store specimens immediately in a humidity-controlled room maintained at 73 degrees F, plus or minus 3 degrees F and 50 percent, plus or minus 4 percent relative humidity for the remainder of the test. Make and report measurements to determine shrinkage expressed as percentage of base length separately for 7, 14, 21, and 28 days of drying after 7 days of moist curing.

C. Compute the drying shrinkage deformation of each specimen as the difference between the base length (at zero days' drying age) and the length after drying at each test age. Compute the average drying shrinkage deformation of the specimens to the nearest 0.0001 inch at each test age. If the drying shrinkage of any specimen departs from the average of that test age by more than 0.0004 inch**,** disregard the results obtained from that specimen. Report results of the shrinkage test to the nearest 0.001 percent of shrinkage. Take compression test specimens in each case from the same concrete used for preparing drying shrinkage specimens. These tests shall be considered a part of the normal compression tests for the project.

D. The maximum concrete shrinkage for specimens cast in the laboratory from the trial batch, as measured at 21-day drying age or at 28-day drying age, shall be 0.036 or 0.042 percent, respectively. Use a mix design for construction that has first met the trial batch shrinkage requirements.

E. If the trial batch specimens do not meet the shrinkage requirements, revise the mix design and/or materials and retest.

1.06 QUALITY ASSURANCE:

A. Provide in accordance with Section 01 45 00.

B. Unless otherwise indicated, materials, workmanship, and practices shall conform to the following standards:

1. Local building codes.

2. ACI 301, “Structural Concrete for Buildings”.

3. ACI 318, “Building Code Requirements for Reinforced Concrete”.

4. ACI 350, “Code Requirements For Environmental Engineering Concrete Structures”.

C. Where provisions of pertinent codes and standards conflict with this specification, the more stringent provisions govern.

D. Concrete not meeting the minimum specified 28-day design strength shall be cause for rejection and removal from the work.

E. Perform concrete work in conformance with ACI 301 unless otherwise specified.

F. Do not use admixtures, including calcium chloride, which will cause accelerated setting of cement in concrete.

G. Do not place concrete until design mix, material tests and trial concrete batch mix compression test results are accepted by the Engineer.

H. The Owner shall employ a testing laboratory to test conformity of materials to specifications. Concrete testing shall be performed by an ACI Concrete Field Technician, Grade I or equivalent. Allow free access to obtain test samples.

I. Methods of Sampling and Testing:

1. Fresh Concrete Sampling: ASTM C172

2. Specimen Preparation: ASTM C31

3. Compressive Strength: ASTM C39

4. Air Content: ASTM C231

5. Slump: ASTM C143

6. Temperature: ASTM C1064

7. Unit Weight: ASTM C138

8. Obtaining Drilled Cores: ASTM C42

9. Drying Shrinkage: ASTM C157

J. Acceptance of Structure: Acceptance of completed concrete work requires conformance with dimensional tolerances, appearance and strength as indicated or specified.

K. Hot weather concrete to conform to ACI 305R and as specified herein.

L. Cold weather concrete to conform to ACI 306R and as specified herein.

M. Reject concrete delivered to job site that exceeds the time limit or temperature limitations specified. Refer to paragraph 3.02.A for limits.

N. Do not place concrete in water or on frozen or uncompacted ground.

O. Workability:

1. Concrete shall be of such consistency and composition that it can be worked readily into the forms and around the reinforcement without excessive vibrating and without permitting the materials to segregate or free water to collect on the surface.

2. Adjust the proportions to secure a plastic, cohesive mixture, and one that is within the specified slump range.

3. To avoid unnecessary changes in consistency, obtain the aggregate from a source with uniform quality, moisture content, and grading. Handle materials to minimize variations in moisture content that would interfere with production of concrete of the established degree of uniformity and slump.

1.07 DELIVERY, STORAGE, AND HANDLING:

A. Provide in conformance with APWA Section 01 66 00 and as specified herein.

B. Deliver concrete to discharge locations in watertight agitator or mixer trucks without altering the specified properties of water-cement ratio, slump, air entrainment, temperature and homogeneity.

C. Reject concrete not conforming to specification, unsuitable for placement, exceeding the time or temperature limitations or not having a complete delivery batch ticket.

1.08 SITE CONDITIONS:

A. Do not place concrete until conditions and facilities for making and curing control test specimens are in compliance with ASTM C31 and as specified herein.

PART 2 - PRODUCTS

2.01 MATERIALS:

A. Cement:

1. Portland Cement, ASTM C595, Type IL.

2. Use only one brand of cement in any individual structure. Use no cement that has become damaged, partially set, lumpy, or caked. Reject the entire contents of the sack or container that contains such cement. Use no salvaged or reclaimed cement.

3. Maximum tricalcium aluminate shall not exceed 8 percent. The maximum percent alkalies shall not exceed 0.6 percent.

B. Fly Ash:

1. Provide fly ash conforming to the following requirements:

a. Class F fly ash conforming to ASTM C618 for chemical and physical properties.

b. Supplemental requirements in percent:

(1) Maximum carbon content: 3 percent

(2) Maximum sulfur trioxide (SO3) content: 4 percent

(3) Maximum loss on ignition: 3 percent

(4) Maximum water requirement (as a percent of control): 100 percent

(5) Fineness, maximum retained on No. 325 sieve: 25 percent

C. Ground Granulated Blast Furnace Slag (GGBF):

1. GGBF, when used, shall meet the requirements of ASTM C989, Grade 100 or better.

D. Silica Fume:

1. The use of silica fume and other natural pozzolans is not permitted.

E. Fine Aggregates:

1. Clean, sharp, natural sand conforming to requirements of ASTM C33 with a fineness modulus between 2.50 and 3.0.

F. Coarse Aggregate:

1. Well graded crushed stone, natural rock conforming to requirements of ASTM C33, and shall contain less than 1 percent asbestos by weight or volume.

2. Limit deleterious substances in accordance with ASTM C33, Table 3, Severe Weathering Regions, limit clay lumps not to exceed 1.0 percent by weight, and limit loss when tested for soundness using magnesium sulfate to 12 percent.

G. Water and Ice:

1. Use water and ice free from injurious amounts of oil, acid, alkali, salt, organic matter or other deleterious substances and conforms to requirements of ASTM C94.

2. Water shall not contain more than 500 mg/L of chlorides nor more than 500 mg/L of sulfate.

3. Heat or cool water to obtain concrete temperatures specified, and in conformance with ACI 305R and ACI 306R.

H. Color Additive for Exterior Electrical Duct Encasement:

1. For exterior electrical duct concrete encasements, use a red color additive for identification purposes.

I. Concrete Admixtures:

1. Maintain compressive strength and maximum water-cement ratios specified in Table 03 30 00-1 when using admixtures. Include admixtures in solution form in the water-cement ratio calculations.

2. Do not use any admixture that contains chlorides or other corrosive elements in any concrete. Admixtures shall be nontoxic after 30 days.

3. Use admixtures in compliance with the manufacturer's printed instructions. The manufacturer shall certify the compatibility of multiple admixtures used in the same mix.

4. Do not use admixtures in greater dosages than recommended by manufacturer.

5. Air Entrainment:

a. Class A concrete; an air-entraining admixture conforming to ASTM C260.

b. Class A-2 concrete; an air-entraining admixture conforming to ASTM C260.

c. Products:

(1) BASF Corporation; MasterAir AE 90.

(2) Sika Corporation; AER-C.

d. Adjust the admixture content to accommodate fly ash or pozzolan requirements, and other admixtures when used, in order to obtain the specified air content.

6. Water Reducing:

a. Class A or Class A-2 concrete; a water-reducing admixture conforming to ASTM C494, Type A and compatible with the air-entraining admixtures. The amount of admixture added to the concrete shall be in accordance with the manufacturer's recommendations.

b. Products:

(1) BASF Corporation; Polyheed Series

(2) Sika Corporation, Plastocrete 161

(3) WR Grace & Co.; Darex II-AEA

(4) Euclid Chemical Company; Eucon NW

7. Water Reducing and Retarding:

a. Class A or A-2 concrete; a water-reducing and retarding admixture conforming to ASTM C494, Type D and compatible with the air-entraining admixtures. The amount of admixture added to the concrete shall be in accordance with the manufacturer's recommendations.

b. Products:

(1) BASF Corporation; Pozzolith Series

(2) Sika Corporation; Plastiment

(3) Euclid Chemical company; Eucon WR-91

8. Mid-Range Water-Reducing Admixture (Superplasticizer):

a. Class A or A-2 concrete; a water-reducing and retarding admixture conforming to ASTM C494, Type A and F and compatible with the air-entraining admixtures. The amount of admixture added to the concrete shall be in accordance with the manufacturer's recommendations.

b. Products:

(1) BASF Corporation; MasterPolyheed 900

(2) Sika Corporation; SikaPlast 200

(3) Euclid Chemical company; Eucon MR

9. High-Range Water-Reducing Admixture (Superplasticizer):

a. High-Range water-reducing admixture conforming to ASTM C494, Type F or ASTM C1017, Type I.

b. Products:

(1) BASF Corporation; Glenium Series

(2) WR Grace & Co.; Daracem 19

(3) Euclid Chemical Company; Eucon SP

10. Shrinkage Reducing Admixture:

a. Class A concrete; shrinkage-reducing admixture is permitted to be used in the mix to meet shrinkage limitations provided that specified strength are met and there is no reduction in sulfate resistance and no increase in permeability. Quantity of shrinkage-reducing admixture used in the mix shall be added to the quantity of water for purposes of determining the water/cementitious materials ratio.

b. Products:

(1) BASF Corporation; MasterLife SRA 20

(2) GCP Applied Technologies; Eclipse

(3) The Euclid Chemical Company; Eucon SRA

J. Epoxy Bonding Agent:

1. Epoxy bonding agent shall conform to ASTM C881 Type I, II, IV or V; Grade 2 for epoxy resin adhesives. The class of epoxy bonding agent shall be suitable for ambient and substrate temperatures.

2. Products:

a. Sika Corporation; Sikadur 32, Hi-Mod

b. Sika Corporation; Sikadur 32, Hi-Mod LPL

c. BASF Corporation, MasterEmaco ADH 326

K. Curing Compound:

1. Liquid form, which will form impervious membrane over, exposed surface of concrete when applied to fresh concrete by means of spray gun. Compound shall not inhibit future bond of floor covering or concrete floor treatment. Use Type I-D compound with red fugitive dye, Class B, having 18 percent minimum solids conforming to ASTM C309.

2. Products:

a. BASF Building Systems; MasterKure 1315WB.

b. The Euclid Chemical Company; Super Diamond Clear VOX.

c. W. R. Meadows, Inc.; VOCOMP-30.

d. Dayton Superior Corp; Cure and Seal 30 percent.

L. Burlap Mats:

1. Conform to AASHTO M182.

M. Sisal-Kraft Paper and Polyethylene Sheets for Curing:

1. Conform to ASTM C171.

N. Crystalline Waterproofing:

1. Provide crystalline waterproofing in all foundation, slabs and all concrete for water retaining structures, gallery roof slabs, wells, well roof slabs, and below grade structures.

2. Cementitious crystalline waterproofing admixture shall be added to concrete at time of batching.

3. Chloride Environment Field Review: An independent review shall have been completed on a marine structure of at least 19 years of age, subject to ongoing salt water exposure and containing crystalline waterproofing admix to protect the reinforcing steel from chloride attack. Based on concrete sampling and analysis the derived chloride diffusion coefficients of the in place concrete shall show an expected time to corrosion of over 150 years based on an average of a minimum of 3 test locations.

4. Products:

   a. Xypex; Admix C-1000NF, Admix C-2000NF, or Admix C-500

2.02 MIXES:

A. Conform to ASTM C94, except as modified by these specifications.

B. Air content, for Class A and B concrete only, shall be as determined by ASTM C231:

1. 5 +/- 1-1/2 percent for concrete using 1-1/2 inch maximum aggregate size.

2. 6 +/- 1-1/2 percent for concrete using 3/4-inch maximum aggregate size.

3. 7 +/- 1-1/2 percent for concrete using 1/2 -inch maximum aggregate size.

C. Provide concrete with the following compressive strengths at 28 days and proportion it for strength and quality requirements in accordance with ACI 318. The resulting mix shall not conflict with limiting values specified in Table 03 30 00-1.

Table 03 30 00-1

Class	Type of Work	28-Day Minimum Compressive Strength (psi)	Minimum Cementitious Content (lbs per C.Y.)	Maximum Water/ Cement Ratio
A	Concrete for all process and liquid containing structures, foundations, piles, and concrete not otherwise specified.	5,000	560	0.42
A-2	Concrete for non-process interior building construction and concrete not otherwise specified.	5,000	560	0.42
A-3	Cement grout	5,000	560	0.42
B	Site Pavement, Sidewalks and Curbs	3,000	420	0.45

Table 03 30 00-1				
Class	**Type of Work**	**28-Day Minimum Compressive Strength (psi)**	**Minimum Cementitious Content (lbs per C.Y.)**	**Maximum Water/ Cement Ratio**
C	Concrete fill below structure foundations, pipe encasement, miscellaneous unreinforced concrete.	2,000	188	0.60

D. Measure slump in accordance with ASTM C143:

1. Proportion and produce the concrete to have a maximum slump of 4 inches. Proportion and produce the concrete for filling driven pipe piles to have a slump of 6 inches. A tolerance of up to 1 inch above the indicated maximum is allowed for individual batches provided the average for all batches or the most recent 10 batches tested, whichever is fewer, does not exceed the maximum limit. Concrete of lower than usual slump may be used provided it is properly placed and consolidated.

2. Mixes containing water reducers shall have a maximum slump of 6 inches after the addition of a mid-range water reducer and maximum slump of 8 inches after the addition of a high range water reducer.

E. Pozzolan Content:

1. Fly ash shall not exceed 20 percent of the total cementitious content.

2. Ground Granulated Blast Furnace Slag (GGBF) will be permitted as a substitute for fly ash at no additional cost to the Owner, in the event that Class F Fly Ash is not available. The slag substitution shall be in the same proportions and percentages of the total cementitious material as shown for fly ash. A higher percentage of GGBF will be allowed if permitted by the Engineer to suit project needs.

F. Aggregate Size:

1. Aggregate size shall be 3/4-inch maximum for slabs and sections 8 inches thick and less. Aggregate size shall be 1 inch maximum for sections greater than 8 inches and less than 17 inches. Aggregate size shall be 1-1/2 inches maximum for all larger slabs and sections. For Class A-3 Concrete: Aggregate shall be:

   a. 3/8-inch maximum

b. Sand aggregate

2. Combined aggregate grading shall be as shown in the following table:

Table 03 30 00-2					
Maximum Aggregate Size	1-1/2 inch	1 inch	3/4-inch	1/2-inch	3/8-inch
Aggregate Grade per ASTM C33	467	57	67	7	8

2.03 CONCRETE TEMPERATURE MONITORING EQUIPMENT:

A. Equipment used to monitor concrete temperature during the curing period shall consist of electronic equipment capable of continuously monitoring and logging the temperature of the concrete, embedded in the concrete at the locations indicated in the Thermal Control Plan.

B. As a minimum the equipment shall consist of an enclosed, battery operated logger embedded in the concrete, attached wires extending to and from the surface of the concrete, and a handheld reader that can be attached to the wires and logger data downloaded.

C. Manufacturers:

1. IntelliRock System, by Engius.

2. The Command Center Maturity System, by the Transtec Group, Inc.

PART 3 - EXECUTION

3.01 INSPECTION:

A. Examine the subgrade and the conditions under which work is to be performed and notify the Engineer in writing of unsatisfactory conditions. Do not proceed with the work until unsatisfactory conditions are corrected to comply with specified subgrade conditions in a manner acceptable to the Engineer.

3.02 MIXING AND TRANSPORTING CONCRETE:

A. General: Conform to concreting procedures set forth in ASTM C94, ACI 304R and as specified herein.

1. Transport concrete to discharge locations without altering the specified properties of water-cement ratio, slump, air entrainment, temperature and homogeneity.

2. Discharge concrete into forms in accordance with Table 03 30 00-3 after cement has entered mixing drum or before the drum has revolved 300 revolutions after the addition of water, whichever occurs first. Do not add water at the jobsite unless permitted by the Engineer. If it is necessary to add water to obtain the specified slump, add water per ASTM C94, but do not exceed the maximum water content in the reviewed concrete design mix. Added water shall be incorporated by additional mixing of at least 35 revolutions.

3. Do not add water to concrete containing high range water reducing admixture. Do not add water to concrete in delivery equipment not acceptable for mixing.

4. Keep a record showing time and place of each placement of concrete, together with transit-mix delivery slips certifying the contents of the pour.

5. Discharge of concrete shall be completed within the limits set out in Table 03 30 00-3.

Table 03 30 00-3

Maximum Time to Concrete Discharge

Concrete Temperature	Limit
Over 90 Degree F	Remove concrete from jobsite and discard concrete
86 to 90 Degree F	45 minutes
81 to 85 Degree F	60 minutes
70 to 80 Degree F	75 minutes
Below 70 Degree F	90 minutes

B. Conveying: Convey concrete from agitator or mixer truck to place of final deposit in forms by one of the following methods:

1. Buckets or hoppers with discharge gates having a clear opening equal to not less than one-third the maximum interior horizontal area or five times the maximum aggregate size being used, whichever is greater, and side slopes of not less than 60 degrees to horizontal.

2. Buggies or wheelbarrows equipped with pneumatic tires.

3. Round bottom, metal or metal-lined chutes with inclined slope of between 2 to 3 feet horizontally to 1 foot vertically and of sufficient capacity to avoid overflow.

4. Circular drop pipes with a top diameter of at least eight times the maximum aggregate size, but not less than 6 inch, or tapered to not less than six times maximum aggregate size.

3.03 CONCRETE ACCEPTANCE:

A. Accept or reject each batch of concrete delivered to the point of agitator or mixer truck discharge. Sign delivery batch tickets to indicate concrete acceptance.

B. Reject concrete delivered without a complete concrete delivery batch ticket as specified herein. The concrete supplier will furnish copies of the signed batch ticket to the Contractor and Engineer.

C. The testing agency shall perform field tests at the point of agitator or mixer truck discharge. Accept or reject concrete on the basis of conformity with slump, air content and temperature specified.

D. The testing agency shall inspect concrete transit truck's barrel revolution counter and gauge for measuring water added to the concrete. Reject concrete that exceeds the maximum barrel revolution of 300, the limits in Table 03 30 00-3 or concrete that has water content exceeding the specified water-cement ratio.

E. Reject concrete not conforming to specification before discharging into the forms.

3.04 PREPARATION AND COORDINATION:

A. Contractor shall notify the Engineer of readiness to place concrete in any portion of the work a minimum of 48 hours prior to concrete placement. Failure to provide this notification will be cause for delay in placing until observations can be completed. For small concrete placement less than 10 cubic yards, the time may be coordinated with the Engineer and revised to 24 hours.

B. Reinforcement, installation of waterstop, positioning of embedded items, and condition of formwork will be observed by the Engineer prior to concrete placement.

C. Coordinate the sequence of placement such that construction joints will occur only as designed.

D. Schedule sufficient equipment for continuous concrete placing. Provide for backup equipment and procedures to be taken in case of an interruption in placing. Provide backup concrete vibrators at the project site. Test concrete vibrators the day before placing concrete.

E. Compact the subgrade and/or bedding. Saturate the subgrade approximately eight hours before placement and sprinkle ahead of the placement of concrete in areas where vapor barrier is not used. Remove standing water, mud, and foreign matter before concrete is deposited.

F. Where shown on contract drawings, intentionally roughen surfaces of set concrete in a manner to expose bonded aggregate uniformly at joints.

G. Where concrete is required to be placed and bonded to existing concrete, coat the contact surfaces with epoxy bonding agent. The method of preparation and application of the bonding agent shall conform to the manufacturer's recommendations.

3.05 CONCRETE PLACEMENT:

A. Placement shall conform to ACI 304R as modified by these specifications.

B. Alternate sections of concrete walls and slabs may be cast simultaneously. Do not place adjacent sections of walls and slabs until three days after placement of first placed concrete.

C. Do not place concrete until free water has been removed or has been diverted by pipes or other means and carried out of the forms, clear of the work. Do not deposit concrete underwater, and do not allow free water to rise on any concrete until the concrete has attained its initial set. Do not permit free or storm water to flow over surfaces of concrete so as to injure the quality or surface finish.

D. Do not place concrete during inclement weather. Protect concrete placed from inclement weather. Keep sufficient protective covering ready at all times for this purpose.

E. Deposit concrete at or near its final position to avoid segregation caused by rehandling or flowing. Do not deposit concrete in large quantities in one place to be worked along the forms with a vibrator.

F. Deposit concrete in walls and columns continuously and in level layers 4 feet thick. Avoid inclined layers and cold joints. Place concrete at lower portion of slope first on sloping surfaces.

G. Deposit concrete slab on grade in forms continuously and in level layers 1 to 2 feet thick. Avoid inclined layers and cold joints. Place concrete at lower portion of slope first on sloping surfaces.

H. Do not deposit partially hardened concrete in forms. Retempering of partially hardened concrete is not permitted. Remove partially hardened concrete from site at no additional compensation.

I. Do not allow concrete to fall freely in forms to cause segregation (separation of coarse aggregate from mortar). Limit maximum free fall of concrete to 4 feet. Do not move concrete horizontally more than four feet from point of discharge. Space points of deposit not more than eight feet apart.

J. At least two hours shall elapse after depositing concrete in the columns or walls before depositing in beams, girders, or slabs supported thereon. Place beams, girders, brackets, column capitals, and haunches monolithically as part of the floor or roof system, unless otherwise shown on contract drawings.

K. Consolidate concrete using mechanical vibrators operated within the mass of concrete and/or on the forms conforming to procedures set forth in ACI 309R and as specified herein.

L. Conduct vibration to produce concrete of uniform texture and appearance, free of honeycombing, streaking, cold joints or visible lift lines.

M. Conduct vibration in a systematic manner with regularly maintained vibrators. Furnish sufficient backup units at job site. Use vibrators having minimum frequency of 8,000 vibrations per minute and of sufficient amplitude to consolidate concrete. Use not less than one vibrator with crew for each 35 to 40 cubic yards of concrete placed per hour.

N. Insert and withdraw vibrator vertically at a uniform spacing over the entire area of placement. Space distances between insertions such that spheres of influence of each insertion overlap.

O. Use additional vibration with pencil vibrators on vertical surfaces and on exposed concrete to bring full surface of mortar against the forms to eliminate air voids, bug holes and other surface defects. Employ the following additional procedures for vibrating concrete as necessary to maintain proper consolidation of concrete:

1. Reduce distance between internal vibration insertions and increase time for each insertion.

2. Insert vibrator as close to face of form as possible without contacting form or reinforcement.

3. Thoroughly vibrate area immediately adjacent to waterstops without damaging the waterstop.

4. Use spading as a supplement to vibration where particularly difficult conditions exist.

P. Pumping Concrete:

1. Conform to the recommendations of ACI 304.2R except as modified herein.

2. Base pump size on rate of concrete placement, length of delivery pipe or hose, aggregate size, mix proportions, vertical lift, and slump of concrete.

3. Use pipe with inside diameter of at least three times the maximum coarse aggregate size, but not less than 2 inches.

4. Do not use aluminum pipes for delivery of concrete to the forms.

Q. Waterstops:

1. Prevent displacement of waterstops during concrete placement.

3.06 CURING AND PROTECTION:

A. General:

1. Protect concrete from premature drying, hot or cold temperatures, and mechanical injury, beginning immediately after placement and maintain concrete with minimal moisture loss at relatively constant temperature.

2. Comply with curing procedures set forth in ACI 301, ACI 308 and as specified herein.

3. Perform hot weather concreting in conformance with ACI 305R and as specified herein when the ambient atmospheric temperature is 80 degrees F or above.

4. Perform cold weather concreting in conformance with ACI 306R.

5. Concrete required to be moist cured shall remain moist for the entire duration of the cure. Repeated wetting and drying cycles of the curing process will not be allowed.

B. Curing Duration:

1. Start initial curing after placing and finishing concrete as soon as free moisture has disappeared from unformed concrete surfaces. Initial curing starts as soon as concrete achieves final set. Forms left tightly in place are considered as part of the curing system, provided that wooden forms are kept moist by wetting three times a day. Keep continuously moist for not less than 72 hours.

2. Begin final curing procedures immediately following initial curing and before the concrete has dried. Continue final curing for at least 7 days and in accordance with ACI 301 procedures for a total curing period, initial plus final, of at least 10 days.

3. Avoid rapid drying at the end of the final curing period.

C. Curing Requirements:

1. Unformed Surfaces: Protect finished slabs from direct rays of the sun to prevent checking, crazing and plastic shrinkage. Cover and cure entire surface of newly placed concrete immediately after completing finishing operations and water film has evaporated from surface or as soon as marring of concrete will not occur.

2. Formed Surfaces: Minimize moisture loss for formed surfaces exposed to heating by the sun by keeping forms wet until safely removed. Keep surface continuously

wet by warm water spray or warm water saturated fabric immediately following form removal unless otherwise permitted by the Engineer.

3. Water Containment Structures: Moist cure by the application of water to maintain the surface in a continually wet condition unless otherwise permitted by the Engineer. Use water that is free of impurities that could etch or discolor exposed concrete surfaces. Other concrete: Moist cure by moisture-retaining cover curing, or the use of curing compound.

D. Curing Methods:

1. Water Curing: Water curing is required for all water retention structures for foundations, floors, and walls. Use water curing for unformed surfaces. Continuously water cure all exposed concrete for the entire curing period. Provide moisture curing by any of the following methods:

   a. Keeping the surface of the concrete continuously wet by ponding or immersion.

   b. Continuous water-fog spray or sprinkling.

   c. Covering the concrete surface with curing mats, thoroughly saturating the mats with water, and keeping the mats continuously wet with sprinklers or porous hoses. Place curing mats to provide coverage of the concrete surfaces and edges, with a 4 inch lap over adjacent mats. Weight down the curing cover to maintain contact with the concrete surface.

2. Sealing Materials:

   a. Use common sealing materials such as plastic film or waterproofing (Kraft) paper.

   b. Lap adjacent sheets a minimum of 12 inch. Seal edges with waterproof tape or adhesive. Use sheets of sufficient length to cover sides of concrete member.

   c. Place sheet materials only on moist concrete surfaces. Wet concrete surface with fine water spray if the surface appears dry before placing sheet material.

   d. The presence of moisture on concrete surfaces at all times during the prescribed curing period is proof of acceptable curing using sheet material.

3. Membrane Curing Compound:

   a. Apply membrane-curing compound uniformly over concrete surface by means of roller or spray at a rate recommended by the curing compound

manufacturer, but not less than 1 gallon per 150 square foot of surface area. Agitate curing material in supply container immediately before transfer to distributor and thoroughly agitate it during application for uniform consistency and dispersion of pigment.

b. Do not use curing compounds on construction and expansion joints or on surfaces to receive liquid hardener, dustproofer/sealer, concrete paint, tile, concrete fills and toppings or other applications requiring positive bond unless removed by pressure washing or sand blasting.

c. Reapply membrane-curing compound to concrete surfaces that have been subjected to wetting within 3 hours after curing compound has been applied by method for initial application.

E. Protection from environmental conditions: Maintain the concrete temperature above 50 degrees F continuously throughout the curing period. Make arrangements before concrete placing for heating, covering, insulation or housing to maintain the specified temperature and moisture conditions continuously for the curing period.

1. When the atmospheric temperature is 80 degrees F and above, or during other climatic conditions which will cause too rapid drying of the concrete, make arrangements before the start of concrete placing for the installation of wind breaks or shading, and for fog spraying, wet sprinkling, or moisture-retaining covering.

2. Protect the concrete continuously for the entire curing period.

3. Maintain concrete temperature as uniformly as possible and protect from rapid atmospheric temperature changes.

4. Avoid temperature changes in concrete that exceed 5 degrees F in any one hour and 50 degrees F in any 24-hour period.

F. Protection from physical injury: Protect concrete from physical disturbances such as shock and vibration during curing period. Protect finished concrete surfaces from damage by construction equipment, materials, curing procedures and rain or running water. Do not load concrete in such a manner as to overstress concrete.

G. Protection from Deicing Agents: Do not apply deicing chemicals to concrete.

3.07 FIELD QUALITY CONTROL:

A. Hot Weather Requirements

1. During hot weather, give proper attention to ingredients, production methods, handling, placing, protection, and curing to prevent excessive concrete

temperatures or water evaporation in accordance with ACI 305R and the following.

2. When the weather is such that the temperature of the concrete as placed would exceed 90 degrees F, use ice or other means of cooling the concrete during mixing and transportation so that the temperature of the concrete as placed will not exceed 90 degrees F.

3. Take precautions when placing concrete during hot, dry weather to eliminate early setting of concrete. This includes protection of reinforcing from direct sunlight to prevent heating of reinforcing, placing concrete during cooler hours of the day, and the proper and timely application of specified curing methods.

B. Cold Weather Requirements:

1. Provide adequate equipment for heating concrete materials and protecting concrete during freezing or near-freezing weather in accordance with ACI 306R and the following.

2. When the temperature of the surrounding atmosphere is 40 degrees F or is likely to fall below this temperature, use heated mixing water not to exceed 140 degrees F. Do not allow the heated water to come in contact with the cement before the cement is added to the batch.

3. When placed in the forms during cold weather, maintain concrete temperature at not less than 55 degrees F. Materials shall be free from ice, snow, and frozen lumps before entering the mixer.

4. Maintain the air and the forms in contact with the concrete at temperatures above 40 degrees F for the first five days after placing, and above 35 degrees F for the remainder of the curing period. Provide thermometers to indicate the ambient temperature and the temperature 2 inches inside the concrete surface.

C. Backfill Against Walls:

1. Do not place backfill against walls until the concrete has obtained a compressive strength equal to the specified 28-day compressive strength. Where backfill is to be placed on both sides of the wall, place the backfill uniformly on both sides.

2. Do not backfill the walls of structures that will be laterally restrained or supported by suspended slabs or slabs on grade until the slab is placed and the concrete has reached the specified compressive strength unless noted otherwise on drawings.

D. Concrete Testing:

1. Concrete quality testing will be performed on the concrete by independent testing agency retained by the Owner.

2. The testing agency will use concrete samples provided by the Contractor at the point of agitator or mixer truck discharge to perform slump (per ASTM C143), air content (per ASTM C231), and temperature tests (per ASTM C1064) and for field control test specimens.

3. The testing agency will submit test reports of concrete field measurements specified above to the Contractor and to the Engineer.

4. Provide and maintain facilities for safe storage and proper curing of concrete test specimens on the project site, as required by ASTM C31.

5. Concrete Quality Test Specimen:

    a. Perform sampling and curing of test specimen in accordance with ASTM C31.

    b. Testing agency personnel will record truck and load number from the delivery batch ticket, the concrete placement location of each specimen, the date, concrete strength, slump, air content and temperature.

    c. The testing agency will cast a minimum of one set of 6 test specimens, each 4-inch diameter by 8-inch long cylinders according the to the following volumes:

        (1) when concrete placement in a single day is less than 200 CY: for each 50 cubic yards of each mix design of concrete per structure,

        (2) when concrete placement in a single day is greater than 200 CY: for each 100 cubic yards of each mix design of concrete per structure,

        (3) but not less than once a day nor less than once for each 5,000 square feet of surface area of foundation mats, base slabs, columns, walls or elevated slabs and floor beams.

    d. Test cylinders in accordance with ASTM C39. Test one cylinder at 7 days for information; test three cylinders at 28 days for acceptance; and hold two reserve cylinders for verification. Strength acceptance will be based on the average of the strengths of the three cylinders tested at 28 days. If one cylinder of a 28-day test manifests evidence of improper sampling, molding, or testing, other than low strength, discard it and use a reserve cylinder for the test result.

6. The Contractor may take field control test specimens for small quantities of concrete.

7. Concrete acceptance shall be based on the requirements of ACI 318 and ACI 350.

8. Field cured cylinders conforming to ASTM C31 will be required to determine field compressive strength of concrete. Laboratory cured cylinders for concrete quality testing shall not be used for determining field compressive strength.

9. Concrete Coring:

   a. When the concrete quality test specimen compression tests fail to be in compliance with the Contract Documents or when the Engineer detects deficiencies in the concrete, the Contractor will take concrete cores at least 2 inches in diameter from the structure in conformance with ASTM C42 at locations determined by the Engineer.

   b. Obtain at least three representative cores from each member or area of concrete that is considered potentially deficient.

   c. Obtain additional cores to replace cores that show evidence of having been damaged subsequent to or during removal from the structure.

   d. The testing agency shall compression test the cores taken from the structure in conformance with ASTM C39 and submit test strength test results of cores specified above to the Contractor and to the Engineer.

   e. All costs associated with coring and testing of cores will be borne by the Contractor at no additional cost to the Owner.

3.08 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

Page Intentionally Left Blank

SECTION 03 34 00

CONTROLLED LOW STRENGTH MATERIAL (CLSM)

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide and install Controlled Low Strength Material (CLSM) as indicated and in compliance with Contract Documents.

1.02 REFERENCES:

1.03 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

1. CLSM mix design and results of strength tests from trial mixes by the Contractor's testing laboratory firm.

2. Submit manufacturer's Stable-Air Generator Admixture product data, installation instructions and recommendations for material use.

3. Test and Performance - Submit the following data:

a. Any required deviations from prescribed tests and special handling instructions for test specimens.

b. For locations intended to be excavatable, Controlled Low Strength Material shall have a maximum strength of 100 psi according to ASTM C39 at 56 days after placement.

c. Pipe pile backfill Controlled Low Strength Material shall have a minimum strength of 800 psi according to ASTM C39 at 56 days after placement.

d. Influent Sewer: Controlled Low Strength Material shall have a maximum strength of 200 psi according to ASTM C39 at 56 days after placement.

e. Controlled Low Strength Material shall have minimal subsidence and bleed water which is measured as a final bleeding of less than 2.0 percent (retains 98.0 percent of original height after placement, approximately 1/4-inch per foot of depth) as measured in Section 10 of ASTM C940.

f. Controlled Low Strength Material shall have a unit weight of 90 - 110 lbs./ft^3 measured at the point of placement.

1.04 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.05 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

B. Do not place CLSM until design mix, material tests and trial batch mix compression test results are approved by the Engineer. Approvals are required at least 30 days before placing any production CLSM.

C. Employ an independent testing laboratory, acceptable to the Engineer to test conformity of materials to specifications and to design CLSM mixes.

D. Furnish, pay for and deliver representative samples of sufficient quantity of cement, aggregates and admixtures required for trial batch mixes to the testing laboratory. Obtain materials from the batching plant that will be supplying production CLSM in conformance with ASTM D75.

E. Measure all materials for CLSM, including water, with equipment and facilities suitable for accurate measurement and capable of being adjusted in conformance with ASTM C94. Use scales certified by local Sealer of Weights and Measures within one year of use and accurate when static load tested to plus or minus 0.4 percent of total capacity of scale. Batch all materials by weight except admixtures that may be batched by volume.

F. The testing laboratory will take control test specimens; conduct slump tests and measure air content and temperature in the field.

G. Methods of Sampling and Testing:

1. Fresh Concrete Sampling: ASTM C172

2. Specimen Preparation: ASTM C31

3. Compressive Strength: ASTM C39

4. Air Content: ASTM C231

5. Slump: ASTM C143

6. Temperature: ASTM C1064

7. Unit Weight: ASTM C138

1.06 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

B. Order CLSM from batching plant so that trucks arrive at discharge locations when material is required.

C. Deliver CLSM to discharge locations in watertight agitator or mixer trucks without altering the specified properties of water-cement ratio, slump, air entrainment, temperature and homogeneity.

D. Reject CLSM not conforming to specification, unsuitable for placement, exceeding the time or temperature limitations or not having a complete delivery batch ticket.

1.07 PROJECT/SITE CONDITIONS:

A. Do not place CLSM until conditions and facilities for making and curing control test specimens are in compliance with ASTM C31 and as specified herein.

PART 2 - PRODUCTS

2.01 MATERIALS:

A. Furnish Type IL cement for all work, unless otherwise specified. Use one approved brand from one mill throughout the contract term unless otherwise approved by the Engineer.

B. Water:

1. Use water that is potable and free from injurious amounts of oil, acid, alkali, organic matter or other deleterious substances, and conforms to the requirements for water in ASTM C94, and as specified herein.

2. The maximum water-soluble chloride ion in the water shall not exceed 0.060 percent by weight of cement.

C. Aggregates:

1. Use aggregates for CLSM conforming to ASTM C33 and to the following requirements.

D. Admixtures:

1. General Requirements: ASTM C494.

E. Fly Ash: Provide fly ash conforming to the following requirements:

1. Class F fly ash conforming to ASTM C618 for chemical and physical properties.

2. Supplemental requirements in percent:

a.	Maximum carbon content	3 percent
b.	Maximum sulfur trioxide (SO_3) content	4 percent
c.	Maximum loss on ignition	3 percent
d.	Maximum water requirement (as a percent of control)	100 percent
e.	Fineness, maximum retained on No. 325 sieve	25 percent

2.02 MIXES:

A. Mix design shall produce a consistency that will result in a flowable product at the time of placement that does not require manual means to move it into place.

B. Provide excavatable mix with compressive strength of maximum 100 psi when measured 56 days after placement.

C. Influent Sewer: Provide mix with compressive strength of maximum 200 psi when measured 56 days after placement.

D. Controlled Low Strength Material shall have minimal subsidence and bleed water which is measured as a Final Bleeding of less than 2.0 percent (retains 98.0 percent of original height after placement, approximately 1/4-inch per foot of depth) as measured in Section 10 of ASTM C940 "Standard Test Method for Expansion and Bleeding of Freshly Mixed Grouts for Preplaced-Aggregate Concrete in the Laboratory".

E. The fresh unit weight shall be 90 - 110 lbs./ft^3, except where specified, and in the absence of strength data the cementitious content shall be a maximum of 150 lbs./cy.

F. Influent Sewer: Unless shown as otherwise on the Drawings, CLSM shall have a unit weight between 90 and 125 pcf.

PART 3 - EXECUTION

3.01 INSTALLATION:

A. Batch, mix and deliver CLSM in conformance with ASTM C94. Batch all constituents at a central batching or mixing plant.

B. Seasonal Conditions:

1. Conform to ACI 305R and as specified herein for hot weather concreting. Do not add retarder admixture to any concrete.

2. Conform to ACI 306R and as specified herein for cold weather concreting. Do not add accelerator admixture to any concrete.

3.02 TRANSPORTING AND MIXING:

A. Conform to concreting procedures set forth in ACI 304R and as specified herein.

B. Transport CLSM to discharge locations without altering the specified properties of water-cement ratio, slump, air entrainment, temperature and homogeneity.

3.03 FIELD TESTING:

A. General:

1. The testing laboratory will use concrete samples taken at the point of agitator or mixer truck discharge to perform slump, air content, and temperature tests and for field control test specimens.

B. Notification of Delivery:

1. Notify the Engineer of concrete deliveries a minimum of 48 hours in advance of the scheduled placement. Include within this notification, the mix design and quantity of concrete, method and location of placement, frequency of trucks, ordered slump and time of initial delivery.

2. Furnish delivery batch ticket to the representative from the owner's testing laboratory or to the Engineer representative in the field with each batch delivered to the discharge locations in conformance with ASTM C94.

C. Test Measurements at Discharge:

1. The testing laboratory firm will take measurement of concrete slump, air content and temperature for each 50 cubic yards of each mix design but not less than once a day. The laboratory will conduct the slump, air content and temperature test measurements in conformance with ASTM C143, ASTM C231, and ASTM C1064, respectively.

2. The testing laboratory will submit test reports of field measurements specified above to the Contractor and to the Engineer.

D. Control Test Specimens:

1. The testing laboratory will cast a minimum of one set of three field control test specimens in conformance with ASTM C31 for each 150 cubic yards of each mix design of concrete but not less than once a day.

2. Laboratory personnel will record truck and load number from the delivery batch ticket, the concrete placement location of each specimen, the date, concrete strength, slump, air content, temperature and truck driver's name.

3. Furnish tightly constructed nonabsorbent test cylinder molds. Use molds of same type and manufacture for all test specimens. Leave molds on cylinders until received in testing laboratory.

4. Furnish boxes for initial curing of test cylinders in conformance with ASTM C31 from time of fabrication until they are transported to the testing laboratory.

5. The testing laboratory will compression test one of each set of three specimens at seven days. Immediately notify the Contractor and the Engineer if the seven-day strength is deficient. Test the two remaining cylinders at 65 days for concrete strength acceptance. The acceptance test result is the average of the strengths of the two specimens tested at 56 days. The laboratory firm will submit compression test results of the control test specimens to both the Contractor and the Engineer. Evaluation and acceptance of concrete shall conform to ACI 301 and ACI 318.

3.04 CURING AND PROTECTION:

A. Protect CLSM from premature drying, hot or cold temperatures, and mechanical injury, beginning immediately after placement and maintain concrete with minimal moisture loss at relatively constant temperature.

B. Comply with curing procedures set forth in ACI 301, applicable portions of ACI 308 and as specified herein.

C. Perform hot weather concreting in conformance with ACI 305R and as specified herein when the ambient atmospheric temperature is 80 degrees F or above.

D. Perform cold weather concreting in conformance with ACI 306R and as specified herein when the ambient atmospheric temperature is 40 degrees F or below.

E. Protect Controlled Low Strength Material from traffic until sufficient strength has been achieved for further construction operations.

3.05 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

Page Intentionally Left Blank

SECTION 03 35 01

CONCRETE FINISHES AND FLOOR TREATMENT

PART 1 - GENERAL

1.01 DESCRIPTION:

A. This section describes materials and methods of concrete finishes for cast in place concrete and floor treatment for all concrete.

1.02 REFERENCES:

A. American Concrete Institute (ACI):

1. 117: Specification for Tolerances for Concrete Construction and Materials (ACI 117-10) and Commentary

2. 301: Specifications for Structural Concrete

3. 302.1R: Construction of Concrete Floors

4. 303R: Architectural Cast-in-Place Concrete

5. 303.1: Architectural Cast-in-Place Concrete

6. 311.4R: Guide for Concrete Inspection

7. 347.3R: Guide to Formed Concrete Surfaces

B. ASTM International (ASTM):

1. D4263: Standard Test Method for Indicating Moisture in Concrete by the Plastic Sheet Method

1.03 SUBMITTALS:

A. Submit following shop drawings in accordance with Section 01 33 00.

B. Submit manufacturer’s product data and surface preparation and application instructions.

C. Submit manufacturer’s color chart for colored floor treatment.

D. Submit VOC content information for floor treatment products.

E. Contractor should establish in-place mockups for the formed face concrete finish CSC2. Multiple in-place mockups are required for the same form face concrete finish if the finish

is applied to both horizontal and vertical surfaces such as a column and an elevated slab. In-place mockups to be established and approved within the first 5% of contracted volume of concrete. Contractor and Licensed Professional should agree on location of mockups. Locations of mockups should be clearly identified and established in permanently visible and accessible locations. In-place mock ups will be maintained and protected in-place by the Contractor until all structures have been completed and all the concrete surfaces have been accepted by the Licensed Professional. In-place mock-ups to be representative of the size and extent of work and be a minimum size of 8-foot square for each finish unless otherwise agreed upon with the Licensed Professional. Before work extends beyond 5% of the contracted volume, the in-place mockups for each formed face finish should be reviewed by and approved by the Licensed Professional in writing. Should different concrete suppliers or contractors be used, an additional mockup is required for each mix, source supplier, or contractor for each formed faced finish noted.

F. Qualifications:

1. Submit statement of qualifications, experience, and training of concrete finishing personnel.

1.04 QUALITY ASSURANCE:

A. Prior to concrete construction, develop an outlined quality control program for concrete finishing.

B. Prior to concrete placement Engineer or Engineers Field Representative will participate in the pre-pour walk-through with the contractor performing the work to verify concrete finishes required.

C. For concrete that will receive additional applied floor finishes, ensure that concrete surface finish and preparation is compatible with the accepted floor finish manufacturer's products. Provide documentation from the floor product manufacturer that specifies the concrete finish and preparation required for proper installation of the floor products.

D. Make changes in concrete finishes and preparation necessary to accommodate flooring products different from those specified at no additional cost to the Owner. Submit the proposed new finishes and their construction methods to the Engineer.

1.05 DELIVERY, STORAGE AND HANDLING:

A. Comply with the requirements in APWA Section 01 66 00.

PART 2 - PRODUCTS

2.01 FLOOR SEALERS AND DENSIFIERS:

A. Shall contain silicate and siliconate and be VOC compliant.

B. Products:

1. Dayton Superior; Sure Hard Densifier J17

2. The Euclid Chemical Company; Euco Diamond Hard

3. BASF Construction Chemicals; Kure-and-Harden

2.02 CLEAR FLOOR HARDENER:

A. Provide a colorless, aqueous solution of zinc and magnesium fluorosilicate.

B. Products:

1. The Euclid Chemical Company; Eucosil.

2. BASF Construction Chemicals; Sonosil

3. L&M Construction Chemicals, Inc; Chem Hard

2.03 NONSLIP AGGREGATE FLOOR FINISH:

A. Minimum 50 percent aluminum oxide content.

B. Products:

1. Dayton Superior; Emery Non-slip

2. BASF Construction Chemicals; Frictex-NS

3. L&M Construction Chemicals, Inc; Grip It

2.04 DRY SHAKE METALLIC FLOOR HARDENER:

A. Products:

1. The Euclid Chemical Company; Surflex

2. Dayton Superior; Ferro Tuff

3. BASF Construction Chemicals; Master Plate 200

2.05 EPOXY BONDING AGENT:

A. Shall be in accordance with Section 03 30 00.

2.06 CONCRETE REPAIR MATERIAL:

A. Shall be in accordance with Section 03 01 30.

PART 3 - EXECUTION

3.01 CONCRETE FINISHES:

A. Do not use curing compound where epoxy, urethane, mortar bed, grout, additional concrete or other toppings or adhesive will be applied unless removed by pressure washing or sand blasting.

B. Do not sprinkle with dry cement or add water when finishing concrete surfaces.

C. Finish concrete surfaces in accordance with the following schedule:

Table 03 35 01-1	
Formed Concrete Surface Finishes	**Area Applied**
CSC2	All formed faced concrete , no exception*
*	If surfaces to be coated provide surface preparation to comply with coating manufacturer requirements.
Unformed Concrete Surface Finishes	**Area Applied**
S-1	Slabs to be covered with roofing assemblies, concrete or grout.*
S-2	Exterior slabs.
S-3	Interior slabs. Slab surfaces to receive sealer or hardener.*
S-4	Slabs in contact with liquid.*
S-5	Slabs at slopes greater than 10 percent and stairs.
E-1	Exposed top of walls, beams, and similar unformed surfaces*
E-2	Unexposed top of walls, beams, and similar unformed surfaces.
*	If surfaces to be coated provide surface preparation to comply with coating manufacturer requirements.

D. Formed Finishes:

1. Finish CSC2: Concrete surfaces where visual appearance is of moderate importance. Description of surface requirements are defined in Table 03 35 01-2 and subsequent Table 03 35 01-3 through Table 03 35 01-7.

Table 03 35 01-2									
Formed Concrete Surface Category (CSC)*	**CSC Requirements**					**Additional Requirements**			
	Texture, Panel Joint	**Void Patching***		**Color Uniformity**		**Surface Irregularities**	**Construction and Facing-Joint**	**Mockup**	**Form-facing category**
		Tie Holes	**Other Voids***	**a**	**na**				
CSC2	T2	Fill	fill ¼" and larger	CU I	CU1	S13	CJ2	Required	FC2

*Guidance for CSC2 deviates from ACI 347-13R guidance in several cases, guidance in table 03 35 01-2 and subsequent table governs over criteria in ACI 347-13Rfor Surface Void Criteria. For matching requirements of formed concrete surface categories refer to the following notes and tables; a= absorbent form facing; na=nonabsorbent form facing.

Table 03 35 01-3	
Texture Classification	**Texture**
T2	Acceptable gaps in adjacent formwork components ≤ 1/2 in. - Acceptable depth of mortar loss ≤ 3/8 in. - Acceptable surface offsets of panel joints up to 1/2 in.(ACI 117-10, Section 4.8.3, Class C). - Allowable projections 1/2 in. from adjacent surface. - Form-facing material examples: Class BBOES plywood, MDO plywood. - Imprints of modular panel frames are acceptable. - Fins to be ground down to ¼" or less (deviation from ACI 347-13R)

Table 03 35 01-4	
Color Uniformity Classification	**Characteristics**
CU1	- Light and dark color variations are acceptable, - Color variations between adjacent placements and layer lines are acceptable, - Rust and dirt stains are acceptable.

Table 03 35 01-5	
Surface Irregularities Classification	**Characteristics**
SI3	- ACI 117-10, Section 4.8.3, Class B-Surface, - Maximum gradual deviation over a distance 5 feet, or abrupt deviation is 1/4 inch, - Limit deflection of formwork structure to L/360, - ACI 117-10, Section 4.8.2 does not apply

Table 03 35 01-6	
Construction and Facing Joints Classification	**Characteristics**
CJ2	- Acceptable offset of surfaces between two adjacent placements is less than or equal to 1/2 inch, - The use of chamfer strips of similar reveals are recommended at construction joints.

Table 03 35 01-7			
Criterion	**Form-Facing Categories**		
		FC2	
Holes, greater than 1/4 in.		Acceptable if patched sanded and sealed or ground to match adjacent form surface	
Holes, 1/4 in. or less		Acceptable without patching, provided form surface is not damaged or torn aroundhole(s)	
Vibrator burns		Unacceptable	
Scratches/dents		Acceptable if patched, sanded, and scaled or grounded to match adjacent form surface	
Concrete remnants		Unacceptable	
Cement residue		Acceptable	
Swelling of facing at fastener or tie holes		Unacceptable	
Patching		Acceptable	

E. Unformed Finishes:

1. Finish S-1: Screed to grade without special finish unless otherwise shown on contract documents. Roughen and/or apply bonding agent where shown on contract drawings.

2. Finish S-2: Trowel finish.

3. Finish S-3: Trowel finish free from trowel marks and all irregularities. Do not hard trowel.

4. Finish S-4: Trowel finish without local depressions or high points. For liquid containment slabs apply a stiff bristle broom finish. Leave broom lines parallel to the direction of slab drainage. Do not hard trowel.

5. Finish S-5: Trowel finish without local depressions or high points. Apply a stiff bristle broom finish. Leave broom lines parallel to the direction of slope drainage. Do not hard trowel.

6. Finish E-1: Provide 3/4-inch chamfer on external corners of exposed concrete walls, beams columns, equipment pads and exposed edges of construction joints. Do not chamfer columns flush with concrete block walls. Repair defective concrete, remove fins, fill depressions 1/4-inch or deeper, and fill tie holes. Strike smooth and float.

7. Finish E-2: Repair defective concrete, remove fins, fill depressions 1/4-inch or deeper, and fill tie holes. Strike smooth and float.

F. Protect finished concrete surfaces from damage by construction equipment, materials, curing procedures and rain or running water.

3.02 FINISHING OF FORMED SURFACES:

A. Cure, finish and repair surfaces in accordance with ACI requirements.

B. Perform finish work in accordance with the schedule in Table 03 35 01-1 and Table 03 35 01-2 as soon as possible after forms are removed.

C. Conform to the requirements specified in Section 03 10 00 for tolerances for formed surfaces.

3.03 TOLERANCE:

A. Within the footprint of the steel package treatment plant tankage, the allowable tolerance of finish elevations (S-2) shall not exceed 1/4 inch per 20 feet in all directions to provide a flat surface for tankage floors to be supported.

B. The tolerance for finish surface under secondary clarifiers, gravity thickeners, chemical storage pad and electrical room is 1/4 inch per 10 feet.

3.04 FINISHING OF UNFORMED SURFACES:

A. Perform finish work in accordance with the schedule in Table 03 35 01-1.

B. Provide S-3 trowel finish to all top, horizontal and inclined surfaces not otherwise specified or indicated. This includes concrete fills and toppings and floors. Provide hand trowel finish to all surfaces such as weirs or walls over which liquids will flow. Do not hard trowel.

C. Provide S-5 broom finish to exterior walkways, exterior stairs, entrance platforms and loading docks.

3.05 FLOOR TREATMENT APPLICATION:

A. Prepare concrete surface in accordance with manufacturer's printed instructions.

B. Perform concrete moisture testing in accordance with product manufacturer's requirements.

C. Apply floor treatment in accordance with product manufacturer's written instructions.

D. Provide mock ups for Nonslip aggregate floor finish and Dry Shake Hardener floor finish. Minimum size of mock up sample shall be 2 feet x 2 feet.

E. Colors for colored floor treatment shall be as selected by Engineer.

3.06 CONCRETE REPAIR:

A. Surface Defects:

1. Do not repair defects until concrete has been inspected by the Engineer. Repair of concrete surfaces shall be in accordance with Section 03 01 30.

2. Repair defects including, air voids and bug holes with a nominal diameter or depth greater than 1/4-inch, honeycombed areas, visible construction joints, fins, burrs, color and texture variations and other defects as determined by the Engineer. Make concrete repairs with a polymer modified cementitious repair mortar in accordance with Section 03 01 30 to produce a concrete surface uniform in color and texture and free of all irregularities.

B. Crack Repair:

1. Shall be in accordance with Section 03 01 30.

C. Tie-Hole Repair:

1. Shall be in accordance with Section 03 10 00.

3.07 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 03 48 18

PRECAST REINFORCED CONCRETE VAULTS

PART 1 - GENERAL

1.01 DESCRIPTION:

A. This section includes materials, design, and installation of factory-built precast reinforced concrete underground vaults and chambers.

1.02 REFERENCES:

A. American Association of State Highway and Transportation Officials (AASHTO):

1. HB: Standard Specifications for Highway Bridges.

2. M198: Standard Specification for Joints for Concrete Pipe, Manholes, and Precast Box Sections Using Preformed Flexible Joint Sealants

B. American Concrete Institute (ACI):

1. 318: Building Code Requirements for Structural Concrete and Commentary

C. ASTM International (ASTM):

1. A48: Standard Specification for Gray Iron Castings.

2. A615: Standard Specification for General Requirements for Stainless Steel Wire and Wire Rods.

3. C31: Practice for Making and Curing Concrete Test Specimens in the Field

4. C33: Specification for Concrete Aggregates

5. C39: Test Method for Compressive Strength of Cylindrical Concrete Specimens

6. C143: Test method for Slump of Hydraulic Cement Concrete

7. C150: Specification for Portland Cement

8. C172: Practice for Sampling Freshly Mixed Concrete

9. C192: Practice for Making and Curing Concrete Test Specimens in the Laboratory

10. C231: Test Method for Air Content of Freshly Mixed Concrete by the Pressure Method

11. C260: Specification for Air-Entraining Admixtures for Concrete

12. C494: Specification for Chemical Admixtures for Concrete

13. C857: Practice for Minimum Structural Design Loading for Underground Precast Concrete Utility Structures.

14. C858: Specification for Underground Precast Utility Chambers

15. C1064: Test Method for Temperature of Freshly Mixed Portland Cement Concrete

16. D75: Practice for Sampling Aggregates

17. D4101: Standard Specification for Polypropylene Injection and Extrusion Materials

1.03 SUBMITTALS:

A. Shop Drawings: Submit the following in accordance with Section 01 33 00.

1. Completely detailed shop drawings for precast concrete vaults. Indicate all dimensions, details, reinforcing steel, inserts, connections, openings and lifting devices. Mark each component for identification. Show mark on erection plan and place legibly on unit at time of manufacture.

B. Drawings of modifications or changes in features or details, which are necessitated by design requirements. Make such modifications without additional compensation.

C. Do not fabricate precast concrete vaults before shop drawings are accepted by the Engineer.

D. Design calculations and certification, signed and sealed by a Professional Engineer registered in the State where the vaults will be installed and employed by the vault manufacturer and stating:

1. Elements and connections are designed to withstand required loads and forces as referenced herein.

2. Codes and specifications to which structural design conforms.

1.04 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.05 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

B. Vault design and construction comply with the specified design load conditions, ASTM C858 and as specified herein.

1.06 DELIVERY, STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

B. Store vaults on clean blocking, off the ground and protected from rain and ground splatter.

PART 2 - PRODUCTS

2.01 PRECAST REINFORCED CONCRETE VAULTS:

A. Manufacturers:

1. Oldcastle Precast, Inc.

2. Shea Concrete Products Inc.

B. Materials:

1. Minimum concrete compressive strength of 5,000 psi at 28 days conforming to Section 03 30 00.

2. Portland Cement: ASTM C150, Type II.

3. Coarse Aggregate and sand conforming to Section 03 30 00.

4. Steel reinforcement conforming to ASTM A615, Grade 60.

5. Water: Potable.

6. Provide air entraining and water reducing concrete admixtures as specified in Section 03 30 00.

7. Butyl rubber-based sealants conforming to AASHTO M198, Type B but with no bitumen content.

8. Non-Shrink Grout:

a. BASF Chemical Company; Masterflow 713 Plus

b. The Euclid Chemical Co.; Euco NS Grout

c. Sika Corporation; SikaGrout 212

C. Design Criteria. Use design loads according to ASTM C857, ASTM C890, ASTM C891, and ASTM C913 or as indicated below, whichever produces the more severe conditions:

1. Design precast reinforced concrete vault to withstand earth and groundwater loads. Assume groundwater elevation to be at grade. Provide design based on an equivalent fluid pressure equal to a minimum of 95 pounds per cubic foot corresponding to saturated soil.

2. Design precast reinforced concrete vault to withstand internal hydrostatic and seismic loading. Assume internal fluid level to be at the top of the vault. Provide design based upon an equivalent fluid pressure of 65 pounds per cubic foot.

3. Design precast reinforced concrete vault to withstand vehicle loading with an impact factor as prescribed in referenced ASTM standards or a minimum of 250 psf surcharge. Account for vehicle positions both above and alongside vault including directly on each maintenance hole cover. HS-20 vehicle loading shall be considered.

4. Design precast reinforced concrete vault ceiling to withstand additional concentrated loads from lifting hooks located directly above each valve, meter or other equipment. Provide lifting hook capable of supporting the load, but not less than 2,500 pounds each hook.

5. Design vaults for the condition where the structure is completely backfilled to the top of the vault and the roof is removed.

6. Design and install vaults to withstand hydrostatic uplift caused by a groundwater elevation at grade level or equal to the top of the vault, whichever produces the most severe condition. Consider a safety factor of 1.50 when considering the self weight of the vault plus the weight of an angled wedge of soil emanating from the edge of the base slab extension based on the soil's friction angle where applicable. Where a base slab extension does not occur, consider a safety factor of 1.15 considering only the weight of the structure.

7. Walls and floor slab: minimum of 8 inches in thickness. Cast lower wall section and floor slab together in one placement.

8. Precast reinforced concrete vault roof: minimum of 8 inches in thickness.

9. Design vault to withstand the load condition where the vault roof is removed while the structure is backfilled to grade and subject to live and dead loads.

10. Provide precast reinforced concrete vault as indicated on the drawings. Provide a watertight vault enclosure including sumps and entrance tubes as indicated.

11. Fabricate precast reinforced concrete vault in sections for as required for installation.

12. Provide pipe sleeves with water stops, rubber pipe boots or other devices at pipe penetrations as indicated.

13. Provide reinforced concrete vertical entrance tube with inside dimensions as indicated.

2.02 MAINTENANCE HOLE FRAMES AND COVERS:

A. Conform to requirements of ASTM A48.

B. Manufacturers:

1. Neenah Foundry

2. Campbell Foundry

C. Castings to be free from scale, lumps, blisters and sandholes.

D. Machine contact surfaces to prevent rocking.

E. Thoroughly clean and hammer inspect.

F. Capable of withstanding AASHTO H-20 loading unless otherwise indicated or specified.

2.03 BITUMINOUS WATERPROOFING MATERIAL:

A. Manufacturers:

1. Tnemec Company, Inc.; Series 46-465 H.B. Tnemecol

2. PPG Industries; Amercoat 78HB

3. Carboline; Bitumastic 300M

B. Apply waterproofing to outside of walls, floor, and ceiling.

2.04 ENTRANCE HATCHES:

A. Provide access hatches per Section 05 53 00.

B. Manufacturers:

1. Bilco Co.

2. Halliday

3. Babcock-Davis Associates, Inc.

C. Provide aluminum hatches of the type and size indicated and as follows:

1. Fabricate hatch and frame with 1/4-inch extruded aluminum frame and 1/4-inch diamond checkered aluminum plate covers.

2. Reinforce cover, with aluminum bars and angles welded to underside of covers, to withstand AASHTO H-20 wheel loading.

3. Provide hatch with hinges, hold-open safety-lock bars and flush lift handles, factory assembled, and shipped complete for installation.

4. Provide stainless steel hardware throughout. Hinge covers to frames with heavy duty stainless steel concealed hinges and stainless steel pins. Attach hinges to covers and frames with countersunk/flathead stainless steel machine screws. Fit covers flush to frame.

5. Provide slam latch, flush mounted grip handle, and removable plug and key wrench.

6. Fabricate gutter type hatches with 1-1/2-inch drainage coupling in one corner of the channel frame.

7. Provide frost proof inner hatch.

8. Provide ladder-up safety post.

9. Provide drain PVC drain piping to location required by the Contract Drawings or as recommended by the Engineer.

2.05 LIFTING HOOKS:

A. Provide lifting hooks in the ceiling above pumps, valves and meters.

PART 3 - EXECUTION

3.01 PROTECTION:

A. Protect aluminum from contact with dissimilar metals, concrete, masonry or mortar.

B. Before coating application, clean contact surfaces, remove dirt, grease, oil, foreign substances.

3.02 FINISHES:

A. Finishes: Aluminum ladders to receive finish as specified or directed by the Engineer. Hatches to receive manufacturers' standard finish for aluminum.

3.03 INSTALLATION:

A. Install precast reinforced concrete vault, and related appurtenances in accordance with manufacturer's instructions.

B. Place precast reinforced concrete vault onto level prepared bedding as indicated. Provide uniform bearing over entire base of vault.

C. Seal all joints inside and out with specified sealant to ensure joints are waterproof.

D. Repair or replace damaged waterproofing.

E. Backfill vault excavation uniformily and in such a manner so as not to damage the waterproofing.

3.04 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

Page Intentionally Left Blank

SECTION 03 60 00

GROUT

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Furnish all labor, materials, equipment, and incidentals required, and install grout complete as shown on the Drawings and as indicated and in compliance with Contract Documents.

1.02 SUMMARY:

A. Section Includes:

1. Material for grouting reinforcing bars, anchor bolts into existing or newly placed concrete.

2. Material for grouting under bearing plates for columns or beams.

3. Materials for grouting under equipment.

4. Materials for miscellaneous grouting including but not limited to railing posts, equipment guides, bollards, precast concrete joints and supports etc.

1.03 REFERENCE STANDARDS:

A. American Association of State Highway and Transportation Officials (AASHTO):

1. M182: Burlap Cloth made from Jute or Kenaf

B. American Petroleum Institute (API):

1. RP 686: Recommended Practice for Machinery Installation and Installation Design

C. ASTM International (ASTM):

1. C33: Standard Specification for Concrete Aggregates

2. C150: Standard Specification for Portland Cement

3. C531: Test Method for Linear Shrinkage and Coefficient of Thermal Expansion of Chemical Resistant Mortars, Grouts, and Monolithic Surfacings

4. C595: Standard Specification for Blended Hydraulic Cement

5. C827: Standard Test Method for Change in Height at Early Ages of Cylindrical Specimens from Cementitious Mixes

6. C1107: Standard Specification for Packaged Dry, Hydraulic, Cement Grout (Non-shrink)

7. D695: Standard Test Method for Compressive Properties of Rigid Plastics

D. U.S. Army Corps of Engineers Standard (CRD):

1. C621: Corps of Engineers Specification for Non-shrink Grout

1.04 DESIGN REQUIREMENTS:

A. Design grout and related anchorage systems in accordance with the design loads specified on the contract drawings or as required by the equipment manufacturer.

B. The design and selection of the grout and grouting system shall be based on the duration and magnitude of the load and the frequency of application. The use of a grout for a specific application shall be verified by the manufacturer of the grout.

1.05 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.06 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Product Data:

1. Commercially manufactured non-shrink, non-metallic cementitious grout:

a. Include catalog cuts, technical data, storage requirements, product life, working time after mixing, temperature considerations, conformity to referenced ASTM standards, and Material Safety Data Sheet (MSDS).

2. Commercially manufactured non-shrink epoxy grout:

a. Include catalog cuts, technical data, storage requirements, product life, working time after mixing, temperature considerations, conformity to referenced ASTM Standards and Material Safety Data Sheet (MSDS).

3. Cement Grout:

a. Include the type and brand of the cement, the gradation of the fine aggregate, product data on any proposed admixtures, and the proposed mix of the grout.

4. Concrete Grout:

a. Include data for concrete as delineated in Section 03 30 00. This includes the mix design, constituent quantities per cubic yard, and the water/cement ratio.

5. Bonding Agent:

a. Include catalog cuts, technical data, storage requirements, product life, working time after mixing, temperature considerations, conformity to referenced ASTM standards, and Material Safety Data Sheet (MSDS).

C. Laboratory Test Reports.

1. Submit laboratory test data as required under Section 03 30 00 for concrete to be used as concrete grout.

D. Mill test reports for each shipment of cement, regardless of quantity, prior to incorporation into the work.

E. Manufacturer's specifications and instructions for all admixtures, curing materials, adjustable inserts and non-shrink non-metallic grout. Manufacturer’s certification of compatibility of all admixtures.

1.07 QUALITY ASSURANCE:

A. Qualifications

1. Grout manufacturer to have a minimum of 5 years’ experience in the production and use of the type of grout proposed for the Work.

B. Field Testing

1. Field testing and inspection services required will be provided by the Owner. Provide assistance in the sampling of materials and provide any ladders, platforms, etc. for access to the Work. Comply with the applicable ASTM Standards for testing.

2. The field testing of concrete grout will be as specified for concrete in Section 03 30 00.

3. Take compression test specimens from the first placement of each type of grout to ensure compliance with these Specifications.

a. Compression tests and fabrication of specimens for cement grout and non-shrink grout will be performed as specified in ASTM C109 at intervals during construction as selected by the Engineer. A set of three specimens will be made for testing at one, seven and 28 days.

b. Compression tests and fabrication of specimens for epoxy grout will be performed as specified in ASTM C579, Method B. A set of three specimens will be made for testing at seven days.

1.08 RESPONSIBILITIES:

A. Assist the Owner in obtaining specimens for testing and furnish all materials necessary for fabricating the test specimens.

B. The cost of laboratory tests on grout will be paid by the Owner except where test results show the grout to be defective. In such case, the Contractor shall pay for the tests, removal and replacement of defective work, and re-testing all at no cost to the Owner.

1.09 WARRANTY:

A. Warrant the materials and products specified in this Section against defective materials and workmanship with the manufacturer’s standard warranty, but for no less than one year from the date of substantial completion.

B. Warrant the work against defects for one year from the date of substantial completion.

1.10 DELIVERY, STORAGE, AND HANDLING:

A. Comply with the requirements in APWA Section 01 66 00.

B. Deliver materials to the jobsite in original, unopened packages, clearly labeled with the manufacturer's name, product identification, batch numbers, and printed instructions.

C. Store materials in accordance with the manufacturer's recommendations. Total storage time from date of manufacture to date of installation shall be limited to six months or the manufacturer's recommended storage time, whichever is less.

D. Reject material that becomes damp, lumpy or otherwise unacceptable and immediately remove from the site and replace with acceptable material at no cost to the Owner.

E. Deliver non-shrink cement based grouts as pre-blended, prepackaged mixes requiring only the addition of water.

F. Deliver non-shrink epoxy grouts as premeasured, prepackaged, three component systems requiring only blending as directed by the manufacturer.

1.11 SERVICES OF MANUFACTURER'S REPRESENTATIVE:

A. The Contractor shall provide the services of a qualified manufacturer's technical representative who shall instruct the Contractor's personnel in the mixing, proper use and application of the non-shrink grout and epoxy grout.

B. The manufacturer's representative shall provide written certification that materials have been mixed and applied properly and surfaces to receive these products have been prepared properly, all in conformance with manufacturer's requirements.

C. The on-site time required for the manufacturer's representative to achieve a successful installation shall be at the expense of the Contractor.

PART 2 - PRODUCTS

2.01 GENERAL:

A. Provide materials produced by one manufacturer or supplier in order to provide standardization of appearance.

2.02 APPLICATION:

A. Unless indicated otherwise, provide grouts as listed below:

Table 03 60 00-1

Type of Grout	Application
Cement Grout	Surface repairs
Non-Shrink – Class I	Storage tanks and other non-motorized equipment.
	Filling block-out spaces for embedded items such as railing posts, gate guide frames, etc. (Where placement time is less than 20 minutes.)
	Repair of holes and defects in concrete members that are not water bearing and not in contact with soil or other fill material.
Non-Shrink – Class II	Column base plates.
	Filling block-out spaces for embedded items such as railing posts, gate guide frames, etc. (Where placement time exceeds 20 minutes.)
	Under precast concrete elements.
Non-Shrink Epoxy	Machinery subject to severe shock loads and high vibration.
Concrete Grout	Toppings and concrete/grout fill, bottom of liquid containing concrete walls.

2.03 MATERIALS:

A. Non-shrink Class I Grout:

1. Non-shrink Class I Grout shall have a minimum 28-day compressive strength of 5000 psi, when mixed at a fluid consistency.

2. Non-shrink Class I grout shall meet the requirements of ASTM C1107, Grade B or C, when mixed to fluid, flowable and plastic consistencies.

3. Products:

   a. Sika Corporation; SikaGrout 212

   b. Master Builders, Inc.; Set Grout

   c. The Euclid Chemical Company; Euco NS

B. Non-shrink Class II Grout:

1. Non-shrink grout shall be a high precision, fluid, extended working time grout. The minimum 28-day compressive strength shall be 7,500 psi, when mixed at a fluid consistency.

2. Grout shall have an extended working time of 30 minutes minimum when mixed to a fluid consistency as defined in ASTM C827 at temperature extremes of 45 to 90 degrees F in accordance with ASTM C1107.

3. Non-shrink grouts shall meet the requirements of ASTM C1107; Grade B or C when tested using the amount of water needed to achieve fluid consistency per ASTM C939.

4. The grout when tested shall not bleed or segregate at maximum allowed water.

5. Products:

   a. Master Builders, Inc.; Masterflow 928

   b. The Euclid Chemical Company; Hi-Flow Grout

   c. Sika Corporation; SikaGrout 212

C. Cement Grout:

1. Cement grouts shall be a mixture of one part portland cement conforming to ASTM C595 types IL and one to two parts sand conforming to ASTM C33 with sufficient water to place the grout. The water content shall be sufficient to impart workability to the grout, but not to the degree that it will allow the grout to flow.

2. Cement grout materials shall be as indicated in Section 03 30 00.

D. Concrete Grout:

1. Concrete grout shall conform to the requirements of Section 03 30 00 except as specified herein. Proportion with cement, coarse and fine aggregates, water, water reducer, and air entraining agent to produce a mix having an average strength of 5,000 psi at 28 days. Coarse aggregate size shall be 3/8-inch maximum. Keep the W/C ratio as low as practical while still retaining sufficient workability.

E. Non-shrink Epoxy-Based Grout:

1. Provide a pre-proportioned, three component, 100 percent solids system consisting of epoxy resin, hardener, and blended aggregate. It shall have a compressive strength of 14,000 psi in seven days when tested in conformity with ASTM D695 and have a maximum thermal expansion of 30 x 10-6 when tested in conformity with ASTM C531.

2. Products:

a. Master Builders, Inc.; Ceilcote 648 CP

b. U.S. Grout Corporation; Five Star Epoxy Grout

c. Sika Corporation; Sikadur 42 Grout-Pak

d. The Euclid Chemical Company; High Strength Epoxy Grout

F. Dry Pack Grout:

1. Make dry pack (to be packed or tamped in place) at no slump consistency.

2. When mixing the batch, add only enough water to the dry materials to produce a rather stiff mixture. Additions of water may be made in small increments until the desired consistency is obtained.

G. Non-epoxy Bonding Compound:

1. Provide non-epoxy bonding compound that is re-wetable for up to two weeks.

2. Products:

a. Larsen Products Corporation; Weldcrete

b. Sta-Dry Manufacturing Corporation; Link

c. The Euclid Chemical Company; Euco Weld

2.04 CURING MATERIALS:

A. Curing materials for cement grout shall be as specified in Specification 03 30 00 and as recommended by the manufacturer for prepackaged grouts.

PART 3 - EXECUTION

3.01 GENERAL:

A. Grout shall not be placed until base concrete has attained its design strength, unless authorized otherwise by the Engineer.

B. Prepare surfaces for curing, and protection of cement grout in accordance with Section 03 30 00.

C. Shade the work sites from sunlight for at least 24 hours before and 48 hours after grouting.

D. Contact the grout manufacturer's representative for assistance on hot and cold weather grouting techniques and precautions if applicable.

3.02 PREPARATION:

A. Clean concrete surfaces to receive grout free of ice, frost, dirt, grease, oil, curing compounds, laitance and paints, and free of all loose or unsound material or foreign matter that may affect the bond or performance of the grout.

B. Roughen concrete surfaces by chipping, sandblasting, or other mechanical means to ensure bond of the grout to the concrete. Remove loose or broken concrete. Irregular voids or projecting coarse aggregate need not be removed if they are sound, free of laitance and firmly embedded into the parent concrete.

C. Remove all loose rust, oil or other deleterious substances from metal embedments prior to the installation of the grout.

D. Wash concrete surfaces clean and keep them moist for at least 24 hours prior to the placement of cementitious or cement grout. Saturate by covering the concrete with a plastic sheet or using either a soaker hose, flooding the surface or other method acceptable to the Engineer. Remove visible water from the surface upon completion of the 24-hour period prior to grouting. Use an accepted adhesive bonding agent in lieu of surface saturation when accepted by the Engineer for each specific location of grout installation.

E. Epoxy based grouts do not require the saturation of the concrete substrate. Surfaces in contact with epoxy grout shall be completely dry before grouting.

F. Construct grout forms or other leak proof containment. Forms shall be lined or coated with release agents recommended by the grout manufacturer.

G. Support equipment during alignment and installation of grout by shims, wedges, blocks, or other accepted means. Prevent the shims, wedges, and blocking devices from bonding to the grout by appropriate bond breaking coatings and remove them after grouting unless otherwise accepted by the Engineer.

H. The embedment depth for epoxy grouted anchor bolts and threaded rod anchors shall be at least 15 bolt or rod diameters, unless otherwise indicated on the drawings.Holes shall be prepared for grouting as recommended by the grout manufacturer.

3.03 INSTALLATION:

A. Anchor bolts and threaded rod anchors:

1. Anchor bolts and threaded rod anchors shall be clean, dry and free of grease and other foreign matter when installed. The bolts, rods and bars shall be set and positioned and the epoxy grout shall be placed and finished in accordance with the recommendations of the grout manufacturer. Care shall be taken to ensure that all spaces and cavities are filled with epoxy grout, without voids. During assembly of all threaded stainless steel components, anti-seize thread lubricant shall be liberally applied to the threaded portion not embedded in concrete grouting machinery foundations

2. Block out the original concrete or finish off a sufficient distance below the bottom of the machinery base to provide for the thickness of grout shown on the Contract Drawings. After the machinery has been set in position and placed at the proper elevation by steel wedges, the space between the bottom of the machinery base and the original placement of concrete shall be filled with a pourable non-shrink grout. Grout and grouting procedure shall be in accordance with API 686.

B. Cement Grouts and Non-shrink Cementitious Grouts:

1. Mix in accordance with manufacturer’s recommendations. Do not add cement, sand, pea gravel, or admixtures without prior approval by the grout manufacturer and the Engineer.

2. Avoid mixing by hand. Pre-wet the mixer and empty excess water. Add premeasured amount of water for mixing, followed by the grout. Begin with the minimum amount of water recommended by the manufacturer and then add the additional water required to obtain workability. However, do not exceed the manufacturer's maximum recommended water content.

3. Place grout into the designated areas in a manner that will avoid segregation or entrapment of air. Do not vibrate grout to release air or to consolidate the material.

Placement should proceed in a manner that will ensure the filling of all spaces and provide full contact between the grout and adjoining surfaces. Provide grout holes as necessary. Place grout rapidly and continuously to avoid cold joints. Do not place cement grouts in layers. Do not add additional water to the mix (re-temper) after initial stiffening.

4. Just before the grout reaches its final set, cut back the grout to the substrate at a 45-degree angle from the lower edge of bearing plate unless otherwise accepted by the Engineer.

5. Begin curing immediately after form removal, cutback, and finishing. Keep grout moist and within its recommended placement temperature range for at least 24 hours after placement or longer if recommended by the manufacturer.

C. Non-Shrink Epoxy Grouts:

1. Apply bonding agent, if required, in accordance with the requirements of the grout manufacturer. Mix in accordance with the procedures recommended by the manufacturer. Do not vary the ratio of components or add solvent to change the consistency of the grout mix. Do not over mix. Mix full batches only to maintain proper proportions of resin, hardener, and aggregate. Partial mixes will be rejected and will require the suspect grout to be removed and be replaced.

2. Monitor ambient weather conditions and contact the grout manufacturer for special placement procedures to be used for temperatures below 60 degrees F or above 90 degrees F.

3. Place grout into the designated areas in a manner that will avoid trapping air. Placement methods shall ensure the filling of all spaces and provide full contact between the grout and adjoining surfaces. Provide grout holes as necessary.

4. The extension of grout horizontally beyond base plate shall be less than or equal to the grout thickness.

5. Epoxy grouts are self-curing and do not require the application of water. Maintain the formed grout within its recommended placement temperature range for at least 24 hours after placing, or longer if recommended by the manufacturer.

D. Concrete Grout:

1. Provide the underlying concrete surface with a broomed finish. Protect and keep the surface clean until placement of concrete grout.

2. Remove the debris and clean the surface of all dirt and other foreign materials.

3. Saturate the concrete surface for at least 24 hours prior to placement of the concrete grout. Remove excess water just prior to placement of the concrete grout.

Place a cement slurry immediately ahead of the concrete grout so that the slurry is moist when the grout is placed. Work the slurry over the surface with a broom until it is coated with approximately 1/16- to 1/8-inch thick cement paste.

E. Dry Pack:

1. Dry pack consistency shall be such that the grout is plastic and moldable but will not flow.

2. The use of pneumatic pressure for dry-packed grouting requires acceptance of the Engineer.

3.04 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

Page Intentionally Left Blank

SECTION 03 64 23

CRACK REPAIR EPOXY INJECTION GROUTING

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide crack repair epoxy injection grout as indicated and in compliance with Contract Documents.

1.02 REFERENCES:

A. American Association of State Highway and Transportation Officials (AASHTO):

1. T237: Standard Method of Test for Testing Epoxy Resin Adhesive.

B. American National Standards Institute (ANSI).

C. ASTM International (ASTM):

1. C882: Standard Specification for Test Method for Bond Strength of Epoxy-Resin System Used with Concrete by Slant Shear.

2. D570: Standard Test Method for Water Absorption of Plastics.

3. D638: Standard Test Method for Tensile Properties of Plastics.

4. D648: Standard Test Method for Deflection Temperature of Plastics under Flexural Load in the Edgewise Position.

5. D695: Standard Test Method for Compressive Properties of Rigid Plastics.

6. D790: Standard Test Methods for Flexural Properties of Unreinforced and Reinforced Plastics and Electrical Insulating Materials.

1.03 DEFINITIONS:

A. Crack: Complete or incomplete separation of concrete into two or more parts produced by breaking or fracturing.

B. Crack Injection: method of sealing or repairing cracks by injecting a polymer.

C. Large Cracks: wider than 0.008 inch, inject all.

D. Moderate Cracks: width greater than or equal to 0.005 inch and less than 0.008 inch, inject leaking cracks.

E. Small Cracks: width equal to 0.005 inch or less. Repair leaking cracks per method approved by Engineer if unable to inject.

1.04 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

1. Physical and chemical properties for epoxy adhesives.

2. Technical data for metering, mixing, and injection equipment.

3. Drawings and photos of proposed injection locations. Do not proceed with injection until review by Engineer is complete.

4. Manufacturer's recommended surface preparation procedures and application instructions for epoxy adhesives.

5. Installation instructions for repairing core holes with epoxy grout.

6. Manufacturer's Certificate of Compliance: certified test results for each batch of epoxy adhesive.

7. Statements of Qualification for Epoxy Adhesive:

a. Manufacturer's site representative.

b. Injection applicator.

c. Injection pump operating technician.

8. Epoxy adhesive two component ratio and injection pressure test records for concrete crack repair work.

1.05 SPARE PARTS:

A. Comply with the requirements specified in Section 01 61 00.

1.06 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

B. Qualifications for Epoxy Injection Staff:

1. Manufacturer's site representative:

a. Capable of instructing successful methods for restoring concrete structures utilizing epoxy injection process.

b. Understands and is capable of explaining technical aspects of correct material selection and use.

c. Experienced in the operation, maintenance, and troubleshooting of application equipment.

2. Injection crew and job foreman shall provide written and verifiable evidence showing compliance with the following requirements:

a. Licensed and certified by epoxy manufacturer.

b. Minimum 3 years' experience in successful epoxy injection for at least 10,000 linear feet of successful crack injection including 2,000 linear feet of wet crack injection to stop water leakage.

1.07 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

B. Packing and Shipping: package adhesive material in new sealed containers and label with following information:

1. Manufacturer's name.

2. Product name and lot number.

3. ANSI Hazard Classification.

4. ANSI recommended precautions for handling.

5. Mix ratio by volume.

C. Storage and Protection: Store adhesive containers at ambient temperatures below 110 degrees F and above 45 degrees F.

PART 2 - PRODUCTS

2.01 MANUFACTURERS:

A. Materials, equipment, and accessories specified in this Section shall be products of:

1. BASF Building Systems, Shakopee, MN; SCB Concresive Series

2. Sika Corporation, Lyndhurst, NJ; Sikadur Series

3. The Euclid Chemical Company, Cleveland, OH; Euco Series

2.02 EPOXY ADHESIVE:

A. Two-component A and B structural epoxy adhesive for injection into cracks or other voids in concrete structures for bonding or grouting.

B. Adhesive Properties:

	Test Method	
7-day, Tensile Strength, psi	ASTM D638	5,000 min.
Tensile Elongation @ Break, percent	ASTM D638	1.0% min.
Compressive Yield Strength, 7 days @ 73 degrees F, psi	ASTM D695[a]	8,000 min.
Compressive Modulus, psi	ASTM D695[a]	$1.5x10^5$ min.
Heat Deflection Temperature, °F	ASTM D648[a]	120 min.[a]
Water absorption @ 24 hours, maximum %	ASTM D570	1.0
Bond Strength @ 2 days psi	ASTM C882	1,000 min.
Bond Strength @ 14 days psi	ASTM C882	1,500 min.
Slant Shear Strength: (5,000 psi Compressive Strength Conc.) (Where test results are available psi.)	AASHTO T237[b]	
Cured 3 days @ 40 degrees F—Wet Concrete		3,500 min.
Cured 1 day @ 77 degrees F—Dry Concrete		5,000 min.
Cured 3 days @ 77 degrees plus or minus 3 degrees F		5,000 min.
[a] Cure test specimens so that peak exothermic temperature of adhesive does not exceed 100 degrees F. [b] See referenced specifications for preparation method of test specimens.		

2.03 SURFACE SEAL:

A. Sufficient strength and adhesion for holding injection fittings firmly in place, and to resist pressures preventing leakage during injection.

B. Capable of removal after injection adhesive has cured.

2.04 SOURCE QUALITY CONTROL:

A. Test Requirements: perform tests for each batch of adhesive.

B. Pot Life Test:

1. Condition Components A and B to required temperature.

2. Measure components in ratio of Component B as stated on manufacturer's label into an 8-fluid ounce paper cup.

3. Start stopwatch immediately and mix components for 60 seconds using wooden tongue depressor, take care to scrape sides and bottom of cup periodically.

4. Probe mixture once with tongue depressor every 30 seconds, starting 2 minutes prior to minimum specified pot life.

5. Pot Life Definition: time at which a soft stringy mass forms in center of cup.

C. Fabrication of Slant Shear Specimens for Testing Bond of Injectable Adhesives to Wet Concrete at 40 degrees F:

1. Scope: Test method for preparation of diagonal concrete mortar blocks used in determining slant shear strength of low viscosity injectable adhesives in accordance with AASHTO T237 when concrete is wet.

2. Materials:

a. Diagonal concrete mortar blocks prepared in accordance with AASHTO Test Method T237 and cured to produce a mortar with compressive strength of 5,000 psi or greater.

b. Paraffin wax.

c. Masking Tape: 3/4 inch wide.

d. Suitable 20-mil-thick shim stock.

3. Preparation:

a. Place a 20-mil shim between diagonal faces of two blocks and align so ends and sides are square.

b. Bind block with masking tape covering gap between blocks.

c. Leave a gap between blocks on one face uncovered for removal of shim and application of adhesive.

d. Paint melted paraffin wax over masking tape.

e. Shallow dam may be built up around opening using paraffin wax or modeling clay to help retain adhesive.

f. Apply suitable capping compound to each end of specimen producing smooth surfaces perpendicular to longitudinal axis of block.

g. Remove shim stock from gap opening.

h. Soak specimen in water at 40 degrees F, plus or minus 3 degrees F for at least 24 hours.

i. After soaking, remove specimen, shake free water from surface and gap opening.

j. Prepare liquid adhesive.

k. Within 5 minutes after removing specimen from water, start flowing adhesive into crack without entrap air bubbles.

l. Place specimen in 40 degrees F, plus or minus 3 degrees F ambient for curing within 15 minutes after removing specimen from water for bonding. Do not expose specimen to temperatures beyond 77 degrees F during the 15-minute period.

m. Cure specimen for 72 hours, plus or minus 4 hours at 40 degrees F, plus or minus 3 degrees F.

PART 3 - EXECUTION

3.01 GENERAL:

A. Structurally repair cracks in structures as specified in Section 03 30 00.

B. Cracks: repair by injection of epoxy adhesive.

3.02 PREPARATION:

A. Free cracks from loose matter, dirt, laitance, oil, grease, salt, and other contaminants.

B. Clean cracks in accordance with epoxy adhesive manufacturer’s instructions.

C. Clean surfaces adjacent to cracks from dirt, dust, grease, oil, efflorescence, and other foreign matter detrimental to bond of surface seal system.

D. Do not use acids and corrosives for cleaning, unless neutralized prior to injecting epoxy.

3.03 APPLICATION:

A. Sealing: apply surface seal in accordance with manufacturer’s instructions to designated crack face prior to injection; seal surface of crack to prevent escape of injection epoxy.

B. Entry Ports:

1. Establish openings for epoxy entry in surface seal along crack.

2. Determine space between entry ports equal to thickness of concrete member to allow epoxy to penetrate to the full thickness of the wall.

3. Provide a means to prevent concrete dusts and fines from contaminating the crack or ports when drilling.

4. Space entry ports closer together to allow adjustment of injection pressure to obtain minimum loss of epoxy to soil at locations where:

   a. Cracks extend entirely through wall.

   b. Backfill of walls on one side.

   c. Difficult to excavate behind wall to seal both crack surfaces.

5. Core drill to verify epoxy depth where only one side of wall is exposed.

C. Epoxy Injection:

1. Store epoxy at minimum of 70 degrees F.

2. Start injection into each crack at lowest elevation entry port.

3. Continue injection at first port until adhesive begins to flow out of port at next highest elevation.

4. Plug first port and start injection at second port until adhesive flows from next port.

5. Inject entire crack with same sequence.

D. Finishing:

1. Cure epoxy adhesive after cracks have been completely filled to allow surface seal removal without draining or runback of epoxy material from cracks.

2. Remove surface seal from cured injection adhesive.

3. Finish crack face flush with adjacent concrete.

4. Indentations or protrusions caused by placement of entry ports are not acceptable.

5. Remove surface seal material and injection adhesive runs and spills from concrete surfaces.

3.04 EQUIPMENT:

A. Portable, positive displacement-type pumps with in-line metering to meter and mix two adhesive components, and inject mixture into crack.

B. Pumps:

1. Electric or air powered with interlocks providing positive ratio control of proportions for the two components at nozzle.

2. Primary injection pumps for each material of different mix ratio, including a standby backup pump of similar ratio.

3. Capable of immediate compensation for changes in resins.

4. Do not use batch mix pumps.

C. Discharge Pressure: automatic pressure controls capable of discharging mixed adhesive at pressures up to 200 psi, plus or minus 5 percent, and able to maintain pressure.

D. Automatic Shutoff Control: provide sensors on both Component A and B reservoirs for stopping machine automatically when only one component is being pumped to mixing head.

E. Proportioning Ratio Tolerance: maintain epoxy adhesive manufacturer's prescribed mix ratio within a tolerance of plus or minus 5 percent by volume at discharge pressure up to 160 psi.

F. Ratio/Pressure Check Device:

1. Two independent, valved nozzles, capable of controlling flow rate and pressure by opening or closing valve to restrict material flow.

2. Pressure gauge, capable of sensing pressure behind each valve.

3.05 FIELD QUALITY CONTROL:

A. Epoxy Adhesive Two Component Ratio Tests:

1. Disconnect mixing head and pump two adhesive components simultaneously through ratio check device.

2. Adjust discharge pressure to 160 psi for both adhesive components.

3. Simultaneously discharge both adhesive components into separate calibrated containers.

4. Compare amounts simultaneously discharged into calibrated containers during same time period to determine mix ratio.

5. Complete test at 160 psi discharge pressure and repeat procedure for 0 psi discharge pressure.

6. Run ratio test for each injection unit at beginning and end of each injection work day, and when injection work has stopped for more than 1 hour.

7. Document and maintain complete accurate records of, ratios and pressure checks.

B. Injection Pressure Test:

1. Disconnect mixing head of injection equipment and connect two adhesive component delivery lines to pressure check device.

2. Pressure Check Device:

a. Two independent valved nozzles capable of controlling flow rate and pressure by opening or closing of valve.

b. Pressure gauge capable of sensing pressure buildup behind each valve.

3. Close valves on pressure check device and operate equipment until gauge pressure on each line reads 160 psi.

4. Stop pumps and observe pressure; do not allow pressure gauge to drop below 150 psi within 3 minutes.

5. Run pressure test for each injection equipment unit:

a. Beginning and end of each injection work day.

b. When injection work as stop for more than 45 minutes.

6. Check tolerance to verify equipment capable of meeting specified ratio tolerance.

C. Crack Injection Tests:

1. Initial Cores:

a. 4-inch-diameter for full crack depth taken from Engineer's selected locations.

b. Take three cores in first 100 linear feet of crack repaired and one core sample for each 500 linear feet thereafter.

2. Provide suitable containers for storage, curing, and transportation of test specimens.

3. Methods of Testing Cores:

   a. Penetration: Visual examination.

   b. Bond Strength/Compression Test: concrete failure prior to adhesive failure.

4. Test Requirements:

   a. Penetration: minimum of 90 percent of crack shall be full of epoxy adhesive.

   b. Bond Strength/Compression Test: concrete failure before adhesive failure, or 6,500 psi with no failure of either concrete or adhesive.

5. Evaluation and Acceptance of Tests:

   a. If initial cores pass tests as specified, epoxy adhesive injection at area represented by cores will be accepted.

   b. If initial cores fail either by lack of penetration or bond strength, crack repair shall not proceed further until areas represented by cores are re-injected or repaired and retested for acceptance.

   c. Obtain verifying core samples, number and location as selected by Engineer, after rework of areas represented by failed initial cores is complete.

6. Core Hole Repair:

   a. Correct as result of testing on notification from Engineer.

   b. Refill initial and verifying core holes with an epoxy grout tamped and rodded in-place to form a dense fill.

   c. Finish surface to blend with adjacent concrete.

3.06 TESTS AND INSPECTIONS:

A. Special inspection, testing, and professional observation shall be provided by the Contractor as indicated in the Statement of Special Inspection in the Drawings and in Section 01 45 33.

B. Special Inspector shall verify that manufacturer and installer's procedures and instructions for surface preparation and installation are followed.

3.07 ALTERNATIVE CRACK REPAIRS:

A. Where specifically approved in writing by the Engineer, alternative crack repair products and procedures may be used, as Specified in Section 03 01 30.

B. Each individual location where alternative crack repair products or procedures are used, shall be approved in writing by the Engineer, prior to beginning work or installing the alternative products.

3.08 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

DIVISION 04

MASONRY

Page Intentionally Left Blank

SECTION 04 20 00

UNIT MASONRY AND ACCESSORIES

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide unit masonry and accessories as indicated and in compliance with Contract Documents.

1. The work under this Section includes the following:

a. Masonry units

b. Mortar and grout

c. Integral water repellent for block and mortar

d. Block sealer

e. Steel reinforcing bars

f. Ties and anchors

g. Miscellaneous masonry accessories

8. C90: Standard Specification for Loadbearing Concrete Masonry Units.

9. C91: Standard Specification for Masonry Cement.

10. C109: Standard Test Method for Compressive Strength of Hydraulic Cement Mortars (Using 2-in. or [50-mm] Cube Specimens).

11. C140: Standard Test Methods of Sampling and Testing Concrete Masonry Units and Related Units.

12. C144: Standard Specification for Aggregate for Masonry Mortar.

13. C150: Standard Specification for Portland Cement.

14. C199: Standard Test Method for Pier Test for Refractory Mortars.

15. C207: Standard Specification for Hydrated Lime for Masonry Purposes.

16. C270: Standard Specification for Mortar for Unit Masonry.

17. C395: Standard Specification for Chemical-Resistant Resin Mortars.

18. C404: Standard Specification for Aggregates for Masonry Grout.

19. C476: Standard Specification for Grout for Masonry.

20. C494: Standard Specification for Chemical Admixtures for Concrete.

21. C780: Standard Test Method for Preconstruction and Construction Evaluation of Mortars for Plain and Reinforced Unit Masonry.

22. C920: Standard Specification for Elastomeric Joint Sealants.

23. C979: Standard Specification for Pigments for Integrally Colored Concrete.

24. C1019: Standard Method of Sampling and Testing Grout.

25. C1093: Standard Practice for Accreditation of Testing Agencies for Masonry.

26. C1314: Standard Test Method for Compressive Strength of Masonry Prisms.

27. C1329: Standard Specification for Mortar Cement.

28. C1623: Standard Specification for Manufactured Concrete Masonry Lintels.

29. D1056: Standard Specification for Flexible Cellular Materials - Sponge or Expanded Rubber.

30. D2287: Standard Specification for Nonrigid Vinyl Chloride Polymer and Copolymer Molding and Extrusion Compounds.

31. E119: Standard Test Methods for Fire Tests of Building Construction and Materials.

32. E488: Standard Test Methods for Strength of Anchors in Concrete and Masonry Elements.

33. E514: Standard Test Method for Water Penetration and Leakage Through Masonry.

34. F1941: Standard Specification for Electrodeposited Coatings on Threaded Fasteners [Metric].

35. F3125: Standard Specification for High Strength Structural Bolts and Assemblies, Steel and Alloy Steel, Heat Treated, 120 ksi and 150 ksi Minimum Tensile Strength.

C. National Concrete Masonry Association (NCMA):

1. TEK8-2A: Removal of Stains from Concrete Masonry

2. Standard for Thermal Insulation, Polystyrene, Boards and Pipe Covering

1.03 DEFINITIONS:

A. CMU(s): Concrete masonry unit(s).

B. Reinforced Masonry: Masonry containing reinforcing steel in grouted cells.

1.04 PERFORMANCE REQUIREMENTS:

A. Provide structural unit masonry that develops indicated net-area compressive strengths at 28 days.

1. Determine net-area compressive strength of masonry from average net-area compressive strengths of masonry units and mortar types (unit-strength method) according to Tables 1 and 2 in TMS 602.

2. Determine net-area compressive strength of masonry by testing masonry prisms according to ASTM C1314.

1.05 PRECONSTRUCTION TESTING:

A. Preconstruction Testing Service: Owner qualified independent testing agency to perform preconstruction testing indicated below. Retesting of materials that fail to comply with specified requirements shall be done at Contractor's expense.

1. Concrete Masonry Unit Test: For each type of unit required, according to ASTM C140 for compressive strength.

2. Mortar Test (Property Specification): For each mix required, according to ASTM C109 for compressive strength.

3. Grout Test (Compressive Strength): For each mix required, according to ASTM C1019.

1.06 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Product Data: For each type of product indicated.

C. Shop Drawings: For the following:

1. Masonry Units: Show sizes, profiles, coursing, and locations of special shapes.

2. Stone Trim Units: Show sizes, profiles, and locations of each stone trim unit required.

3. Reinforcing Steel: Detail bending and placement of unit masonry reinforcing bars. Comply with ACI SP-66, "Details and Detailing of Concrete Reinforcement."

D. Samples for Verification: For each type and color of the following:

1. Exposed CMUs.

2. Pigmented and colored-aggregate mortar. Make Samples using same sand and mortar ingredients to be used on Project.

3. Concrete Masonry Units: Verification Samples: For each product specified, two samples, representing types, colors, textures, and finishes to be installed

4. Accessories embedded in masonry.

E. List of Materials Used in Constructing Mockups: List generic product names together with manufacturers, manufacturers' product names, model numbers, lot numbers, batch

numbers, source of supply, and other information as required to identify materials used. Include mix proportions for mortar and grout and source of aggregates.

1. Submittal is for information only. Neither receipt of list nor approval of mockup constitutes approval of deviations from the Contract Documents unless such deviations are specifically brought to the attention of Engineer and accepted in writing.

F. Qualification Data: For testing agency.

G. Material Certificates: For each type and size of the following:

1. Masonry units.

a. Include data on material properties.

b. For masonry units used in structural masonry, include data and calculations establishing average net-area compressive strength of units.

2. Cementitious materials. Include brand, type, and name of manufacturer.

3. Preblended, dry mortar mixes. Include description of type and proportions of ingredients.

4. Grout mixes. Include description of type and proportions of ingredients.

5. Reinforcing bars.

6. Joint reinforcement.

7. Anchors and metal accessories.

H. Mix Designs: For each type of mortar and grout. Include description of type and proportions of ingredients.

1. Include test reports for mortar mixes required to comply with property specification. Test according to ASTM C109 for compressive strength, ASTM C1506 for water retention, and ASTM C91 for air content.

2. Include test reports, according to ASTM C1019, for grout mixes required to comply with compressive strength requirement.

I. Statement of Compressive Strength of Masonry: For each combination of masonry unit type and mortar type, provide statement of average net-area compressive strength of masonry units, mortar type, and resulting net-area compressive strength of masonry determined according to Tables 1 and 2 in TMS 602.

J. Cold-Weather and Hot-Weather Procedures: Detailed description of methods, materials, and equipment to be used to comply with requirements.

1.07 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

B. Testing Agency Qualifications: Qualified according to ASTM C1093 for testing indicated. Testing agency shall be retained by Owner/Engineer.

C. Source Limitations for Masonry Units: Obtain exposed masonry units of a uniform texture and color, or a uniform blend within the ranges accepted for these characteristics, from single source from single manufacturer for each product required.

D. Source Limitations for Mortar Materials: Obtain mortar ingredients of a uniform quality, including color for exposed masonry, from single manufacturer for each cementitious component and from single source or producer for each aggregate.

E. Masonry Standard: Comply with TMS 602 unless modified by requirements in the Contract Documents.

F. Sample Panels: Build sample panels to verify selections made under sample submittals and to demonstrate aesthetic effects. Comply with requirements in Section 01 45 00 for mockups.

1. Build sample panels for each type of exposed unit masonry construction in sizes approximately 48 inches long by 36 inches high by full thickness.

2. Clean exposed faces of panels with masonry cleaner indicated.

3. Protect accepted sample panels from the elements with weather-resistant membrane.

4. Approval of sample panels is for color, texture, and blending of masonry units; relationship of mortar, sealer, and sealant colors to masonry unit colors; tooling of joints; aesthetic qualities of workmanship; and other material and construction qualities specifically accepted by Engineer in writing.

a. Approval of sample panels does not constitute approval of deviations from the Contract Documents contained in sample panels unless such deviations are specifically accepted by Engineer in writing.

G. Mockups: Build mockups to verify selections made under sample submittals and to demonstrate aesthetic effects and set quality standards for materials and execution.

1. Build mockup of typical wall area as shown on Drawings.

2. Build mockups for each type of exposed unit masonry construction in sizes approximately 48 inches long by 48 inches high by full thickness, including face and backup wythes and accessories.

   a. Include a sealant-filled joint at least 16 inches long in each mockup.

   b. Include lower corner of window opening at upper right had corner of interior wall mockup and door jamb on the left edge. Make opening approximately 12 inches wide by 16 inches high.

   c. Include door jamb on the left edge of interior wall mockup.

   d. Include through-wall flashing installed for a 24-inch length in corner of exterior wall mockup approximately 16 inches down from top of mockup, with a 12-inch length of flashing left exposed to view (omit masonry above half of flashing).

3. Clean exposed faces of mockups with masonry cleaner as indicated.

4. Protect accepted mockups from the elements with weather-resistant membrane.

5. Approval of mockups is for color, texture, and blending of masonry units; relationship of mortar, block sealer, and sealant colors to masonry unit colors; tooling of joints; and aesthetic qualities of workmanship.

6. Accepted mockups may become part of the completed Work if undisturbed at time of Substantial Completion.

1.08 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

B. Store masonry units on elevated platforms in a dry location. If units are not stored in an enclosed location, cover tops and sides of stacks with waterproof sheeting, securely tied. If units become wet, do not install until they are dry.

C. Store cementitious materials on elevated platforms, under cover, and in a dry location. Do not use cementitious materials that have become damp.

D. Store aggregates where grading and other required characteristics can be maintained and contamination avoided.

E. Deliver preblended, dry mortar mix in moisture-resistant containers designed for use with dispensing silos. Store preblended, dry mortar mix in delivery containers on elevated platforms, under cover, and in a dry location or in covered weatherproof dispensing silos.

F. Store masonry accessories, including metal items, to prevent corrosion and accumulation of dirt and oil.

1.09 PROJECT/SITE CONDITIONS:

A. Protection of Masonry: During construction, cover tops of walls, projections, and sills with waterproof sheeting at end of each day's work. Cover partially completed masonry when construction is not in progress.

1. Extend cover a minimum of 24 inches down both sides of walls and hold cover securely in place.

B. Do not apply uniform floor or roof loads for at least 12 hours and concentrated loads for at least three days after building masonry walls or columns.

C. Stain Prevention: Prevent grout, mortar, and soil from staining the face of masonry to be left exposed or painted. Immediately remove grout, mortar, and soil that come in contact with such masonry.

1. Protect base of walls from rain-splashed mud and from mortar splatter by spreading coverings on ground and over wall surface.

2. Protect sills, ledges, and projections from mortar droppings.

3. Protect surfaces of window and door frames, as well as similar products with painted and integral finishes, from mortar droppings.

4. Prevent mortar and dirt contamination onto completed masonry.

D. Cold-Weather Requirements: Do not use frozen materials or materials mixed or coated with ice or frost. Do not build on frozen substrates. Remove and replace unit masonry damaged by frost or by freezing conditions. Comply with cold-weather construction requirements contained in TMS 602.

1. Cold-Weather Cleaning: Use liquid cleaning methods only when air temperature is 40 degrees F and higher and will remain so until masonry has dried, but not less than seven days after completing cleaning.

E. Hot-Weather Requirements: Comply with hot-weather construction requirements contained in TMS 602.

PART 2 - PRODUCTS

2.01 MASONRY UNITS, GENERAL:

A. Defective Units: Referenced masonry unit standards may allow a certain percentage of units to contain chips, cracks, or other defects exceeding limits stated in the standard. Do not use units where such defects will be exposed in the completed Work.

B. Fire-Resistance Ratings: Where indicated, provide units that comply with requirements for fire-resistance ratings indicated as determined by testing according to ASTM E119, by equivalent masonry thickness, or by other means, as acceptable to authorities having jurisdiction.

2.02 CONCRETE MASONRY UNITS:

A. Basis of Design:

1. Premier Ultra Burnished Masonry Units as manufactured by County Materials

2. Trendstone Plus as manufactured by Trendstone Corporation

B. Product Description

1. Integrally pigmented loadbearing hollow units with a net area compressive strength of greater than or equal to 1900 psi.

2. Coloring: Integral, through-body coloring; synthetic or natural iron oxide pigments

3. Water Repellent: Integral Water Repellent.

4. Finish: Ground Face filled and polished

C. Shapes: Provide shapes indicated and as follows, with exposed surfaces matching exposed faces of adjacent units unless otherwise indicated.

1. Provide special shapes for lintels, corners, jambs, sashes, movement joints, headers, bonding, and other special conditions.

2. Provide square-edged units for outside corners and bullnose units at opening jambs unless otherwise indicated.

D. Integral Water Repellent: Provide units made with integral water repellent.

1. Integral Water Repellent: Liquid polymeric, integral water-repellent admixture that does not reduce flexural bond strength. Units made with integral water repellent, when tested according to ASTM E514 as a wall assembly made with mortar containing integral water-repellent manufacturer's mortar additive, with test period extended to 24 hours, shall show no visible water or leaks on the back of test specimen.

a. Products:

(1) ACM Chemistries; RainBloc.

(2) BASF Aktiengesellschaft; Rheopel Plus.

(3) Grace Construction Products, W. R. Grace & Co. - Conn.; Dry-Block.

E. CMUs: ASTM C90.

1. Density Classification: Normal weight.

2. Size (Width): Manufactured to dimensions 3/8 inch less than nominal dimensions.

3. Exposed Faces: Provide color and texture matching the range represented by approved sample.

2.03 MASONRY LINTELS:

A. General: Provide one of the following:

B. Masonry Lintels: Built-in-place masonry lintels made from bond beam CMUs with reinforcing bars placed as indicated and filled with coarse grout. Temporarily support built-in-place lintels until cured.

2.04 MORTAR AND GROUT MATERIALS:

A. Cement: ASTM C595, Type IF. Provide natural color or white cement as required to produce mortar color indicated.

B. Hydrated Lime: ASTM C207, Type S.

C. Cement-Lime Mix: Packaged blend of Portland cement and hydrated lime containing no other ingredients.

D. Masonry Cement: ASTM C91.

1. Products:

a. Capital Materials Corporation; Flamingo Color Masonry Cement

b. Cemex S.A.B. de C.V.; Citadel Type S

c. Holcim (US) Inc.; Mortamix Masonry Cement

d. Lafarge North America Inc.; Lafarge Masonry Cement

e. Lehigh Cement Company; Lehigh Masonry Cement

f. National Cement Company, Inc.; Coosa Masonry Cement

E. Mortar Cement: ASTM C1329.

1. Products:

a. Lafarge North America, Inc.; Lafarge Mortar Cement

F. Aggregate for Mortar: ASTM C144.

1. For mortar that is exposed to view, use washed aggregate consisting of natural sand or crushed stone.

2. For joints less than 1/4 inch thick, use aggregate graded with 100 percent passing the No. 16 sieve.

3. Mortar Aggregates: Natural sand or crushed stone of color necessary to produce required mortar color.

G. Aggregate for Grout: ASTM C404.

H. Cold-Weather Admixture: Nonchloride, noncorrosive, accelerating admixture complying with ASTM C494, Type C, and recommended by manufacturer for use in masonry mortar of composition indicated.

1. Products:

a. The Euclid Chemical Company; Accelguard 80

b. Grace Construction Products, W. R. Grace & Co. - Conn.; Morset

c. Sonneborn Products, BASF Aktiengesellschaft; Trimix-NCA

I. Water-Repellent Admixture: Liquid water-repellent mortar admixture intended for use with CMUs containing integral water repellent by same manufacturer.

1. Products:

a. ACM Chemistries; RainBloc for Mortar

b. BASF Aktiengesellschaft; Rheopel Mortar Admixture

c. Grace Construction Products, W. R. Grace & Co. - Conn.; Dry-Block Mortar Admixture

J. Water: Potable.

K. Block Sealer: Provide sealer recommended by selected CMU manufacture to bottom four feet of wall for all exposed CMU surfaces in areas indicating an exposure on drawings as highly corrosive.

2.05 REINFORCEMENT:

A. Uncoated Steel Reinforcing Bars: ASTM A615 Grade 60.

B. Masonry Joint Reinforcement, General: ASTM A951.

1. Interior Walls: Hot-dip galvanized, carbon steel.

2. Exterior Walls: Hot-dip galvanized, carbon steel.

3. Wire Size for Side Rods: 0.187-inch diameter.

4. Wire Size for Cross Rods: 0.187-inch diameter.

5. Spacing of Cross Rods, Tabs, and Cross Ties: Not more than 16 inches o.c.

6. Provide in lengths of not less than 10 feet**,** with prefabricated corner and tee units.

C. Masonry Joint Reinforcement for Single-Wythe Masonry: Truss type with single pair of side rods.

2.06 ANCHORS:

A. Materials: Provide anchors specified in this article that are made from materials that comply with the following unless otherwise indicated.

1. Hot-Dip Galvanized, Carbon-Steel Wire: ASTM A82; with ASTM A153, Class B-2 coating.

B. Adjustable Anchors for Connecting to Structural Steel Framing: Provide anchors that allow vertical or horizontal adjustment but resist tension and compression forces perpendicular to plane of wall.

C. Adjustable Anchors for Connecting to Concrete: Provide anchors that allow vertical or horizontal adjustment but resist tension and compression forces perpendicular to plane of wall.

2.07 MISCELLANEOUS ANCHORS:

A. Unit Type Inserts in Concrete: Cast-iron or malleable-iron wedge-type inserts.

B. Dovetail Slots in Concrete: Furnish dovetail slots with filler strips, of slot size indicated, fabricated from 0.034-inch, galvanized steel sheet.

C. Anchor Bolts: Headed steel bolts complying with ASTM A307, Grade A; with ASTM A563 hex nuts and, where indicated, flat washers; hot-dip galvanized to comply with ASTM A153, Class C; of dimensions indicated.

2.08 MISCELLANEOUS MASONRY ACCESSORIES:

A. Compressible Filler: Premolded filler strips complying with ASTM D1056, Grade 2A1; compressible up to 35 percent; of width and thickness indicated; formulated from neoprene or PVC.

B. Preformed Control-Joint Gaskets: Made from PVC, complying with ASTM D2287, Type PVC-65406 and designed to fit standard sash block and to maintain lateral stability in masonry wall; size and configuration as indicated.

C. Bond-Breaker Strips: Asphalt-saturated, organic roofing felt complying with ASTM D226, Type I (No. 15 asphalt felt).

D. Reinforcing Bar Positioners: Wire units designed to fit into mortar bed joints spanning masonry unit cells and hold reinforcing bars in center of cells. Units are formed from 0.148-inch steel wire, hot-dip galvanized after fabrication. Provide units designed for number of bars indicated.

1. Products:

a. Dayton Superior Corporation, Dur-O-Wal Division; D/A 810, D/A 812 or D/A 817

b. Heckmann Building Products Inc.; No. 376 Rebar Positioner

c. Hohmann & Barnard, Inc.; #RB or #RB-Twin Rebar Positioner

d. Wire-Bond; O-Ring or Double O-Ring Rebar Positioner

2.09 MASONRY CLEANERS:

A. Proprietary Acidic Cleaner: Manufacturer's standard-strength cleaner designed for removing mortar/grout stains, efflorescence, and other new construction stains from new masonry without discoloring or damaging masonry surfaces. Use product expressly approved for intended use by cleaner manufacturer and manufacturer of masonry units being cleaned.

1. Manufacturers:

a. Diedrich Technologies, Inc.

b. EaCo Chem, Inc.

c. ProSoCo, Inc.

2.10 MORTAR AND GROUT MIXES:

A. General: Do not use admixtures, including pigments, air-entraining agents, accelerators, retarders, water-repellent agents, antifreeze compounds, or other admixtures, unless otherwise indicated.

1. Do not use calcium chloride in mortar or grout.

2. Use Portland cement-lime masonry cement mortar unless otherwise indicated.

3. Add cold-weather admixture (if used) at same rate for all mortar that will be exposed to view, regardless of weather conditions, to ensure that mortar color is consistent.

B. Preblended, Dry Mortar Mix: Furnish dry mortar ingredients in form of a preblended mix. Measure quantities by weight to ensure accurate proportions, and thoroughly blend ingredients before delivering to Project site.

C. Mortar for Unit Masonry: Comply with ASTM C270, Proportion Specification. Provide the following types of mortar for applications stated unless another type is indicated or needed to provide required compressive strength of masonry.

1. For reinforced masonry, use Type M or S.

D. Grout for Unit Masonry: Comply with ASTM C476.

1. Use grout of type indicated or, if not otherwise indicated, of type (fine or coarse) that will comply with Table 1.15.1 in TMS 602 for dimensions of grout spaces and pour height.

2. Proportion grout in accordance with ASTM C476, Table 1.

3. Compressive strength of grout shall be equal to or exceed 1900psi.

4. Provide grout with a slump of 8 to 11 inches as measured according to ASTM C143/C143M.

PART 3 - EXECUTION

3.02 EXAMINATION:

A. Examine conditions, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.

1. For the record, prepare written report, endorsed by Installer, listing conditions detrimental to performance of work.

2. Verify that reinforcing dowels are properly placed.

B. Before installation, examine rough-in and built-in construction for piping systems to verify actual locations of piping connections.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.03 INSTALLATION, GENERAL:

A. Thickness: Build single-wythe walls to actual widths of masonry units, using units of widths indicated.

B. Build chases and recesses to accommodate items specified in this and other sections.

C. Leave openings for equipment to be installed before completing masonry. After installing equipment, complete masonry to match the construction immediately adjacent to opening.

D. Use full-size units without cutting if possible. If cutting is required to provide a continuous pattern or to fit adjoining construction, cut units with motor-driven saws; provide clean, sharp, unchipped edges. Allow units to dry before laying unless wetting of units is specified. Install cut units with cut surfaces and, where possible, cut edges concealed.

E. Select and arrange units for exposed unit masonry to produce a uniform blend of colors and textures.

1. Mix units from several pallets or cubes as they are placed.

3.04 TOLERANCES:

A. Dimensions and Locations of Elements:

1. For dimensions in cross-section or elevation do not vary by more than plus 1/2-inch or minus 1/4-inch.

2. For location of elements in plan do not vary from that indicated by more than plus or minus 1/2-inch.

3. For location of elements in elevation do not vary from that indicated by more than plus or minus 1/4-inch in a story height or 1/2-inch total.

B. Lines and Levels:

1. For bed joints and top surfaces of bearing walls do not vary from level by more than 1/4 inch in 10 feet, or 1/2 inch maximum.

2. For conspicuous horizontal lines, such as lintels, sills, parapets, and reveals, do not vary from level by more than 1/8 inch in 10 feet, 1/4 inch in 20 feet, or 1/2 inch maximum.

3. For vertical lines and surfaces do not vary from plumb by more than 1/4 inch in 10 feet, 3/8 inch in 20 feet, or 1/2 inch maximum.

4. For conspicuous vertical lines, such as external corners, door jambs, reveals, and expansion and control joints, do not vary from plumb by more than 1/8 inch in 10 feet, 1/4 inch in 20 feet, or 1/2 inch maximum.

5. For lines and surfaces do not vary from straight by more than 1/4 inch in 10 feet, 3/8 inch in 20 feet, or 1/2 inch maximum.

6. For vertical alignment of exposed head joints, do not vary from plumb by more than 1/4 inch in 10 feet, or 1/2 inch maximum.

7. For faces of adjacent exposed masonry units, do not vary from flush alignment by more than 1/16 inch except due to warpage of masonry units within tolerances specified for warpage of units.

C. Joints:

1. For bed joints, do not vary from thickness indicated by more than plus or minus 1/8-inch, with a maximum thickness limited to 1/2 inch.

2. For exposed bed joints, do not vary from bed-joint thickness of adjacent courses by more than 1/8 inch.

3. For head and collar joints, do not vary from thickness indicated by more than plus 3/8 inch or minus 1/4 inch.

4. For exposed head joints, do not vary from thickness indicated by more than plus or minus 1/8 inch.

5. For exposed bed joints and head joints of stacked bond, do not vary from a straight line by more than 1/16 inch from one masonry unit to the next.

3.05 LAYING MASONRY WALLS:

A. Lay out walls in advance for accurate spacing of surface bond patterns with uniform joint thicknesses and for accurate location of openings, movement-type joints, returns, and offsets. Avoid using less-than-half-size units, particularly at corners, jambs, and, where possible, at other locations.

B. Bond Pattern for Exposed Masonry: Unless otherwise indicated, lay exposed masonry in running bond; do not use units with less than nominal 4-inch horizontal face dimensions at corners or jambs.

C. Lay concealed masonry with all units in a wythe in running bond or bonded by lapping not less than 2 inches. Bond and interlock each course of each wythe at corners. Do not use units with less than nominal 4-inch horizontal face dimensions at corners or jambs.

D. Stopping and Resuming Work: Stop work by racking back units in each course from those in course below; do not tooth. When resuming work, clean masonry surfaces that are to receive mortar, remove loose masonry units and mortar, and wet brick if required before laying fresh masonry.

E. Built-in Work: As construction progresses, build in items specified in this and other sections. Fill in solidly with masonry around built-in items.

F. Fill space between steel frames and masonry solidly with mortar unless otherwise indicated.

G. Where built-in items are to be embedded in cores of hollow masonry units, place a layer of metal lath, wire mesh, or plastic mesh in the joint below and rod mortar or grout into core.

H. Fill cores in hollow CMUs with grout 24 inches under bearing plates, beams, lintels, posts, and similar items unless otherwise indicated.

I. Build non-load-bearing interior partitions full height of story to underside of solid floor or roof structure above unless otherwise indicated.

1. Install compressible filler in joint between top of partition and underside of structure above.

2. Fasten partition top anchors to structure above and build into top of partition. Grout cells of CMUs solidly around plastic tubes of anchors and push tubes down into grout to provide 1/2-inch clearance between end of anchor rod and end of tube. Space anchors 48 inches o.c. unless otherwise indicated.

3. Wedge non-load-bearing partitions against structure above with small pieces of tile, slate, or metal. Fill joint with mortar after dead-load deflection of structure above approaches final position.

4. At fire-rated partitions, treat joint between top of partition, penetrations, and underside of structure above to comply with Section 07 84 00.

3.06 MORTAR BEDDING AND JOINTING:

A. Lay hollow CMUs as follows:

1. With face shells fully bedded in mortar and with head joints of depth equal to bed joints.

2. With webs fully bedded in mortar in all courses of piers, columns, and pilasters.

3. With webs fully bedded in mortar in grouted masonry, including starting course on footings.

4. With entire units, including areas under cells, fully bedded in mortar at starting course on footings where cells are not grouted.

3.07 MASONRY JOINT REINFORCEMENT:

A. General: Install entire length of longitudinal side rods in mortar with a minimum cover of 5/8 inch on exterior side of walls, 1/2 inch elsewhere. Lap reinforcement a minimum of 6 inches.

1. Space reinforcement not more than 16 inches o.c.

2. Provide reinforcement not more than 8 inches above and below wall openings and extending 12 inches beyond openings in addition to continuous reinforcement.

B. Interrupt joint reinforcement at control and expansion joints unless otherwise indicated.

C. Provide continuity at wall intersections by using prefabricated T-shaped units.

D. Provide continuity at corners by using prefabricated L-shaped units.

E. Cut and bend reinforcing units as directed by manufacturer for continuity at corners, returns, offsets, column fireproofing, pipe enclosures, and other special conditions.

3.08 CONTROL AND EXPANSION JOINTS:

A. General: Install control and expansion joint materials in unit masonry as masonry progresses. Do not allow materials to span control and expansion joints without provision to allow for in-plane wall or partition movement.

B. Form control joints in concrete masonry using one of the following methods:

1. Fit bond-breaker strips into hollow contour in ends of CMUs on one side of control joint. Fill resultant core with grout and rake out joints in exposed faces for application of sealant.

2. Install preformed control-joint gaskets designed to fit standard sash block.

3. Install interlocking units designed for control joints. Install bond-breaker strips at joint. Keep head joints free and clear of mortar or rake out joint for application of sealant.

4. Install temporary foam-plastic filler in head joints and remove filler when unit masonry is complete for application of sealant.

3.09 LINTELS:

A. Install steel lintels where indicated.

B. Provide masonry lintels where shown and where openings of more than 12 inches for brick-size units and 24 inches for block-size units are shown without structural steel or other supporting lintels.

C. Provide minimum bearing of 8 inches at each jamb unless otherwise indicated.

3.10 REINFORCED UNIT MASONRY INSTALLATION:

A. Temporary Formwork and Shores: Construct formwork and shores as needed to support reinforced masonry elements during construction.

1. Construct formwork to provide shape, line, and dimensions of completed masonry as indicated. Make forms sufficiently tight to prevent leakage of mortar and grout. Brace, tie, and support forms to maintain position and shape during construction and curing of reinforced masonry.

2. Do not remove forms and shores until reinforced masonry members have hardened sufficiently to carry their own weight and other loads that may be placed on them during construction.

B. Placing Reinforcement: Comply with requirements in TMS 602.

C. Grouting: Do not place grout until entire height of masonry to be grouted has attained enough strength to resist grout pressure.

1. Comply with requirements in TMS 602 for cleanouts and for grout placement, including minimum grout space and maximum pour height.

2. Limit height of vertical grout pours to not more than 60 inches.

3.11 FIELD QUALITY CONTROL:

A. Testing and Inspecting: Owner will engage special inspectors to perform tests and inspections and prepare reports. Allow inspectors access to scaffolding and work areas, as needed to perform tests and inspections. Retesting of materials that fail to comply with specified requirements shall be done at Contractor's expense.

B. Inspections: Special inspections according to the "International Building Code."

1. Begin masonry construction only after inspectors have verified proportions of site-prepared mortar.

2. Place grout only after inspectors have verified compliance of grout spaces and of grades, sizes, and locations of reinforcement.

3. Place grout only after inspectors have verified proportions of site-prepared grout.

C. Testing Prior to Construction: One set of tests.

D. Testing Frequency: One set of tests for each 5000 sq. ft of wall area or portion thereof.

E. Concrete Masonry Unit Test: For each type of unit provided, according to ASTM C140 for compressive strength.

F. Mortar Aggregate Ratio Test (Proportion Specification): For each mix provided, according to ASTM C780.

G. Prism Test: For each type of construction provided, according to ASTM C1314 at 7 days and at 28 days.

3.12 REPAIRING, POINTING, AND CLEANING:

A. Remove and replace masonry units that are loose, chipped, broken, stained, or otherwise damaged or that do not match adjoining units. Install new units to match adjoining units; install in fresh mortar, pointed to eliminate evidence of replacement.

B. Pointing: During the tooling of joints, enlarge voids and holes, except weep holes, and completely fill with mortar. Point up joints, including corners, openings, and adjacent construction, to provide a neat, uniform appearance. Prepare joints for sealant application, where indicated.

C. In-Progress Cleaning: Clean unit masonry as work progresses by dry brushing to remove mortar fins and smears before tooling joints.

D. Final Cleaning: After mortar is thoroughly set and cured, clean exposed masonry as follows:

1. Remove large mortar particles by hand with wooden paddles and nonmetallic scrape hoes or chisels.

2. Test cleaning methods on sample wall panel; leave one-half of panel uncleaned for comparison purposes. Obtain Engineer's approval of sample cleaning before proceeding with cleaning of masonry.

3. Protect adjacent non-masonry surfaces from contact with cleaner by covering them with liquid strippable masking agent or polyethylene film and waterproof masking tape.

4. Wet wall surfaces with water before applying cleaners; remove cleaners promptly by rinsing surfaces thoroughly with clear water.

5. Clean masonry with a proprietary acidic cleaner applied according to manufacturer's written instructions.

6. Clean concrete masonry by cleaning method indicated in NCMA TEK 8-2A applicable to type of stain on exposed surfaces.

3.13 MASONRY WASTE DISPOSAL:

A. Salvageable Materials: Unless otherwise indicated, excess masonry materials are Contractor's property. At completion of unit masonry work, remove from Project site.

B. Waste Disposal as Fill Material: Dispose of clean masonry waste, including excess or soil-contaminated sand, waste mortar, and broken masonry units, by crushing and mixing with fill material as fill is placed.

1. Crush masonry waste to less than 4 inches in each dimension.

2. Mix masonry waste with at least two parts of specified fill material for each part of masonry waste. Fill material is specified in Section 31 23 00.

3. Do not dispose of masonry waste as fill within 18 inches of finished grade.

C. Excess Masonry Waste: Remove excess clean masonry waste that cannot be used as fill, as described above, and other masonry waste, and legally dispose of off Owner's property.

3.14 PROTECTION:

A. Protect the walls, including window sills, with non-staining waterproof coverings when work not in process.

B. Provide minimum 24-inch overhang of protective covering on each side of wall and anchor securely.

C. Protect facing materials from staining.

3.15 CONTRACT CLOSEOUT:

A. Provide in accordance with Section 01 77 00.

METALS

Page Intentionally Left Blank

SECTION 05 50 00

MISCELLANEOUS METAL

PART 1 - GENERAL

1.01 DESCRIPTION:

A. This section includes metal fabrications not specifically included in other Sections and required for completion of work as shown on Contract Drawings and in accordance with Contract Documents.

B. Furnish labor, materials, equipment and incidentals necessary to install the products specified.

1. MBG 531: Metal Bar Grating Manual

2. MBG 532: Heavy Duty Metal Bar Grating Manual

3. MBG 533: Welding Specifications for Fabrication of Steel, Aluminum and Stainless Bar Grating

F. Aluminum Association:

1. Aluminum Design Manual–Specifications and Guidelines for Aluminum Structures.

a. AA M31C22A41

(1) M31: Mechanical Finish, Fine Satin

(2) C22: Finish, Medium Matte

(3) A41: Clear Anodic Coating, Class I

G. Submit the following shop drawings in accordance with Section 01 33 00.

1. Submit shop drawings and product data showing materials of construction and details of installation for all items furnished under this Section. Shop drawings shall show sizes of members, method of assembly, anchorage and connection to other members.

2. Test Reports:

a. Submit certified copies of mill test reports on each steel, stainless steel, or aluminum proposed for use showing the physical properties and chemical analysis.

3. Product Data:

a. Manufacturer's catalog sheets on pre-manufactured items.

4. Miscellaneous Submittals:

a. Provide International Conference of Building Officials (ICBO) or other similar building code organization recommendations regarding safe allowable design loads for concrete anchors.

5. Stamped by Professional Structural Engineer registered in State where the project is located.

1.03 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.04 DESIGN CRITERIA:

A. Structural Connections: AISC Specification for Structural Steel Buildings. Design connections not fully detailed on the Drawings to resist the loads shown on the Contract Drawings or specified.

B. Where beam end reactions are not shown, design the connection for one-half the total allowable uniform load in kips for beams laterally supported at the given span, as determined by the tables for allowable loads on beams in the AISC Manual of Steel Construction, in addition to any axial loads identified on the Contract Drawings.

1.05 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

B. Test and inspect structural assemblies in accordance with Section 01 45 33.

C. Design connections not detailed on the Drawings under direct supervision of a Professional Structural Engineer experienced in design of this work and licensed in the State where the Project is located.

D. Steel:

1. Conform to codes for arc and gas welding in building construction of AWS and to AISC Specifications. Surfaces to be welded shall be free from loose scale, rust, grease, paint, and other foreign material, except mill scale that will withstand vigorous wire brushing may remain. Perform no welding when base metal is lower than 0 degrees F.

2. Qualify welding operators in accordance with AWS D1.1. Qualification tests shall be run by a recognized testing laboratory acceptable to the Engineer at Contractor's expense.

E. Aluminum:

1. Weld with gas metal arc (GMA) or gas tungsten arc (GTA) processes in accordance with AWS.

F. Adhesive Anchors:

1. Adhesive Anchor Installers shall be trained and certified by manufacturer.

G. Galvanized Coating:

1. Company specializing in hot-dip galvanizing after fabrication and following procedures of Quality Assurance Manual of the American Galvanizers Association.

1.06 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

B. Insofar as practical, factory assemble items specified herein. Package, ship and tag unassembled materials in a manner that will protect materials from damage and will facilitate identification and field assembly.

C. Package stainless steel items in a manner to provide protection from carbon impregnation.

D. Protect painted coatings and hot-dip galvanized finishes from damage due to metal banding and rough handling. Use padded slings and straps.

E. Deliver items to be incorporated into the work of other trades in sufficient time to be checked prior to installation.

F. Store fabricated items in a dry area, not in direct contact with ground.

1.07 FIELD MEASUREMENTS:

A. The Contractor shall verify all dimensions and shall make any field measurements necessary and shall be fully responsible for accuracy and layout of the work.

B. The Contractor shall review the Contract Drawings and any discrepancies shall be reported to the Engineer for clarification prior to starting fabrication.

PART 2 - PRODUCTS

2.01 MISCELLANEOUS METAL SHAPES, CASTINGS, BOLTS AND ACCESSORIES:

A. Structural Steel Shapes:

1.	W Shapes:	ASTM A992, 50 ksi
2.	S, C and MC Shapes:	ASTM A36
3.	L Shapes:	ASTM A36
4.	HSS Square and Rectangular Shapes:	ASTM A500, Grade C, 50 ksi
5.	HSS Round Shapes:	ASTM A500, Grade C, 46 ksi
6.	Pipe Shapes:	ASTM A53, Grade B, 35 ksi

	7.	Plates and Bars:	ASTM A36
	8.	Steel Sheets:	ASTM A366
B.	Stainless Steel Shapes:		
	1.	Exterior and Submerged Uses:	AISI, Type 316
	2.	Industrial Uses:	AISI, Type 316
	3.	Interior and Architectural Uses:	AISI, Type 304
	4.	For Welding:	AISI, Type 304L, Type 316L
	5.	Shapes and Bars	ASTM A276
	6.	Plate, Sheet and Strip	ASTM A240
C.	Aluminum Shapes:		
	1.	Structural Shapes	ASTM B308, Alloy 6061-T6
	2.	Extruded Pipe	ASTM B429, Alloy 6063-T6
	3.	Aluminum Sheet and Plate	ASTM B209, Alloy 6061-T6
D.	High Strength Bolts for Steel Members		ASTM A325/F3125
C.	Steel Washers		ASTM F436
D.	Plain Unhardened Steel Washers:		ASTM F844

E. Anchor Bolts: ASTM F1554, Grade 36 standard headed bolts with heavy hex nuts, Grade A washers, hot-dip galvanized, unless otherwise specified.

F. Stainless Steel Bolts and Nuts: F593 and F594, AISI Type 316

G. Connection Bolts for Wood Members: ASTM A307, galvanized where specified

H. Iron Castings: ASTM A48, Class 35

I. Galvanizing: ASTM A123, Zn w/0.5 percent minimum Ni.

J. Galvanizing, hardware: ASTM A153, Zn w/0.5 percent minimum Ni.

2.02 POST INSTALLED ANCHORS:

A. Mechanical Expansion Type Anchors: Anchors shall be qualified per ICC-ES AC193.

1. Products:

a. Hilti Corporation, Kwik-Bolt TZ

b. Dewalt, Power Stud SD1+ Stud Anchor

c. Simpson Strong Tie, Strong Bolt

2. General:

a. Use Zinc or chromate-plated carbon steel where totally embedded, in interior locations with controlled humidity and other protected locations, unless otherwise specified on Contract Drawings.

b. Use stainless steel in other locations or when attaching aluminum and stainless steel.

c. Do not use expansion anchors in submerged and dynamic load applications.

B. Drop-In Anchors: Anchors shall be qualified per ICC-ES AC01.

1. Products:

a. Hilti Corporation, HDI Drop-In Anchor

b. Dewalt Fasteners, Steel Drop-In

c. Simpson Strong-Tie, Drop-In

2. General:

a. Use Zinc or chromate-plated carbon steel in interior locations with controlled humidity and other protected locations, unless otherwise specified on Contract Drawings.

b. Use stainless steel in other locations or when attaching aluminum and stainless steel.

c. Do not use drop-in anchors in corrosive or humid areas or when subjected to dynamic loads.

C. Sleeve Anchors: Anchors shall be qualified per ICC-ES AC01.

1. Products:

a. Hilti Corporation, HLC Sleeve Anchor

b. Dewalt Fasteners, Lok-Bolt

c. Simpson Strong-Tie, Sleeve-All

2. General:

a. Use Zinc or chromate-plated carbon steel in interior locations with controlled humidity and other protected locations, unless otherwise specified on Contract Drawings.

b. Use stainless steel in other locations or when attaching aluminum and stainless steel. Anchors in submerged locations shall be stainless steel Type 316.

D. Undercut Anchors:

1. Products:

a. Hilti Corporation, HDA Undercut Anchor

b. Dewalt Fasteners, Atomic+ Undercut

c. Simpson Strong-Tie, Type Torq-Cut

2. General:

a. Use Zinc or chromate-plated carbon steel in interior locations with controlled humidity and other protected locations, unless otherwise specified on Contract Drawings.

b. Use stainless steel in other locations or when attaching aluminum and stainless steel.

c. Under cut anchors are not acceptable for use in submerged applications.

E. Adhesive Anchors:

1. Products:

a. Hilti Corporation, HIT-HY 200

b. Dewalt Fasteners, PE1000+ Epoxy Adhesive Anchoring System

c. Simpson Strong Tie, SET-XP Epoxy-Tie or Acrylic-Tie

2. General:

a. Adhesive anchors shall be hot-dipped galvanized.

b. Use stainless steel in other locations or when attaching aluminum and stainless steel. Anchors in submerged locations shall be stainless steel Type 316.

2.03 ANCHOR CHANNEL INSERTS:

A. Make anchor channels from channel profiles with "I" anchors shop welded to back of channels. Furnish anchor channels with head bolts, channels, nuts for a complete installation. Material shall be Stainless Steel Type 304.

2.04 WEDGE INSERTS:

A. Manufacturers:

1. Gateway Building Products

2. Richmond Screw Anchor Company

B. General:

1. Malleable iron casting, 3/4-inch minimum size with minimum combined working load capacity of 1,300 pounds in shear and 1,000 pounds in tension.

2. Stainless Steel bolts and hardware.

2.05 EYE BOLTS:

A. Provide eyebolts of the welded-eye or forged type, carbon steel hot-dipped galvanized steel per ASTM F2329.

B. Provide threaded carbon steel lifting eyes that comply with ASTM A489, Type 1, Style B.

C. Provide threaded alloy steel eyebolts that comply with ASTM F541 and ASME B18.5, Type 1, long length.

2.06 GRATING SUPPORT ANGLES AND FRAMING:

A. Provide stainless steel support angles embedded in concrete. Angles shall be 1/4-inch thick, inside depth of support angle shall equal depth of bearing bar, inside length of support angle leg shall equal depth of grating. Provide 1 inch by 1/4-inch by 8 inches long bent anchor bars or 3/8-inch diameter by 6 inch headed anchor studs welded to backs of angles at 18 inches on center.

B. Provide stainless steel support angles embedded in concrete. Angles shall be equal depth of bearing bar, inside length of support angle leg shall equal depth of grating, but not less

than 1-3/4 inch. Provide long bent anchor bars or headed anchor studs welded to backs of angles as indicated on the Contract Drawings.

C. For fiberglass reinforced plastic grating provide supports and framing in accordance with Section 06 60 10.

2.07 METAL FRAMES:

A. Provide door, hatch, and grille frames, and other frames fabricated from structural shapes, as indicated on the Contract Drawings.

B. Fabricate frames from rolled steel sections or rolled steel sections and steel plates. Select sections for trueness of web and flange. Straighten members so finished frames are uniform, square, and true throughout length and depth of assembled units.

C. Connect built-up members of frames by plug welding. Miter or cope and join members with continuous welding beads. Provide temporary spreader bars to prevent springing frames out of shape prior to and during erection.

2.08 STRAP ANCHORS AND STUD ANCHORS:

A. Provide anchors for frames, curbs, sills, and other metal fabrications anchored into concrete or masonry. Fabricate anchors from strap iron, bent to shape, or of weldable studs, welded to backs of members. Where size and spacing not noted, provide 1 inch by 1/4-inch strap anchors or 3/4-inch diameter studs for concrete and 1-1/2 inch by 1/8-inch strap anchors for masonry. Space masonry anchors to fit jointing of adjacent masonry work at 4 feet on center. Space concrete anchors at 3 feet on center.

B. Where anchors and plates or clips are to be built in for attachment of later Work, provide bolts in plates or clips, welded to back, with threaded ends extended.

C. For attaching Work to concrete where anchors or inserts cannot be built in, provide concrete anchors or machine bolts and screws.

2.09 NEOPRENE GASKET:

A. Provide soft, closed-cell neoprene gasket material suitable for exposure to sewage and sewage gases conforming to ASTM D1056, Type 2, Class C, and Grade 1.

B. Unless otherwise shown on Contract Drawings, provide neoprene gaskets with a minimum thickness of 1/4-inch.

C. Furnish neoprene gaskets without skin coat.

2.10 MAINTENANCE HOLE COVERS AND FRAMES:

A. Manufacturers:

1. Neenah Foundry Inc.

2. Campbell

B. General:

1. Assemblies shall be of dimension and type as shown on Contract Drawings.

2.11 STEEL BOLLARDS:

A. Galvanized steel pipe bollards shall be fabricated to dimensions and details shown in Contract Drawings. Fabricated bollards from 6 inch nominal outside diameter pipe.

2.12 PRESSURE RELIEF VALVES:

A. Wall Type Pressure Relief Valves:

1. Manufacturers:

a. Trumbull Industries, Inc..; QuadroSeal Hydrostatic Tank Pressure Relief Valves

b. Clow Valve Co.; Type F-1494

c. Neenah Foundry, Inc.; Type R-5002

2. General:

a. Valves shall have a removable strainer retained in the valve.

b. Valves shall be furnished with rubber or neoprene seats and stainless steel or brass pins.

c. Valves shall be flanged and gasketed for connection to ductile iron wall pipe or fittings.

B. Floor Type Pressure Relief Valves: (Not Used in Contract)

1. Manufacturers:

a. Clow Valve Co.; Type F-1493

b. Neenah Foundry, Inc.; Type R-5000

2. General:

a. Shall be furnished with lead, rubber or neoprene seats.

C. Provide 4 inch cast-iron or stainless steel or ductile iron pressure relief valves as shown on Contract Drawings.

2.13 STOP PLANK GROOVES:

A. Manufacturers:

1. Neenah Foundry Inc., Type R-7500 Type A

B. Cast iron or ductile iron stop plank grooves.

2.14 MANUAL BAR SCREEN:

A. General:

1. Manual bar screen shall be 316 stainless steel firmly fastened to the manual bar screen channel using 316 stainless steel hardware as indicated on the contract drawings.

2.15 FABRICATION:

A. Connections and Workmanship:

1. Fabricate details and connection assemblies in accordance with Contract Drawings and Specifications, with projecting corners clipped and filler pieces welded flush.

2. Fit work together in fabrication shop and deliver complete or in parts, ready to be set in-place or assembled in field.

3. Provide work true to detail; with clean, straight, sharply defined profiles and smooth surfaces of uniform color and texture free from defects impairing strength or durability.

4. Provide clips, lugs, brackets, straps, plates, bolts, nuts, washers, and similar items, as required for fabrication and erection.

5. Provide castings of uniform quality, free from blowholes, porosity, hard spots, shrinkage distortion; smooth and well cleaned by shot blasting.

6. Welding:

a. Provide rigid and continuous welds or spot welded as specified and as shown on Contract Drawing. Dress the face of welds flush and smooth. Close fit exposed joints and locate where least conspicuous.

b. Weld aluminum work on the unexposed side when possible in order to prevent pitting or discoloration.

c. Weld aluminum in compliance with the latest edition of AWS D1.2. Support and clamp component parts of built-up members in proper position for welding.

d. Weld shop connections and bolt or field weld connections, unless otherwise specified.

e. Grind exposed edges of welds to 1/8-inch minimum radius. Grind burrs, jagged edges, and surface defects smooth.

f. Prepare welds and adjacent areas so there is:

(1) No undercutting or reverse ridges on weld bead.

(2) No weld spatter on or adjacent to weld or other area to be painted or coated.

(3) No sharp peaks or ridges along weld bead.

7. Bolting:

a. Use bolts of lengths required so bolts do not project more than 1/4-inch beyond face of nut. Do not use washers unless specified. Provide hexagonal head bolts with hexagonal nuts.

b. Provide holes required for connection of adjacent or adjoining work wherever noted on Drawings. Locate holes for bolting equipment to supports to tolerance of +/- 1/16-inch of dimensions indicated.

B. Galvanizing:

1. Galvanize after fabrication by hot-dipped process conforming with ASTM A123.

2. Ship and handle in manner to avoid damage to zinc coating.

C. Painting of aluminum in contact with concrete:

1. Coat areas of aluminum fabrications in contact with concrete with high solids epoxy or phenolic epoxy having a minimum volume solids of 80 percent (ASTM D2697). Maximum thickness of an individual coating shall not exceed the manufacturer's recommendation.

2. Manufacturers:

a. PPG, Amerlock 400 or 400VOC

b. PPG, PITT-GUARD® Direct-to-Rust Epoxy Mastic Coating 97-145 series

c. Tnemec, Chembuild Series 135

PART 3 - EXECUTION

3.01 EXAMINATION:

A. Upon receipt of material at job site, inspect all materials for shipping damage. Replace damaged items at no cost to Owner.

B. Examine supports for size, layout and alignment.

C. Correct defects considered detrimental to proper installation.

3.02 INSTALLATION:

A. Provide items such as bolts, shims, blocks, nuts, washers, and wedging pieces to complete installation.

B. Erect to lines and levels, plumb and true, and in correct relation to adjoining Work. Secure parts using concealed connections when practicable.

C. Plumb and true vertical members to tolerance of +/- 1/8 inch in 10 feet. Level horizontal members to tolerance of +/- 1/8 inch in 10 feet.

D. Use steel bolts to connect structural steel members. Use stainless steel bolts to connect structural aluminum members.

E. Anchor Bolts and Concrete Anchors:

1. Preset anchor bolts using templates. Do not use concrete anchors in place of anchor bolts.

2. After anchor bolts are embedded, protect projecting threads by applying grease and having the nuts installed until the time of installation of equipment or metalwork.

3. Do not install concrete anchors until concrete has reached specified minimum compressive strength.

4. Install concrete anchors in accordance with anchor manufacturer recommendation. Embedment depth of anchor shall be as recommended by the anchor manufacturer, but not less than as shown on Contract Drawings.

5. Locate concrete anchors to clear reinforcing bars in concrete.

F. Weld headed anchor studs in accordance with manufacturer's recommendations.

G. Do not place new holes or enlarge unfair holes by use of cutting torch.

3.03 PAINTING, REPAIR, AND PROTECTION:

A. Prepare surface of aluminum in contact with concrete.

1. Prepare aluminum surface by solvent or steam cleaning per SSPC SP-1; do not use alkali cleaning. Then dust blast.

2. Paint aluminum in contact with concrete with three or more coats of high solids epoxy or phenolic epoxy. Under no circumstances shall aluminum contact dissimilar metal.

B. Under no circumstances shall aluminum contact dissimilar metal.

C. Between aluminum grating, aluminum stair treads, or aluminum handrail brackets and steel supports, insert 1/4-inch thick neoprene isolator pads, 85 +/- 5 Shore A durometer, sized for full width and length of bracket or support.

D. Apply an anti-seize compound on all stainless steel fasteners to prevent galling.

E. Field Repair of Damaged Galvanized Coatings:

1. Clean and repair Zinc coating that has been burned by welding, abraded, or otherwise damaged after installation. Clean damage area by wire brushing and removing all traces of welding flux and loose or cracked zinc coating.

2. Coat surfaces using zinc-rich paint.

F. Field repair of damaged primer.

1. Touch up abrasions in the shop primer immediately after erection. Paint areas left unprimed for welding with primer after welding.

3.04 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 05 53 00

METAL GRATING, COVER PLATES, AND ACCESS HATCHES

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide metal grating, cover plates and access hatches as indicated and in compliance with Contract Documents.

B. This section includes:

1. Aluminum Bar Grating

2. Steel Grating

3. Aluminum Cover Plates

4. Stainless Steel Cover Plates

5. Stainless Steel Floor Access Hatches

C. Furnish all labor, materials, equipment and incidentals necessary to install the products specified.

1.02 REFERENCES:

A. ASTM International (ASTM):

1. A6: General Requirements for Rolled Structural Steel Bars, Plates, Shapes and Sheet Piling.

2. A36: Standard Specification for Carbon Structural Steel.

D. Aluminum Association:

1. Aluminum Association Designation System for Aluminum Finishes

2. AAMA 607.1: Voluntary Guide Specification and Inspection Methods for Clear Anodic Finishes for Architectural Aluminum

1.03 DESIGN CRITERIA:

A. Grating and Cover Plates:

1. Provide grating and cover plates of minimum depth shown on contract drawings, not exceeding manufacturer's maximum recommended span, and meeting the following load and deflection criteria.

a. 100 psf uniform live load or 300 pounds concentrated live load, whichever produces maximum stress

b. L/360 maximum deflection under uniform live load of 100 psf

B. 12,000 psi maximum flexural stress

C. Heavy Duty Grating

1. Provide grating meeting AASHTO HS 20 loads.

1.04 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

1. Detail shop drawings indicating:

a. Dimensions.

b. Sectional assembly.

c. Location and identification mark.

d. Connections and fastening methods.

e. Size and location of supporting frames required.

f. Materials of construction.

g. Installation instructions.

2. Catalog data and design tables showing limits for span length and deflection under load.

1.05 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.06 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

B. Obtain field measurements prior to preparation of shop drawings and fabrication.

C. Steel:

1. Conform to codes for arc and gas welding in building construction of AWS and to AISC Specifications. Prepare surfaces to be welded according to requirements of AWS D1.1. No welding shall be done when base metal lower than 0 degrees F.

2. Qualify welding operators in accordance with AWS D1.1.

D. Aluminum:

1. Weld with gas metal arc (GMA) or gas tungsten arc (GTA) processes in accordance with manufacturer's recommendations as accepted and in accordance with recommendations of AWS D1.2.

1.07 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

B. Store to avoid damage.

C. Remove material that has become damaged as to be unfit for use.

D. Identify and match-mark all materials, items, and fabrications for installation and field assembly.

1.08 FIELD MEASUREMENTS:

A. Verify dimensions and make any field measurements necessary and be fully responsible for accuracy and layout of the work.

B. Review the Contract Drawings and report any discrepancies to the Engineer for clarification prior to starting fabrication.

PART 2 - PRODUCTS

2.01 STEEL GRATING:

A. Manufacturers:

1. IKG Borden Metal Products Co.; Type B or W/B.

2. Ohio Gratings, Inc.; Type DT or SGCS Series.

B. Provide steel grating material conforming to ASTM A36.

C. Provide grating size as indicated on the Contract Drawings.

D. Fabricate in standard size sections where possible with a maximum panel weight of no more than 80 pounds.

E. Apply bearing bar banding at ends of grating sections and at fixture or pipe openings where two or more bearing bars are cut.

F. Anchor grating to support members using stainless steel saddle clips.

G. Exterior grating shall be serrated. Provide interior surface with mill finish.

H. Hot dip galvanize steel grating after fabrication in accordance with ASTM A123.

2.02 ALUMINUM BAR GRATING:

A. Manufacturers:

1. IKG Borden Metal Products Co.; Type S/B or B/F.

2. Ohio Gratings, Inc.; Type SG or ADT Series.

3. McNichols Co.; GAL or GAA and GBB Series.

B. Provide aluminum alloy 6063-T6 grating material.

C. Provide grating as indicated on the Contract Drawings.

D. Fabricate in standard size sections where possible with a maximum panel weight of no more than 80 pounds.

E. Apply bearing bar banding at ends of grating sections and at fixture or pipe openings where two or more bearing bars are cut.

F. Anchor grating to support members using stainless steel saddle clips.

G. Exterior grating shall be serrated. Provide interior surface with mill finish.

2.03 ALUMINUM COVER PLATE:

A. Provide floor checkered plates conforming to the following aluminum alloys and tempers with a mill finish:

1. Angles

a. Extruded: AA 6063-T5

b. Structural: AA 6061-T6

2. Checkered Plate: AA 6061-T6

3. Anchors Bolts, Washers, and Nuts: Stainless Steel Type 316

B. General:

1. Fabricate with a maximum panel weight of no more than 80 pounds.

2. Provide flush type lifting handles for all section of checkered plates.

3. Provide a raised pattern, non-skid surface.

4. See drawings for stiffener spacing.

5. Thickness as shown on contract drawings.

C. Furnish fixed cover checkered plates complete with frames, anchors, lifting handles and stainless steel flush head screw fastenings.

D. Furnish hinged checkered plate covers complete with frames, anchors, lifting handles and heavy duty hinges. Provide a minimum of two hinges of Type 316L stainless steel, with stainless steel pins and fastenings for each checkered plate section.

2.04 STAINLESS STEEL COVER PLATE:

A. Provide floor checkered plates conforming to the following material properties:

1. Angles: AISI, Type 304 or 316, per Contract Drawings

2. Plate: ASTM A240 Type 316L

3. Anchors Bolts, Washers, and Nuts: Stainless Steel Type 316

B. General:

1. Fabricate with a maximum panel weight of no more than 80 pounds.

2. Provide flush type lifting handles for all section of checkered plates.

3. Provide a raised pattern, non-skid surface.

4. See drawings for stiffener spacing.

5. Thickness as shown on contract drawings.

C. Furnish fixed cover checkered plates complete with frames, anchors, lifting handles and stainless steel flush head screw fastenings.

D. Furnish hinged checkered plate covers complete with frames, anchors, lifting handles and heavy duty hinges. Provide a minimum of two hinges of Type 316L stainless steel, with stainless steel pins and fastenings for each checkered plate section.

2.05 FLOOR ACCESS HATCHES:

A. Manufacturers of Prefabricated Floor Access Hatches:

1. Bilco Company, Type J series

2. Halliday

3. Thompson Fabrication Company

B. Component Fabrication:

1. Provide 316 stainless steel access hatches and frames of type and size as shown on Drawings.

2. Where hatches are noted with drainage channel, drainage channel frame shall be 1/4-inch 316 stainless steel thick trough frame with continuous anchor flange around perimeter. Weld 1-1/2 inch diameter drain coupling to frame trough unless indicated otherwise on Drawings.

3. Where hatches are noted without drainage channel provide 1/4-inch thick minimum 316 stainless steel hatch frame with strap anchors or continuous anchors around frame.

4. Door leaves: 1/4-inch 316 stainless steel diamond plate with reinforcing on underside for live load. Provide stainless steel safety chain and attachments for end of double-leaf door assembly when open.

5. Door Hardware:

a. Equip doors with heavy stainless steel hinges with stainless steel pins. Hinges shall be through bolted to cover and frame with stainless steel bolts.

b. Equip doors with fully enclosed 316 stainless steel compression springs and hold - open arm with positive locking device with conveniently positioned release handle for easy and controlled closing.

c. Hardware shall be Type 316 stainless steel.

d. Stainless steel snap lock mounted on bottom of door leaf with a removable topside handle and socket recessed in cover.

e. Hinged hasp on exterior door surface.

f. Cylinder lock with keyway protected by a threaded cover plug.

6. Manufacturer shall warranty in writing against defects in materials or workmanship for five years.

7. Fall Protection Safety Grate:

   a. Color shall be safety orange.

   b. Provide torsion rod lift assistance for ease of operation.

   c. Provide a stainless steel hold open arm to automatically lock the panel in the fully open 90 degree position.

   d. Provide a stainless steel release handle for closing the grating panel with a provision for locking the panel to prevent unauthorized access.

   e. All other hardware shall be Type 316 stainless steel.

PART 3 - EXECUTION

3.01 EXAMINATION:

A. Upon receipt of material at job site, inspect all materials for shipping damage. Damaged items shall be replaced at no cost to Owner.

B. Examine supports for size, layout and alignment. Surface shall be free of debris.

C. Correct defects considered detrimental to proper installation.

3.02 PROTECTION:

A. Protect aluminum from contact with dissimilar metals or concrete. Under no circumstances shall aluminum directly contact concrete or dissimilar metal.

B. Apply one coat of bituminous paint coating.

C. Before coating application, clean contact surfaces, remove dirt, grease, oil, foreign substances, followed by immersing in, or wipe thoroughly with, an acceptable solvent. Rinse with clean hot water and dry thoroughly.

3.03 INSTALLATION:

A. Install and make connections in accordance with accepted submittals and manufacturer's written instructions.

B. Install materials accurately in location and elevation, level and plumb. Field fabricate as necessary for accurate fit.

C. Coordinate and furnish anchorages, including concrete inserts, sleeves, anchor bolts, and miscellaneous items having integral anchors that are to be embedded in concrete or masonry construction.

3.04 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

DIVISION 06

WOODS, PLASTICS, AND COMPOSITES

Page Intentionally Left Blank

SECTION 06 10 00

ROUGH CARPENTRY

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide materials to perform the rough carpentry work as indicated and in compliance with Contract Documents.

1. Section Includes:

a. Wood blocking and nailers

b. Plywood backing panels for telephone and electrical back boards

c. Wood blocking for support of toilet and bath accessories

1.02 REFERENCES:

A. American Society of Mechanical Engineers (ASME):

1. B18.2.1: Square and Hex Bolts and Screws (Inch Series)

2. B18.6.1: Wood Screws (Inch Series)

17. F594: Specification for Stainless Steel Nuts

18. F738M: Standard Specification for Stainless Steel Metric Bolts, Screws, and Studs

19. F836M: Standard Specification for Style 1 Stainless Steel Metric Nuts

20. F1667: Specification for Driven Fasteners: Nails, Spikes, and Staples

C. American Wood Preserver's Association Standard (AWPA):

1. M4: Standard for the Care of Preservative Treated Wood Products

2. U1: User Specification for Treated Wood

D. California Department of Public Health (CDPH)

1. Standard Method for the Testing and Evaluation of Volatile Organic Chemical Emissions from Indoor Sources using Environmental Chambers

1.03 DEFINITIONS:

A. Exposed Framing: Framing not concealed by other construction.

B. Dimension Lumber: Lumber of 2 inches nominal or greater but less than 5 inches nominal in least dimension.

C. Lumber grading agencies, and the abbreviations used to reference them, include the following:

1. NeLMA: Northeastern Lumber Manufacturers' Association

2. NLGA: National Lumber Grades Authority

3. RIS: Redwood Inspection Service

4. SPIB: The Southern Pine Inspection Bureau

5. WCLIB: West Coast Lumber Inspection Bureau

6. WWPA: Western Wood Products Association

1.04 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

1. For fire-retardant treatments, include physical properties of treated lumber both before and after exposure to elevated temperatures, based on testing by a qualified independent testing agency according to ASTM D5664.

2. For products receiving a waterborne treatment, include statement that moisture content of treated materials was reduced to levels specified before shipment to Project site.

3. Include copies of warranties from chemical treatment manufacturers for each type of treatment.

B. Material Certificates: For dimension lumber specified to comply with minimum allowable unit stresses. Indicate species and grade selected for each use and design values approved by the ALSC Board of Review.

C. Evaluation Reports: For the following, from ICC-ES:

1. Wood-preservative-treated wood

2. Fire-retardant-treated wood

3. Power-driven fasteners

4. Powder-actuated fasteners

5. Expansion anchors

1.05 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

B. Testing Agency Qualifications: For testing agency providing classification marking for fire-retardant treated material, an inspection agency acceptable to authorities having jurisdiction that periodically performs inspections to verify that the material bearing the classification marking is representative of the material tested.

1.06 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

B. Stack lumber flat with spacers beneath and between each bundle to provide air circulation. Protect lumber from weather by covering with waterproof sheeting, securely anchored. Provide for air circulation around stacks and under coverings.

PART 2 - PRODUCTS

2.01 WOOD PRODUCTS, GENERAL:

A. Certified Wood: Materials shall be produced from wood obtained from forests certified by an FSC-accredited certification body to comply with FSC STD-01-001, "FSC Principles and Criteria for Forest Stewardship for the following:

1. Miscellaneous lumber

B. Lumber: DOC PS 20 and applicable rules of grading agencies indicated. If no grading agency is indicated, provide lumber that complies with the applicable rules of any rules-writing agency certified by the ALSC Board of Review. Provide lumber graded by an agency certified by the ALSC Board of Review to inspect and grade lumber under the rules indicated.

1. Factory mark each piece of lumber with grade stamp of grading agency.

2. Provide dressed lumber, S4S, unless otherwise indicated.

C. Maximum Moisture Content of Lumber: 15 percent for 2-inch nominal thickness or less, 19 percent for more than 2-inch nominal thickness unless otherwise indicated.

2.02 WOOD-PRESERVATIVE-TREATED LUMBER:

A. Preservative Treatment by Pressure Process: AWPA U1; Use Category UC2 for interior construction not in contact with the ground, Use Category UC3b for exterior construction not in contact with the ground, and Use Category UC4a for items in contact with the ground.

1. Preservative Chemicals: Acceptable to authorities having jurisdiction and containing no arsenic or chromium. Do not use inorganic boron (SBX) for sill plates.

B. Kiln-dry lumber after treatment to a maximum moisture content of 19 percent. Do not use material that is warped or that does not comply with requirements for untreated material.

C. Mark lumber with treatment quality mark of an inspection agency approved by the ALSC Board of Review.

D. Application: Treat items indicated on Drawings, and the following:

1. Wood cants, nailers, curbs, equipment support bases, blocking, stripping, and similar members in connection with roofing, flashing, vapor barriers, and waterproofing.

2. Wood sills, sleepers, blocking, furring, stripping and similar concealed members in contact with masonry or concrete.

2.03 MISCELLANEOUS LUMBER:

A. General: Provide miscellaneous lumber indicated and lumber for support or attachment of other construction, including the following:

1. Blocking

2. Nailers

3. Rooftop equipment bases and support curbs

4. Cants

5. Furring

6. Grounds

7. Utility shelving

B. For concealed boards, provide lumber with 15 percent maximum moisture content any of the following species and grades:

1. Mixed southern pine; No. 2 grade; SPIB.

2. Hem-fir or hem-fir (north); Construction or No. 2 Common grade; NLGA, WCLIB, or WWPA.

3. Spruce-pine-fir (south) or spruce-pine-fir; Construction or No. 2 Common

4. Western woods; Construction or No. 2 Common grade; WCLIB or WWPA.

C. For blocking not used for attachment of other construction, Utility, Stud, or No. 3 grade lumber of any species may be used provided that it is cut and selected to eliminate defects that will interfere with its attachment and purpose.

D. For blocking and nailers used for attachment of other construction, select and cut lumber to eliminate knots and other defects that will interfere with attachment of other work.

E. For furring strips for installing plywood or hardboard paneling, select boards with no knots capable of producing bent-over nails and damage to paneling.

2.04 PLYWOOD BACKING PANELS:

A. Equipment Backing Panels: DOC PS 1, Exterior, AC in thickness indicated or, if not indicated, not less than 3/4-inch nominal thickness.

1. Plywood shall comply with the testing and product requirements of the California Department of Health Services' "Standard Practice for the Testing of Volatile Organic Emissions from Various Sources Using Small-Scale Environmental Chambers."

2.05 FASTENERS:

A. General: Provide fasteners of size and type indicated that comply with requirements specified in this article for material and manufacture.

1. Where rough carpentry is exposed to weather, in ground contact, pressure-preservative treated, or in area of high relative humidity, provide fasteners with hot-dip zinc coating complying with ASTM A153

B. Nails, Brads, and Staples: ASTM F1667

C. Power-Driven Fasteners: NES NER-272

D. Wood Screws: ASME B18.6.1

E. Lag Bolts: ASME B18.2.1

F. Bolts: Steel bolts complying with ASTM A307, Grade A; with ASTM A563 hex nuts and, where indicated, flat washers.

G. Expansion Anchors: Anchor bolt and sleeve assembly of material indicated below with capability to sustain, without failure, a load equal to six times the load imposed when installed in unit masonry assemblies and equal to four times the load imposed when installed in concrete as determined by testing per ASTM E488 conducted by a qualified independent testing and inspecting agency.

H. Material: Carbon-steel components, zinc plated to comply with ASTM B633, Class Fe/Zn 5.

1. Material: Stainless steel with bolts and nuts complying with ASTM F593 and ASTM F594, Alloy Group 1 or 2.

I. Hemmed edges

2.06 MISCELLANEOUS MATERIALS:

A. Flexible Flashing: Composite, self-adhesive, flashing product consisting of a pliable, butyl rubber compound, bonded to a high-density polyethylene film, aluminum foil, or spunbonded polyolefin to produce an overall thickness of not less than 0.025 inch.

B. Adhesives for Gluing to Concrete or Masonry: Formulation complying with ASTM D3498 that is approved for use indicated by adhesive manufacturer.

C. Water-Repellent Preservative: NWWDA-tested and -accepted formulation containing 3-iodo-2-propynyl butyl carbamate, combined with an insecticide containing chloropyrifos as its active ingredient.

PART 3 - EXECUTION

3.01 INSTALLATION, GENERAL:

A. Set rough carpentry to required levels and lines, with members plumb, true to line, cut, and fitted. Fit rough carpentry to other construction; scribe and cope as needed for accurate fit. Locate nailers, blocking, and similar supports to comply with requirements for attaching other construction.

B. Install plywood backing panels by fastening to studs; coordinate locations with utilities requiring backing panels.

C. Install sill sealer gasket to form continuous seal between sill plates and foundation walls.

D. Do not splice structural members between supports unless otherwise indicated.

E. Provide blocking as indicated and as required to support facing materials, fixtures, specialty items, and trim.

F. Sort and select lumber so that natural characteristics will not interfere with installation or with fastening other materials to lumber. Do not use materials with defects that interfere with function of member or pieces that are too small to use with minimum number of joints or optimum joint arrangement.

G. Comply with AWPA M4 for applying field treatment to cut surfaces of preservative-treated lumber.

1. Use inorganic boron for items that are continuously protected from liquid water.

2. Use copper naphthenate for items not continuously protected from liquid water.

H. Securely attach rough carpentry work to substrate by anchoring and fastening as indicated, complying with the following:

1. NES NER-272 for power-driven fasteners.

2. Table 2304.9.1, "Fastening Schedule," in ICC's International Building Code.

3. Table R602.3(1), "Fastener Schedule for Structural Members," and Table R602.3(2), "Alternate Attachments," in ICC's International Residential Code for One- and Two-Family Dwellings.

I. Use steel common nails unless otherwise indicated. Select fasteners of size that will not fully penetrate members where opposite side will be exposed to view or will receive finish materials. Make tight connections between members. Install fasteners without splitting wood. Drive nails snug but do not countersink nail heads unless otherwise indicated.

J. For exposed work, arrange fasteners in straight rows parallel with edges of members, with fasteners evenly spaced, and with adjacent rows staggered.

1. Comply with accepted fastener patterns where applicable

2. Use common nails unless otherwise indicated. Drive nails snug but do not countersink nail heads.

3.02 WOOD BLOCKING, AND NAILER INSTALLATION:

A. Install where indicated and where required for attaching other work. Form to shapes indicated and cut as required for true line and level of attached work. Coordinate locations with other work involved.

B. Attach items to substrates to support applied loading. Recess bolts and nuts flush with surfaces unless otherwise indicated.

C. Where wood-preservative-treated lumber is installed adjacent to metal decking, install continuous flexible flashing separator between wood and metal decking.

D. Provide permanent grounds of dressed, pressure-preservative-treated, key-beveled lumber not less than 1-1/2 inches wide and of thickness required to bring face of ground to exact thickness of finish material. Remove temporary grounds when no longer required.

3.03 PROTECTION:

A. Protect wood that has been treated with inorganic boron (SBX) from weather. If, despite protection, inorganic boron-treated wood becomes wet, apply EPA-registered borate treatment. Apply borate solution by spraying to comply with EPA-registered label.

3.04 CONTRACT CLOSEOUT:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

Page Intentionally Left Blank

SECTION 06 60 10

FIBERGLASS REINFORCED PRODUCTS AND FABRICATIONS

PART 1 - GENERAL

1.01 DESCRIPTION:

A. This section includes:

1. FRP Grating

2. FRP Structural Shapes

3. FRP Railing

B. Furnish all labor, materials, equipment and incidentals necessary to install the fiberglass polymer products as indicated and in compliance with Contract Documents.

1.02 REFERENCES:

A. ASTM International (ASTM):

1. D70: Standard Test Method for Density of Semi-Solid Bituminous Materials (Pycnometer Method).

2. D256: Standard Test Methods for Determining the Izod Pendulum Impact Resistance of Plastics.

3. D635: Standard Test Method for Rate of Burning and/or Extent and Time of Burning of Plastics in a Horizontal Position.

4. D638: Standard Test Method for Tensile Properties of Plastics.

5. D695: Standard Test Method for Compressive Properties of Rigid Plastics.

6. D696: Standard Test Method for Coefficient of Linear Thermal Expansion of Plastics Between-30 Degree C and 30 Degree C with a Vitreous Silica Dilatometer.

7. D732: Standard Test Method for Shear Strength of Plastics by Punch Tool.

8. D790: Standard Test Methods for Flexural Properties of Unreinforced and Reinforced Plastics and Electrical Insulating Materials.

9. D792: Standard Test Methods for Density and Specific Gravity (Relative Density) of Plastics by Displacement.

10. D2583: Standard Test Method for Indentation Hardness of Rigid Plastics by Means of a Barcol Impressor.

11. D3918: Standard Terminology Relating to Reinforced Plastic Pultruded Products.

12. E84: Standard Test Method for Surface Burning Characteristics of Building Materials.

13. G152: Standard Practice for Operating Open Flame Carbon Arc Light Apparatus for Exposure of Nonmetallic Materials

14. G153: Standard Practice for Operating Enclosed Carbon Arc Light Apparatus for Exposure of Nonmetallic Materials

1.03 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

1. Detail shop drawings indicating:

a. Dimensions

b. Sectional assembly

c. Location and identification mark

d. Connections, connections to structure and fastening methods

e. Size and location of supporting frames required

f. Materials of construction

g. Installation instructions

2. Catalog data and design tables showing limits for span length and deflection under various and concentrated loads.

3. Comprehensive calculations showing the codes or standards used, loads considered, member stresses, and associated deflections. Calculations shall be signed and sealed by a Professional Structural Engineer registered in Utah.

4. Stamped by Professional Structural Engineer registered in Utah.

1.04 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

B. Product Data for Credits MR 4.1 and Credit MR 4.2: For products having recycled content, provide documentation indicating percentages (by weight) of post-consumer and pre-consumer recycled content.

1. For each recycled product used, include a statement indicating costs.

C. Product Certificates for Credit MR 5.1: For products extracted, harvested and manufactured within 500 miles of the project site, provide documentation indicating percentages (by weight) of regional materials that meet the criteria.

1. For each regional product used, include a statement indicating costs.

1.05 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

B. Furnish material from an ISO-9001 certified manufacturer of proven ability who has regularly engaged in the manufacture and installation of FRP systems.

C. Provide documentation showing that the Contractor doing this work has a minimum of 5 years' experience in the manufacture and installation of FRP systems similar to that indicated for this project, with sufficient capacity to produce required units without causing delay of work.

D. Install materials in accordance with the manufacturer's instructions.

1.06 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

B. Store materials during and after shipment to prevent cracking, twisting, bending, breaking, chipping or damage of any kind to materials, including damage due to over exposure to sun.

C. Remove material that is damaged from the site, at no cost to the Owner.

D. Identify and match-mark all materials, items, and fabrications for installation and field assembly.

PART 2 - PRODUCTS

2.01 MANUFACTURERS:

A. Seasafe, Inc.

B. Strongwell

C. IMCO Reinforced Plastics, Inc.

D. International Grating, Inc.

E. Fibergrate Composite Structures, Inc.

F. If the Contractor chooses to substitute equipment other than a named manufacturer, any additional costs required to accommodate such equipment shall be made without a change in the Contract Price or Contract Time and at no additional cost to the Owner.

2.02 GENERAL:

A. Provide new materials free from defects and imperfections that might affect performance of finished product.

B. After fabrication, seal cut ends, holes and abrasions of FRP shapes with a compatible resin coating to prevent intrusion of corrosion and moisture.

C. Fabricate so that exposed surfaces are smooth and true to form.

D. Manufacture FRP products using vinyl ester resin with flame retardant and UV inhibitor additives. Provide synthetic surface veil covering exterior surface. Provide FRP shapes with flame spread of 25 or less in accordance with ASTM E84.

E. Provide FRP products exposed to weather with ultraviolet inhibitor and one mil thick UV coating to shield from ultra-violet light.

F. Provide Type 316L stainless steel metal accessories unless noted otherwise. Provide concrete anchors that comply with Section 05 50 00.

2.03 FRP GRATING:

A. Design Requirements:

1. Grating:

a. Design grating and support system to sustain dead loads and superimposed live loads.

b. 100 psf uniform live load or 300 pound concentrated live load, whichever produces maximum stress.

B. Fabricate grating from pultruded bearing bars and cross rods. Assemble grating using a locking cross-rod design that makes a permanent connection between the cross-rod and bearing bar, and is completely bond into a one-piece panel.

C. Color shall be gray.

D. Provide grating with a slip resistant epoxy grit surface.

E. Use Type 316L stainless steel grating hold down clamps spaced as required by manufacturer, but not greater than 4 feet on center. Provide two at each support with a minimum of four per panel.

F. Position grating sections flat and square with ends bearing minimum 1-1/4 inches on supporting structure.

G. Provide embedded angle support frames with continuous integral anchor for grating set in concrete openings unless noted otherwise.

H. Maximum Grating Clearances:

1. 1/4-inches from vertical steel sections

2. 1/2-inches from concrete and masonry walls

3. 1/4-inches between sections and at ends

2.04 STRUCTURAL SHAPES:

A. Design requirements:

1. Design Loads:

a. Design structural framing to sustain dead loads and superimposed live loads.

b. 100 psf uniform live load or 300 pound concentrated live load, whichever produces maximum stress.

2. Deflection:

a. Span: L/240 maximum

B. Manufacture structural shapes by the pultrusion process.

C. Provide structural shapes with a UV inhibitor.

D. Provide structural shapes containing a glass fiber reinforced polyester ester resin matrix, approximately 50 percent glass by weight with a synthetic surface veil outer layer covering the exterior surfaces. Provide glass strand rovings shall be for longitudinal strength. Provide continuous strand glass mats or stitched reinforcements shall for transverse strength.

E. Provide Type 316L stainless steel bolts and washers.

F. Abrade joint surfaces to be bonded to remove surface gloss and be free of burrs or other foreign materials that would prevent proper adhesion.

2.05 RAILING:

A. Design Requirement:

1. Design railing system to meet the configuration and loading requirements of OSHA, IBC or local buildings codes. Apply requirements of the most stringent code.

B. Fully bond all post to rail connections with an epoxy adhesive and with an internal connection for added strength and durability. Provide smooth transitions between post and rail connections.

C. Provide kickplates where required by OSHA. Kick plate shall be 4 inches by 1/2-inch (corrugated) by 1/4-inch thick pultruded shape attached to posts with stainless connectors.

D. Color shall be safety yellow.

E. Fabricate handrail to standard two-rail design unless noted otherwise.

1. Post Locations:

a. No greater than 12 inches from horizontal or vertical change in handrail direction.

b. Post centers shall be no greater than 60 inches apart on any straight run of rail.

c. Post centers shall be no greater than 48 inches apart on inclined rail section.

F. Provide side mounted, base mounted, embedded, or removable anchorage mounted handrail as noted on Drawings.

G. Accurately locate handrail sections and erect plumb and level.

PART 3 - EXECUTION

3.01 EXAMINATION:

A. Remove and replace damaged items at no cost to Owner.

B. Examine supports for size, layout and alignment. Maintain surfaces free of debris.

3.02 INSTALLATION:

A. Install and make connections in accordance with accepted submittals and manufacturer's written instructions.

B. Install materials accurately in location and elevation, level and plumb. Field fabricate as necessary for accurate fit.

C. Coordinate and furnish anchorages, including concrete inserts, sleeves, anchor bolts, and miscellaneous items having integral anchors that are to be embedded in concrete or masonry construction.

3.03 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

Page Intentionally Left Blank

SECTION 06 68 10

POLYETHYLENE BOLLARD COVERS

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide materials and installation of colored polyethylene bollard covers as indicated and in compliance with Contract Documents.

1.02 REFERENCES:

A. American National Standards Institute (ANSI):

2. Z535.1: Safety Colors

1.03 SUBMITTALS:

A. Submit shop drawings in accordance with Section 01 33 00.

1.04 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.05 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

1.06 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

PART 2 - PRODUCTS

2.01 BOLLARD COVERS:

A. Fabricate covers of 1/8-inch-thick high-density polyethylene, with integral UV protection. Color shall be yellow or as noted on the drawings.

1. Product: Seton Bollard Covers

2. Product: Thermoprene “Bollard Gard™”.

2.02 REFLECTIVE TAPE MARKINGS:

A. Provide two 1-inch-wide reflective tapes, located approximately 3.25 and 14.25 inches from the top of the bollard. Tape color shall be red or as noted on the drawings.

1. Products: 3M Reflective Tape

PART 3 - EXECUTION

3.01 INSTALLATION:

A. Place the bollard covers over the bollard posts. Attach per manufacturer's instructions using the gripper tab attachment accessories provided. Apply one row of tabs approximately 6 inches from the top of the bollard and a second row approximately 6 to 12 inches from the base of the bollard. Slide the cover over the bollard. The installation shall be firm and tight.

3.02 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

SECTION 07 21 00

BUILDING INSULATION

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide building insulation as indicated and in compliance with Contract Documents:

1. Section includes:

a. Foam-plastic board insulation

b. Concrete faced board insulation

c. Mineral-Wool insulation

1.02 REFERENCES:

A. ASTM International (ASTM):

1. C1289: Standard Specification for Faced Rigid Cellular Polyisocyanurate Thermal Insulation Board.

2. C518: Standard Test Method for Steady-State Thermal Transmission Properties by Means of the Heat Flow Meter Apparatus

3. C578: Standard Specification for Rigid, Cellular Polystyrene Thermal Insulation

4. C665: Standard Specification for Mineral-Fiber Blanket Thermal Insulation for Light Frame Construction and Manufactured Housing.

5. D696: Standard Test Method for Coefficient of Linear Thermal Expansion of Plastics Between −30°C and 30°C with a Vitreous Silica Dilatometer

6. D1621: Standard Test Method for Compressive Properties of Rigid Cellular Plastics

7. D2842: Standard Test Method for Water Absorption of Rigid Cellular Plastics

8. E84: Standard Test Method for Surface Burning Characteristics of Building Materials.

9. E96: Standard Test Methods for Water Vapor Transmission of Materials

10. E119: Standard Test Methods for Fire Tests of Building Construction and Materials

11. E136: Standard Test Method for Behavior of Materials in a Vertical Tube Furnace at 750 degrees C.

1.03 DEFINITIONS:

A. Thermal Resistivity: Where the thermal resistivity of insulation products is designated by "r values," they represent the reciprocal of thermal conductivity (k values). Thermal conductivity is the rate of heat flow through a homogenous material exactly 1 inch thick. Thermal resistivities are expressed by the temperature difference in degrees F between the two exposed faces required to cause one BTU to flow through one square foot per hour at mean temperatures indicated.

1.04 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

1. Product Data: For each type of product indicated.

2. Product Test Reports: Based on evaluation of comprehensive tests performed by a qualified testing agency, for each product.

3. Research/Evaluation Reports: For foam-plastic insulation, from ICC-ES.

1.05 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

B. Surface-Burning Characteristics: As determined by testing identical products according to ASTM E84 by a qualified testing agency. Identify products with appropriate markings of applicable testing agency.

C. Fire Performance Characteristics: Provide insulation materials that meet the following:

1. Surface Burning Characteristic: ASTM E84.

2. Fire Resistance Ratings: ASTM E119.

3. Combustion Characteristics: ASTM E136.

D. Single Source Responsibility for Insulation Products: Obtain each type of building insulation from a single source with resources to provide products of consistent quality in appearance and physical properties without delaying progress of the Work.

1.06 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.07 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

B. Protect insulation materials from physical damage and from deterioration due to moisture, soiling, and other sources. Store inside and in a dry location. Comply with manufacturer's written instructions for handling, storing, and protecting during installation.

C. Protect foam-plastic board insulation as follows:

1. Do not expose to sunlight except to necessary extent for period of installation and concealment.

2. Protect against ignition at all times. Do not deliver foam-plastic board materials to Project site before installation time.

3. Quickly complete installation and concealment of foam-plastic board insulation in each area of construction.

PART 2 - PRODUCTS

2.01 FOAM-PLASTIC BOARD INSULATION:

A. Extruded-Polystyrene Board Insulation: ASTM C578, of type and minimum compressive strength indicated below, with maximum flame-spread and smoke-developed indexes of 75 and 450, respectively, per ASTM E84.

1. Manufacturers:

a. DiversiFoam Products.

b. Dow Chemical Company (The).

c. Owens Corning.

d. Pactiv Building Products.

B. Adhesive for Bonding Insulation: Provide manufacturers recommended product with demonstrated capability to bond insulation securely to substrates without damaging insulation and substrates.

2.02 CONCRETE FACED INSULATION BOARD:

A. Extruded Polystyrene board, ASTM C 578, Type IV, rigid, closed cell, with integral high density 5/16-inch thick latex modified concrete facing.

1. Board Size: 2-feet by 4-feet by 2 5/16-inches.

2. Edges: tongue and groove sides, square edge ends.

3. Maximum Use Temperature: 165 degrees F

4. Thermal resistance (ASTM C 518): Long term aged R-value of 5 per-inch.

5. Foam Compression Strength: ASTM D1621, minimum: 35 psi.

6. Compressive Strength: ASTM D 1621, minimum 40 psi.

7. Water Absorption: ASTM D 2842, <0.1 (0.7% by volume maximum).

8. Water Vapor Permeance: ASTM E 96, 0.8 (50 ng/Pas M)

9. Coefficient of lineal Thermal Expansion: ASTM D 696, in/in x degrees F: 3.5 x 10-5 (6.3 x 10-2).

B. Manufacturers:

a. T. Clear/FinPan: WallGUARD.

b. Tech-Crete Processors Ltd.: CFI Insulated Wall Panels

C. Concrete Faced Insulation Accessories:

1. Provide manufacturers recommended accessories as required for installation and to protect any exposed edges from UV exposure.

2. Metal cap flashing: 24-gauge galvanized steel J-channel; 2 1/4 -inches wide, 4-inches short leg; prefinished in color as selected.

3. Clips and fasteners: Corrosion resistant type, sized to suit application.

2.03 UNFACED MINERAL-WOOL BATT INSULATION

A. Manufacturers:

1. Fibrex Insulations Inc.

2. Owens Corning.

3. Roxul Inc.

4. Thermafiber.

B. Unfaced, Mineral-Wool Blanket Insulation: ASTM C665, Type I (blankets without membrane facing); consisting of fibers; with maximum flame-spread and smoke-developed indexes of 25 and 50, respectively, per ASTM E84; passing ASTM E136 for combustion characteristics.

2.04 FACED MINERAL-WOOL BATT INSULATION:

A. Manufacturers:

1. Fibrex Insulations Inc.

2. Owens Corning.

3. Roxul Inc.

4. Thermafiber.

B. Foil-Faced, Mineral-Wool Board Insulation: ASTM C612; faced on one side with foil-scrim; with maximum flame-spread and smoke-developed indexes of 25 and 5, respectively, per ASTM E84.

1. Nominal density of 4 lb/cu. ft. (64 kg/cu. m), Types IA and IB, thermal resistivity of 4 degrees F x h x sq. ft./Btu x in. at 75 degrees F (27.7 K x m/W at 24 degrees C).

PART 3 - EXECUTION

3.01 PREPARATION:

A. Clean substrates of substances that are harmful to insulation or that interfere with insulation attachment.

3.02 INSTALLATION, GENERAL:

A. Comply with insulation manufacturer's written instructions applicable to products and applications indicated.

B. Install insulation that is undamaged, dry, and unsoiled and that has not been left exposed to ice, rain, or snow at any time.

C. Extend insulation to envelop entire area to be insulated. Cut and fit tightly around obstructions and fill voids with insulation. Remove projections that interfere with placement.

D. Provide sizes to fit applications indicated and selected from manufacturer's standard thicknesses, widths, and lengths. Apply single layer of insulation units to produce thickness indicated unless multiple layers are otherwise shown or required to make up total thickness.

3.03 INSTALLATION OF BELOW-GRADE INSULATION:

A. On vertical footing and foundation wall surfaces, set insulation units using manufacturer's recommended adhesive according to manufacturer's written instructions.

1. If not otherwise indicated, extend insulation a minimum of 24 inches below exterior grade line where there are no below grade spaces. At exterior walls with below grade spaces, extend insulation 10 feet below grade line or to the level of the lowest floor, whichever is less.

2. Provide concrete faced insulation board where the insulation is exposed above grade and extend 12 inches minimum below grade. Where insulation is required to extend beyond 12 inches below grade, beyond the 12 inches below grade, the insulation is permitted to be foam plastic board insulation.

3.04 INSTALLATION OF INSULATION FOR CONCRETE SUBSTRATES:

A. Install board insulation on concrete substrates by adhesively attached, spindle-type insulation anchors as follows:

1. Fasten foam board insulation to concrete substrates with insulation adhesive according to insulation manufacturer's written instructions.

2. Fasten concrete faced insulation board to concrete substrates with accessories according to insulation manufacturer's written instructions.

3.05 PROTECTION:

A. Protect installed insulation from damage due to harmful weather exposures, physical abuse, and other causes. Provide temporary coverings or enclosures where insulation is subject to abuse and cannot be concealed and protected by permanent construction immediately after installation.

3.06 CONTRACT CLOSEOUT:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 07 72 00

ROOF ACCESSORIES

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide roof accessories as indicated and in compliance with Contract Documents.

B. Section Includes:

1. Confined Space Davit Base

1.02 REFERENCES:

A. American Architectural Manufacturers Association (AAMA):

G. Underwriters' Laboratories, Inc. (UL):

1. 793: Standard for Safety Automatically Operated Roof Vents for Smoke and Heat

2. 972: Standard for Safety Burglary Resisting Glazing Material

1.03 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Product Data: For each type of roof accessory indicated.

C. Shop Drawings: Show fabrication and installation details for roof accessories.

D. Samples: For each type of exposed factory-applied color finish required and for each type of roof accessory indicated, prepared on Samples of size to adequately show color.

E. Confined Space Davit Base:

1. Product Data: Manufacturer's data and product information indicating the sizes, descriptions, capacities, test certifications, and other descriptive data showing in sufficient detail that the product complies with the contract requirements.

2. Shop Drawings: Layout drawings of each base in relation to the supporting structure indicating the locations of properly labeled components.

3. Installer's Certification: Furnish proof of installer's certification approval by manufacturer in the form of the installer's current certificate issued by the manufacture.

4. Product Certificate: Containing the manufacturer's batch number on each individual component used in the systems.

5. Qualifications Statement: For engineer performing delegated design.

6. Warranty: Submit manufacturer warranty and ensure that forms have been completed in Owner's name and registered with manufacturer.

7. Delegated-Design Submittal: For confined space davit base, including analysis data signed and sealed by the qualified professional engineer responsible for their preparation.

1.04 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.05 SPARE PARTS:

A. Comply with the requirements specified in Section 01 61 00.

1.06 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

B. Sheet Metal Standard: Comply with SMACNA's "Architectural Sheet Metal Manual" details for fabrication of units, including flanges and cap flashing to coordinate with type of roofing indicated.

C. Fall Protection Systems:

1. Manufacturer Qualifications: Minimum 5 years' experience manufacturing similar products.

2. Installer Qualifications: Minimum 2 years' experience installing similar products, authorized, trained, and certified by manufacturer.

3. Engineer for Delegated Design: Licensed in Utah and with a minimum of 2 years engineering fall protection systems.

4. Coordination: Coordinate the installation of horizontal fall protection system with structural supports and finish materials.

5. Secure materials and equipment required under this section from a single manufacturer

D. Confined Space Davit Base:

1. Manufacturer Qualifications: Minimum 5 years' experience manufacturing similar products.

2. Installer Qualifications: Minimum 2 years' experience installing similar products, authorized, trained, and certified by manufacturer.

3. Engineer for Delegated Design: Licensed in Utah and with a minimum of 2 years engineering fall protection systems.

4. Coordination: Coordinate the installation of confined space davit base with owner selected confined space davit system.

5. Secure materials and equipment required compatible with and from the same manufacturer as owner selected confined space davit system.

1.07 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

PART 2 - PRODUCTS

2.01 MANUFACTURERS:

A. Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, manufacturers listed in other Part 2 articles.

2.02 METAL MATERIALS:

A. Galvanized Steel Sheet: ASTM A653, G90 coated and mill phosphatized for field painting.

B. Aluminum-Zinc Alloy-Coated Steel Sheet: ASTM A792, AZ50 coated.

C. Pre-painted, Metallic-Coated Steel Sheet: Steel sheet metallic coated by hot-dip process and pre-painted by coil-coating process to comply with ASTM A755.

1. Galvanized Steel Sheet: ASTM A653, G90 coated.

2. Aluminum-Zinc Alloy-Coated Steel Sheet: ASTM A792, Class AZ50 coated.

3. Exposed Finishes: Manufacturer's standard 2-coat, thermocured system consisting of specially formulated inhibitive primer and fluoropolymer color topcoat containing not less than 70 percent polyvinylidene fluoride resin by weight.

D. Aluminum Sheet: ASTM B209, alloy and temper recommended by manufacturer for type of use and mill finish. Coil-coat finish as follows**:**

1. Factory-Prime Coating: Where painting after installation is indicated, provide pretreatment and white or light-colored, factory-applied, baked-on epoxy primer coat; with a minimum dry film thickness of 0.2 mil.

2. Anodic Finish: Architectural Class II, complying with AAMA 611.

a. Color: As selected by Architect/Engineer from manufacturer's full range.

3. Baked-Enamel Finish: Organic Coating: Thermosetting, modified-acrylic enamel primer/topcoat system complying with AAMA 2603 except with a minimum dry film thickness of 1.5 mils, medium gloss.

a. Color and Gloss: As selected by Architect/Engineer from manufacturer's full range.

4. High-Performance Organic Finish: Manufacturer's standard 2-coat, thermocured system consisting of specially formulated inhibitive primer and fluoropolymer color topcoat containing not less than 70 percent polyvinylidene fluoride resin by weight.

a. Color and Gloss: As selected by Architect/Engineer from manufacturer's full range.

5. Powder-Coat Finish: Immediately after cleaning and pretreating, electrostatically apply manufacturer's standard baked-polymer thermosetting powder finish.

a. Color and Gloss: As selected by Architect/Engineer from manufacturer's full range.

E. Stainless-Steel Shapes or Sheet: ASTM A240 or ASTM A666, Type 304 or Type 316, No. 2D finish.

2.03 CONFINED SPACE DAVIT BASE:

A. Manufacturers:

1. 3M Fall Protection Business: DBI-SALA Flush Mount Sleeve Model#8512828 (Dewatering) 8512831 (Liquid Train).

B. Description:

1. Dewatering: Floor mount cast-in-place sleeve davit base with built-in pins for fresh concrete

2. Liquid Train: Floor mount sleeve davit base with PVC sleeve liner and all required mounting hardware.

3. Rated Capacity(working load) 450 pounds @ minimum 4:1 Design Factor (see appl. restriction 2) Mast Moment Proof Load 90.000 In.-lbs Mast Rotation 360°PVC davit mast sleeve liner

4. Heavy duty stainless steel sleeve cap at each base installation

5. General Construction:

a. Welded Steel/Stainless Steel Weld Certification CWB-47.1

b. Structure Material 304 SS

c. Sleeve Material 304 SS

d. Sleeve Bearing Material PVC Pipe - ASTM-D-1785

e. Thrust Bearing Material High Density Polyethene

f. Finish (Stainless Steel) Brush Blast

6. The Structure and mounting hardware must be capable of withstanding a 90,000 in.-lbs moment and a 5000 lbs. vertical load.

7. Installation MUST BE approved to local regulations by a qualified engineer.

PART 3 - EXECUTION

3.01 INSTALLATION:

A. General: Install roof accessories according to manufacturer's written instructions. Anchor roof accessories securely in place and capable of resisting forces specified. Use fasteners, separators, sealants, and other miscellaneous items as required for completing roof accessory installation. Install roof accessories to resist exposure to weather without failing, rattling, leaking, and fastener disengagement.

B. Install roof accessories to fit substrates and to result in watertight performance.

C. Metal Protection: Where dissimilar metals will contact each other or corrosive substrates, protect against galvanic action by painting contact surfaces with bituminous coating or by other permanent separation as recommended by manufacturer.

1. Coat concealed side of uncoated aluminum, or stainless-steel roof accessories with bituminous coating where in contact with wood, ferrous metal, or cementitious construction.

2. Underlayment: Where installing exposed-to-view components of roof accessories directly on cementitious or wood substrates, install a course of felt underlayment and cover with a slip sheet, or install a course of polyethylene underlayment.

3. Bed flanges in thick coat of asphalt roofing cement where required by roof accessory manufacturers for waterproof performance.

D. Install roof accessories level, plumb, true to line and elevation, and without warping, jogs in alignment, excessive oil canning, buckling, or tool marks.

E. Seal joints with elastomeric or butyl sealant as required by manufacturer of roof accessories.

F. Coordinate location of fall protection and confined space davit equipment indicated to be attached to structural substrate or surface of roofing system, and furnish anchoring devices with templates, and diagrams.

G. Examine areas and conditions, with installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of fall protection and confined space davit equipment.

1. Proceed with installation only after unsatisfactory conditions have been corrected.

2. Adjust fall protection components to function smoothly and safely.

3.02 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

B. Fall protection and confined space davit equipment:

1. Demonstration: Demonstrate operation of system to Owner's personnel.

   a. Briefly describe function, operation, and inspection of each component.

2. Training: Train Owner's personnel on operation and inspection of system.

   a. Use operation and maintenance manual as training reference, supplemented with additional training materials as required.

   b. Provide minimum of one hour of training

   c. Location: At project site

3. Training to take place at the completion of the installation.

4. Recertification: Coordinate annual recertification program per manufacturers recommendation.

END OF SECTION

SECTION 07 84 00

FIRESTOPPING

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide firestopping as indicated and in compliance with Contract Documents.

1. Section includes:

a. Penetrations through fire resistance rated floor and roof construction including both empty openings and openings containing cables, pipes, ducts, conduits, and other penetrating items.

b. Penetrations through fire resistance rated walls and partitions including both empty openings and openings containing cables, pipes, ducts, conduits, and other penetrating items.

c. Penetrations through smoke barriers and construction enclosing compartmentalized areas involving both empty openings and openings containing penetrating items.

d. Sealant joints in fire resistance rated construction, including gypsum drywall partitions, concrete walls and adjacent construction.

B. General Contractor shall be responsible for providing firestopping for the project.

C. General Contractor shall be responsible for providing firestopping for the project, including all filed sub-bids work.

1.02 REFERENCES:

A. ASTM International (ASTM):

1. E84: Standard Test Method for Surface Burning Characteristics of Building Materials

2. E814: Standard Test Method for Fire Tests of Penetration Firestop Systems

3. E2174: Standard Practice for On-Site Inspection of Installed Fire Stops

4. Guide #40U19

B. FM Global (FM):

1. 4991: Approval of Firestop Contractors

C. Underwriters' Laboratories, Inc. (UL).

1. 1479: Standard for Safety Fire Tests of Through-Penetration Firestops

1.03 DEFINITIONS:

A. Firestopping: Asbestos free closures to fire and smoke at openings around penetrations, gaps and joints within fire separations and assemblies having a fire-resistance rating and no fire-resistance rating, including openings and spaces at perimeter edge conditions.

1. Draft tight barriers to retard passage of flame and smoke, and firefighter's hose stream and passage of liquids around outside of mechanical and electrical assemblies where they penetrate fire separations.

2. Maintain fire resistance rating of adjacent floor, wall or other fire separation assembly acceptable to authorities having jurisdiction.

3. Conform to both the temperature and flame ratings of ASTM E814, and other requirements of authorities having jurisdiction.

1.04 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Product Data: For each type of product indicated.

1. Product Schedule: For each penetration and joint firestopping system. Include location and design designation of qualified testing and inspecting agency.

2. Where Project conditions require modification to a qualified testing and inspecting agency's illustration for a particular firestopping condition, submit illustration, with modifications marked, approved by firestopping manufacturer's fire-protection engineer as an engineering judgment or equivalent fire-resistance-rated assembly.

C. Qualification Data: For qualified Installer

D. Installer Certificates: From Installer indicating firestopping has been installed in compliance with requirements and manufacturer's written recommendations.

E. Product Test Reports: Based on evaluation of comprehensive tests performed by a qualified testing agency, for firestopping.

1.05 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

B. Installer Qualifications: A firm that has been approved by FM Global according to FM Global 4991, "Approval of Firestop Contractors," or been evaluated by UL and found to comply with its "Qualified Firestop Contractor Program Requirements."

C. Installer Qualifications: A firm experienced in installing firestopping similar in material, design, and extent to that indicated for this Project, whose work has resulted in construction with a record of successful performance. Qualifications include having the necessary experience, staff, and training to install manufacturer's products per specified requirements. Manufacturer's willingness to sell its firestopping products to Contractor or to Installer engaged by Contractor does not in itself confer qualification on buyer.

D. Fire-Test-Response Characteristics: Firestopping shall comply with the following requirements:

1. Firestopping tests are performed by a qualified testing agency acceptable to authorities having jurisdiction.

2. Firestopping is identical to those tested per testing standard referenced. Provide rated systems complying with the following requirements:

a. Firestopping products bear classification marking of qualified testing and inspecting agency.

b. Classification markings on firestopping correspond to designations listed by the following:

(1) UL in its "Fire Resistance Directory."

(2) Intertek ETL SEMKO in its "Directory of Listed Building Products."

(3) FM Global in its "Building Materials Approval Guide."

E. Preinstallation Conference: Conduct conference at Project site.

F. Regulatory Requirements: Be responsible for securing approval from authority having jurisdiction where project conditions require modification to tested and listed systems.

1. Submit authority having jurisdiction approval for modified systems.

1.06 PERFORMANCE CRITERIA:

A. Ratings according ASTM E814, "Fire Tests of Through Penetration Fire Stops" are

1. F-rating, Flame Ratings:

a. The F-rating is expressed in hours and the number indicates the specific length of time that a barrier can withstand fire before being consumed or before permitting the passage of flame through the opening.

b. A F-rated opening shall also withstand a hose stream test.

2. T-rating, Thermal Ratings:

a. The T-rating is expressed in hours and the number indicates the length of time that the temperature on the non-fire side of the penetration does not exceed 325 degrees F above the ambient temperature. This ensures that the temperature on the side of the wall away from the flame does not reach the flash point of any materials on that side of the wall.

3. L-rating, Smoke Ratings:

a. The L-rating is the amount of air (or cold smoke) that can leak through a penetration and the number indicates the amount of air in cubic feet per minute.

b. L-rating is tested under a differential pressure of 0.30 inches water column at 75 degrees F and at 400 degrees F.

4. A W-rating may also be established for a through-penetration firestop system. The W-rating is based on the water resistance of the test sample.

1.07 PROJECT/SITE CONDITIONS:

A. Environmental Limitations: Do not install firestopping when ambient or substrate temperatures are outside the limits permitted by firestopping manufacturers or when substrates are wet because of rain, frost, condensation, or other causes.

B. Install and cure firestopping per manufacturer's written instructions using natural means of ventilations or, where this is inadequate, forced-air circulation.

1.08 COORDINATION:

A. Coordinate construction of joints, openings and penetrating items to ensure that firestopping is installed according to specified requirements.

B. Coordinate sizing of sleeves, openings, core-drilled holes, or cut openings to accommodate firestopping.

C. Notify Owner's testing agency at least seven days in advance of firestopping installations; confirm dates and times on day preceding each series of installations.

PART 2 - PRODUCTS

2.01 MANUFACTURERS:

A. Grace Construction Products

B. 3M Fire Protection Products

C. Tremco, Inc.; Tremco Fire Protection Systems Group

2.02 FIRESTOPPING:

A. Provide penetration firestopping that is produced and installed to resist spread of fire according to requirements indicated, resist passage of smoke and other gases, and maintain original fire-resistance rating of construction penetrated. Penetration firestopping systems shall be compatible with one another, with the substrates forming openings, and with penetrating items if any.

B. Penetrations in Fire-Resistance-Rated Walls: Provide penetration firestopping with ratings determined per ASTM E814 or UL 1479, based on testing at a positive pressure differential of 0.01-inch wg.

1. Fire-resistance-rated walls include fire walls fire-barrier walls smoke-barrier walls and fire partitions.

2. F-Rating: Not less than the fire-resistance rating of constructions penetrated.

C. Penetrations in Horizontal Assemblies: Provide penetration firestopping with ratings determined per ASTM E814 or UL 1479, based on testing at a positive pressure differential of 0.01-inch wg.

1. Horizontal assemblies include floors floor/ceiling assemblies and ceiling membranes of roof/ceiling assemblies.

2. F-Rating: At least 1 hour, but not less than the fire-resistance rating of constructions penetrated.

3. T-Rating: At least 1 hour, but not less than the fire-resistance rating of constructions penetrated except for floor penetrations within the cavity of a wall.

D. Penetrations in Smoke Barriers: Provide penetration firestopping with ratings determined per UL 1479.

1. L-Rating: Not exceeding 5.0 cfm/sq. ft. of penetration opening at 0.30-inch wg at both ambient and elevated temperatures.

E. W-Rating: Provide penetration firestopping showing no evidence of water leakage when tested according to UL 1479.

F. Exposed Penetration Firestopping: Provide products with flame-spread and smoke-developed indexes of less than 25 and 450, respectively, as determined per ASTM E84.

G. VOC Content: Penetration firestopping sealants and sealant primers shall comply with the following limits for VOC content when calculated according to 40 CFR 59, Subpart D (EPA Method 24):

1. Sealants: 250 g/L

2. Sealant Primers for Nonporous Substrates: 250 g/L

3. Sealant Primers for Porous Substrates: 775 g/L

H. Accessories: Provide components for each firestopping system that are needed to install fill materials and to maintain ratings required. Use only those components specified by firestopping manufacturer and approved by qualified testing and inspecting agency for firestopping indicated.

1. Permanent forming/damming/backing materials, including the following:

a. Slag-wool-fiber or rock-wool-fiber insulation

b. Sealants used in combination with other forming/damming/backing materials to prevent leakage of fill materials in liquid state.

c. Fire-rated form board

d. Fillers for sealants

2. Temporary forming materials

3. Substrate primers

4. Collars

5. Steel sleeves

2.03 FILL MATERIALS:

A. Cast-in-Place Firestop Devices: Factory-assembled devices for use in cast-in-place concrete floors and consisting of an outer metallic sleeve lined with an intumescent strip, a radial extended flange attached to one end of the sleeve for fastening to concrete formwork, and a neoprene gasket.

B. Latex Sealants: Single-component latex formulations that do not re-emulsify after cure during exposure to moisture.

C. Firestop Devices: Factory-assembled collars formed from galvanized steel and lined with intumescent material sized to fit specific diameter of penetrant.

D. Intumescent Composite Sheets: Rigid panels consisting of aluminum-foil-faced elastomeric sheet bonded to galvanized-steel sheet.

E. Intumescent Putties: Nonhardening dielectric, water-resistant putties containing no solvents, inorganic fibers, or silicone compounds.

F. Intumescent Wrap Strips: Single-component intumescent elastomeric sheets with aluminum foil on one side.

G. Mortars: Prepackaged dry mixes consisting of a blend of inorganic binders, hydraulic cement, fillers, and lightweight aggregate formulated for mixing with water at Project site to form a non-shrinking, homogeneous mortar.

H. Pillows/Bags: Reusable heat-expanding pillows/bags consisting of glass-fiber cloth cases filled with a combination of mineral-fiber, water-insoluble expansion agents, and fire-retardant additives. Where exposed, cover openings with steel-reinforcing wire mesh to protect pillows/bags from being easily removed.

I. Preformed, Pre-Compressed, Self-Expanding, Fire Rated Sealant System with Tensionless Silicone Pre-Coated Surface, Watertight, 1 Hour UL2079 Rated, 100 percent movement, for Vertical Expansion Joints for Interior and Exterior Walls

J. Silicone Foams: Multi-component, silicone-based liquid elastomers that, when mixed, expand and cure in place to produce a flexible, non-shrinking foam.

K. Silicone Sealants: Single-component, silicone-based, neutral-curing elastomeric sealants of grade indicated below:

1. Grade: Pourable (self-leveling) formulation for openings in floors and other horizontal surfaces, and non-sag formulation for openings in vertical and sloped surfaces, unless indicated firestopping limits use of non-sag grade for both opening conditions.

2.04 MIXING:

A. For those products requiring mixing before application, comply with firestopping manufacturer's written instructions for accurate proportioning of materials, water (if required), type of mixing equipment, selection of mixer speeds, mixing containers, mixing time, and other items or procedures needed to produce products of uniform quality with optimum performance characteristics for application indicated.

PART 3 - EXECUTION

3.01 EXAMINATION:

A. Examine substrates and conditions, with Installer present, for compliance with requirements for opening configurations, penetrating items, substrates, and other conditions affecting performance of the Work.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 PREPARATION:

A. Surface Cleaning: Clean out openings immediately before installing firestopping to comply with manufacturer's written instructions and with the following requirements:

1. Remove from surfaces of joints and opening substrates and from penetrating items foreign materials that could interfere with adhesion of firestopping.

2. Clean joints, opening substrates and penetrating items to produce clean, sound surfaces capable of developing optimum bond with firestopping. Remove loose particles remaining from cleaning operation.

3. Remove laitance and form-release agents from concrete.

B. Priming: Prime substrates where recommended in writing by manufacturer using that manufacturer's recommended products and methods. Confine primers to areas of bond; do not allow spillage and migration onto exposed surfaces.

C. Masking Tape: Use masking tape to prevent firestopping from contacting adjoining surfaces that will remain exposed on completion of the Work and that would otherwise be permanently stained or damaged by such contact or by cleaning methods used to remove stains. Remove tape as soon as possible without disturbing firestopping's seal with substrates.

3.03 INSTALLATION:

A. General: Install firestopping to comply with manufacturer's written installation instructions and published drawings for products and applications indicated.

B. Install forming materials and other accessories of types required to support fill materials during their application and in the position needed to produce cross-sectional shapes and depths required to achieve fire ratings indicated.

1. After installing fill materials and allowing them to fully cure, remove combustible forming materials and other accessories not indicated as permanent components of firestopping.

C. Install fill materials for firestopping by proven techniques to produce the following results:

1. Fill voids and cavities formed by openings, forming materials, accessories, and penetrating items as required to achieve fire-resistance ratings indicated.

2. Apply materials so they contact and adhere to substrates formed by openings and penetrating items.

3. For fill materials that will remain exposed after completing the Work, finish to produce smooth, uniform surfaces that are flush with adjoining finishes.

3.04 IDENTIFICATION:

A. Identify firestopping with preprinted metal or plastic labels. Attach labels permanently to surfaces adjacent to and within 6 inches of firestopping edge so labels will be visible to anyone seeking to remove penetrating items or firestopping. Use mechanical fasteners or self-adhering-type labels with adhesives capable of permanently bonding labels to surfaces on which labels are placed. Include the following information on labels:

1. The words "Warning - Firestopping - Do Not Disturb. Notify Building Management of Any Damage."

2. Contractor's name, address, and phone number

3. Designation of applicable testing and inspecting agency

4. Date of installation

5. Manufacturer's name

6. Installer's name

3.05 FIELD QUALITY CONTROL:

A. Owner may engage a qualified testing agency to perform tests and inspections.

B. Where deficiencies are found or firestopping is damaged or removed because of testing, repair or replace firestopping to comply with requirements.

C. Proceed with enclosing firestopping with other construction only after inspection reports are issued and installations comply with requirements.

3.06 CLEANING AND PROTECTION:

A. Clean off excess fill materials adjacent to openings as the Work progresses by methods and with cleaning materials that are approved in writing by firestopping manufacturers and that do not damage materials in which openings occur.

B. Provide final protection and maintain conditions during and after installation that ensure that firestopping is without damage or deterioration at time of Substantial Completion. If, despite such protection, damage or deterioration occurs, immediately cut out and remove damaged or deteriorated firestopping and install new materials to produce systems complying with specified requirements.

3.07 CONTRACT CLOSEOUT:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 07 92 00

JOINT SEALANTS

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide joint sealants as indicated and in compliance with Contract Documents.

1. Section Includes:

a. Silicone joint sealants

b. Urethane joint sealants

c. Polysulfide joint sealants

d. Solvent-release-curing joint sealants

1.02 REFERENCES:

A. ASTM International (ASTM):

1. C834: Standard Specification for Latex Sealing Compounds

2. C919: Standard Practice for Use of Sealants in Acoustical Applications

3. C920: Standard Specification for Elastomeric Joint Sealants

4. C1021: Standard Practice for Laboratories Engaged in Testing of Building Sealants

5. C1087: Standard Test Method for Determining Compatibility of Liquid-Applied Sealants with Accessories Used in Structural Glazing Systems

6. C1193: Standard Guide for Use of Joint Sealants

7. C1247: Standard Test Method for Durability of Sealants Exposed to Continuous Immersion in Liquids

8. C1248: Standard Test Method for Staining of Porous Substrate by Joint Sealants

9. C1311: Standard Specification for Solvent Release Sealants

10. C1330: Standard Specification for Cylindrical Sealant Backing for Use with Cold Liquid- Applied Sealants

11. C1521: Standard Practice for Evaluating Adhesion of Installed Weatherproofing Sealant Joints

12. E90: Standard Test Method for Laboratory Measurement of Airborne Sound Transmission Loss of Building Partitions and Elements

B. California Department of Public Health (CDPH):

1. Standard Method for the Testing and Evaluation of Volatile Organic Chemical Emissions from Indoor Sources using Environmental Chambers

1.03 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Product Data: For each joint-sealant product indicated

C. Samples for Initial Selection: Manufacturer's color charts consisting of strips of cured sealants showing the full range of colors available for each product exposed to view.

D. Samples for Verification: For each kind and color of joint sealant required, provide Samples with joint sealants in 1/2-inch-wide joints formed between two 6-inch-long strips of material matching the appearance of exposed surfaces adjacent to joint sealants.

E. Joint-Sealant Schedule: Include the following information:

1. Joint-sealant application, joint location, and designation

2. Joint-sealant manufacturer and product name

3. Joint-sealant formulation

4. Joint-sealant color

F. Product Certificates: For each kind of joint sealant and accessory, from manufacturer

G. Field-Adhesion Test Reports: For each sealant application tested

H. Warranties: Sample of special warranties

1.04 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

B. Installer Qualifications: Manufacturer's authorized representative who is trained and approved for installation of units required for this Project.

C. Source Limitations: Obtain each kind of joint sealant from single source from single manufacturer.

D. Product Testing: Test joint sealants using a qualified testing agency.

1. Testing Agency Qualifications: An independent testing agency qualified according to ASTM C1021 to conduct the testing indicated.

E. Preinstallation Conference: Conduct conference at Project site.

1.05 PROJECT CONDITIONS:

A. Do not proceed with installation of joint sealants under the following conditions:

1. When ambient and substrate temperature conditions are outside limits permitted by joint-sealant manufacturer.

2. When joint substrates are wet.

3. Where joint widths are less than those allowed by joint-sealant manufacturer for applications indicated.

4. Where contaminants capable of interfering with adhesion have not yet been removed from joint substrates.

1.06 WARRANTY:

A. Comply with general requirements specified in Section 01 78 36.

B. Special Installer's Warranty: Manufacturer's standard form in which Installer agrees to repair or replace joint sealants that do not comply with performance and other requirements specified in this Section within specified warranty period.

1. Warranty Period: Two years from date of Substantial Completion.

C. Special Manufacturer's Warranty: Manufacturer's standard form in which joint-sealant manufacturer agrees to furnish joint sealants to repair or replace those that do not comply with performance and other requirements specified in this Section within specified warranty period.

1. Warranty Period: Five years from date of Substantial Completion.

D. Special warranties specified in this article exclude deterioration or failure of joint sealants from the following:

1. Movement of the structure caused by structural settlement or errors attributable to design or construction resulting in stresses on the sealant exceeding sealant manufacturer's written specifications for sealant elongation and compression.

2. Disintegration of joint substrates from natural causes exceeding design specifications.

3. Mechanical damage caused by individuals, tools, or other outside agents.

4. Changes in sealant appearance caused by accumulation of dirt or other atmospheric contaminants.

PART 2 - PRODUCTS

2.01 MATERIALS, GENERAL:

A. Compatibility: Provide joint sealants, backings, and other related materials that are compatible with one another and with joint substrates under conditions of service and application, as demonstrated by joint-sealant manufacturer, based on testing and field experience.

B. VOC Content of Interior Sealants: Provide sealants and sealant primers for use inside the weatherproofing system that comply with the following limits for VOC content when calculated according to 40 CFR 59, Part 59, Subpart D (EPA Method 24):

1. Architectural Sealants: 250 g/L

2. Sealant Primers for Nonporous Substrates: 250 g/L

3. Sealant Primers for Porous Substrates: 775 g/L

C. Liquid-Applied Joint Sealants: Comply with ASTM C920 and other requirements indicated for each liquid-applied joint sealant specified, including those referencing ASTM C920 classifications for type, grade, class, and uses related to exposure and joint substrates.

D. Low-Emitting Interior Sealants: Sealants and sealant primers used inside the weatherproofing system shall comply with the testing and product requirements of the California Department of Health Services' "Standard Practice for the Testing of Volatile Organic Emissions from Various Sources Using Small-Scale Environmental Chambers."

E. Liquid-Applied Joint Sealants: Comply with ASTM C920 and other requirements indicated for each liquid-applied joint sealant specified, including those referencing ASTM C920 classifications for type, grade, class, and uses related to exposure and joint substrates.

1. Suitability for Immersion in Liquids. Where sealants are indicated for Use I for joints that will be continuously immersed in liquids, provide products that have undergone testing according to ASTM C1247. Liquid used for testing sealants is deionized water, unless otherwise indicated.

F. Stain-Test-Response Characteristics: Where sealants are specified to be non-staining to porous substrates, provide products that have undergone testing according to ASTM C1248 and have not stained porous joint substrates indicated for Project.

G. Suitability for Contact with Food: Where sealants are indicated for joints that will come in repeated contact with food, provide products that comply with 21 CFR 177.2600.

H. Colors of Exposed Joint Sealants: As selected by Engineer from manufacturer's full range.

2.02 SILICONE JOINT SEALANTS:

A. Manufacturers:

1. Pecora Corporation

2. Sika Corporation, Construction Products Division

3. Tremco Incorporated

2.03 URETHANE JOINT SEALANTS:

A. Manufacturers:

1. Sika Corporation, Construction Products Division

2. Tremco Incorporated

3. Pecora Corporation

2.04 POLYSULFIDE JOINT SEALANTS:

A. Manufacturers:

1. W. R. Meadows, Inc.

2. Pecora Corporation

3. BASF Building Systems

2.05 SOLVENT-RELEASE-CURING JOINT SEALANTS:

A. Manufacturers:

1. Tremco Incorporated

2.06 PREFORMED JOINT SEALANTS:

A. Preformed Foam Joint Sealant: Manufacturer's silicone pre-coated, preformed, pre-compressed, self-expanding, sealant system. Expanding foam to be cellular foam

impregnated with a water-based, non-drying, 100 percent acrylic dispersion. Seal shall combine factory-applied, low-modulus silicone and a backing of acrylic-impregnated expanding foam into a unified hybrid sealant system. Material shall be capable of movements of +50 percent, -50 percent (100 percent total) of nominal material size.

B. Factory produce in pre-compressed sizes in stick form to fit joint widths indicated; coated on one side with a pressure-sensitive adhesive and covered with protective wrapping.

1. Products:

a. EMSEAL Joint Systems, Ltd.; Colorseal/Seismic

b. Dayton Superior Specialty Chemicals

c. Sandell Manufacturing Co., Inc.

2.07 JOINT SEALANT BACKING:

A. General: Provide sealant backings of material that are non-staining; are compatible with joint substrates, sealants, primers, and other joint fillers; and are approved for applications indicated by sealant manufacturer based on field experience and laboratory testing.

B. Cylindrical Sealant Backings: ASTM C1330, Type C (closed-cell material with a surface skin) Type O (open-cell material) Type B (bicellular material with a surface skin) or any of the preceding types, as approved in writing by joint-sealant manufacturer for joint application indicated, and of size and density to control sealant depth and otherwise contribute to producing optimum sealant performance.

C. Bond-Breaker Tape: Polyethylene tape or other plastic tape recommended by sealant manufacturer for preventing sealant from adhering to rigid, inflexible joint-filler materials or joint surfaces at back of joint. Provide self-adhesive tape where applicable.

2.08 MISCELLANEOUS MATERIALS:

A. Primer: Material recommended by joint-sealant manufacturer where required for adhesion of sealant to joint substrates indicated, as determined from preconstruction joint-sealant-substrate tests and field tests.

B. Cleaners for Non-porous Surfaces: Chemical cleaners acceptable to manufacturers of sealants and sealant backing materials, free of oily residues or other substances capable of staining or harming joint substrates and adjacent nonporous surfaces in any way, and formulated to promote optimum adhesion of sealants to joint substrates.

C. Masking Tape: Non-staining, nonabsorbent material compatible with joint sealants and surfaces adjacent to joints.

PART 3 - EXECUTION

3.01 EXAMINATION:

A. Examine joints indicated to receive joint sealants, with Installer present, for compliance with requirements for joint configuration, installation tolerances, and other conditions affecting joint-sealant performance.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 PREPARATION:

A. Surface Cleaning of Joints: Clean out joints immediately before installing joint sealants to comply with joint-sealant manufacturer's written instructions and the following requirements:

1. Remove all foreign material from joint substrates that could interfere with adhesion of joint sealant, including dust, paints (except for permanent, protective coatings tested and approved for sealant adhesion and compatibility by sealant manufacturer), old joint sealants, oil, grease, waterproofing, water repellents, water, surface dirt, and frost.

2. Clean porous joint substrate surfaces by brushing, grinding, mechanical abrading, or a combination of these methods to produce a clean, sound substrate capable of developing optimum bond with joint sealants. Remove loose particles remaining after cleaning operations above by vacuuming or blowing out joints with oil-free compressed air. Porous joint substrates include the following:

a. Concrete

b. Masonry

3. form-release agents from concrete.

4. Clean nonporous joint substrate surfaces with chemical cleaners or other means that do not stain, harm substrates, or leave residues capable of interfering with adhesion of joint sealants. Nonporous joint substrates include the following:

a. Metal

b. Glass

c. Glazed surfaces of ceramic tile

B. Joint Priming: Prime joint substrates where recommended by joint-sealant manufacturer or as indicated by preconstruction joint-sealant-substrate tests or prior experience. Apply primer to comply with joint-sealant manufacturer's written instructions. Confine primers to areas of joint-sealant bond; do not allow spillage or migration onto adjoining surfaces.

C. Masking Tape: Use masking tape where required to prevent contact of sealant or primer with adjoining surfaces that otherwise would be permanently stained or damaged by such contact or by cleaning methods required to remove sealant smears. Remove tape immediately after tooling without disturbing joint seal.

3.03 INSTALLATION OF JOINT SEALANTS:

A. General: Comply with joint-sealant manufacturer's written installation instructions for products and applications indicated, unless more stringent requirements apply.

B. Sealant Installation Standard: Comply with recommendations in ASTM C1193 for use of joint sealants as applicable to materials, applications, and conditions indicated.

C. Install sealant backings of kind indicated to support sealants during application and at position required to produce cross-sectional shapes and depths of installed sealants relative to joint widths that allow optimum sealant movement capability.

1. Do not leave gaps between ends of sealant backings.

2. Do not stretch, twist, puncture, or tear sealant backings.

3. Remove absorbent sealant backings that have become wet before sealant application and replace them with dry materials.

D. Install bond-breaker tape behind sealants where sealant backings are not used between sealants and backs of joints.

E. Install sealants using proven techniques that comply with the following and at the same time backings are installed:

1. Place sealants so they directly contact and fully wet joint substrates.

2. Completely fill recesses in each joint configuration.

3. Produce uniform, cross-sectional shapes and depths relative to joint widths that allow optimum sealant movement capability.

F. Tooling of Non-sag Sealants: Immediately after sealant application and before skinning or curing begins, tool sealants according to requirements specified in subparagraphs below to form smooth, uniform beads of configuration indicated; to eliminate air pockets; and to ensure contact and adhesion of sealant with sides of joint.

1. Remove excess sealant from surfaces adjacent to joints.

2. Use tooling agents that are approved in writing by sealant manufacturer and that do not discolor sealants or adjacent surfaces.

3. Provide concave joint profile per Figure 8A in ASTM C1193, unless otherwise indicated.

4. Provide flush joint profile where indicated per Figure 8B in ASTM C1193.

5. Provide recessed joint configuration of recess depth and at locations indicated per Figure 8C in ASTM C1193.

    a. Use masking tape to protect surfaces adjacent to recessed tooled joints.

G. Acoustical Sealant Installation: At sound-rated assemblies and elsewhere as indicated, seal construction at perimeters, behind control joints, and at openings and penetrations with a continuous bead of acoustical sealant. Install acoustical sealant at both faces of partitions at perimeters and through penetrations. Comply with ASTM C919 and with manufacturer's written recommendations.

3.04 FIELD QUALITY CONTROL:

A. Field-Adhesion Testing: Field test joint-sealant adhesion to joint substrates as follows:

1. Extent of Testing: Test completed and cured sealant joints as follows:

    a. Perform 1 test for each 1,000 feet of joint length thereafter or 1 test per each floor per elevation.

2. Test Method: Test joint sealants according to Method A, Field-Applied Sealant Joint Hand Pull Tab, in Appendix X1 in ASTM C1193 or Method A, Tail Procedure, in ASTM C1521.

    a. For joints with dissimilar substrates, verify adhesion to each substrate separately; extend cut along one side, verifying adhesion to opposite side. Repeat procedure for opposite side.

3. Inspect tested joints and report on the following:

    a. Whether sealants filled joint cavities and are free of voids.

    b. Whether sealant dimensions and configurations comply with specified requirements.

    c. Whether sealants in joints connected to pulled-out portion failed to adhere to joint substrates or tore cohesively. Include data on pull distance used to test each kind of product and joint substrate. Compare these results to determine if adhesion passes sealant manufacturer's field-adhesion hand-pull test criteria.

4. Record test results in a field-adhesion-test log. Include dates when sealants were installed, names of persons who installed sealants, test dates, test locations, whether

joints were primed, adhesion results and percent elongations, sealant fill, sealant configuration, and sealant dimensions.

5. Repair sealants pulled from test area by applying new sealants following same procedures used originally to seal joints. Ensure that original sealant surfaces are clean and that new sealant contacts original sealant.

B. Evaluation of Field-Adhesion Test Results: Sealants not evidencing adhesive failure from testing or noncompliance with other indicated requirements will be considered satisfactory. Remove sealants that fail to adhere to joint substrates during testing or to comply with other requirements. Retest failed applications until test results prove sealants comply with indicated requirements.

3.05 CLEANING:

A. Clean off excess sealant or sealant smears adjacent to joints as the Work progresses by methods and with cleaning materials approved in writing by manufacturers of joint sealants and of products in which joints occur.

3.06 PROTECTION:

A. Protect joint sealants during and after curing period from contact with contaminating substances and from damage resulting from construction operations or other causes so sealants are without deterioration or damage at time of Substantial Completion. If, despite such protection, damage or deterioration occurs, cut out and remove damaged or deteriorated joint sealants immediately so installations with repaired areas are indistinguishable from original work.

3.07 CONTRACT CLOSEOUT:

A. Provide in accordance with Section 01 77 00.

3.08 JOINT-SEALANT SCHEDULE:

A. General: The Joint Sealant Schedule indicates the design intent as required by the Construction Documents for joint substrates, conditions, and materials. The final approval for the joint sealant systems to be used on all project conditions shall be accomplished through the Engineer's approval of the Joint-Sealant Schedule submitted by the Contractor as required by Article 1.7.G of this section. The submittal shall indicate application, joint location, designation, joint sealant

1. Manufacturer and product name and joint sealant formulation for all conditions required to execute the design intent as required by the Construction Documents.

B. Joint-Sealant Application: Exterior joints in horizontal traffic surfaces.

1. Joint Locations: Expansion joint between concrete slab-on-grade and building walls or other elements.

2. Urethane Joint Sealant: Multicomponent, self-leveling, traffic grade, Class 25.

3. Joint-Sealant Color: As selected by the Engineer from the manufacturer's full range of colors.

C. Joint-Sealant Application: Exterior joints in vertical surfaces and horizontal non-traffic surfaces.

1. Joint Locations:

a. Perimeter of exterior openings where aluminum window and door frames meet adjacent building materials.

2. Silicone Joint Sealant: Single-component, non-sag, neutral-curing, Class 50.

3. Joint-Sealant Color: As selected by the Engineer from the manufacturer's full range of colors.

D. Joint-Sealant Application: Exterior joints in vertical surfaces and horizontal non-traffic surfaces.

1. Joint Locations:

a. Joints between Precast architectural concrete panels.

b. Joints between different materials listed above.

c. Perimeter joints between materials listed above and frames of doors, windows, and louvers.

d. Other joints as indicated.

2. Urethane Joint Sealant: Multi-component, non-sag, Class 50.

3. Joint-Sealant Color: As selected by Engineer from manufacturer's full range of colors.

E. Joint-Sealant Application: Interior joints in horizontal traffic surfaces.

1. Joint Locations:

a. Floor control and expansion joints. (Except at chemical storage areas or areas with the possibility of being exposed to chemicals from adjacent chemical areas or rooms.

b. Horizontal joints between dissimilar materials.

2. Urethane Joint Sealant: Multi-component, self-leveling, traffic grade, Class 25.

3. Joint-Sealant Color: As selected by Engineer.

F. Joint-Sealant Application: Interior joints in vertical surfaces and horizontal non-traffic surfaces.

1. Joint Locations:

a. Wall control and expansion joints on exposed interior surfaces of exterior walls.

b. Perimeter joints of exterior door and window opening frames where indicated.

c. Vertical joints on exposed surfaces of interior unit masonry and precast concrete walls.

d. Joints on underside of precast structural concrete tees, beams and planks.

e. Perimeter joints between interior wall surfaces and frames of interior doors and windows.

f. Other joints as indicated.

2. Urethane Joint Sealant: Multi-component, non-sag, Class 50, non-traffic.

3. Joint-Sealant Color: As selected by Engineer from manufacturer's full range of colors.

G. Joint-Sealant Application: Interior joints in vertical surfaces and horizontal nontraffic surfaces.

1. Joint Locations:

a. Seal interior perimeters of exterior aluminum openings as shown on the Drawings.

2. Silicone Joint Sealant: single component, non-sag, neutral curing, Class 50.

3. Joint-Sealant Color: As selected by Engineer from manufacturer's full range of colors.

H. Joint-Sealant Application: Mildew-resistant interior joints in vertical surfaces and horizontal non-traffic surfaces.

1. Joint Sealant Location:

a. Joints between plumbing fixtures and adjoining walls, floors, and counters.

2. Silicone Joint Sealant: Single component, non-sag, mildew resistant, acid curing, Class 25.

3. Joint-Sealant Color: As selected by Engineer from manufacturer's full range of colors.

I. Joint-Sealant Application: Interior joints in vertical surfaces and overhead horizontal non-traffic surfaces.

1. Joint Location:

a. Field-painted joints not otherwise indicated.

2. Joint Sealant: Acrylic latex or siliconized acrylic latex, Type OP, Grade NF.

3. Joint-Sealant Color: As selected by Engineer from manufacturer's full range.

J. Joint-Sealant Application: Interior joints in horizontal surfaces at chemical storage areas and areas subject to exposure to chemicals from adjacent chemical areas or rooms.

1. Joint Location:

a. Expansion joint between concrete slab-on-grade and building walls or other elements.

2. Polysulfide Joint Sealant: Multi-component, non-sag, Class 25.

3. Joint-Sealant Color: As selected by Engineer from manufacturer's full range.

1.03 DEFINITIONS:

A. Minimum Thickness: Minimum thickness of base metal without coatings.

B. Custom Hollow Metal Work: Hollow metal work fabricated according to ANSI/ NAAMM-HMMA 861.

1.04 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Product Data: For each type of product indicated. Include construction details, material descriptions, core descriptions, fire-resistance rating, and finishes.

1. Elevations of each door design.

2. Details of doors, including vertical and horizontal edge details and metal thicknesses.

3. Frame details for each frame type, including dimensioned profiles and metal thicknesses.

4. Locations of reinforcement and preparations for hardware.

5. Details of each different wall opening condition.

6. Details of anchorages, joints, field splices, and connections.

7. Details of accessories.

8. Details of moldings, removable stops, and glazing.

9. Details of conduit and preparations for power, signal, and control systems.

10. Schedule: Provide a schedule of hollow metal work prepared by or under the supervision of supplier, using same reference numbers for details and openings as those on Drawings. Coordinate with door hardware schedule.

C. Product Test Reports: Based on evaluation of comprehensive tests performed by a qualified testing agency, for each type of hollow metal door and frame assembly.

1.05 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

B. Source Limitations: Obtain hollow metal work from single source from single manufacturer.

C. Fire-Rated Door Assemblies: Assemblies complying with NFPA 80 that are listed and labeled by a qualified testing agency, for fire-protection ratings indicated, based on testing at positive pressure according to UL 10C.

1.06 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

B. Before delivery, identify type and size of each door with markings that will not damage finish.

C. Preassemble frames and door mullions in shop and deliver to project site with spreader bar at sill, or tie in pairs to form box.

D. Store all doors and frames in a weathertight enclosure and do not expose to the elements.

E. Deliver hollow metal work palletized, wrapped, or crated to provide protection during transit and Project-site storage. Do not use non-vented plastic.

F. Deliver welded frames with two removable spreader bars across bottom of frames, tack welded to jambs and mullions.

G. Store hollow metal work under cover at Project site. Place in stacks of five units maximum in a vertical position with heads up, spaced by blocking, on minimum 4-inch-high wood blocking. Do not store in a manner that traps excess humidity.

1. Provide minimum 1/4-inch space between each stacked door to permit air circulation.

1.07 PROJECT CONDITIONS:

A. Field Measurements: Verify actual dimensions of openings by field measurements before fabrication.

1.08 COORDINATION:

A. Coordinate installation of anchorages for hollow metal frames. Furnish setting drawings, templates, and directions for installing anchorages, including sleeves, concrete inserts,

anchor bolts, and items with integral anchors. Deliver such items to Project site in time for installation.

PART 2 - PRODUCTS

2.01 PREPARATION:

A. Verify details; obtain copy of accepted hardware schedule templates and other information.

B. Verify size, design and fire-resistive rating of each opening.

C. Coordinate details of construction with other work supporting or adjoining frames and doors.

2.02 MANUFACTURERS:

A. Manufacturers:

1. Southwestern Hollow Metal

2. Stiles Custom Metal

3. West Central Manufacturing

2.03 MATERIALS:

A. Cold-Rolled Steel Sheet: ASTM A1008, Commercial Steel (CS), Type B; suitable for exposed applications.

B. Hot-Rolled Steel Sheet: ASTM A1011, Commercial Steel (CS), Type B; free of scale, pitting, or surface defects; pickled and oiled.

C. Metallic-Coated Steel Sheet: ASTM A653, Commercial Steel (CS), Type B; with minimum G60 or A60 metallic coating.

D. Frame Anchors: ASTM A591, Commercial Steel (CS), 40Z coating designation; mill phosphatized.

1. For anchors built into exterior walls, steel sheet complying with ASTM A1008 or ASTM A1011, hot-dip galvanized according to ASTM A153, Class B.

E. Inserts, Bolts, and Fasteners: Hot-dip galvanized according to ASTM A153.

F. Powder-Actuated Fasteners in Concrete: Fastener system of type suitable for application indicated, fabricated from corrosion-resistant materials, with clips or other accessory devices for attaching hollow metal frames of type indicated.

G. Grout: ASTM C476, except with a maximum slump of 4 inches, as measured according to ASTM C143.

H. Mineral-Fiber Insulation: ASTM C665, Type I (blankets without membrane facing); consisting of fibers manufactured from slag or rock wool with 6- to 12-lb/cu. ft. density; with maximum flame-spread and smoke-development indexes of 25 and 50, respectively; passing ASTM E136 for combustion characteristics.

I. Glazing: Comply with requirements in Section 08 81 00.

J. Bituminous Coating: Cold-applied asphalt mastic, SSPC-Paint 12, compounded for 15-mil dry film thickness per coat. Provide inert-type noncorrosive compound free of asbestos fibers, sulfur components, and other deleterious impurities.

2.04 CUSTOM HOLLOW METAL DOORS:

A. General: Provide doors not less than 1-3/4 inches thick, of seamless hollow construction unless otherwise indicated. Construct doors with smooth surfaces without visible joints or seams on exposed faces. Comply with ANSI/NAAMM-HMMA 861.

B. Exterior Door Face Sheets: Fabricated from metallic-coated steel sheet, minimum 0.053 inch thick.

C. Interior Door Face Sheets: Fabricated from metallic-coated steel sheet, minimum 0.053 inch thick.

D. Core Construction: Provide thermal-resistance-rated cores for exterior doors and interior doors where indicated.

1. Steel-Stiffened Core: 0.026-inch-thick, steel vertical stiffeners of same material as face sheets extending full-door height, with vertical webs spaced not more than 6 inches apart, spot welded to face sheets a maximum of 5 inches o.c. Spaces filled between stiffeners with glass- or mineral-fiber insulation.

a. Fire Door Core: As required to provide fire-protection ratings indicated.

b. Thermal-Rated (Insulated) Doors: Where indicated, provide doors fabricated with thermal-resistance value (R-value) of not less than 4.0 degrees F x h x sq. ft./Btu when tested according to ASTM C1363.

E. Vertical Edges for Single-Acting Doors: Beveled 1/8 inch in 2 inches.

F. Vertical Edges for Double-Acting Doors: Round vertical edges with 2-1/8-inch radius.

G. Top and Bottom Channels: Closed with continuous channels, minimum 0.053 inch thick, of same material as face sheets and spot welded to both face sheets.

H. Hardware Reinforcement: Fabricate according to ANSI/NAAMM-HMMA 861 with reinforcing plates from same material as door face sheets.

2.05 CUSTOM HOLLOW METAL FRAMES:

A. General: Fabricate frames of construction indicated. Close contact edges of corner joints tight with faces mitered and stops butted or mitered. Continuously weld faces and soffits and finish faces smooth. Comply with ANSI/NAAMM-HMMA 861.

1. Door Frames for Openings 48 Inches Wide or Less: Fabricated from 0.053-inch-thick steel sheet.

2. Door Frames for Openings More Than 48 Inches Wide: Fabricated from 0.067-inch-thick steel sheet.

3. Transom Frames: Fabricated from same thickness material as adjacent door frame.

4. Borrowed-Light Frames: Fabricated from 0.053-inch-thick steel sheet.

B. Exterior Frames: Formed from metallic-coated steel sheet.

C. Interior Frames: Formed from metallic-coated steel sheet.

D. Hardware Reinforcement: Fabricate according to ANSI/NAAMM-HMMA 861 with reinforcing plates from same material as frame.

E. Head Reinforcement: Provide minimum 0.093-inch-thick, steel channel or angle stiffener for opening widths more than 48 inches.

2.06 FRAME ANCHORS:

A. Jamb Anchors:

1. Masonry Type: Adjustable strap-and-stirrup or T-shaped anchors to suit frame size, not less than 0.042 inch thick, with corrugated or perforated straps not less than 2 inches wide by 10 inches long; or wire anchors not less than 0.177 inch thick.

2. Stud Wall Type: Designed to engage stud, weld back of frames; not less than 0.042 inch thick.

3. Post-installed Expansion Type for In-Place Concrete or Masonry: Minimum 3/8-inch-diameter bolts with expansion shields or inserts. Provide pipe spacer from frame to wall, with throat reinforcement plate, welded to frame at each anchor location.

B. Floor Anchors: Formed from same material as frames, not less than 0.042 inch thick, and as follows:

1. Monolithic Concrete Slabs: Clip-type anchors, with two holes to receive fasteners.

2. Separate Topping Concrete Slabs: Adjustable-type anchors with extension clips, allowing not less than 2-inch height adjustment. Terminate bottom of frames at finish floor surface.

2.07 HOLLOW METAL PANELS:

A. Provide hollow metal panels of same materials, construction, and finish as specified for adjoining hollow metal work.

2.08 STOPS AND MOLDINGS:

A. Moldings for Glazed Lites in Doors: Minimum 0.032 inch thick, fabricated from same material as door face sheet in which they are installed.

B. Fixed Frame Moldings: Formed integral with hollow metal frames, a minimum of 5/8 inch high unless otherwise indicated.

C. Loose Stops for Glazed Lites in Frames: Minimum 0.032 inch thick, fabricated from same material as frames in which they are installed.

2.09 LOUVERS:

A. Provide louvers for interior doors, where indicated, that comply with SDI 111C, with blades or baffles formed of 0.020 inch thick cold rolled steel sheet set into 0.032 inch thick steel frame.

1. Sight proof louver: Stationary louvers constructed with inverted V shaped or Y shaped blades.

2.10 ACCESSORIES:

A. Mullions and Transom Bars: Join to adjacent members by welding or rigid mechanical anchors.

B. Ceiling Struts: Minimum 1/4-inch-thick by 1-inch-wide steel.

C. Grout Guards: Formed from same material as frames, not less than 0.016 inch thick.

2.11 FABRICATION:

A. Fabricate hollow metal work to be rigid and free of defects, warp, or buckle. Accurately form metal to required sizes and profiles, with minimum radius for thickness of metal. Where practical, fit and assemble units in manufacturer's plant. To ensure proper

assembly at Project site, clearly identify work that cannot be permanently factory assembled before shipment.

B. Tolerances: Fabricate hollow metal work to tolerances indicated in ANSI/NAAMM-HMMA 861.

C. Hollow Metal Doors:

1. Exterior Doors: Provide weep-hole openings in bottom of exterior doors to permit moisture to escape. Seal joints in top edges of doors against water penetration.

2. Glazed Lites: Factory cut openings in doors.

3. Astragals: Provide overlapping astragal on one leaf of pairs of doors where required by NFPA 80 for fire-performance rating or where indicated. Extend minimum 3/4-inch beyond edge of door on which astragal is mounted.

D. Hollow Metal Frames: Where frames are fabricated in sections due to shipping or handling limitations, provide alignment plates or angles at each joint, fabricated of same thickness metal as frames.

1. Welded Frames: Weld flush face joints continuously; grind, fill, dress, and make smooth, flush, and invisible.

2. Transom Bar Frames: Provide closed tubular members with no visible face seams or joints, fabricated from same material as door frame. Fasten members at crossings and to jambs by butt welding.

3. Provide countersunk, flat- or oval-head exposed screws and bolts for exposed fasteners unless otherwise indicated.

4. Grout Guards: Weld guards to frame at back of hardware mortises in frames to be grouted.

5. Floor Anchors: Weld anchors to bottom of jambs and mullions with at least four spot welds per anchor.

6. Jamb Anchors: Provide number and spacing of anchors as follows:

a. Stud Wall Type: Locate anchors not more than 18 inches from top and bottom of frame. Space anchors not more than 32 inches o.c. and as follows:

(1) Three anchors per jamb up to 60 inches high.

(2) Four anchors per jamb from 60 inches to 90 inches high.

(3) Five anchors per jamb from 90 to 96 inches high.

(4) Two anchors per head for frames above 42 inches wide and mounted in metal stud partitions

b. Post-installed Expansion Type: Locate anchors not more than 6 inches from top and bottom of frame. Space anchors not more than 26 inches o.c.

7. Door Silencers: Except on weather-stripped doors, drill stops to receive door silencers as follows. Keep holes clear during construction.

a. Single-Door Frames: Drill stop in strike jamb to receive three door silencers.

b. Double-Door Frames: Drill stop in head jamb to receive two door silencers.

E. Fabricate concealed stiffeners, edge channels, and hardware reinforcement from either cold- or hot-rolled steel sheet.

F. Hardware Preparation: Factory prepare hollow metal work to receive templated mortised hardware; include cutouts, reinforcement, mortising, drilling, and tapping according to the Door Hardware Schedule and templates furnished as specified in Section 08 71 00.

1. Locate hardware as indicated, or if not indicated, according to ANSI/NAAMM-HMMA 861.

2. Reinforce doors and frames to receive non-templated, mortised and surface-mounted door hardware.

3. Comply with applicable requirements in ANSI/SDI A250.6 and ANSI/DHI A115 Series specifications for preparation of hollow metal work for hardware.

4. Coordinate locations of conduit and wiring boxes for electrical connections with Division 26 Sections.

G. Stops and Moldings: Provide stops and moldings around glazed lites where indicated. Form corners of stops and moldings with butted or mitered hairline joints.

1. Single Glazed Lites: Provide fixed stops and moldings welded on secure side of hollow metal work.

2. Multiple Glazed Lites: Provide fixed and removable stops and moldings so that each glazed lite are capable of being removed independently.

3. Provide fixed frame moldings on outside of exterior and on secure side of interior doors and frames.

4. Provide loose stops and moldings on inside of hollow metal work.

5. Coordinate rabbet width between fixed and removable stops with type of glazing and type of installation indicated.

2.12 STEEL FINISHES:

A. Prime Finish: Apply manufacturer's standard primer immediately after cleaning and pretreating.

1. Shop Primer: Manufacturer's standard, fast-curing, lead- and chromate-free primer complying with ANSI/SDI A250.10 acceptance criteria; recommended by primer manufacturer for substrate; compatible with substrate and field-applied coatings despite prolonged exposure.

PART 3 - EXECUTION

3.01 EXAMINATION:

A. Examine substrates, areas, and conditions, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.

B. Examine roughing-in for embedded and built-in anchors to verify actual locations before frame installation.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 PREPARATION:

A. Remove welded-in shipping spreaders installed at factory. Restore exposed finish by grinding, filling, and dressing, as required to make repaired area smooth, flush, and invisible on exposed faces.

B. Prior to installation, adjust and securely brace welded hollow metal frames for squareness, alignment, twist, and plumbness to the following tolerances:

1. Squareness: plus or minus 1/16 inch, measured at door rabbet on a line 90 degrees from jamb perpendicular to frame head.

2. Alignment: plus or minus 1/16 inch, measured at jambs on a horizontal line parallel to plane of wall.

3. Twist: plus or minus 1/16 inch, measured at opposite face corners of jambs on parallel lines, and perpendicular to plane of wall.

4. Plumbness: plus or minus 1/16 inch, measured at jambs on a perpendicular line from head to floor.

C. Drill and tap doors and frames to receive non-templated, mortised, and surface-mounted door hardware.

3.03 INSTALLATION:

A. General: Install hollow metal work plumb, rigid, properly aligned, and securely fastened in place; comply with Drawings and manufacturer's written instructions.

B. Hollow Metal Frames: Install hollow metal frames of size and profile indicated. Comply with HMMA 840.

1. Set frames accurately in position, plumbed, aligned, and braced securely until permanent anchors are set. After wall construction is complete, remove temporary braces, leaving surfaces smooth and undamaged.

a. At fire-protection-rated openings, install frames according to NFPA 80.

b. Where frames are fabricated in sections because of shipping or handling limitations, field splice at accepted locations by welding face joint continuously; grind, fill, dress, and make splice smooth, flush, and invisible on exposed faces.

c. Install frames with removable glazing stops located on secure side of opening.

d. Install door silencers in frames before grouting.

e. Remove temporary braces necessary for installation only after frames have been properly set and secured.

f. Check plumbness, squareness, and twist of frames as walls are constructed. Shim as necessary to comply with installation tolerances.

g. Field apply bituminous coating to backs of frames that are filled with grout containing anti-freezing agents.

2. Floor Anchors: Provide floor anchors for each jamb and mullion that extends to floor, and secure with post-installed expansion anchors.

a. Floor anchors may be set with powder-actuated fasteners instead of post-installed expansion anchors if so indicated and accepted on Shop Drawings.

3. Metal stud partitions: Solidly pack mineral fiber insulation behind frame.

4. Concrete Walls: Solidly fill space between frames and concrete with grout. Take precautions, including bracing frames, to ensure that frames are not deformed or damaged by grout forces.

5. In-Place Concrete Construction: Secure frames in place with post-installed expansion anchors. Countersink anchors, and fill and make smooth, flush, and invisible on exposed faces.

6. Installation Tolerances: Adjust hollow metal door frames for squareness, alignment, twist, and plumb to the following tolerances:

   a. Squareness: plus or minus 1/16 inch, measured at door rabbet on a line 90 degrees from jamb perpendicular to frame head.

   b. Alignment: plus or minus 1/16 inch, measured at jambs on a horizontal line parallel to plane of wall.

   c. Twist: plus or minus 1/16 inch, measured at opposite face corners of jambs on parallel lines, and perpendicular to plane of wall.

   d. Plumbness: plus or minus 1/16 inch, measured at jambs at floor.

C. Hollow Metal Doors: Fit hollow metal doors accurately in frames, within clearances specified below. Shim as necessary.

1. Non-Fire-Rated Standard Steel Doors:

   a. Jambs and Head: 1/8 inch, plus or minus 1/16 inch.

   b. Between Edges of Pairs of Doors: 1/8 inch, plus or minus 1/16 inch.

   c. Between Bottom of Door and Top of Threshold: Maximum 3/8 inch.

   d. Between Bottom of Door and Top of Finish Floor (No Threshold): Maximum 3/4 inch.

2. Fire-Rated Doors: Install doors with clearances according to NFPA 80.

D. Glazing: Comply with installation requirements in Section 08 81 00 and with hollow metal manufacturer's written instructions.

1. Secure stops with countersunk flat- or oval-head machine screws spaced uniformly not more than 9 inches o.c. and not more than 2 inches o.c. from each corner.

3.04 ADJUSTING AND CLEANING:

A. Final Adjustments: Check and readjust operating hardware items immediately before final inspection. Leave work in complete and proper operating condition. Remove and replace defective work, including hollow metal work that is warped, bowed, or otherwise unacceptable.

B. Remove grout and other bonding material from hollow metal work immediately after installation.

C. Prime-Coat Touchup: Immediately after erection, sand smooth rusted or damaged areas of prime coat and apply touchup of compatible air-drying, rust-inhibitive primer.

3.05 PROTECTION:

A. After erection, protect doors, frames, vision panels and finishing hardware from damage due to installation of other work or from lime, acid, cement, or other harmful compounds.

B. After erection, protect doors, frames and finishing hardware from damage due to installation of other work or from lime, acid, cement, or other harmful compounds.

C. Replace damaged doors, frames and finishing hardware as determined by the Engineer with new items and at no additional expense to the Owner.

3.06 CONTRACT CLOSEOUT:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 08 41 13

ALUMINUM FRAMED ENTRANCES AND STOREFRONTS

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide exterior entrances and aluminum window systems and accessories as indicated and in compliance with Contract Documents.

1. Section Includes:

a. Storefront systems for punched openings

b. Entrance doors and storefront systems

1.03 PERFORMANCE REQUIREMENTS:

A. General Performance: Aluminum-framed systems shall withstand the effects of the following performance requirements without exceeding performance criteria or failure due to defective manufacture, fabrication, installation, or other defects in construction:

1. Movements of supporting structure indicated on Drawings including, but not limited to, story drift and deflection from uniformly distributed and concentrated live loads.

2. Dimensional tolerances of building frame and other adjacent construction.

3. Failure includes the following:

a. Deflection exceeding specified limits.

b. Thermal stresses transferring to building structure.

c. Framing members transferring stresses, including those caused by thermal and structural movements to glazing.

d. Glazing-to-glazing contact.

e. Noise or vibration created by wind and by thermal and structural movements.

f. Loosening or weakening of fasteners, attachments, and other components.

g. Sealant failure.

B. Delegated Design: Design aluminum-framed systems, including comprehensive engineering analysis by a qualified professional engineer, using performance requirements and design criteria indicated.

C. Structural Loads:

1. Seismic Loads: As indicated on Structural Drawings

2. Wind Loads: As indicated on Structural Drawings

D. Deflection of Framing Members:

1. Deflection Normal to Wall Plane: Limited to edge of glass in a direction perpendicular to glass plane shall not exceed L/175 of the glass edge length for each individual glazing lite or an amount that restricts edge deflection of individual glazing lites to 3/4-inch, whichever is less.

2. Deflection Parallel to Glazing Plane: Limited to amount not exceeding that which reduces glazing bite to less than 75 percent of design dimension and that which reduces edge clearance between framing members and glazing or other fixed components directly below them to less than 1/8-inch and clearance between members and operable units directly below them to less than 1/16-inch.

E. Structural-Test Performance: Provide aluminum-framed systems tested according to ASTM E330 as follows:

1. When tested at positive and negative wind-load design pressures, systems do not evidence deflection exceeding specified limits.

2. When tested at 150 percent of positive and negative wind-load design pressures, systems, including anchorage, do not evidence material failures, structural distress, and permanent deformation of main framing members exceeding 0.2 percent of span.

3. Test Durations: As required by design wind velocity, but not fewer than 10 seconds.

F. Windborne-Debris-Impact-Resistance Performance: Provide aluminum-framed systems that pass missile-impact and cyclic-pressure tests when tested according to ASTM E1886 and testing information in ASTM E1996.

1. Large-Missile Impact: For aluminum-framed systems located within 30 feet of grade.

2. Small-Missile Impact: For aluminum-framed systems located more than 30 feet above grade.

G. Story Drift: Provide aluminum-framed systems that accommodate design displacement of adjacent stories indicated.

1. Test Performance: Meet criteria for passing, based on building occupancy type, when tested according to AAMA 501.4 at design displacement and 1.5 times design displacement.

H. Air Infiltration: Provide aluminum-framed systems with maximum air leakage through fixed glazing and framing areas of 0.06 cfm/sq. ft. of fixed wall area when tested according to ASTM E283 at a minimum static-air-pressure difference of 6.24 lbf/sq. ft.

I. Water Penetration under Static Pressure: Provide aluminum-framed systems that do not evidence water penetration through fixed glazing and framing areas when tested according to ASTM E331 at a minimum static-air-pressure difference of 20 percent of positive wind-load design pressure, but not less than 6.24 lbf/sq. ft.

J. Water Penetration under Dynamic Pressure: Provide aluminum-framed systems that do not evidence water leakage through fixed glazing and framing areas when tested according to AAMA 501.1 under dynamic pressure equal to 20 percent of positive wind-load design pressure, but not less than 6.24 lbf/sq. ft.

1. Maximum Water Leakage: No uncontrolled water penetrating aluminum-framed systems or water appearing on systems' normally exposed interior surfaces from sources other than condensation. Water leakage does not include water controlled by flashing and gutters that is drained to exterior and water that cannot damage adjacent materials or finishes.

K. Thermal Movements: Provide aluminum-framed systems that allow for thermal movements resulting from the following maximum change (range) in ambient and surface temperatures. Base engineering calculation on surface temperatures of materials due to both solar heat gain and nighttime-sky heat loss.

1. Temperature Change (Range): 120 degrees F, ambient; 180 degrees F, material surfaces.

2. Test Performance: No buckling; stress on glass; sealant failure; excess stress on framing, anchors, and fasteners; or reduction of performance when tested according to AAMA 501.5.

a. High Exterior Ambient-Air Temperature: That which produces an exterior metal-surface temperature of 180 degrees F

b. Low Exterior Ambient-Air Temperature: 0 degrees F

3. Interior Ambient-Air Temperature: 75 degrees F

L. Condensation Resistance: Provide aluminum-framed systems with fixed glazing and framing areas having condensation-resistance factor (CRF) of not less than 51 when tested according to AAMA 1503.

M. Thermal Conductance: Provide aluminum-framed systems with fixed glazing and framing areas having an average U-factor of not more than 0.36 Btu/sq. ft. x h x degrees F when tested according to AAMA 1503.

N. Structural Sealant: Capable of withstanding tensile and shear stresses imposed by aluminum-framed systems without failing adhesively or cohesively. When tested for preconstruction adhesion and compatibility, cohesive failure of sealant shall occur before adhesive failure.

1. Adhesive failure occurs when sealant pulls away from substrate cleanly, leaving no sealant material behind.

2. Cohesive failure occurs when sealant breaks or tears within itself but does not separate from each substrate because sealant-to-substrate bond strength exceeds sealant's internal strength.

O. Structural-Sealant Joints: Designed to produce tensile or shear stress of less than 20 psi.

1.04 SUSTAINABLE DESIGN:

A. Comply with requirements specified in Section 01 81 13.01.

1.05 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Product Data: For each type of product indicated. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes for aluminum-framed systems.

1. Product Data for Credit IEQ 4.1: For adhesives and sealants used inside of the weatherproofing system, documentation including printed statement of VOC content.

C. Shop Drawings: For aluminum-framed systems. Include plans, elevations, sections, details, and attachments to other work.

1. Include details of provisions for system expansion and contraction and for drainage of moisture in the system to the exterior.

D. Fabrication Sample: Of each vertical-to-horizontal intersection of aluminum-framed systems, made from 12-inch lengths of full-size components and showing details of the following:

1. Joinery, including concealed welds

2. Anchorage

3. Expansion provisions

4. Glazing

5. Flashing and drainage

E. Delegated-Design Submittal: For aluminum-framed systems indicated to comply with performance requirements and design criteria, including analysis data signed and sealed by the qualified professional engineer responsible for their preparation.

1. Detail fabrication and assembly of aluminum-framed systems.

2. Include design calculations.

F. Product Test Reports: Based on evaluation of comprehensive tests performed by a qualified testing agency, for aluminum-framed systems, indicating compliance with performance requirements.

G. Entrance Door Hardware Schedule: Prepared by or under supervision of supplier, detailing fabrication and assembly of entrance door hardware, as well as procedures and diagrams. Coordinate final entrance door hardware schedule with doors, frames, and related work to ensure proper size, thickness, hand, function, and finish of entrance door hardware.

H. Warranties: Sample of special warranties.

I. Maintenance Data: For aluminum-framed systems to include in maintenance manuals.

1.06 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

B. Installer Qualifications: Manufacturer's authorized representative who is trained and approved for installation of units required for this Project.

C. Product Options: Information on Drawings and in Specifications establishes requirements for systems' aesthetic effects and performance characteristics. Aesthetic effects are indicated by dimensions, arrangements, alignment, and profiles of components and assemblies as they relate to sightlines, to one another, and to adjoining construction. Performance characteristics are indicated by criteria subject to verification by one or more methods including preconstruction testing, field testing, and in-service performance.

1. Do not revise intended aesthetic effects, as judged solely by Engineer, except with Engineer’s acceptance. If revisions are proposed, submit comprehensive explanatory data to Engineer for review.

D. Source Limitations for Aluminum-Framed Systems: Obtain from single source from single manufacturer.

E. Preinstallation Conference: Conduct conference at Project site.

1. Convene minimum one week prior to commencing Work of this section.

1.07 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

B. Handle Products of this section in accordance with AAMA MCWM-1 - Curtain Wall Manual #10.

C. Protect finished aluminum surfaces with wrapping. Do not use adhesive papers or sprayed coatings that bond when exposed to sunlight or weather.

1.08 PROJECT/SITE CONDITIONS:

A. Field Measurements: Verify actual locations of structural supports for aluminum-framed systems by field measurements before fabrication and indicate measurements on Shop Drawings.

B. Environmental Conditions: Do not install sealants nor glazing materials when ambient temperature is less than 40 degrees F during and 48 hours after installation.

1.09 WARRANTY:

A. Comply with general requirements specified in Section 01 78 36.

B. Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components of aluminum-framed systems that do not comply with requirements or that fail in materials or workmanship within specified warranty period.

1. Failures include, but are not limited to, the following:

a. Structural failures including, but not limited to, excessive deflection.

b. Noise or vibration caused by thermal movements.

c. Deterioration of metals, metal finishes, and other materials beyond normal weathering.

d. Adhesive or cohesive sealant failures.

e. Water leakage through fixed glazing and framing areas.

2. Warranty Period: 10 years from date of Substantial Completion.

C. Special Finish Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components on which finishes do not comply with requirements or that fail in materials or workmanship within specified warranty period. Warranty does not include normal weathering.

1. Warranty Period: 20 years from date of Substantial Completion.

PART 2 - PRODUCTS

2.01 SYSTEM DESCRIPTION:

A. Aluminum-framed storefront system includes tubular aluminum sections, shop fabricated, factory finished, glass and glazing, insulated metal panel infill, related flashings, anchorage and attachment devices.

B. System Assembly: Shop unitized assembly

2.02 MANUFACTURERS:

A. Aluminum Entrances and Storefronts:

1. EFCO Corporation; X-Therm Series 403X

2. Kawneer North America; an Alcoa Company; Trifab 451 UT

3. United States Aluminum; Series 45X

B. Aluminum Infill Panels

1. Mapes Industries, Inc.; Mapes-R panel

2. NUDO; Endure 525

3. Laminators Inc.; Omega Foam-Ply

2.03 MATERIALS:

A. Aluminum: Alloy and temper recommended by manufacturer for type of use and finish indicated.

1. Sheet and Plate: ASTM B209

2. Extruded Bars, Rods, Profiles, and Tubes: ASTM B221

3. Extruded Structural Pipe and Tubes: ASTM B429

4. Structural Profiles: ASTM B308

B. Steel Reinforcement: Manufacturer's standard zinc-rich, corrosion-resistant primer, complying with SSPC-PS Guide No. 12.00; applied immediately after surface preparation and pretreatment. Select surface preparation methods according to recommendations in SSPC-SP COM and prepare surfaces according to applicable SSPC standard.

1. Structural Shapes, Plates, and Bars: ASTM A36

2. Cold-Rolled Sheet and Strip: ASTM A1008

3. Hot-Rolled Sheet and Strip: ASTM A1011

2.04 FRAMING SYSTEMS:

A. Framing Members: Manufacturer's standard extruded-aluminum framing members of thickness required and reinforced as required to support imposed loads.

1. Construction: Thermally broken

2. Glazing System: Retained mechanically with gaskets on four sides

3. Glazing Plane: Center

B. Brackets and Reinforcements: Manufacturer's standard high-strength aluminum with non-staining, non-ferrous shims for aligning system components.

C. Fasteners and Accessories: Manufacturer's standard corrosion-resistant, non-staining, nonbleeding fasteners and accessories compatible with adjacent materials.

1. Use self-locking devices where fasteners are subject to loosening or turning out from thermal and structural movements, wind loads, or vibration.

2. Reinforce members as required to receive fastener threads.

3. Provide concealed fasteners except where unavoidable use exposed fasteners with countersunk Phillips screw heads, finished to match framing system

D. Concrete and Masonry Inserts: Hot-dip galvanized cast-iron, malleable-iron, or steel inserts, complying with ASTM A123 or ASTM A153.

E. Concealed Flashing: Manufacturer's standard corrosion-resistant, non-staining, nonbleeding flashing and end dams compatible with adjacent materials.

F. Framing System Gaskets and Sealants: Manufacturer's standard, recommended by manufacturer for joint type.

2.05 ENTRANCE DOOR SYSTEMS

A. Entrance Doors: Manufacturer's standard glazed entrance doors for manual-swing operation.

1. Door Construction: 2-inch overall thickness, with 0.125-inch- thick, extruded-aluminum tubular rail and stile members. Mechanically fasten corners with reinforcing brackets that are deeply penetrated, and fillet welded or that incorporate concealed tie rods.

a. Thermal Construction: High-performance plastic connectors separate aluminum members exposed to the exterior from members exposed to the interior.

2. Door Design: 5-inch nominal width stiles *and 10-inch bottom rail*.

3. Glazing Stops and Gaskets: snap-on, extruded-aluminum stops and preformed gaskets.

a. Provide nonremovable glazing stops on outside of door.

4. Finish: Match adjacent storefront framing finish.

2.06 ENTRANCE DOOR HARDWARE

A. Entrance Door Hardware: Hardware not specified in this Section is specified in Section 08 71 00.

B. General: Provide entrance door hardware and entrance door hardware sets indicated in door and frame schedule on drawings.

C. Continuous-Gear Hinges: BHMA A156.26.

D. Weather Stripping: Manufacturer's standard replaceable components.

1. Compression Type: Made of ASTM D2000 molded neoprene or ASTM D2287 molded PVC.

2. Sliding Type: AAMA 701/702, made of wool, polypropylene, or nylon woven pile with nylon-fabric or aluminum-strip backing.

E. Weather Sweeps: Manufacturer's standard exterior-door bottom sweep with concealed fasteners on mounting strip.

F. Finger Guards: Manufacturer's standard collapsible neoprene or PVC gasket anchored to frame hinge-jamb at center-pivoted doors.

2.07 GLAZING SYSTEMS:

A. Glazing: As specified in Section 08 81 00.

B. Glazing Gaskets: Manufacturer's standard compression types; replaceable, molded or extruded, of profile and hardness required to maintain watertight seal.

C. Spacers and Setting Blocks: Manufacturer's standard elastomeric type.

D. Bond-Breaker Tape: Manufacturer's standard TFE-fluorocarbon or polyethylene material to which sealants will not develop adhesion.

1. Weatherseal Sealant: ASTM C920 for Type S, Grade NS, Class 25, Uses NT, G, A, and O; single-component neutral-curing formulation that is compatible with structural sealant and other system components with which it comes in contact; recommended by structural-sealant, weatherseal-sealant, and aluminum-framed-system manufacturers for this use.

2.08 ACCESSORY MATERIALS:

A. Joint Sealants: For installation at perimeter of aluminum-framed systems, as specified in Section 07 92 00.

B. Bituminous Paint: Cold-applied, asphalt-mastic paint complying with SSPC-Paint 12 requirements except containing no asbestos; formulated for 30-mil thickness per coat.

2.09 FABRICATION:

A. Form or extrude aluminum shapes before finishing.

B. Weld in concealed locations to greatest extent possible to minimize distortion or discoloration of finish. Remove weld spatter and welding oxides from exposed surfaces by descaling or grinding.

C. Framing Members, General: Fabricate components that, when assembled, have the following characteristics:

1. Profiles that are sharp, straight, and free of defects or deformations.

2. Accurately fitted joints with ends coped or mitered.

3. Means to drain water passing joints, condensation within framing members, and moisture migrating within the system to exterior.

4. Physical and thermal isolation of glazing from framing members.

5. Accommodations for thermal and mechanical movements of glazing and framing to maintain required glazing edge clearances.

6. Provisions for field replacement of glazing from interior.

7. Fasteners, anchors, and connection devices that are concealed from view to greatest extent possible.

D. Mechanically Glazed Framing Members: Fabricate for flush glazing without projecting stops.

2.10 ALUMINUM FINISHES:

A. Anodic Finish: AAMA 611, AA-M12C22A41, Class I, 0.018 mm.

PART 3 - EXECUTION

3.01 EXAMINATION:

A. Examine areas and conditions, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.

B. Verify dimensions and method of attachment with other work.

C. Verify wall openings and adjoining air and vapor seal materials are ready to receive work of this Section.

D. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 INSTALLATION:

A. General:

1. Comply with manufacturer's written instructions.

2. Do not install damaged components.

3. Fit joints to produce hairline joints free of burrs and distortion.

4. Rigidly secure non-movement joints.

5. Install anchors with separators and isolators to prevent metal corrosion and electrolytic deterioration.

6. Seal joints watertight unless otherwise indicated.

B. Metal Protection:

1. Where aluminum will contact dissimilar metals, protect against galvanic action by painting contact surfaces with primer or applying sealant or tape, or by installing nonconductive spacers as recommended by manufacturer for this purpose.

2. Where aluminum will contact concrete or masonry, protect against corrosion by painting contact surfaces with bituminous paint.

C. Install components to drain water passing joints, condensation occurring within framing members, and moisture migrating within the system to exterior.

D. Set continuous sill members and flashing in full sealant bed as specified in Section 07 92 00 to produce weathertight installation.

E. Install components plumb and true in alignment with established lines and grades, and without warp or rack.

F. Install glazing as specified in Section 08 81 00.

3.03 ERECTION TOLERANCES:

A. Install aluminum-framed systems to comply with the following maximum erection tolerances:

1. Location and Plane: Limit variation from true location and plane to 1/8-inch in 12 feet; 1/4-inch over total length.

2. Alignment:

a. Where surfaces abut in line, limit offset from true alignment to 1/16-inch.

b. Where surfaces meet at corners, limit offset from true alignment to 1/32-inch.

B. Diagonal Measurements: Limit difference between diagonal measurements to 1/8-inch.

3.04 CLEANING:

A. Perform cleaning in accordance with Section 01 74 23.

B. Remove protective material from pre-finished aluminum surfaces.

C. Wash down surfaces with a solution of mild detergent in warm water, applied with soft, clean wiping cloths. Take care to remove dirt from corners. Wipe surfaces clean.

D. Remove excess sealant by method acceptable to sealant manufacturer.

3.05 PROTECTION OF INSTALLED CONSTRUCTION:

A. Protect installed aluminum entrances in accordance with Section 01 74 23.

B. Protect finished Work from damage.

3.06 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 08 63 00

METAL-FRAMED SKYLIGHTS

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide metal-framed skylights as indicated and in compliance with Contract Documents.

1. Section includes skylights with metal framing.

1.02 REFERENCES:

1.03 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Product Data: For each type of product indicated. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes for metal-framed skylights.

C. Shop Drawings: For metal-framed skylights. Include plans, elevations, sections, details, and attachments to other work.

1. Include details of provisions for assembly expansion and contraction and for draining moisture within the assembly to the exterior.

2. Include full-size isometric details of each vertical-to-horizontal intersection of assembly, showing the following:

a. Joinery including concealed welds.

b. Anchorage.

c. Expansion provisions.

d. Glazing.

e. Flashing and drainage.

D. Samples for Initial Selection: For units with factory-applied color finishes.

E. Samples for Verification: For each type of exposed finish required, in manufacturer's standard sizes.

F. Delegated-Design Submittal: For metal-framed skylights and fall protection mesh indicated to comply with performance requirements and design criteria, including analysis data signed and sealed by the qualified professional engineer responsible for their preparation.

G. Qualification Data: For qualified Installer.

H. Welding certificates.

I. Product Test Reports: Based on evaluation of comprehensive tests performed by a qualified testing agency, for metal-framed skylights.

J. Field quality-control reports.

K. Warranties: Sample of special warranties.

1.04 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

B. Installer Qualifications: An experienced installer who has specialized in installing metal-framed skylights similar to those indicated for this Project and who is acceptable to manufacturer.

C. Professional Engineer Qualifications: A professional engineer who is experienced in providing engineering services of the kind indicated. Engineering services are defined as those performed for installations of skylights that are similar to those indicated for this Project in material, design, and extent.

D. Product Options: Information on Drawings and in Specifications establishes requirements for skylights' aesthetic effects and performance characteristics. Aesthetic effects are indicated by dimensions, arrangements, alignment, and profiles of components and assemblies as they relate to sightlines, to one another, and to adjoining construction. Performance characteristics are indicated by criteria subject to verification by one or more methods including testing conducted by an independent testing agency and in-service performance.

1. Do not modify intended aesthetic effects, as judged solely by Engineer, except with Engineer's approval. If modifications are proposed, submit comprehensive explanatory data to Engineer for review.

E. Welding Qualifications: Qualify procedures and personnel according to AWS D1.2, "Structural Welding Code - Aluminum

F. Provide metal-framed skylights that comply with test-performance requirements indicated, as evidenced by reports of tests performed on manufacturer's standard assemblies.

G. Preinstallation Conference: Conduct conference at Project site.

1.05 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

1.06 WARRANTY:

A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components of metal-framed skylights that fail in materials or workmanship within specified warranty period.

1. Failures include, but are not limited to, the following:

a. Structural failures including, but not limited to, excessive deflection.

b. Noise or vibration caused by thermal movements.

c. Deterioration of metals, metal finishes, and other materials beyond normal weathering.

d. Water leakage. Water leakage; defined as uncontrolled water appearing on normally exposed interior surfaces of skylights from sources other than condensation, resulting from defects in skylight materials or workmanship. Water leakage resulting from improper installations not part of this warranty.

B. System Warranty Period: Five years from date of Substantial Completion.

C. Special Finish Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components on which finishes fail within specified warranty period. Warranty does not include normal weathering.

1. Failures include, but are not limited to, checking, crazing, peeling, chalking, and fading of finishes.

D. Plastic Warranty: Provide written warranty signed by manufacturer agreeing to repair or replace work that has or develops defects in the plastic. "Defects" is defined as abnormal aging or deterioration.

1. Warranty Period for polycarbonate: 10 years from date of Substantial Completion.

E. Finish Warranty: Provide written warranty signed by manufacturer agreeing to repair or replace work with finish defects. "Defects" is defined as peeling, chipping, chalking, fading, abnormal aging or deterioration, and failure to perform as required.

1. Warranty Period for Kynar 500 Finish: 10 years from date of Substantial Completion.

PART 2 - PRODUCTS

2.01 Manufacturers:

A. Manufacturers:

1. Basis of design: Wasco Products, Inc. – Pinnacle 350

2. Bristolite Skylights.

3. Kawneer North America; an Alcoa company.

2.02 PERFORMANCE REQUIREMENTS:

A. General: Metal-framed skylights shall withstand the effects of the following without failure due to defective manufacture, fabrication, installation, or other defects in construction:

1. Structural loads.

2. Thermal movements.

3. Movements of supporting structure.

4. Dimensional tolerances of support system and other adjacent construction.

5. Failure includes, but is not limited to, the following:

a. Deflection exceeding specified limits.

b. Thermal stresses transferring to building structure.

c. Framing members transferring stresses, including those caused by thermal and structural movements to glazing.

d. Noise or vibration created by wind and by thermal and structural movements.

e. Loosening or weakening of fasteners, attachments, and other components.

f. Sealant failure.

B. Delegated Design: Design metal-framed skylights and fall protection mesh, including comprehensive engineering analysis by a qualified professional engineer, using performance requirements and design criteria indicated.

C. Structural Loads:

1. Wind Loads: See Section 01 41 20 Seismic and Wind Requirements

2. Seismic Loads: See Section 01 41 20 Seismic and Wind Requirements

3. Concentrated Load: 250 lbs applied to framing members at location that produces the most severe stress or deflection.

4. Snow Loads: As required by codes in force

D. Deflection of Framing Members: At design wind pressure, as follows:

1. Deflection Normal to Glazing Plane: Limited to edge of glass in a direction perpendicular to glass plane not exceeding L/175 of the glass edge length for each

individual glazing lite or an amount that restricts edge deflection of individual glazing lites to 3/4-inch, whichever is less.

2. Deflection Parallel to Glazing Plane: Limited to /360 of clear span or 1/8-inch, whichever is smaller

E. Lateral Bracing of Framing Members: Compression flanges of flexural members are laterally braced by cross members with minimum depth equal to 50 percent of flexural member that is braced. Glazing does not provide lateral support.

F. Structural-Test Performance: Provide metal-framed skylights tested according to ASTM E330, as follows:

1. When tested at positive and negative wind-load design pressures, assemblies do not evidence deflection exceeding specified limits.

2. When tested at 150 percent of positive and negative wind-load design pressures, assemblies, including anchorage, do not evidence material failures, structural distress, and permanent deformation of main framing members exceeding 0.2 percent of span.

3. Test Durations: As required by design wind velocity, but not less than 10seconds.

G. Air Infiltration: Provide metal-framed skylights with maximum air leakage through fixed glazing and framing areas of 0.06 cfm/sq. ft. of fixed wall area when tested according to ASTM E 283 at a minimum static-air-pressure difference of 6.24 lbf/sq. ft.

H. Water Penetration under Static Pressure: Provide metal-framed skylights that do not evidence water penetration through fixed glazing and framing areas when tested according to ASTM E331 at a minimum static-air-pressure difference of 20 percent of positive wind-load design pressure, but not less than 6.24 lbf/sq. ft

I. Water Penetration under Dynamic Pressure: Provide metal-framed skylights that do not evidence water leakage through fixed glazing and framing areas when tested according to AAMA 501.1 under dynamic pressure equal to 20 percent of positive wind-load design pressure, but not less than 6.24 lbf/sq. ft.

1. Maximum Water Leakage: No uncontrolled water penetrating aluminum-framed systems or water appearing on systems' normally exposed interior surfaces from sources other than condensation.

J. Thermal Movements: Provide metal-framed skylights that allow for thermal movements resulting from the following maximum change (range) in ambient and surface temperatures. Base engineering calculations on surface temperatures of materials due to both solar heat gain and nighttime-sky heat loss.

1. Temperature Change (Range): 100 degrees F , ambient; 180 degrees F, material surfaces.

K. Condensation Resistance: Provide metal-framed skylights with fixed glazing and framing areas having condensation-resistance factor (CRF) of not less than 88 when tested according to NFRC 500.

L. Energy Performance: Provide metal-framed skylights with performance properties specified, as indicated in manufacturer's published test data, based on procedures indicated below and certified and labeled according to NFRC:

1. Thermal Transmittance (U-Factor): Fixed glazing and framing areas shall have U-factor of not more than 0.180 Btu/sq. ft. x h x degrees F as determined according to NFRC 100.

2. Solar Heat Gain Coefficient: Fixed glazing and framing areas shall have a solar heat gain coefficient of no greater than .49 as determined according to NFRC 200.

2.03 FRAMING SYSTEMS:

A. Framing Members: Extruded aluminum alloy 6063-T5 or T6, ASTM B221 with minimum effective thickness of 0.109 inches.

B. Exterior Pressure Caps: Extruded aluminum alloy 6063-T5 or T6, ASTM B221 with minimum effective thickness of 0.090 inches.

C. Concealed Flashing: Manufacturer’s standard corrosion-resistant, non-staining, non-bleeding flashing; compatible with adjacent materials.

D. Exposed Flashing and Closures: Aluminum sheet alloy and temper of 1100-H14, thickness as require for proper performance.

1. Minimum Thickness: 0.032 inch Apron Flashing.

2. Minimum Thickness: 0.062 inch Closures.

E. Fasteners and Accessories: Manufacturer’s standard corrosion-resistant, non-staining, non-bleeding fasteners and accessories; compatible with adjacent materials.

1. Aluminum Retaining Cap Fasteners and Framing Members Fasteners: ASTM A193, Series 300 stainless-steel screws; type as recommended by manufacturer.

2. Connections to Supporting Structure: Series 300 Stainless Steel or ASTM A307, hot dipped galvanized steel fasteners by installer.

F. Framing-System Sealants: Single-component, non-sag, high performance, non-priming, gun-grade elastomeric polyurethane sealant furnished by skylight manufacturer.

1. Sealant complies with ASTM C920, Type S, Grade NS, Class 25, Use T, NT, M, A, G, and O. Canadian Specification CAN/CGSB-19.13-M87, Classification MCG-2-25-A-N.

2. Sealant conforms to USDA approval standards.

G. Bituminous Paint: Cold-applied asphalt mastic paint complying with SSPC-Paint 12, except containing no asbestos, and formulated for 30-mil thickness per coat.

2.04 GLAZING:

A. Multiwall Polycarbonate: 25MM multiwall polycarbonate panels

1. Clear/Crystal with Lumira Aerogel.

a. No fiberglass allowed.

B. Glazing Gaskets: Manufacturer's proprietary pressure-glazing gaskets of elastomer type and hardness selected by the skylight manufacturer to comply with requirements. Glazing gaskets to be extruded thermoplastic elastomer by the skylight manufacturer.

C. Spacers, Edge Blocks, and Setting Blocks: Manufacturer's standard permanent non-migrating type of elastomer type and hardness selected to comply with requirements. Spacers, Edge Blocks, and Setting Blocks to be extruded thermoplastic elastomer by the skylight manufacturer.

D. Glazing Weatherseal Sealant: Neutral-curing silicone sealant recommended by skylight and sealant manufacturers for this use and furnished by skylight manufacturer.

1. Sealant is capable of withstanding 50 percent movement in both extension and compression (total of 100 percent movement) when tested for adhesion and cohesion under maximum cyclic movement according to ASTM C719.

2. Sealant complies with ASTM C 920 for Type S, Grade NS, Class 25, Uses NT, G, A, and, as applicable to substrates including other sealants with which it comes in contact, O.

3. Color: Black.

E. Flashing Sealant: Single-component, non-sag, high performance, non-priming, gun-grade elastomeric polyurethane sealant furnished by skylight manufacturer.

1. Sealant complies with ASTM C920, Type S, Grade NS, Class 25, Use T, NT, M, A, G, and O.

2. Sealant conforms to USDA approval standards.

2.05 FALL PROTECTION SCREEN

A. MATERIALS

1. Screen: Welded steel wire mesh, 4" x 4" spacing, wire diameter - .188" min. hot dipped galvanized finish on carbon steel.

2. Frame: Extruded aluminum alloy 6063-T5 (min). ASTM B 221 (ASTM B 221 M) with minimum effective thickness of 0.090 inch (2.2 mm).

3. Frame includes a pocket for the edges of the screen material, and a downward leg for attachment to any vertical surface of a skylight retainer or frame.

4. Adjustment Bar: Extruded aluminum bar stock, ¼" x 1", alloy 6063-T5 (min). ASTM B 221 (ASTM B 221 M).

5. Adjustment bar is slotted for width adjustment in the field.

6. Fasteners: Nonmagnetic stainless steel or other non-corrosive metal as recommended by manufacturer.

7. OSHA compliant per 29 CFR SS1910.23 and SS1926.501.

B. FABRICATION

1. Fabricate frame components to factory specifications.

2. Assemble frame legs (2 sides) and adjustment bar (2 sides) into a frame using ¼-14 x 1" hex hd. stainless steel fasteners.

3. Install screen in frame and fix into frame with 1/4-14 x 1" hex hd. stainless steel fasteners.

2.06 FABRICATION:

A. Framing Components: As follows:

1. Factory fit and assemble components, where practical.

2. Fabricate components that, when assembled, will have accurately fitted joints with ends coped or mitered to produce hairline joints free of burrs and distortion.

3. Fabricate components to drain water passing joints and to drain condensation and moisture occurring or migrating within skylight system to the exterior.

4. Fabricate components to accommodate expansion, contraction, and field adjustment, and to provide for minimum clearance and shimming at skylight perimeter.

5. Fabricate components to ensure that glazing is thermally and physically isolated from framing members.

6. Form shapes with sharp profiles, straight and free of defects or deformations, before finishing.

7. Fit and assemble components to greatest extent practicable before finishing.

8. Reinforce members as required to retain fastener threads.

9. Attach retainer bars with gasketed stainless steel fasteners spaced at a maximum of 12 inches on center.

10. Weld components before finishing and in concealed locations to greatest extent practicable to minimize distortion.

11. Before shipping, shop assemble, mark, and disassemble components that cannot be permanently shop assembled.

B. Provide continuous aluminum frame with weatherproof splice joints and locked and sealed or fully welded corners. Locate weep holes in the frame at each rafter connection to drain condensation.

C. Prepare framing to receive anchor and connection devices and fasteners.

D. Field Glazing: Locate and size extruded elastomeric setting blocks and spacers in accordance with the glazing manufacturer’s recommendations. At no point shall the glazing come in contact with the skylight frame or fasteners.

2.07 ALUMINUM FINISHES:

A. High-Performance Organic Finish: Four-coat fluoropolymer finish complying with AAMA 2605 and containing not less than 70 percent PVDF resin by weight in both color coat and clear topcoat. Prepare, pretreat, and apply coating to exposed metal surfaces to comply with coating and resin manufacturers' written instructions.

1. Color and Gloss: As selected by Engineer from manufacturer's full range.

PART 3 - EXECUTION

3.01 EXAMINATION:

A. Examine areas and conditions, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 PREPARATION

A. Where aluminum will contact dissimilar metals, protect against galvanic action by painting contact surfaces with primer or by applying sealant or tape recommended by manufacturer for this purpose.

B. Where aluminum will contact concrete or masonry, protect against corrosion by painting contact surfaces with bituminous paint.

C. Where aluminum will contact pressure-treated wood, separate dissimilar materials by methods recommended by manufacturer.

3.03 INSTALLATION:

A. General:

1. Comply with manufacturer's written instructions.

2. Fit frame joints to produce hairline joints free of burrs and distortion.

3. Rigidly secure non-movement joints.

4. Accommodate thermal and mechanical movements.

5. Install framing components to drain water passing joints and to drain condensation and moisture occurring or migrating within skylight system to the exterior.

6. Coordinate installation of flashings and crickets at skylight perimeters to maintain continuity of water barriers.

7. Set continuous curbs and flashings in a full sealant bed, unless otherwise indicated. Comply with requirements in Division 7 Section “Joint Sealants.”

B. Metal Protection: Where aluminum will contact dissimilar materials, protect against galvanic action by painting contact surfaces with protective coating or by installing nonconductive spacers as recommended in writing by manufacturer for this purpose.

C. Install continuous aluminum sill closure with weatherproof expansion joints and locked and sealed or welded corners. Locate weep holes at rafters.

D. Install components to drain water passing joints, condensation occurring within framing members, and moisture migrating within skylight to exterior.

E. Install components plumb and true in alignment with established lines and elevations.

F. Install weatherseal sealant according to Section 07 92 00 and according to weatherseal-sealant manufacturer's written instructions to produce weatherproof joints. Install joint filler behind weatherseal sealant as recommended in writing by weatherseal-sealant manufacturer.

G. Erection Tolerances: Install skylight components true in plane, accurately aligned, and without warp or rack. Adjust framing to comply with the following tolerances:

1. Variation from Plane: Limit variation from plane or location shown to 1/8 inch in 10 feet; 1/4 inch over total length.

2. Alignment: Where surfaces abut in line and at corners and where surfaces are separated by less than 3 inches, limit offset from true alignment to less than 1/32 inch; otherwise, limit offset from true alignment to 1/8 inch.

H. Field Glazing: Locate and size extruded elastomeric setting blocks and spacers in accordance with the glazing manufacturer's recommendations. At no point shall the glazing come in contact with the skylight frame or fasteners

I. Install secondary-sealant weatherseal according to sealant manufacturer's written instructions to provide weatherproof joints. Install joint fillers behind sealant as recommended by sealant manufacturer.

3.04 CLEANING

A. Clean skylights inside and outside, immediately after installation and after sealants have cured, according to manufacturer's written recommendations.

1. Remove temporary protective coverings and strippable coatings from pre-finished metal surfaces. Remove labels and markings from all components.

B. Remove excess sealant according to sealant manufacturer's written recommendations.

3.05 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 08 71 00

FINISH HARDWARE

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide finish hardware as indicated and in compliance with Contract Documents.

1. Section Includes:

a. Finish hardware for doors as specified and as listed in "Hardware Groups" and required by actual conditions. Mechanical door hardware as indicated on the drawings.

b. Cylinders for door hardware specified in other Sections.

c. Electrified door hardware.

d. Screws, special screws, bolts, special bolts, expansion shields, and other devices for proper application of hardware.

B. General Requirements:

1. Provide items, articles, materials, operations and methods listed, mentioned or scheduled herein or on drawings, in quantities as required to complete project. Provide hardware that functions properly. Prior to furnishing hardware, advise Engineer of items that will not operate properly, are improper for conditions, or will not remain permanently anchored.

1.03 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Product Data: For each type of product indicated. Include construction and installation details, material descriptions, dimensions of individual components and profiles, and finishes.

C. Shop Drawings: Details of electrified door hardware, indicating the following:

1. Wiring Diagrams: For power, signal, and control wiring and including the following:

a. Details of interface of electrified door hardware and building safety and security systems

b. Schematic diagram of systems that interface with electrified door hardware

c. Point-to-point wiring

d. Risers

e. Elevations of doors controlled by electrified door hardware

2. Operation Narrative: Describe the operation of doors controlled by electrified door hardware.

D. Samples for Initial Selection: For plastic protective trim units in each finish, color, and texture required for each type of trim unit indicated.

E. Samples for Verification: For exposed door hardware of each type required, in each finish specified, prepared on Samples of size indicated below. Tag Samples with full description for coordination with the door hardware schedule. Submit Samples before, or concurrent with, submission of door hardware schedule.

1. Sample Size: Full-size units or minimum 2 by 4-inch samples for sheet and 4-inch long Samples for other products.

a. Full-size Samples will be returned to Contractor. Units that are acceptable and remain undamaged through submittal, review, and field comparison process may, after final check of operation, be incorporated into the Work, within limitations of keying requirements.

2. Other Submittals:

a. Door Hardware Schedule: Prepared by or under the supervision of Installer, detailing fabrication and assembly of door hardware, as well as installation procedures and diagrams. Coordinate final door hardware schedule with doors, frames, and related work to ensure proper size, thickness, hand, function, and finish of door hardware.

(1) Submittal Sequence: Submit door hardware schedule concurrent with submissions of Product Data, Samples, and Shop Drawings. Coordinate submission of door hardware schedule with scheduling requirements of other work to facilitate the fabrication of other work that is critical in Project construction schedule.

(2) Format: Use same scheduling sequence and format and use same door numbers as in the Contract Documents.

(3) Content: Include the following information:

(a) Identification number, location, hand, fire rating, size, and material of each door and frame.

(b) Locations of each door hardware set, cross-referenced to Drawings on floor plans and to door and frame schedule.

(c) Complete designations, including name and manufacturer, type, style, function, size, quantity, function, and finish of each door hardware product.

(d) Description of electrified door hardware sequences of operation and interfaces with other building control systems.

(e) Fastenings and other pertinent information.

(f) Explanation of abbreviations, symbols, and codes contained in schedule.

(g) Mounting locations for door hardware.

(h) List of related door devices specified in other Sections for each door and frame.

b. Keying Schedule: Prepared by or under the supervision of Installer, detailing Owner's final keying instructions for locks. Include schematic keying diagram and index each key set to unique door designations that are coordinated with the Contract Documents.

F. Qualification Data: For Installer and Architectural Hardware Consultant.

G. Product Certificates: For electrified door hardware, from the manufacturer.

1. Certify that door hardware approved for use on types and sizes of labeled fire-rated doors complies with listed fire-rated door assemblies.

H. Product Test Reports: For compliance with accessibility requirements, based on evaluation of comprehensive tests performed by manufacturer and witnessed by a qualified testing agency, for door hardware on doors located in accessible routes.

I. Maintenance Data: For each type of door hardware to include in maintenance manuals. Include final hardware and keying schedule.

J. Warranty: Special warranty specified in this Section.

K. Maintenance Data: For each type of door hardware to include in maintenance manuals. Include final hardware and keying schedule.

L. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1.04 SPARE PARTS:

A. Comply with the requirements specified in Section 01 61 00.

B. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1.05 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

B. Installer Qualifications: Supplier of products and an employer of workers trained and approved by product manufacturers and an Architectural Hardware Consultant who is available during the course of the Work to consult with Contractor, Engineer, and Owner about door hardware and keying.

1. Warehousing Facilities: In Project's vicinity.

2. Scheduling Responsibility: Preparation of door hardware and keying schedules.

3. Engineering Responsibility: Preparation of data for electrified door hardware, including Shop Drawings, based on testing and engineering analysis of manufacturer's standard units in assemblies similar to those indicated for this Project.

C. Architectural Hardware Consultant Qualifications: A person who is experienced in providing consulting services for door hardware installations that are comparable in material, design, and extent to that indicated for this Project and who is currently certified by DHI as follows:

1. For door hardware, an Architectural Hardware Consultant (AHC) who is also an Electrified Hardware Consultant (EHC).

D. Source Limitations: Obtain each type of door hardware from a single manufacturer.

1. Provide electrified door hardware from same manufacturer as mechanical door hardware, unless otherwise indicated. Manufacturers that perform electrical modifications and that are listed by a testing and inspecting agency acceptable to authorities having jurisdiction are acceptable.

E. Fire-Rated Door Assemblies: Where fire-rated door assemblies are indicated, provide door hardware rated for use in assemblies complying with NFPA 80 that are listed and labeled by a qualified testing agency, for fire-protection ratings indicated, based on testing at positive pressure according to NFPA 252 or UL 10C, unless otherwise indicated.

F. Smoke- and Draft-Control Door Assemblies: Where smoke- and draft-control door assemblies are required, provide door hardware that meet requirements of assemblies tested according to UL 1784 and installed in compliance with NFPA 105.

1. Air Leakage Rate: Maximum air leakage of 0.3 cfm/sq. ft. at the tested pressure differential of 0.3-inch wg of water.

G. Electrified Door Hardware: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction.

H. Means of Egress Doors: Latches do not require more than 15 lbf to release the latch. Locks do not require use of a key, tool, or special knowledge for operation.

I. Accessibility Requirements: For door hardware on doors in an accessible route, comply with ICC/ANSI A117.1.

1. Provide operating devices that do not require tight grasping, pinching, or twisting of the wrist and that operate with a force of not more than 5 lbf.

2. Comply with the following maximum opening-force requirements:

a. Interior, Non-Fire-Rated Hinged Doors: 5 lbf applied perpendicular to door.

b. Fire Doors: Minimum opening force allowable by authorities having jurisdiction.

3. Bevel raised thresholds with a slope of not more than 1:2. Provide thresholds not more than 1/2 inch high.

4. Adjust door closer sweep periods so that, from an open position of 70 degrees, the door will take at least 3 seconds to move to a point 3 inches from the latch, measured to the leading edge of the door.

J. Keying Conference: Conduct conference at Project site to comply with requirements in Division 01 "Project Management and Coordination" Section. In addition to Owner, Contractor, and Engineer, conference participants shall also include Installer's Architectural Hardware Consultant and Owner's security consultant. Incorporate keying conference decisions into final keying schedule after reviewing door hardware keying system including, but not limited to, the following:

1. Function of building, flow of traffic, purpose of each area, degree of security required, and plans for future expansion.

2. Preliminary key system schematic diagram.

3. Requirements for key control system.

4. Requirements for access control.

5. Address for delivery of keys.

K. Preinstallation Conference: Conduct conference at Project site.

1. Review and finalize construction schedule and verify availability of materials, Installer's personnel, equipment, and facilities needed to make progress and avoid delays.

2. Inspect and discuss preparatory work performed by other trades.

3. Inspect and discuss electrical roughing-in for electrified door hardware.

4. Review sequence of operation for each type of electrified door hardware.

5. Review required testing, inspecting, and certifying procedures.

1.06 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

B. Inventory door hardware on receipt and provide secure lock-up for door hardware delivered to Project site.

C. Tag each item or package separately with identification coordinated with the final door hardware schedule, and include installation instructions, templates, and necessary fasteners with each item or package.

D. Deliver keys to manufacturer of key control system for subsequent delivery to Owner.

E. Deliver keys and permanent cores to Owner by registered mail or overnight package service.

1.07 COORDINATION:

A. Installation Templates: Distribute for doors, frames, and other work specified to be factory prepared. Check Shop Drawings of other work to confirm that adequate provisions are made for locating and installing door hardware to comply with indicated requirements.

B. Security: Coordinate installation of door hardware, keying, and access control with Owner's security consultant.

C. Electrical System Roughing-In: Coordinate layout and installation of electrified door hardware with connections to power supplies and building safety and security systems.

D. Existing Openings: Where hardware components are scheduled for application to existing construction or where modifications to existing door hardware are required, field verify existing conditions and coordinate installation of door hardware to suit opening conditions and to provide proper door operation.

1.08 WARRANTY:

A. Comply with general requirements specified in Section 01 78 36.

B. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components of door hardware that fail in materials or workmanship within specified warranty period.

1. Failures include, but are not limited to, the following:

a. Structural failures including excessive deflection, cracking, or breakage.

b. Faulty operation of doors and door hardware.

c. Deterioration of metals, metal finishes, and other materials beyond normal weathering and use.

2. Warranty Period: Three years from date of Substantial Completion, unless otherwise indicated.

a. Exit Devices: Two years from date of Substantial Completion.

b. Closers: 10 years from date of Substantial Completion.

1.09 MAINTENANCE SERVICE:

A. Maintenance Tools and Instructions: Furnish a complete set of specialized tools and maintenance instructions for Owner's continued adjustment, maintenance, and removal and replacement of door hardware.

B. Maintenance Service: Beginning at Substantial Completion, provide six months' full maintenance by skilled employees of door hardware Installer. Include quarterly preventive maintenance, repair or replacement of worn or defective components, lubrication, cleaning, and adjusting as required for proper door and door hardware operation. Provide parts and supplies that are the same as those used in the manufacture and installation of original products.

PART 2 - PRODUCTS

2.01 SCHEDULED DOOR HARDWARE:

A. Provide door hardware for each door as scheduled in Part 3 "Door Hardware Schedule" Article and on as indicated Drawings to comply with requirements in this Section.

1. Door Hardware Sets: Provide quantity, item, size, finish or color indicated, and products complying with BHMA designations referenced.

2. Sequence of Operation: Provide electrified door hardware function, sequence of operation, and interface with other building control systems indicated.

B. Designations: Requirements for design, grade, function, finish, size, and other distinctive qualities of each type of door hardware are indicated in Part 3 "Door Hardware Schedule" Article. Products are identified by using door hardware designations, as follows:

1. References to BHMA Designations: Provide products complying with these designations and requirements for description, quality, and function.

2.02 HINGES:

A. Hinges: BHMA A156.1. Provide template-produced hinges for hinges installed on hollow-metal doors and hollow-metal frames.

1. Manufacturers:

a. Hager Companies

b. McKinney Products Company; an ASSA ABLOY Group company

c. Stanley Commercial Hardware; Div. of The Stanley Works

2.03 CONTINUOUS HINGES:

A. Continuous hinges: BHMA A156.26; minimum 0.120-inch thick, hinge leaves with minimum overall width of 4-inches; fabricated to full height of door and frame and to template screw locations; with components finished after milling and drilling are complete.

1. Pin-and-Barrel-Type Hinges:

a. Hager Companies

b. IVES Hardware; an Ingersoll-Rand company

c. McKinney Products Company; an ASSA ABLOY Group company

2. Continuous, gear-type hinges: Extruded-aluminum, pinless, geared hinge leaves joined by a continuous extruded- aluminum channel cap; with concealed, self-lubricating thrust bearings.

a. Hager Companies

b. IVES Hardware; an Ingersoll-Rand company

c. McKinney Products Company; an ASSA ABLOY Group company

2.04 MECHANICAL LOCKS AND LATCHES:

A. Manufacturers:

1. Bored Locks.

a. Best Access Systems; Div. of Stanley Security Solutions, Inc.

B. Lock Functions: As indicated in door hardware schedule.

C. Lock Throw: Comply with testing requirements for length of bolts required for labeled fire doors, and as follows:

1. Bored Locks: Minimum 1/2-inch latchbolt throw.

D. Lock Backset: 2-3/4 inches, unless otherwise indicated.

E. Lock Trim:

1. Levers: Cast.

a. Best 15D.

2. Escutcheons (Roses): Wrought.

3. Dummy Trim: Match lever lock trim and escutcheons.

4. Operating Device: Lever with escutcheons (roses).

F. Strikes: Provide Manufacturer's standard strike for each lock bolt or latchbolt complying with requirements indicated for applicable lock or latch and with strike box and curved lip extended to protect frame; finished to match lock or latch.

1. Flat-lip strikes: For locks with three-piece antifriction latchbolts, as recommended by Manufacturer.

2. Extra-long-lip strikes: For locks used on frames with applied wood casing trim.

3. Aluminum-frame strike box: Manufacturer's special strike box fabricated for aluminum framing.

4. Rabbet front and strike: Provide on locksets for rabbeted meeting stiles.

G. Bored locks: BHMA A156.2; Grade 1; Series 4000.

2.05 AUXILIARY LOCKS:

A. Bored Auxiliary Locks: BHMA A156.5: Grade 1; with strike that suits frame.

1. Manufacturers:

a. Best Access Systems; Div. of Stanley Security Solutions, Inc.

B. Mortise Auxiliary Locks: BHMA A156.5; Grade 1; with strike that suits frame.

1. Manufacturers:

a. Best Access Systems; Div. of Stanley Security Solutions, Inc.

2.06 ELECTRIC STRIKES:

A. Electric Strikes: BHMA A156.31; Grade 1; with faceplate to suit lock and frame.

1. Manufacturers:

a. HES, Inc.; an ASSA ABLOY Group company

b. Rutherford Controls Int'l. Corp.

c. Von Duprin; an Ingersoll-Rand company

2.07 PUSH/PULL UNITS:

A. Where door pulls are scheduled on one side of door and push plates on other side issue installations instructions to ensure that the pull is secured through door from reverse side and countersunk flush with door installation of push plate. Locate push plate to cover fasteners for door pulls.

1. Manufacturers:

a. Trimco

b. Hiawatha

c. Metalcraft

2.08 ELECTROMECHANICAL LOCKS:

A. Electromechanical locks: BHMA A156.25; Grade 1; motor or solenoid driven; bored; with strike that suits frame.

1. Manufacturers:

a. Best Access Systems; Div. of Stanley Security Solutions, Inc.

2.09 MANUAL FLUSH BOLTS:

A. Manual Flush Bolts: BHMA A156.16; minimum 3/4-inch throw; designed for mortising into door edge.

1. Manufacturers:

a. Hiawatha, Inc.

b. IVES Hardware; an Ingersoll-Rand company

c. Trimco

2.10 AUTOMATIC AND SELF-LATCHING FLUSH BOLTS:

A. Automatic and self-latching flush bolts: BHMA A156.16; minimum 3/4-inch throw; designed for mortising into door edge.

1. Manufacturers:

a. Door Controls International, Inc.

b. IVES Hardware; an Ingersoll-Rand company

c. Trimco

2.11 EXIT DEVICES AND AUXILIARY ITEMS:

A. Exit Devices and Auxiliary Items: BHMA A156.3.

B. Lock cylinders: Tumbler type, constructed from brass or bronze, stainless steel, or nickel silver.

C. Standard lock cylinders: BHMA A156.5; Grade 1; permanent cores that are interchangeable; face finished to match lockset.

D. Construction cores: Provide construction cores that are replaceable by permanent cores. Provide 10 construction master keys.

1. Manufacturers:

a. Precision Hardware, Inc.; Division of Stanley Security Solutions, Inc.

b. Von Duprin; an Ingersoll-Rand company

2.12 LOCK CYLINDERS:

A. Lock Cylinders: Tumbler type, constructed from brass or bronze, stainless steel, or nickel silver.

1. Manufacturers:

a. Best Access Systems; Div. of Stanley Security Solutions, Inc.

B. Standard Lock Cylinders: BHMA A156.5; Grade 1; permanent cores that are interchangeable; face finished to match lockset.

C. Construction Cores: Provide construction cores that are replaceable by permanent cores. Provide 10 construction master keys.

2.13 KEYING:

A. Keying System: Factory registered, complying with guidelines in BHMA A156.28, Appendix A. Incorporate decisions made in keying conference.

1. Grand Master Key System: Change keys, a master key, and a grand master key operate cylinders.

2. Existing System:

a. Master key or grand master key locks to Owner's existing system.

B. Keys: Nickel silver.

1. Stamping: Permanently inscribe each key with a visual key control number and include the following notation:

a. Notation: "DO NOT DUPLICATE."

2. Quantity: In addition to one extra key blank for each lock, provide the following:

a. Cylinder Change Keys: Three

b. Master Keys: Five

c. Grand Master Keys: Five

d. Great-Grand Master Keys: Five

2.14 KEY CONTROL SYSTEM:

A. Key Control Cabinet: BHMA A156.5; metal cabinet with baked-enamel finish; containing key-holding hooks, labels, 2 sets of key tags with self-locking key holders,

key-gathering envelopes, and temporary and permanent markers; with key capacity of 150 percent of the number of locks.

1. Manufacturers:

    a. American Key Boxes and Cabinets

    b. GE Security, Inc.

    c. Lund Equipment Co., Inc.

2. Wall-Mounted Cabinet: Cabinet with hinged-panel door equipped with key-holding panels and pin-tumbler cylinder door lock.

B. Key Lock Boxes: Designed for storage of two keys.

1. Manufacturers:

    a. GE Security, Inc.

    b. HPC, Inc.

    c. Knox Company

C. Cross-Index System: Single-index system for recording key information. Include three receipt forms for each key-holding hook. Set up by Installer.

1. Manufacturers:

    a. Lund Equipment Co., Inc.

    b. MMF Industries

    c. Tri Palm International

2.15 OPERATING TRIM:

A. Operating Trim: BHMA A156.6; brass or , unless otherwise indicated.

1. Manufacturers:

    a. Hager Companies

    b. IVES Hardware; an Ingersoll-Rand company

    c. Trimco

2.16 ACCESSORIES FOR PAIRS OF DOORS:

A. Coordinators: BHMA A156.3; consisting of active-leaf, hold-open lever and inactive-leaf release trigger; fabricated from steel with nylon-coated strike plates; with built-in, adjustable safety release; and with internal override.

B. Carry-Open Bars: BHMA A156.3; prevent the inactive leaf from opening before the active leaf; provide polished brass or bronze carry-open bars with strike plate for inactive leaves of pairs of doors unless automatic or self-latching bolts are used.

C. Astragals: BHMA A156.22.

2.17 SURFACE CLOSERS:

A. Surface Closers: BHMA A156.4; rack-and-pinion hydraulic type with adjustable sweep and latch speeds controlled by key-operated valves and forged-steel main arm. Comply with manufacturer's written recommendations for size of door closers depending on size of door, exposure to weather, and anticipated frequency of use. Provide factory-sized closers, adjustable to meet field conditions and requirements for opening force.

1. Manufacturers:

a. LCN Closers; an Ingersoll-Rand company, 4040XP

b. Stanley Closers QDC100

2.18 MECHANICAL STOPS AND HOLDERS:

A. Wall- and floor-mounted stops: BHMA A156.16; cast brass or bronze, base metal.

1. Manufacturers:

a. Hager Companies

b. IVES Hardware; an Ingersoll-Rand company

c. Trimco

2.19 DOOR GASKETING:

A. Door Gasketing: BHMA A156.22; air leakage not to exceed 0.50 cfm per foot of crack length for gasketing other than for smoke control, as tested according to ASTM E283; with resilient or flexible seal strips that are easily replaceable and readily available from stocks maintained by manufacturer.

1. Manufacturers:

a. National Guard Products

b. Reese Enterprises, Inc.

c. Zero International

2.20 THRESHOLDS:

A. Thresholds: BHMA A156.21; fabricated to full width of opening indicated.

1. Manufacturers:

a. National Guard Products

b. Reese Enterprises, Inc.

c. Zero International

2.21 PROTECTION PLATES

A. Manufacturers:

1. Hager

2. Trimco

B. Fasteners: Provide manufacturer's standard exposed fasteners for door trim units. Machine screws or self-tapping screw.

C. Fabricate protection plates (armor, kick or mop) not more than 1-1/2 inch less than door width on stop side and not more than 1/2 inch less than door width on pull side, by height indicated.

1. Metal Plates: Stainless steel, 0.050 inch (U.S. 18 ga) beveled edges, with countersunk screw holes of intervals of not over 6 inch on all four sides.

2.22 METAL PROTECTIVE TRIM UNITS:

A. Metal Protective Trim Units: BHMA A156.6; fabricated from 0.050-inch-thick chrome plated steel; with manufacturer's standard machine or self-tapping screw fasteners.

1. Manufacturers:

a. Hiawatha, Inc.

b. IVES Hardware; an Ingersoll-Rand company

c. Trimco

2.23 AUXILIARY DOOR HARDWARE:

A. Auxiliary Hardware: BHMA A156.16.

1. Manufacturers:

a. Hager Companies

b. Stanley Commercial Hardware; Div. of The Stanley Works

c. Trimco

2.24 AUXILIARY ELECTRIFIED DOOR HARDWARE:

A. Auxiliary Electrified Door Hardware: BHMA A156.25.

1. Manufacturers:

a. GE Security, Inc.

b. Securitron Magnalock Corporation; an ASSA ABLOY Group company

c. Security Door Controls

2.25 FABRICATION:

A. Manufacturer's Nameplate: Do not provide products that have manufacturer's name or trade name displayed in a visible location except in conjunction with required fire-rated labels and as otherwise accepted by Engineer.

1. Manufacturer's identification is permitted on rim of lock cylinders only.

B. Base Metals: Produce door hardware units of base metal indicated, fabricated by forming method indicated, using manufacturer's standard metal alloy, composition, temper, and hardness. Furnish metals of a quality equal to or greater than that of specified door hardware units and BHMA A156.18.

C. Fasteners: Provide door hardware manufactured to comply with published templates prepared for machine, wood, and sheet metal screws. Provide screws that comply with commercially recognized industry standards for application intended, except aluminum fasteners are not permitted. Provide Phillips flat-head screws with finished heads to match surface of door hardware, unless otherwise indicated.

1. Concealed Fasteners: For door hardware units that are exposed when door is closed, except for units already specified with concealed fasteners. Do not use through bolts for installation where bolt head or nut on opposite face is exposed unless it is the only means of securely attaching the door hardware. Where

through bolts are used on hollow door and frame construction, provide sleeves for each through bolt.

2. Fire-Rated Applications:

a. Machine Screws: For the following:

(1) Hinges mortised to doors or frames.

(2) Strike plates to frames.

(3) Closers to doors and frames.

b. Steel Through Bolts: For the following unless door blocking is provided:

(1) Surface hinges to doors.

(2) Closers to doors and frames.

(3) Surface-mounted exit devices.

3. Spacers or Sex Bolts: For through bolting of hollow-metal doors.

4. Gasketing Fasteners: Provide noncorrosive fasteners for exterior applications and elsewhere as indicated.

2.26 FINISHES:

A. Provide finishes complying with BHMA A156.18 as indicated in door hardware schedule.

B. Protect mechanical finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipping.

C. Appearance of Finished Work: Variations in appearance of abutting or adjacent pieces are acceptable if they are within one-half of the range of accepted Samples. Noticeable variations in the same piece are not acceptable. Variations in appearance of other components are acceptable if they are within the range of accepted Samples and are assembled or installed to minimize contrast.

PART 3 - EXECUTION

3.01 EXAMINATION:

A. Examine doors and frames, with Installer present, for compliance with requirements for installation tolerances, labeled fire-rated door assembly construction, wall and floor construction, and other conditions affecting performance.

B. Examine roughing-in for electrical power systems to verify actual locations of wiring connections before electrified door hardware installation.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 PREPARATION:

A. Steel Doors and Frames: For surface applied door hardware, drill and tap doors and frames according to ANSI/SDI A250.6.

3.03 INSTALLATION:

A. Mounting Heights: Mount door hardware units at heights to comply with the following unless otherwise indicated or required to comply with governing regulations.

1. Standard Steel Doors and Frames: ANSI/SDI A250.8.

B. Install each door hardware item to comply with manufacturer's written instructions. Where cutting and fitting are required to install door hardware onto or into surfaces that are later to be painted or finished in another way, coordinate removal, storage, and reinstallation of surface protective trim units with finishing work specified in Division 09 Sections. Do not install surface-mounted items until finishes have been completed on substrates involved.

1. Set units level, plumb, and true to line and location. Adjust and reinforce attachment substrates as necessary for proper installation and operation.

2. Drill and countersink units that are not factory prepared for anchorage fasteners. Space fasteners and anchors according to industry standards.

C. Hinges: Install types and in quantities indicated in door hardware schedule but not fewer than the number recommended by manufacturer for application indicated or one hinge for every 30 inches of door height, whichever is more stringent, unless other equivalent means of support for door, such as spring hinges or pivots, are provided.

D. Lock Cylinders: Install construction cores to secure building and areas during construction period.

1. Permanent cores to be Owner purchased and Owner installed.

E. Key Control System: Tag keys and place them on markers and hooks in key control system cabinet, as determined by final keying schedule.

F. Boxed Power Supplies: Locate power supplies as indicated or, if not indicated, [in equipment room. Verify location with Engineer.

1. Configuration: Provide least number of power supplies required to adequately serve doors with electrified door hardware.

G. Thresholds: Set thresholds for exterior doors and other doors indicated in full bed of sealant complying with requirements specified in Section 07 92 00.

H. Stops: Provide floor stops for doors unless wall or other type stops are indicated in door hardware schedule. Do not mount floor stops where they will impede traffic.

I. Perimeter Gasketing: Apply to head and jamb, forming seal between door and frame.

J. Meeting Stile Gasketing: Fasten to meeting stiles, forming seal when doors are closed.

K. Door Bottoms: Apply to bottom of door, forming seal with threshold when door is closed.

3.04 FIELD QUALITY CONTROL:

A. Independent Architectural Hardware Consultant: Owner will engage a qualified independent Architectural Hardware Consultant to perform inspections and to prepare inspection reports.

1. Independent Architectural Hardware Consultant will inspect door hardware and state in each report whether installed work complies with or deviates from requirements, including whether door hardware is properly installed and adjusted.

3.05 ADJUSTING:

A. Initial Adjustment: Adjust and check each operating item of door hardware and each door to ensure proper operation or function of every unit. Replace units that cannot be adjusted to operate as intended. Adjust door control devices to compensate for final operation of heating and ventilating equipment and to comply with referenced accessibility requirements.

1. Spring Hinges: Adjust to achieve positive latching when door is allowed to close freely from an open position of 30 degrees.

2. Electric Strikes: Adjust horizontal and vertical alignment of keeper to properly engage lock bolt.

3. Door Closers: Adjust sweep period to comply with accessibility requirements and requirements of authorities having jurisdiction.

3.06 CLEANING AND PROTECTION:

A. Clean adjacent surfaces soiled by door hardware installation.

B. Clean operating items as necessary to restore proper function and finish.

C. Provide final protection and maintain conditions that ensure that door hardware is without damage or deterioration at time of Substantial Completion.

3.07 CONTRACT CLOSEOUT:

A. Provide in accordance with Section 01 77 00.

3.08 DOOR HARDWARE SCHEDULE:

A. The Schedule is a partial list to establish quality and clarify hardware requirements of certain items.

B. Provide fasteners, accessories, and other devices required for complete and proper installation for each particular location.

C. Manufacturer's reference number indicated is first Manufacturer on Manufacturer's list.

D. See Door Schedule on Drawings for hardware group application.

SECTION 08 81 00

GLASS AND GLAZING

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide glazing as indicated and in compliance with Contract Documents.

1.02 REFERENCES:

A. American Architectural Manufacturers Association (AAMA):

1. 800: Voluntary Specifications and Test Methods for Sealants

2. 806.3: Back-Bedding Mastic Glazing Tapes

3. 807.3: Back-Bedding Mastic Glazing Tapes

4. 810.1: Expanded Cellular Glazing Tapes

B. American National Standards Institute (ANSI):

1. Z97.1: Safety Glazing Materials Used in Buildings – Safety Performance Specifications and Methods of Test

C. ASTM International (ASTM):

1. C509: Standard Specification for Elastomeric Cellular Preformed Gasket and Sealing Material

2. C542: Standard Specification for Lock-Strip Gaskets

3. C716: Standard Specification for Installing Lock-Strip Gaskets and Infill Glazing Materials

4. C864: Standard Specification for Dense Elastomeric Compression Seal Gaskets, Setting Blocks, and Spacers

5. C920: Standard Specification for Elastomeric Joint Sealants.

6. C1036: Standard Specification for Flat Glass

7. C1048: Standard Specification for Heat-Treated Flat Glass - Kind HS, Kind FT Coated and Uncoated Glass

8. C1281: Standard Specification for Preformed Tape Sealants for Glazing Applications

9. C1330: Standard Specification for Cylindrical Sealant Backing for Use with Cold Liquid- Applied Sealants

10. E1300: Standard Practice for Determining Load Resistance of Glass in Buildings

11. E2190: Standard Specification for Insulating Glass Unit Performance and Evaluation

D. California Department of Public Health (CDPH):

1. Standard Method for the Testing and Evaluation of Volatile Organic Chemical Emissions from Indoor Sources using Environmental Chambers

E. Consumers Product Safety Commission (CPSC):

3. 300: Standard Test Method for Determining the Solar Optical Properties of Glazing Materials and Systems

4. CAP1: Certification Agency Program

J. South Coast Air Quality Management District (SCAQMD):

1. Rule 1168: Adhesive and Sealant Applications

1.03 DEFINITIONS:

A. Glass Manufacturers: Firms that produce primary glass, fabricated glass, or both, as defined in referenced glazing publications.

B. Glass Thicknesses: Indicated by thickness designations in millimeters according to ASTM C1036.

C. Interspace: Space between lites of an insulating-glass unit.

1.04 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Product Data: For each glass product and glazing material indicated, evidencing compliance with specifications.

C. Glass Samples: For each type of glass product other than clear monolithic vision glass.

D. Glazing Schedule: List glass types and thicknesses for each size opening and location. Use same designations shown on the Drawings.

E. Product Certificates: For glass and glazing products, from Manufacturer.

1. Product Test Reports: Based on evaluation of comprehensive tests performed by a qualified testing agency, for insulating glass.

2. Warranties: Sample of special warranties.

F. Warranty documentation as specified in Section 01 78 36.

G. O&M documentation as specified in Section 01 78 23.

H. Sustainable Design Submittals:

1. Comply with the requirements as specified in Section 01 81 13.01.

I. Submit product data or other published information verifying compliance with CDPH Standard Method v1.1, using the applicable exposure scenario. Manufacturer's claims of compliance shall also state the range of total VOCs after 14 days.

1.05 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

B. Manufacturer Qualifications for Insulating-Glass Units with Sputter-Coated, Low-E Coatings: A qualified insulating-glass manufacturer who is approved by coated-glass manufacturer.

C. Installer Qualifications: A qualified installer who employs glass installers for this project who are certified under the National Glass Association's Certified Glass Installer Program.

D. Glass Testing Agency Qualifications: A qualified independent testing agency accredited in accordance with the NFRC CAP1 Certification Agency Program.

E. Single Source Responsibility for Glass: To ensure consistent quality of appearance and performance, provide materials produced by a single Manufacturer or fabricator for each kind and condition of glass indicated and composed of primary glass obtained from a single source for each type and class required.

F. Glazing Publications: In accordance with published recommendations of glass product Manufacturers and organizations below, unless more stringent requirements are indicated. Refer to these publications for glazing terms not otherwise defined in this Section or in referenced standards.

1. GANA Publications: GANA's "Laminated Glazing Reference Manual" and GANA's "Glazing Manual."

G. Safety Glazing Products: Where required by code provide in accordance with testing requirements in 16 CFR 1201 and, for wired glass, ANSI Z97.1.

1. Subject to compliance with requirements, obtain safety glazing products permanently marked with certification label of the Safety Glazing Certification Council or another certification agency acceptable to authorities having jurisdiction.

H. Fire-Protection-Rated Glazing Labeling: Permanently mark fire-protection-rated glazing with certification label of a testing agency acceptable to authorities having jurisdiction. Label shall indicate Manufacturer's name, test standard, whether glazing is for use in fire doors or other openings, whether or not glazing passes hose-stream test, whether or not glazing has a temperature rise rating of 450 degrees F, and the fire-resistance rating in minutes.

I. Insulating-Glass Certification Program: Permanently marked either on spacers or on at least one component lite of units with appropriate certification label of IGCC.

J. Performance Requirements:

1. General: Installed glazing systems shall withstand normal thermal movement and wind and impact loads (where applicable) without failure, including loss or glass breakage attributable to the following: defective manufacture, fabrication, or

installation; failure of sealants or gaskets to remain watertight and airtight; deterioration of glazing materials; or other defects in construction.

2. Delegated Design: Design glass, including comprehensive engineering analysis in accordance with ASTM E1300 by a qualified professional Engineer, using the following design criteria:

3. Design Wind Pressures: As shown on the Drawings.

   a. Ultimate design wind speed: Speed (VULT): 175 mph.

   b. Risk category: III.

   c. Exposure category: C.

K. Glass Design: Glass thicknesses shown on the Drawings are for detailing only. Confirm glass thicknesses by analyzing project loads and in-service conditions. Provide glass lites for various size openings in the thicknesses and strengths (annealed or heat-treated) to meet or exceed the following criteria:

1. Minimum glass thickness, nominally, of lites in exterior walls is 0.23 inch.

2. Minimum glass thicknesses of lites, whether composed of annealed or heat-treated glass, are selected so the worst-case probability of failure does not exceed the following:

   a. 8 lites per 1000 for lites set vertically or not over 15 degrees off vertical and under wind action. Determine minimum thickness of monolithic annealed glass in accordance with ASTM E1300. For other than monolithic annealed glass, determine thickness per Glass Manufacturer's standard method of analysis including applying adjustment factors to ASTM E1300 based on type of glass.

   b. 1 lite per 1000 for lites set over 15 degrees off vertical and under action of wind or snow.

L. Thermal Movements: Allow for thermal movements from ambient and surface temperature changes acting on glass framing members and glazing components. Base engineering calculations on materials' actual surface temperature due to both solar heat gain and nighttime sky heat loss.

1. Temperature change: 120 degrees F, ambient; 180 degrees F, material surfaces.

1.06 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

B. Protect glazing materials according to manufacturer's written instructions. Prevent damage to glass and glazing materials from condensation, temperature changes, direct exposure to sun, or other causes.

1.07 PROJECT CONDITIONS:

A. Environmental Limitations: Do not proceed with glazing when ambient and substrate temperature conditions are outside limits permitted by glazing material manufacturers and when glazing channel substrates are wet from rain, frost, condensation, or other causes.

1. Do not install glazing sealants when ambient and substrate temperature conditions are outside limits permitted by sealant manufacturer or below 40 degrees F.

1.08 WARRANTY:

A. Warranty requirements as specified in Section 01 78 36.

B. Manufacturer's Special Warranty for Coated-Glass Products: Manufacturer's standard form in which coated-glass Manufacturer agrees to replace coated-glass units that deteriorate within specified warranty period. Deterioration of coated glass is defined as defects developed from normal use that are not attributed to glass breakage or to maintaining and cleaning coated glass contrary to Manufacturer's written instructions. Defects include peeling, cracking, and other indications of deterioration in coating.

1. Warranty Period: 10 years from date of substantial completion.

C. Manufacturer's Special Warranty on Insulating Glass: Manufacturer's standard form in which insulating-glass Manufacturer agrees to replace insulating-glass units that deteriorate within specified warranty period. Deterioration of insulating glass is defined as failure of hermetic seal under normal use that is not attributed to glass breakage or to maintaining and cleaning insulating glass contrary to Manufacturer's written instructions. Evidence of failure is the obstruction of vision by dust, moisture or film on interior surfaces of glass.

1. Warranty Period: 10 years from date of substantial completion.

D. Mirror Glass: Fifteen (15) years against silver spoilage.

1.09 O&M SPECIAL REQUIREMENTS:

A. O&M data requirements as specified in Section 01 78 23.

PART 2 - PRODUCTS

2.01 MANUFACTURERS:

A. Glass Products:

1. Float Glass:

a. AFG Industries, Inc.

b. Guardian Industries Corp.

c. Pilkington North America

d. PPG Industries, Inc.

B. Insulating Glass:

1. J. E. Berkowitz

2. Oldcastle Building Envelope

3. Viracon

C. Fire Protection Rated Laminated Ceramic Glazing:

1. Nippon Electric Glass Co., Ltd. (distributed by Technical Glass Products), FireLite Plus

2. Schott North America, Inc., Laminated Pyran Crystal

3. Vetrotech Saint-Gobain, SGG Keralite FR-L

2.02 MATERIALS:

A. Sustainable Design Product Requirements:

1. Comply with the requirements as specified in Section 01 81 13.01.

2. ISI Envision:

a. Sustainable procurement practices (RA1.2): Maximize the procurement of materials that follow sustainable procurement practices.

b. Recycled materials (RA1.3): Maximize the procurement of materials with recycled content.

c. Locally sourced materials (RA1.4): Maximize the procurement of materials within the radius as specified in Section 01 81 13.01.

B. Glass Products, General:

1. Thickness: Where glass thickness is indicated, it is a minimum. Provide glass lites in thicknesses as needed to comply with requirements indicated.

   a. Minimum glass thickness for exterior lites: Not less than 1/4-inch.

   b. Thickness of tinted glass: Provide same thickness for each tint color indicated throughout project.

2. Strength: Where float glass is indicated, provide annealed float glass, Kind HS heat-treated float glass, or Kind FT heat-treated float glass as needed to be in accordance with Performance Requirements specified in this Section. Where heat-strengthened glass is indicated, provide Kind HS heat-treated float glass or Kind FT heat-treated float glass as needed to comply with "Performance Requirements". Where fully tempered glass is indicated, provide Kind FT heat-treated float glass.

3. Thermal and optical performance properties: Provide glass with performance properties specified, as indicated in Manufacturer's published test data, based on procedures indicated below:

   a. For monolithic-glass lites, properties are based on units with lites 6.0 mm thick.

   b. For laminated-glass lites, properties are based on products of construction indicated.

   c. For insulating-glass units, properties are based on units of thickness indicated for overall unit and for each lite.

   d. U-Factors: Center-of-glazing values, in accordance with NFRC 100, expressed as Btu/square feet x h x degrees F.

   e. Solar heat-gain coefficient and visible transmittance: Center-of-glazing values, in accordance with NFRC 200 and based on LBL's WINDOW 5.2 computer program.

4. Visible reflectance: Center-of-glazing values, in accordance with NFRC 300.

C. Glass:

1. Float glass: ASTM C1036, Type I, Quality-Q3, Class I (clear) unless otherwise indicated, minimum 6 mm thick.

2. Heat-treated float glass: ASTM C1048; Type I; Quality-Q3; Class I (clear) unless otherwise indicated; of kind and condition indicated, minimum 1/4-inch thick.

    a. Fabrication process: By horizontal (roller-hearth) process with roll-wave distortion parallel to bottom edge of glass as installed unless otherwise indicated.

    b. For uncoated glass, comply with requirements for Condition A.

    c. For coated vision glass, comply with requirements for Condition C (other coated glass).

3. Uncoated tinted float glass: Class 2, complying with other requirements specified.

    a. Basis-of-design product: Viracon VE33-2M.

        (1) Tint color: Gray, as selected by Engineer from Manufacturer's full range in accordance with the procedures specified in Section 01 33 00.

        (2) Visible light transmittance: 52 percent minimum.

4. Ceramic-coated vision glass: Heat-treated float glass, Condition C; with ceramic enamel applied by silk-screened process; complying with Specification No. 95-1-31 in GANA's Tempering Division's "Engineering Standards Manual" and with other requirements specified.

    a. Glass: Clear float.

    b. Tint color: Gray.

    c. Ceramic coating color and pattern: As selected by Engineer from Manufacturer's full range in accordance with the procedures specified in Section 01 33 00.

D. Insulating Glass:

1. Insulating-glass units: Factory-assembled units consisting of sealed lites of glass separated by a dehydrated interspace, qualified in accordance with ASTM E2190, and complying with other requirements specified.

    a. Sealing system: Dual seal, with Manufacturer's standard polyisobutylene and silicone primary and secondary.

    b. Spacer: Manufacturer's standard black aluminum spacer material and construction.

    c. Desiccant: Molecular sieve or silica gel, or blend of both.

2. Glass: Comply with applicable requirements in "Glass Products" Article as indicated by designations in "Insulating- Glass Types" Article.

E. Fire-Protection-Rated Glazing:

1. Fire-protection-rated glazing, General: Listed and labeled by a testing agency acceptable to authorities having jurisdiction, for fire-protection ratings indicated, based on testing in accordance with NFPA 252 for door assemblies.

2. Laminated ceramic glazing: Laminated glass made from 2 plies of clear, ceramic flat glass; 5/16-inch total nominal thickness; in accordance with testing requirements in 16 CFR 1201 for Category II materials.

2.03 COMPONENTS:

A. Monolithic-Glass Types:

1. Glass type clear float glass, heat-strengthened float glass or fully tempered float glass.

a. Thickness: 1/4 or 1/2-inch.

b. Provide safety glazing.

B. Insulating-Glass Types:

1. Glass type: Low-e-coated, tinted insulating glass. Basis of design: Viracon VE33-2M.

a. Overall unit thickness: 1 inch.

b. Thickness of each glass lite: 1/4-inch.

c. Outdoor lite: Tinted heat-strengthened float glass.

d. Interspace content: Air.

e. Indoor lite: Clear float glass or heat-strengthened float glass.

f. Low-E coating: Sputtered on second surface.

g. Visible light transmittance: 52 percent minimum.

h. Winter nighttime U-Factor: 0.30 maximum.

i. Summer daytime U-Factor: 0.26 maximum.

j. Solar heat gain coefficient: 0.31 maximum.

k. Provide safety glazing.

2. Glass Type: Ceramic-coated, tinted insulating vision glass. Basis of design: Viracon VE33-2M with Silkscreen #3.

a. Overall unit thickness: 1 inch.

b. Thickness of each glass lite: 1/4-inch.

c. Outdoor lite: Heat-strengthened float glass.

d. Interspace content: Air.

e. Indoor lite: Heat-strengthened float glass.

f. Coating location: VE-2M coating second surface.

(1) Silk screen location: Standard Viracon silk screen, ceramic frit color V933 Warm Gray, #3 surface, performance data based on 40 percent silk screen coverage

g. Visible light transmittance: 34 percent minimum.

h. Winter nighttime U-Factor: 0.30 maximum.

i. Summer daytime U-Factor: 0.26 maximum.

j. Solar heat gain coefficient: 0.28 maximum.

k. Provide safety glazing labeling.

C. Fire-Protection-Rated Glazing Types:

1. Glass type: 20-minute fire-rated glazing; laminated ceramic glazing.

a. Provide safety glazing labeling.

2.04 ACCESSORIES:

A. Glazing Gaskets:

1. Dense compression gaskets: Molded or extruded gaskets of profile and hardness required to maintain watertight seal.

2. Soft compression gaskets: Extruded or molded, closed-cell, integral-skinned neoprene, silicone or thermoplastic polyolefin rubber gaskets complying with ASTM C509, Type II, black; of profile and hardness required to maintain watertight seal.

    a. Application: Use where soft compression gaskets will be compressed by inserting dense compression gaskets on opposite side of glazing or pressure applied by means of pressure-glazing stops on opposite side of glazing.

    b. Lock-strip gaskets: Neoprene extrusions in size and shape indicated, fabricated into frames with molded corner units and zipper lock-strips, complying with ASTM C542, black.

B. Glazing Sealants:

1. Compatibility: Provide glazing sealants that are compatible with one another and with other materials they will contact, including glass products, seals of insulating-glass units, and glazing channel substrates, under conditions of service and application, as demonstrated by sealant Manufacturer based on testing and field experience.

2. Suitability: Comply with sealant and the Glass Manufacturers' written instructions for selecting glazing sealants suitable for applications indicated and for conditions existing at time of installation.

3. Sealants used inside the weatherproofing system, shall have a VOC content of not more than 250 g/L when calculated in accordance with 40 CFR 59, Subpart D (EPA Method 24).

4. Elastomeric sealant standard: Provide Manufacturer's standard chemically curing, elastomeric sealant of base polymer in accordance with ASTM C920 requirements, including those for type, grade, class and uses.

5. Sealants used inside the weatherproofing system shall comply with the testing and product requirements of the California Department of Health Services' "Standard Practice for the Testing of Volatile Organic Emissions from Indoor Sources Using Environmental Chambers"

6. Colors of exposed glazing sealants: As selected by Engineer from Manufacturer's full range.

C. Glazing Tapes:

1. Back-bedding mastic glazing tapes: Preformed, butyl-based, 100 percent solids elastomeric tape; non-staining and non- migrating in contact with nonporous surfaces; with or without spacer rod as recommended in writing by tape and the

Glass Manufacturers for application indicated; and in accordance with ASTM C1281 and AAMA 800 for products indicated below:

a. AAMA 806.3 tape, for glazing applications in which tape is subject to continuous pressure.

b. AAMA 807.3 tape, for glazing applications in which tape is not subject to continuous pressure.

2. Expanded cellular glazing tapes: Closed-cell, PVC foam tapes; factory coated with adhesive on both surfaces; and in accordance with AAMA 800 for the following types:

a. AAMA 810.1, Type 1, for glazing applications in which tape acts as the primary sealant.

b. AAMA 810.1, Type 2, for glazing applications in which tape is used in combination with a full bead of liquid sealant.

D. Miscellaneous Glazing Materials:

1. General: Provide products of material, size, and shape complying with referenced glazing standard, requirements of Manufacturers of glass and other glazing materials for application indicated, and with a proven record of compatibility with surfaces contacted in installation.

2. Cleaners, primers, and sealers: Types recommended by sealant or gasket Manufacturer.

3. Setting blocks: Elastomeric material with a Shore, Type A durometer hardness of 85, plus or minus 5.

4. Spacers: Elastomeric blocks or continuous extrusions of hardness required by glass Manufacturer to maintain glass lites in place for installation indicated.

5. Edge blocks: Elastomeric material of hardness needed to limit glass lateral movement (side walking).

6. Cylindrical glazing sealant backing: ASTM C1330, Type O (open-cell material), of size and density to control glazing sealant depth and otherwise produce optimum glazing sealant performance.

7. Perimeter insulation for fire-resistive glazing: Product that is approved by testing agency that listed and labeled fire- resistant glazing product with which it is used for application and fire-protection rating indicated.

2.05 FABRICATION:

A. Fabricate glazing units in sizes required to fit openings indicated for project, with edge and face clearances, edge and surface conditions, and bite complying with written instructions of product Manufacturer and referenced glazing publications, to comply with system performance requirements.

B. Clean-cut or flat-grind vertical edges of butt-glazed monolithic lites to produce square edges with slight chamfers at junctions of edges and faces.

C. Grind smooth and polish exposed glass edges and corners.

PART 3 - EXECUTION

3.01 PREPARATION:

A. Examine framing, glazing channels, and stops, with installer present, for compliance with the following:

1. Manufacturing and installation tolerances, including those for size, squareness, and offsets at corners.

2. Presence and functioning of weep systems.

3. Minimum required face and edge clearances.

4. Effective sealing between joints of glass-framing members.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

C. Clean glazing channels and other framing members receiving glass immediately before glazing. Remove coatings not firmly bonded to substrates.

D. Examine glazing units to locate exterior and interior surfaces. Label or mark units as needed so that exterior and interior surfaces are readily identifiable. Do not use materials that will leave visible marks in the completed Work.

3.02 ERECTION / INSTALLATION / APPLICATION:

A. Glazing, General:

1. Comply with combined written instructions of Manufacturers of glass, sealants, gaskets, and other glazing materials, unless more stringent requirements are indicated, including those in referenced glazing publications.

2. Adjust glazing channel dimensions as required by project conditions during installation to provide necessary bite on glass, minimum edge and face clearances, and adequate sealant thicknesses, with reasonable tolerances.

3. Protect glass edges from damage during handling and installation. Remove damaged glass from project site and legally dispose of off project site. Damaged glass is glass with edge damage or other imperfections that, when installed, could weaken glass and impair performance and appearance.

4. Apply primers to joint surfaces where required for adhesion of sealants, as determined by preconstruction testing.

5. Install setting blocks in sill rabbets, sized and located to comply with referenced glazing publications, unless otherwise required by Glass Manufacturer. Set blocks in thin course of compatible sealant suitable for heel bead.

6. Do not exceed edge pressures stipulated by Glass Manufacturer for installing glass lites.

7. Provide spacers for glass lites where length plus width is larger than 50-inches.

    a. Locate spacers directly opposite each other on both inside and outside faces of glass. Install correct size and spacing to preserve required face clearances, unless gaskets and glazing tapes are used that have demonstrated ability to maintain required face clearances and to comply with system performance requirements.

    b. Provide 1/8-inch minimum bite of spacers on glass and use thickness equal to sealant width. With glazing tape, use thickness slightly less than final compressed thickness of tape.

8. Provide edge blocking where indicated or needed to prevent glass lites from moving sideways in glazing channel, as recommended in writing by Glass Manufacturer and in accordance with requirements in referenced glazing publications.

9. Set glass lites in each series with uniform pattern, draw, bow, and similar characteristics.

10. Set glass lites with proper orientation so that coatings face exterior or interior as specified.

11. Where wedge-shaped gaskets are driven into one side of channel to pressurize sealant or gasket on opposite side, provide adequate anchorage so gasket cannot walk out when installation is subjected to movement.

12. Square cut wedge-shaped gaskets at corners and install gaskets in a manner recommended by gasket Manufacturer to prevent corners from pulling away; seal corner joints and butt joints with sealant recommended by Gasket Manufacturer.

B. Tape Glazing:

1. Position tapes on fixed stops so that, when compressed by glass, their exposed edges are flush with or protrude slightly above sightline of stops.

2. Install tapes continuously, but not necessarily in one continuous length. Do not stretch tapes to make them fit opening.

3. Cover vertical framing joints by applying tapes to heads and sills first and then to jambs. Cover horizontal framing joints by applying tapes to jambs and then to heads and sills.

4. Place joints in tapes at corners of opening with adjoining lengths butted together, not lapped. Seal joints in tapes with compatible sealant approved by tape Manufacturer.

5. Do not remove release paper from tape until right before each glazing unit is installed.

6. Apply heel bead of elastomeric sealant.

7. Center glass lites in openings on setting blocks and press firmly against tape by inserting dense compression gaskets formed and installed to lock in place against faces of removable stops. Start gasket applications at corners and work toward centers of openings.

8. Apply cap bead of elastomeric sealant over exposed edge of tape.

C. Gasket Glazing (Dry):

1. Cut compression gaskets to lengths recommended by gasket Manufacturer to fit openings exactly, with allowance for stretch during installation.

2. Insert soft compression gasket between glass and frame or fixed stop so it is securely in place with joints miter cut and bonded together at corners.

3. Installation with Drive-in Wedge Gaskets: Center glass lites in openings on setting blocks and press firmly against soft compression gasket by inserting dense compression gaskets formed and installed to lock in place against faces of removable stops. Start gasket applications at corners and work toward centers of openings. Compress gaskets to produce a weathertight seal without developing bending stresses in glass. Seal gasket joints with sealant recommended by gasket Manufacturer.

4. Installation with Pressure-Glazing Stops: Center glass lites in openings on setting blocks and press firmly against soft compression gasket. Install dense compression gaskets and pressure-glazing stops, applying pressure uniformly to compression gaskets. Compress gaskets to produce a weathertight seal without developing bending stresses in glass. Seal gasket joints with sealant recommended by gasket Manufacturer.

5. Install gaskets so they protrude past face of glazing stops.

D. Sealant Glazing (Wet):

1. Install continuous spacers, or spacers combined with cylindrical sealant backing, between glass lites and glazing stops to maintain glass face clearances and to prevent sealant from extruding into glass channel and blocking weep systems until sealants cure. Secure spacers or spacers and backings in place and in position to control depth of installed sealant relative to edge clearance for optimum sealant performance.

2. Force sealants into glazing channels to eliminate voids and to ensure complete wetting or bond of sealant to glass and channel surfaces.

3. Tool exposed surfaces of sealants to provide a substantial wash away from glass.

E. Lock-Strip Gasket Glazing:

1. In accordance with ASTM C716 and gasket Manufacturer's written instructions. Provide supplementary wet seal and weep system unless otherwise indicated.

3.03 REPAIRS / RESTORATION:

A. Remove and replace glass that is broken, chipped, cracked, or abraded or that is damaged from natural causes, accidents, and vandalism, during construction period.

3.04 PROTECTION:

A. Protect exterior glass from damage immediately after installation by attaching crossed streamers to framing held away from glass. Do not apply markers to glass surface. Remove nonpermanent labels and clean surfaces.

B. Protect glass from contact with contaminating substances resulting from construction operations. If, despite such protection, contaminating substances do come into contact with glass, remove substances immediately as recommended in writing by the Glass Manufacturer.

C. Examine glass surfaces adjacent to or below exterior concrete and other masonry surfaces at frequent intervals during construction, but not less than once a month, for buildup of dirt, scum, alkaline deposits, or stains; remove as recommended in writing by the Glass Manufacturer.

3.05 CLEANING:

A. Wash glass on both exposed surfaces in each area of project not more than four days before date scheduled for inspections that establish date of substantial completion. Wash glass as recommended in writing by the Glass Manufacturer.

3.06 CONTRACT CLOSEOUT:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 08 91 00

LOUVERS

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide louvers as indicated and in compliance with Contract Documents.

1.02 REFERENCES:

A. American Architectural Manufacturers Association (AAMA):

G. Sheet Metal and Air Conditioning Contractors' National Association (SMACNA):

1. Architectural Sheet Metal Manual

1.03 DEFINITIONS:

A. Louver Terminology: Definitions of terms for metal louvers contained in AMCA 501 apply to this Section unless otherwise defined in this Section or in referenced standards.

B. Horizontal Louver: Louver with horizontal blades; i.e., the axes of the blades are horizontal.

C. Drainable-Blade Louver: Louver with blades having gutters that collect water and drain it to channels in jambs and mullions, which carry it to bottom of unit and away from opening.

D. Storm-Resistant Louver: Louver that provides specified wind-driven rain performance, as determined by testing according to AMCA 500-L.

1.04 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Warranty documentation as specified in Section 01 61 00.

C. O&M documentation as specified in Section 01 78 23.

D. Submit the following as specified in Section 01 33 00.

1. Product data: For each type of product indicated.

a. For louvers specified to bear AMCA seal, include printed catalog catalogue pages showing specified models with appropriate AMCA Certified Ratings Seals.

2. Shop Drawings: For louvers and accessories. Include plans, elevations, sections, details, and attachments to other Work. Show frame profiles and blade profiles, angles, and spacing.

a. Show weep paths, gaskets, flashing, sealant, and other means of preventing water intrusion.

b. Show mullion profiles and locations.

3. Samples Color Selection: Color Selector showing the full range of manufacturer’s standard colors.

4. Samples for Verification: Two samples of each color requested by the Engineer for selection:

5. Delegated-design submittal: For louvers to comply with structural performance requirements and design criteria specified in this Section, including analysis data signed and sealed by the qualified professional Engineer responsible for their preparation.

6. Product test reports: Based on evaluation of comprehensive tests performed in accordance with AMCA 500-L by a qualified testing agency or by Manufacturer and witnessed by a qualified testing agency, for each type of louver and showing compliance with performance requirements specified in this Section.

E. Sustainable Design Submittals:

1. As specified in Section 01 81 13.01.

1.05 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

B. Performance Requirements:

1. Delegated design: Design louvers, including comprehensive engineering analysis by a qualified professional Engineer, using structural performance requirements and design criteria indicated.

2. Structural performance: Louvers shall withstand the effects of gravity loads and the following loads and stresses within limits and under conditions indicated without permanent deformation of louver components, noise or metal fatigue caused by louver blade rattle or flutter, or permanent damage to fasteners and anchors. Wind pressures shall be considered to act normal to the face of the building.

C. Wind loads: Determine loads based on pressures as shown on the Drawings.

1. Ultimate design wind speed (VULT): 175 mph

2. Risk Category: III

3. Exposure Category: C

D. Thermal Movements: Allow for thermal movements from ambient and surface temperature changes, without buckling, opening of joints, overstressing of components, failure of connections, or other detrimental effects.

1. Temperature change (Range): 120 degrees F, ambient; 180 degrees F, material surfaces.

E. Louver Performance Ratings: Provide louvers in accordance with requirements specified, as demonstrated by testing Manufacturer's stock units identical to those provided, except for length and width in accordance with AMCA 500-L.

F. Comply with the requirements specified in Section 01 45 00.

G. Source Limitations: Obtain louvers and vents from single source from a single Manufacturer where indicated to be of same type, design, or factory-applied color finish.

H. Welding: Qualify procedures and personnel in accordance with AWS D1.2.

I. SMACNA Standard: Comply with recommendations in SMACNA's "Architectural Sheet Metal Manual" for fabrication, construction details, and installation procedures.

1.06 PROJECT CONDITIONS:

A. Field Measurements: Verify actual dimensions of openings by field measurements before fabrication.

1.07 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

1. Brace and support units to prevent deformation during delivery.

2. Factory wrap units with accepted materials to protect finish during delivery and storage.

3. Handle units with care to prevent bending or scratching.

4. Placement:

a. Material shall be placed in accordance with sound material handling practices and in such a way as to minimize racking.

b. Louver sections may be hoisted by attaching straps to the jambs and lifting the section while it is in a vertical position.

c. Louver sections should only be lifted and carried by the jambs. Heads, sills and blades are not to be used for lifting or hoisting louver sections.

5. Shop assembly for architectural screen: Coordinate field measurements and shop Drawings with fabrication and shop assembly to minimize field adjustments, mechanical attachment and field assembly of units. Pre-assemble units in ship to greatest extent possible and disassemble as necessary for shipping and handling limitations. Clearly mark units for re-assembly and coordinated installation.

1.08 WARRANTY:

A. Warranty requirements as specified in Section 01 78 36.

1.09 O&M SPECIAL REQUIREMENTS:

A. O&M data requirements as specified in Section 01 78 23.

PART 2 - PRODUCTS

2.01 MANUFACTURERS:

A. Fixed, Extruded-Aluminum Louvers:

1. Horizontal, Drainable-Blade Louver:

a. Construction Specialties, Inc., A4097

b. Greenheck Fan Corporation, ESD-403

c. Nystrom Building Products, Drainable Louvers

d. Ruskin Company; Tomkins PLC, ELF 375 Series

2.02 MATERIALS:

A. Sustainable Design Product Requirements:

1. Comply with the requirements as specified in Section 01 81 13.01.

2. ISI Envision:

a. Sustainable procurement practices (RA1.2): Maximize the procurement of materials that follow sustainable procurement practices.

b. Recycled Materials (RA1.3): Maximize the procurement of materials with recycled content.

c. Locally sourced materials (RA1.4): Maximize the procurement of materials within the radius as specified in Section 01 81 13.01.

B. Aluminum Extrusions: ASTM B221, Alloy 6063-T5, T-52, or T6.

C. Aluminum Sheet: ASTM B209, Alloy 3003 or 5005 with temper as required for forming, or as otherwise recommended by metal producer for required finish.

D. Aluminum Castings: ASTM B26, Alloy 319.

2.03 COMPONENTS:

A. Fixed, Extruded-Aluminum Louvers:

1. Horizontal, Drainable-Blade Louver:

a. Louver Depth: 4-inches.

b. Frame and Blade Nominal Thickness: Not less than 0.080-inch for blades and 0.080-inch for frames.

c. Mullion Type: Sliding interlock with internal drains.

d. Heads, sills, jambs and mullions to be one-piece structural aluminum members with integral caulking slot and retaining beads.

e. Blades to be one-piece aluminum extrusions with gutter(s) designed to catch and direct water to jamb and mullion drains.

f. Louver Performance Ratings:

(1) Free area: Not less than 8.0 square feet for 48-inch wide by 48-inch high louver.

(2) Free area velocity at point of beginning water penetration: Not less than 1040 fpm.

(3) Intake pressure drop at point of beginning water penetration: Not more than 0.20-inch wg static pressure drop.

(4) Air performance: Not more than 0.18-inch wg static pressure drop at 1000-fpm free-area exhaust velocity.

(5) AMCA Seal: Mark units with AMCA Certified Ratings Seal.

B. Louver Screens:

1. General: Provide screen at each exterior louver.

a. Screen location for fixed louvers: Interior face.

b. Screening Type: Bird screening.

2. Secure screen frames to louver frames with machine screws with heads finished to match louver, spaced a maximum of 6-inches from each corner and at 12-inches on center (o.c.).

3. Louver screen frames: Fabricate with mitered corners to louver indicated.

   a. Metal: Same kind and form of metal as indicated for louver which screens are attached. Reinforce extruded-aluminum screen frames at corners with clips.

   b. Finish: Same finish as louver to which louver screens are attached.

   c. Type: Re-wireable frames with a driven spline or insert.

4. Louver screening for aluminum louvers:

   a. Bird screening: Aluminum, 1/2-inch square mesh, 0.063-inch wire.

   b. Blank-off panels:

      (1) Insulated, blank-off panels: Laminated panels consisting of insulating core surfaced on back and front with metal sheets and attached to back of louver.

         (a) Thickness: 2-inches.

         (b) Metal facing sheets: Aluminum sheet, not less than 0.032-inch nominal thickness.

         (c) Insulating core: extruded-polystyrene foam.

         (d) Edge treatment: Trim perimeter edges of blank-off panels with louver Manufacturer's standard extruded-aluminum-channel frames, not less than 0.080-inch nominal thickness channel frames, with corners mitered and with same finish as panels.

         (e) Seal perimeter joints between panel faces and louver frames with gaskets or sealant.

         (f) Panel finish: Same type of finish applied to louver.

         (g) Attach blank-off panels with clip.

2.04 ACCESSORIES:

A. Fasteners: Use types and sizes to suit unit installation conditions.

   1. Use tamper-resistant screws for exposed fasteners unless otherwise indicated.

   2. For fastening aluminum, use aluminum or 300 series stainless-steel fasteners.

   3. For color-finished louvers, use fasteners with heads that match color of louvers.

B. Post-installed fasteners for concrete and masonry: Torque-controlled expansion anchors, made from stainless-steel components, with capability to sustain, without failure, a load equal to 4 times the loads imposed, for concrete, or 6 times the load imposed, for masonry, as determined by testing in accordance with ASTM E488, conducted by a qualified independent testing agency.

C. Jamb trim: Provide jamb trim at louvers where stone facing returns to the louver frames as shown on the Drawings. Jamb trim shall be fabricated from material matching the louver construction and finished to match.

D. Bituminous paint: Cold-applied asphalt emulsion in accordance with ASTM D1187.

2.05 FABRICATION:

A. Assemble louvers in factory to minimize field splicing and assembly. Disassemble units as necessary for shipping and handling limitations. Clearly mark units for reassembly and coordinated installation.

B. Vertical Assemblies: Where height of louver units exceeds fabrication and handling limitations, fabricate units to permit field-bolted assembly with close-fitting joints in jambs and mullions, reinforced with splice plates.

1. Horizontal mullions: Provide horizontal mullions at joints where shown on drawings or required due to height of louver.

C. Fabricate frames, including integral sills, to fit in openings of sizes indicated, with allowances made for fabrication and installation tolerances, adjoining material tolerances, and perimeter sealant joints.

D. Include supports, anchorages, and accessories required for complete assembly.

E. Heads, sills, jambs and mullions to be one-piece structural aluminum members with integral caulking slot and retaining beads.

F. Blades to be one-piece aluminum extrusions with gutter(s) designed to catch and direct water to jamb and mullion drains.

1. Provide vertical mullions of sliding interlock type and at spacings indicated, but not more than recommended by Manufacturer, or 72-inches o.c., whichever is less.

2. Exposed mullions: Where indicated, provide units with exposed mullions of same width and depth as louver frame. Where length of louver exceeds fabrication and handling limitations, provide interlocking split mullions designed to permit expansion and contraction.

G. Provide sub-sills made of same material as louvers or extended sills for recessed louvers as shown on the Drawings.

H. Join frame members to each other and to fixed louver blades mechanically with stainless steel or aluminum fasteners. Match louver color where exposed to view.

2.06 FINISHES:

A. Provide finishes in accordance with NAAMM for recommendations for applying and designating finishes.

B. Aluminum Finishes:

1. Apply finishes in factory.

2. High-performance organic finish: 2-coat fluoropolymer finish in accordance with AAMA 2605 and containing not less than 70 percent polyvinylidene fluoride (PVDF) resin by weight in color coat. Prepare, pretreat, and apply coating to exposed metal surfaces to in accordance with coating and resin Manufacturers' written instructions.

a. Color and gloss: As selected by Engineer from Manufacturer's full range in accordance with the procedures specified in Section 01 33 00.

PART 3 - EXECUTION

3.01 PREPARATION:

A. Examine substrates and openings, with installer present, for compliance with requirements for installation tolerances and other conditions affecting performance.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

C. Coordinate setting Drawings, diagrams, templates, instructions, and directions for installation of anchorages that are to be embedded in concrete or masonry construction. Coordinate delivery of such items to Project site.

3.02 ERECTION / INSTALLATION / APPLICATION:

A. Locate and place louvers and vents level, plumb, and t alignment specified in this Section with adjacent Work.

B. Use concealed anchorages where possible. Use non-ferrous metal or hot-dip galvanized anchors and inserts for installation and elsewhere as required for corrosion resistance. Use stainless steel or lead expansion bolt devices for drilled-in place anchors. Furnish inserts, as required, to be set into concrete or masonry Work.

C. Form closely fitted joints with exposed connections accurately located and secured.

D. Provide perimeter reveals and openings of uniform width for sealants and joint fillers, as indicated.

E. Do not erect warped, bowed, deformed or otherwise damaged or defaced members. Remove and replace any members damaged in the erection process as directed.

F. Repair finishes damaged by cutting, welding, soldering, and grinding. Restore finishes so no evidence remains of corrective Work. Return items that cannot be refinished in the field to the factory, make required alterations, and refinish entire unit or provide new units.

G. Protect unpainted galvanized and nonferrous-metal surfaces that will be in contact with concrete, masonry, or dissimilar metals from corrosion and galvanic action by applying a heavy coating of bituminous paint or by separating surfaces with waterproof gaskets or nonmetallic flashing.

H. Install concealed gaskets, flashings, joint fillers, and insulation as louver installation progresses, where weathertight louver joints are required. Seal joints between units and substrate to provide a weathertight installation at all joints and intersections and at opening perimeters. Comply requirements as specified in Section 07 92 00 for sealants applied during louver installation.

I. Erection Tolerances:

1. Maximum variation from plane or location shown on the approved shop Drawings: 1/8-inch per 12-feet of length, but not exceeding 1/2-inch in any total building length or portion thereof (non-cumulative).

2. Maximum offset from true alignment between two members abutting end to end, edge-to-edge in line or separated by less than 3-inch: 1/16-inch (shop or field joints). This limiting condition shall prevail under both load and no load conditions.

3.03 PROTECTION:

A. Initiate and maintain protection and other precautions required through the remainder of the construction period, to ensure that, except for normal weathering, louver units will be free of damage or deterioration at the time of final inspection.

3.04 STARTUP AND COMMISSIONING:

A. Startup and commissioning requirements for the equipment specified herein as specified in Section 01 78 25.

3.05 CLEANING:

A. Clean exposed surfaces of louvers and vents that are not protected by temporary covering, to remove fingerprints and soil during construction period. Do not let soil accumulate during construction period.

B. Before final inspection, clean exposed surfaces with water and a mild soap or detergent not harmful to finishes. Thoroughly rinse surfaces and dry.

C. Restore louvers and vents damaged during installation and construction so no evidence remains of corrective Work. If results of restoration are unsuccessful, as determined by Engineer, remove damaged units and replace with new units.

1. Touch up minor abrasions in finishes with air-dried coating that matches color and gloss of, and is compatible with, factory-applied finish coating.

3.06 CONTRACT CLOSEOUT:

A. Provide in accordance with Section 01 77 00.

DIVISION 09

FINISHES

Page Intentionally Left Blank

SECTION 09 29 00

DRYWALL CONSTRUCTION

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide gypsum board and accessories as indicated and in compliance with Contract Documents.

B. Section Includes:

1. Interior gypsum board

2. Tile backing panels

3. Framing Components

1.02 REFERENCES:

A. ASTM International (ASTM):

1. B221: Standard Specification for Aluminum and Aluminum-Alloy Extruded Bars, Rods, Wire, Profiles, and Tubes

2. C423: Standard Test Method for Sound Absorption and Sound Absorption Coefficients by the Reverberation Room Method

3. C475: Standard Specification for Joint Compound and Joint Tape for Finishing Gypsum Board

4. C665: Standard Specification for Mineral-Fiber Blanket Thermal Insulation for Light Frame Construction and Manufactured Housing

5. C834: Standard Specification for Latex Sealants

6. C840: Standard Specification for Application and Finishing of Gypsum Board

7. C919: Standard Practice for Use of Sealants in Acoustical Applications

8. c954: Standard Specification for Steel Drill Screws for the Application of Gypsum Panel Products or Metal Plaster Bases to Steel Studs From 0.033 in. (0.84 mm) to 0.112 in. (2.84 mm) in Thickness

9. C1002: Standard Specification for Steel Self-Piercing Tapping Screws for the Application of Gypsum Panel Products or Metal Plaster Bases to Wood Studs or Steel Studs

10. C1047: Standard Specification for Accessories for Gypsum Wallboard and Gypsum Veneer Base

11. C1177: Standard Specification for Glass Mat Gypsum Substrate for Use as Sheathing

12. C1178: Standard Specification for Coated Glass Mat Water-Resistant Gypsum Backing Panel

13. C1278: Standard Specification for Fiber-Reinforced Gypsum Panel

14. C1288: Standard Specification for Discrete Non-Asbestos Fiber-Cement Interior Substrate Sheets

15. C1325: Standard Specification for Non-Asbestos Fiber-Mat Reinforced Cementitious Backer Units

16. C1396: Standard Specification for Gypsum Board

17. C1629: Standard Classification for Abuse-Resistant Nondecorated Interior Gypsum Panel Products and Fiber-Reinforced Cement Panels

18. C1658: Standard Specification for Glass Mat Gypsum Panels

19. D3273: Standard Test Method for Resistance to Growth of Mold on the Surface of Interior Coatings in an Environmental Chamber

20. E84: Standard Test Method for Surface Burning Characteristics of Building Materials

21. E90: Standard Test Method for Laboratory Measurement of Airborne Sound Transmission Loss of Building Partitions and Elements

22. E119: Standard Test Methods for Fire Tests of Building Construction and Materials

23. E413: Classification for Rating Sound Insulation

B. American National Standards Institute (ANSI):

1. A108.11: Interior Installation of Cementitious Backer Units

2. A118.9: Cementitious Backer Units

1.03 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Product Data: For each type of product.

C. Samples: For the following products:

1. Trim Accessories: Full-size Sample in 12-inch-long length for each trim accessory indicated.

1.04 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.05 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

1.06 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

B. Store materials inside under cover and keep them dry and protected against weather, condensation, direct sunlight, construction traffic, and other potential causes of damage. Stack panels flat and supported on risers on a flat platform to prevent sagging.

1.07 PROJECT/SITE CONDITIONS:

A. Environmental Limitations: Comply with ASTM C840 requirements or gypsum board manufacturer's written recommendations, whichever are more stringent.

B. Do not install paper-faced gypsum panels until installation areas are enclosed and conditioned.

C. Do not install panels that are wet, those that are moisture damaged, and those that are mold damaged.

1. Indications that panels are wet or moisture damaged include, but are not limited to, discoloration, sagging, or irregular shape.

2. Indications that panels are mold damaged include, but are not limited to, fuzzy or splotchy surface contamination and discoloration.

PART 2 - PRODUCTS

2.01 PERFORMANCE REQUIREMENTS:

A. Low-Emitting Materials: For ceiling and wall assemblies, provide materials and construction identical to those tested in assembly and complying with the testing and product requirements of the California Department of Health Services' "Standard Practice for the Testing of Volatile Organic Emissions from Various Sources Using Small-Scale Environmental Chambers."

2.02 GYPSUM BOARD, GENERAL:

A. Recycled Content of Gypsum Panel Products: Postconsumer recycled content plus one-half of preconsumer recycled content not less than 25 percent.

B. Regional Materials: Gypsum panel products shall be manufactured within 500 miles of Project site from materials that have been extracted, harvested, or recovered, as well as manufactured, within 500 miles of Project site.

C. Regional Materials: Gypsum panel products shall be manufactured within 500 miles of Project site.

D. Size: Provide maximum lengths and widths available that will minimize joints in each area and that correspond with support system indicated.

2.03 INTERIOR GYPSUM BOARD:

A. Manufacturers:

1. CertainTeed Corp

2. Georgia-Pacific Gypsum LLC

3. USG Corporation

B. Moisture- and Mold-Resistant Gypsum Board: ASTM C1396/C1396M. With moisture- and mold-resistant core and paper surfaces.

1. Core: 1/2 inch, regular type

2. Long Edges: Tapered

3. Mold Resistance: ASTM D3273, score of 10

C. Moisture- and Mold-Resistant Gypsum Board: ASTM C1396/C1396M. With moisture- and mold-resistant core and paper surfaces.

1. Core: 5/8 inch, regular type

2. Long Edges: Tapered

3. Mold Resistance: ASTM D3273, score of 10

D. Gypsum Wallboard: ASTM C1396.

1. Thickness: 5/8 inch.

2. Long Edges: Tapered for prefilling.

E. Gypsum Board, Type X: ASTM C1396.

1. Thickness: 5/8 inch.

2. Long Edges: Tapered for prefilling.

2.04 TILE BACKING PANELS:

A. Glass-Mat, Water-Resistant Backing Board: ASTM C1178, with manufacturer's standard edges.

1. Products:

a. CertainTeed Corp.; GlasRoc Tile Backer

b. Georgia-Pacific Gypsum LLC; DensShield Tile Backer

2. Core: 1/2 inch , regular type

3. Mold Resistance: ASTM D3273, score of 10

2.05 TRIM ACCESSORIES:

A. Interior Trim: ASTM C1047.

1. Material: Galvanized or aluminum-coated steel sheet, rolled zinc, plastic, or paper-faced galvanized steel sheet.

2. Shapes:

a. Cornerbead

b. Bullnose bead

c. LC-Bead: J-shaped; exposed long flange receives joint compound

d. L-Bead: L-shaped; exposed long flange receives joint compound

e. U-Bead: J-shaped; exposed short flange does not receive joint compound

f. Expansion (control) joint

g. Curved-Edge Cornerbead: With notched or flexible flanges

2.06 JOINT TREATMENT MATERIALS:

A. General: Comply with ASTM C475

B. Joint Tape:

1. Interior Gypsum Board: Paper

2. Tile Backing Panels: As recommended by panel manufacturer

C. Joint Compound for Interior Gypsum Board: For each coat use formulation that is compatible with other compounds applied on previous or for successive coats.

1. Prefilling: At open joints and damaged surface areas, use setting-type taping compound.

2. Embedding and First Coat: For embedding tape and first coat on joints, fasteners, and trim flanges, use setting-type taping compound.

a. Use setting-type compound for installing paper-faced metal trim accessories.

3. Fill Coat: For second coat, use drying-type, all-purpose compound.

4. Finish Coat: For third coat, use drying-type, all-purpose compound.

D. Joint Compound for Tile Backing Panels:

1. Glass-Mat, Water-Resistant Backing Panel: As recommended by backing panel manufacturer.

2. Cementitious Backer Units: As recommended by backer unit manufacturer.

3. Water-Resistant Gypsum Backing Board: Use setting-type taping compound and setting-type, sandable topping compound.

2.07 FRAMING COMPONENTS

A. Manufacturers:

1. Clark Dietrich Steel Framing Systems

2. Dale Industries, Inc. - Dale/Incor

3. National Gypsum Company

B. Steel Studs and Runners: Provide in accordance with ASTM C645.

1. Minimum base metal thickness and strength: 0.0179-inch/33 ksi or 0.0155-inch/50 ksi

2. Depth: 3 5/8-inches, and 6-inches where shown on Drawings

3. At door jambs and walls having a tile finish provide minimum base metal thickness and strength: 0.0312-inch/33 ksi, Depth: 3 5/8-inches

C. Deep-Leg Deflection Track: ASTM C645 top runner with 2-inches deep flanges.

2.08 AUXILIARY MATERIALS:

A. General: Provide auxiliary materials that comply with referenced installation standards and manufacturer's written recommendations.

B. Laminating Adhesive: Adhesive or joint compound recommended for directly adhering gypsum panels to continuous substrate.

1. Laminating adhesive shall have a VOC content of 50 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).

C. Steel Drill Screws: ASTM C1002, unless otherwise indicated.

1. Use screws complying with ASTM C954 for fastening panels to steel members from 0.033 to 0.112 inch thick.

2. For fastening cementitious backer units, use screws of type and size recommended by panel manufacturer.

D. Sound Attenuation Blankets: ASTM C665, Type I (blankets without membrane facing) produced by combining thermosetting resins with mineral fibers manufactured from glass, slag wool, or rock wool.

1. Fire-Resistance-Rated Assemblies: Comply with mineral-fiber requirements of assembly.

2. Recycled Content of Blankets: Post-consumer recycled content plus one-half of pre-consumer recycled content not less than 70 percent.

E. Acoustical Joint Sealant: Manufacturer's standard non-sag, paintable, non-staining latex sealant complying with ASTM C834. Product effectively reduces airborne sound transmission through perimeter joints and openings in building construction as demonstrated by testing representative assemblies according to ASTM E90.

1. Products:

a. Pecora Corporation; AIS-919

b. Specified Technologies, Inc.; Smoke N Sound Acoustical Sealant

c. USG Corporation; SHEETROCK Acoustical Sealant

2. Acoustical joint sealant shall have a VOC content of 250 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).

3. Acoustical joint sealant shall comply with the testing and product requirements of the California Department of Health Services' "Standard Practice for the Testing of Volatile Organic Emissions from Various Sources Using Small-Scale Environmental Chambers."

PART 3 - EXECUTION

3.01 EXAMINATION:

A. Examine areas and substrates including welded hollow-metal frames and framing, with Installer present, for compliance with requirements and other conditions affecting performance.

B. Examine panels before installation. Reject panels that are wet, moisture damaged, and mold damaged.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 INSTALLING FRAMING COMPONENTS, GENERAL:

A. Steel framing installation standard: Install steel framing in accordance with ASTM C754 and with ASTM C840 requirements that apply to framing installation.

B. Install supplementary framing, blocking, and bracing at terminations in gypsum board assemblies to support fixtures, equipment services, and heavy trim, grab bars, toilet accessories, furnishings, or similar construction, in accordance with recommendations of the Gypsum Board Manufacturer or, if none available, with United States Gypsum Co.'s "Gypsum Construction Handbook."

C. Isolate steel framing from building structure at locations as required to prevent transfer of loading imposed by structural movement. In accordance with details shown on the Drawings.

1. Where building structure abuts ceiling perimeter or penetrates ceiling.

2. Where partition framing and wall furring abut structure, except at floor.

a. Provide slip- or cushioned-type joints as detailed to attain lateral support and avoid axial loading.

D. Do not bridge building control and expansion joints with steel framing or furring members. Independently frame both sides of joints with framing or furring members.

3.03 INSTALLING STEEL FRAMING FOR WALLS AND PARTITIONS:

A. Install runners (tracks) at floors, ceilings, and structural walls and columns where gypsum board stud assemblies abut other construction.

B. Installation tolerances: Install each steel framing and furring member so that fastening surfaces do not vary more than 1/8-inches from the plane formed by the faces of adjacent framing.

C. Extend partition framing full height to structural supports or substrates above suspended ceilings, except where partitions are shown on Drawings to terminate at suspended ceilings or at another level above ceilings. Continue framing over frames for doors and openings and frame around ducts penetrating partitions above ceiling to provide support for gypsum board.

1. For STC-rated and fire-resistance-rated partitions that extend to the underside of floor/roof slabs and decks or other continuous solid structural surfaces to obtain ratings, install framing around structural and other members ex- tending below floor/roof slabs and decks, as needed, to support gypsum board closures needed to make partitions continuous from floor to underside of solid structure.

D. Terminate partition framing at suspended ceilings where shown on Drawings.

E. Install steel studs and furring in sizes and at spacing shown on Drawings.

1. Single-Layer Construction: Space studs 16-inches on center (o.c.), unless otherwise indicated.

2. Tile Backer Unit Construction: Space studs 16-inches o.c., unless otherwise indicated.

F. Install steel studs so flanges point in the same direction and leading edge or end of each gypsum board panel can be attached to open (unsupported) edges of stud flanges first.

G. Frame door openings to in accordance with applicable published recommendations of the Gypsum Board Manufacturer, unless otherwise indicated. Attach vertical studs at jambs with screws either directly to frames or to jamb anchor clips on door frames; install runner track section (for cripple studs) at head and secure to jamb studs.

1. Install 2 studs at each jamb, unless otherwise indicated.

3.04 APPLYING AND FINISHING PANELS, GENERAL:

A. Comply with ASTM C840.

B. Install panels with face side out. Butt panels together for a light contact at edges and ends with not more than 1/16 inch of open space between panels. Do not force into place.

C. Locate edge and end joints over supports, except in ceiling applications where intermediate supports or gypsum board back-blocking is provided behind end joints. Do not place tapered edges against cut edges or ends. Stagger vertical joints on opposite sides of partitions. Do not make joints other than control joints at corners of framed openings.

D. Form control and expansion joints with space between edges of adjoining gypsum panels.

E. Cover both faces of support framing with gypsum panels in concealed spaces (above ceilings, etc.), except in chases braced internally.

1. Unless concealed application is indicated or required for sound, fire, air, or smoke ratings, coverage may be accomplished with scraps of not less than 8 square feet in area.

2. Fit gypsum panels around ducts, pipes, and conduits.

3. Where partitions intersect structural members projecting below underside of floor/roof slabs and decks, cut gypsum panels to fit profile formed by structural members; allow 1/4- to 3/8-inch-wide joints to install sealant.

F. Isolate perimeter of gypsum board applied to non-load-bearing partitions at structural abutments, except floors. Provide 1/4- to 1/2-inch-wide spaces at these locations and trim edges with edge trim where edges of panels are exposed. Seal joints between edges and abutting structural surfaces with acoustical sealant.

G. Attachment to Steel Framing: Attach panels so leading edge or end of each panel is attached to open (unsupported) edges of stud flanges first.

H. Install sound attenuation blankets before installing gypsum panels unless blankets are readily installed after panels have been installed on one side.

3.05 APPLYING INTERIOR GYPSUM BOARD:

A. Install interior gypsum board in the following locations:

1. Moisture- and Mold-Resistant Type: Unless indicated otherwise

2. Glass-Mat Interior Type: At surfaces to receive tile

B. Single-Layer Application:

1. On partitions/walls, apply gypsum panels horizontally (perpendicular to framing) unless otherwise indicated or required by fire-resistance-rated assembly, and minimize end joints.

a. Stagger abutting end joints not less than one framing member in alternate courses of panels.

b. At stairwells and other high walls, install panels horizontally unless otherwise indicated or required by fire-resistance-rated assembly.

2. On Z-furring members, apply gypsum panels vertically (parallel to framing) with no end joints. Locate edge joints over furring members.

3. Fastening Methods: Apply gypsum panels to supports with steel drill screws.

C. Multilayer Application:

1. On ceilings, apply gypsum board indicated for base layers before applying base layers on walls/partitions; apply face layers in same sequence. Apply base layers at right angles to framing members and offset face-layer joints one framing member, 16 inches minimum, from parallel base-layer joints, unless otherwise indicated or required by fire-resistance-rated assembly.

2. On partitions/walls, apply gypsum board indicated for base layers and face layers vertically (parallel to framing) with joints of base layers located over stud or furring member and face-layer joints offset at least one stud or furring member with base-layer joints, unless otherwise indicated or required by fire-resistance-rated assembly. Stagger joints on opposite sides of partitions.

3. On Z-furring members, apply base layer vertically (parallel to framing) and face layer either vertically (parallel to framing) or horizontally (perpendicular to framing) with vertical joints offset at least one furring member. Locate edge joints of base layer over furring members.

4. Fastening Methods: Fasten base layers and face layers separately to supports with screws.

D. Laminating to Substrate: Where gypsum panels are indicated as directly adhered to a substrate (other than studs, joists, furring members, or base layer of gypsum board), comply with gypsum board manufacturer's written recommendations and temporarily brace or fasten gypsum panels until fastening adhesive has set.

3.06 APPLYING TILE BACKING PANELS:

A. Glass-Mat, Water-Resistant Backing Panels: Comply with manufacturer's written installation instructions and install at locations indicated to receive tile. Install with 1/4-inch gap where panels abut other construction or penetrations.

B. Where tile backing panels abut other types of panels in same plane, shim surfaces to produce a uniform plane across panel surfaces.

3.07 INSTALLING TRIM ACCESSORIES:

A. General: For trim with back flanges intended for fasteners, attach to framing with same fasteners used for panels. Otherwise, attach trim according to manufacturer's written instructions.

B. Control Joints: Install control joints according to ASTM C840 and in specific locations accepted by Engineer for visual effect.

C. Interior Trim: Install in the following locations:

1. Cornerbead: Use at outside corners unless otherwise indicated

3.08 FINISHING GYPSUM BOARD:

A. General: Treat gypsum board joints, interior angles, edge trim, control joints, penetrations, fastener heads, surface defects, and elsewhere as required to prepare gypsum board surfaces for decoration. Promptly remove residual joint compound from adjacent surfaces.

B. Prefill open joints and damaged surface areas.

C. Apply joint tape over gypsum board joints, except for trim products specifically indicated as not intended to receive tape.

D. Gypsum Board Finish Levels: Finish panels to levels indicated below and according to ASTM C840:

1. Level 1: Ceiling plenum areas, concealed areas, and where indicated

2. Level 2: Panels that are substrate for tile

3. Level 4: At panel surfaces that will be exposed to view unless otherwise indicated

   a. Primer and its application to surfaces are specified in other Division 09 sections.

E. Glass-Mat Gypsum Sheathing Board: Finish according to manufacturer's written instructions for use as exposed soffit board.

F. Glass-Mat Faced Panels: Finish according to manufacturer's written instructions.

3.09 PROTECTION:

A. Protect adjacent surfaces from drywall compound and promptly remove from floors and other non-drywall surfaces. Repair surfaces stained, marred, or otherwise damaged during drywall application.

B. Protect installed products from damage from weather, condensation, direct sunlight, construction, and other causes during remainder of the construction period.

C. Remove and replace panels that are wet, moisture damaged, and mold damaged.

1. Indications that panels are wet or moisture damaged include, but are not limited to, discoloration, sagging, or irregular shape.

2. Indications that panels are mold damaged include, but are not limited to, fuzzy or splotchy surface contamination and discoloration.

3.10 CONTRACT CLOSEOUT:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

Page Intentionally Left Blank

SECTION 09 30 00

TILE WORK

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide tile work as indicated and in compliance with Contract Documents.

1. Section Includes:

a. Ceramic tile

1.02 REFERENCES:

15. C1353: Standard Test Method Using the Taber Abraser for Abrasion Resistance of Dimension Stone Subjected to Foot Traffic

16. D87: Standard Test Method for Melting Point of Petroleum Wax (Cooling Curve)

17. D226: Standard Specification for Asphalt-Saturated Organic Felt Used in Roofing and Waterproofing

18. D4397: Standard Specification for Polyethylene Sheeting for Construction, Industrial, and Agricultural Applications

C. Federal Regulations (CFR:)

1. 40 CFR 59: National Volatile Organic Compound Emission Standards for Architectural Coatings

D. Tile Council of North America (TCA):

1. Handbook for Ceramic Tile Installation.

1.03 DEFINITIONS:

A. General: Definitions in the ANSI A108 series of tile installation standards and in ANSI A137.1 apply to Work of this Section unless otherwise specified.

B. ANSI A108 Series: ANSI A108.01, ANSI A108.02, ANSI A108.1A, ANSI A108.1B, ANSI A108.1C, ANSI A108.4, ANSI A108.5, ANSI A108.6, ANSI A108.8, ANSI A108.9, ANSI A108.10, ANSI A108.11, ANSI A108.12, ANSI A108.13, ANSI A108.14, ANSI A108.15, ANSI A108.16, and ANSI A108.17, which are contained in "American National Standard Specifications for Installation of Ceramic Tile."

C. Module Size: Actual tile size plus joint width indicated

D. Face Size: Actual tile size, excluding spacer lugs

1.04 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Product Data: For each type of product indicated.

C. Shop Drawings: Show locations of each type of tile and tile pattern. Show widths, details, and locations of expansion, contraction, control, and isolation joints in tile substrates and finished tile surfaces.

D. Samples for Initial Selection: For each type of tile and grout indicated. Include Samples of accessories involving color selection.

E. Qualification Data: For qualified Installer.

1.05 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.06 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

B. Source Limitations for Tile: Obtain tile of each type and color or finish from one source or producer.

1. Obtain tile of each type and color or finish from same production run and of consistent quality in appearance and physical properties for each contiguous area.

C. Source Limitations for Setting and Grouting Materials: Obtain ingredients of a uniform quality for each mortar, adhesive, and grout component from one manufacturer and each aggregate from one source or producer.

1.07 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

B. Deliver and store packaged materials in original containers with seals unbroken and labels intact until time of use. Comply with requirements in ANSI A137.1 for labeling tile packages.

C. Store tile and cementitious materials on elevated platforms, under cover, and in a dry location.

D. Store aggregates where grading and other required characteristics can be maintained and contamination can be avoided.

E. Store liquid materials in unopened containers and protected from freezing.

F. Handle tile that has temporary protective coating on exposed surfaces to prevent coated surfaces from contacting backs or edges of other units. If coating does contact bonding surfaces of tile, remove coating from bonding surfaces before setting tile.

1.08 PROJECT/SITE CONDITIONS:

A. Environmental Limitations: Do not install tile until construction in spaces is complete and ambient temperature and humidity conditions are maintained at the levels indicated in referenced standards and manufacturer's written instructions.

B. Do not install adhesives and grouts in an unventilated environment.

C. Maintain ambient and substrate temperature of 50 degrees F during installation of mortar materials.

1.09 MAINTENANCE:

A. Extra Materials:

1. Furnish extra materials described below that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

a. Tile and Trim Units: Furnish quantity of full-size units equal to 3 percent of amount installed, for each type, composition, color, pattern, and size indicated.

PART 2 - PRODUCTS

2.01 PRODUCTS, GENERAL:

A. ANSI Ceramic Tile Standard: Provide tile that complies with ANSI A137.1 for types, compositions, and other characteristics indicated.

1. Provide tile complying with Standard grade requirements unless otherwise indicated.

B. ANSI Standards for Tile Installation Materials: Provide materials complying with ANSI A108.02, ANSI standards referenced in other Part 2 articles, ANSI standards referenced by TCA installation methods specified in tile installation schedules, and other requirements specified.

C. FloorScore Compliance: Tile for floors shall comply with requirements of FloorScore Standard.

D. Factory Blending: For tile exhibiting color variations within ranges, blend tile in factory and package so tile units taken from one package show same range in colors as those taken from other packages and match accepted Samples.

E. Factory-Applied Temporary Protective Coating: Where indicated under tile type, protect exposed surfaces of tile against adherence of mortar and grout by precoating with continuous film of petroleum paraffin wax, applied hot. Do not coat unexposed tile surfaces.

2.02 TILE PRODUCTS:

A. Tile Type: Glazed wall tile.

1. Manufacturers:

a. American Marazzi Tile, Inc.

b. American Olean; Division of Dal-Tile International Inc.

c. Daltile; Division of Dal-Tile International Inc.

2. Module Size: 6 by 6 inches.

3. Thickness: 5/16-inch.

4. Face: Plain with modified square edges or cushion edges

5. Finish: Bright, opaque glaze.

6. Tile Color and Pattern: As selected by Engineer from manufacturer's full range.

7. Grout Color: As selected by Engineer from manufacturer's full range.

8. Trim Units: Coordinated with sizes and coursing of adjoining flat tile where applicable and matching characteristics of adjoining flat tile. Provide shapes as follows, selected from manufacturer's standard shapes:

a. Base for Portland Cement Mortar Installations: Coved, module size 6 by 6 inches.

b. Wainscot Cap for Thin-Set Mortar Installations: Surface bullnose, module size 6 by 6 inches.

c. Wainscot Cap for Flush Conditions: Regular flat tile for conditions where tile wainscot is shown flush with wall surface above it, same size as adjoining flat tile.

d. External Corners for Portland Cement Mortar Installations: Bullnose shape with radius of at least 3/4-inch unless otherwise indicated.

e. External Corners for Thin-Set Mortar Installations: Surface bullnose, same size as adjoining flat tile.

f. Internal Corners: Field-butted square corners. For coved base and cap use angle pieces designed to fit with stretcher shapes.

B. Latex-Portland Cement: Flexible mortar consisting of cement-based mix and latex additive.

1. Products:

a. Boiardi Products; a QEP company; Elastiment 323 Cement Based Waterproofing, Anti-Fracture/Crack Suppression Membrane

b. C-Cure; UltraCure 971

c. MAPEI Corporation; Mapelastic (PRP 315)

2.03 SETTING MATERIALS:

A. Dry-Set Portland Cement Mortar (Thin Set): ANSI A118.1.

1. Manufacturers:

a. Boiardi Products; a QEP company

b. Bonsal American; an Oldcastle company

c. Bostik, Inc.

2. For wall applications, provide mortar that complies with requirements for non-sagging mortar in addition to the other requirements in ANSI A118.1.

B. Latex-Portland Cement Mortar (Thin Set): ANSI A118.4.

1. Manufacturers:

a. Boiardi Products; a QEP company

b. Bonsal American; an Oldcastle company

c. Bostik, Inc.

2. Provide prepackaged, dry-mortar mix containing dry, redispersible, vinyl acetate or acrylic additive to which only water must be added at Project site.

3. For wall applications, provide mortar that complies with requirements for non-sagging mortar in addition to the other requirements in ANSI A118.4.

2.04 GROUT MATERIALS:

A. Polymer-Modified Tile Grout: ANSI A118.7.

1. Manufacturers:

a. Boiardi Products; a QEP company

b. Bonsal American; an Oldcastle company

c. Bostik, Inc.

2. Polymer Type: Ethylene vinyl acetate or acrylic additive, in dry, redispersible form, prepackaged with other dry ingredients.

2.05 MISCELLANEOUS MATERIALS:

A. Trowelable Underlayments and Patching Compounds: Latex-modified, Portland cement-based formulation provided or approved by manufacturer of tile-setting materials for installations indicated.

1. Grout release in form of manufacturer's standard proprietary liquid coating that is specially formulated and recommended for use as temporary protective coating for tile.

B. Tile Cleaner: A neutral cleaner capable of removing soil and residue without harming tile and grout surfaces, specifically approved for materials and installations indicated by tile and grout manufacturers.

C. Grout Sealer: Manufacturer's standard silicone product for sealing grout joints and that does not change color or appearance of grout.

1. Products:

a. Bonsal American; an Oldcastle company; Grout Sealer

b. Bostik, Inc.; CeramaSeal C-Cure; Penetrating Sealer 978

c. Custom Building Products; Jamo Inc.

d. MAPEI Corporation; KER Southern Grouts & Mortars, Inc.; Silicone Grout Sealer

e. Summitville Tiles, Inc.; SL-15, Invisible Seal Penetrating Grout and Tile Sealer

f. TEC; a subsidiary of H. B. Fuller Company

2.06 MIXING MORTARS AND GROUT:

A. Mix mortars and grouts to comply with referenced standards and mortar and grout manufacturers' written instructions.

B. Add materials, water, and additives in accurate proportions.

C. Obtain and use type of mixing equipment, mixer speeds, mixing containers, mixing time, and other procedures to produce mortars and grouts of uniform quality with optimum performance characteristics for installations indicated.

PART 3 - EXECUTION

3.01 EXAMINATION:

A. Examine substrates, areas, and conditions where tile will be installed, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of installed tile.

1. Verify that substrates for setting tile are firm, dry, clean, free of coatings that are incompatible with tile-setting materials including curing compounds and other substances that contain soap, wax, oil, or silicone; and comply with flatness tolerances required by ANSI A108.01 for installations indicated.

2. Verify that installation of grounds, anchors, recessed frames, electrical and mechanical units of work, and similar items located in or behind tile has been completed.

3. Verify that joints and cracks in tile substrates are coordinated with tile joint locations; if not coordinated, adjust joint locations in consultation with Engineer.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 PREPARATION:

A. Protect surrounding work from damage.

B. Vacuum clean surfaces.

C. Blending: For tile exhibiting color variations, verify that tile has been factory blended and packaged so tile units taken from one package show same range of colors as those taken from other packages and match accepted Samples. If not factory blended, either return to manufacturer or blend tiles at Project site before installing.

3.03 TILE INSTALLATION:

A. Comply with TCA's "Handbook for Ceramic Tile Installation" for TCA installation methods specified in tile installation schedules. Comply with parts of the ANSI A108 Series "Specifications for Installation of Ceramic Tile" that are referenced in TCA installation methods, specified in tile installation schedules, and apply to types of setting and grouting materials used.

B. Extend tile work into recesses and under or behind equipment and fixtures to form complete covering without interruptions unless otherwise indicated. Terminate work neatly at obstructions, edges, and corners without disrupting pattern or joint alignments.

C. Accurately form intersections and returns. Perform cutting and drilling of tile without marring visible surfaces. Carefully grind cut edges of tile abutting trim, finish, or built-in items for straight aligned joints. Fit tile closely to electrical outlets, piping, fixtures, and other penetrations so plates, collars, or covers overlap tile.

D. Provide manufacturer's standard trim shapes where necessary to eliminate exposed tile edges.

E. Jointing Pattern: Lay tile in grid pattern unless otherwise indicated. Lay out tile work and center tile fields in both directions in each space or on each wall area. Lay out tile work to minimize the use of pieces that are less than half of a tile. Provide uniform joint widths unless otherwise indicated.

1. Where adjoining tiles on floor, base, walls, or trim are specified or indicated to be same size, align joints.

F. Joint Widths and Grout Types: Unless otherwise indicated, install tile with the following joint widths and grout types:

1. Glazed Wall Tile: 1/16-inch.

G. Lay out tile wainscots to dimensions indicated or to next full tile beyond dimensions indicated.

H. Grout Sealer: Apply grout sealer to grout joints according to grout-sealer manufacturer's written instructions. As soon as grout sealer has penetrated grout joints, remove excess sealer and sealer from tile faces by wiping with soft cloth.

3.04 WATERPROOFING INSTALLATION:

A. Install waterproofing to comply with ANSI A108.13 and manufacturer's written instructions to produce waterproof membrane of uniform thickness and bonded securely to substrate.

B. Do not install tile or setting materials over waterproofing until waterproofing has cured and been tested to determine that it is watertight.

3.05 CRACK ISOLATION MEMBRANE INSTALLATION:

A. Install crack isolation membrane to comply with ANSI A108.17 and manufacturer's written instructions to produce membrane of uniform thickness and bonded securely to substrate.

B. Do not install tile or setting materials over crack isolation membrane until membrane has cured.

3.06 CLEANING AND PROTECTING:

A. Cleaning: On completion of placement and grouting, clean all ceramic tile surfaces so they are free of foreign matter.

1. Remove grout residue from tile as soon as possible.

2. Clean grout smears and haze from tile according to tile and grout manufacturer's written instructions but no sooner than 10 days after installation. Use only cleaners recommended by tile and grout manufacturers and only after determining that cleaners are safe to use by testing on samples of tile and other surfaces to be cleaned. Protect metal surfaces and plumbing fixtures from effects of cleaning. Flush surfaces with clean water before and after cleaning.

3. Remove temporary protective coating by method recommended by coating manufacturer and that is acceptable to tile and grout manufacturer. Trap and remove coating to prevent drain clogging.

B. Protect installed tile work with Kraft paper or other heavy covering during construction period to prevent staining, damage, and wear. If recommended by tile manufacturer, apply coat of neutral protective cleaner to completed tile walls and floors.

C. Prohibit foot and wheel traffic from tiled floors for at least seven days after grouting is completed.

D. Before final inspection, remove protective coverings and rinse neutral protective cleaner from tile surfaces.

3.07 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

Page Intentionally Left Blank

SECTION 09 51 13

ACOUSTICAL PANEL CEILINGS

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide suspended acoustical ceilings, mechanical suspension system and accessories; as indicated and in compliance with Contract Documents.

1.02 REFERENCES:

A. American Architectural Manufacturers Association (AAMA):

1. 611: Voluntary Specification for Anodized Architectural Aluminum

B. American Society of Civil Engineers (ASCE):

C. ASTM International (ASTM):

1. A580: Standard Specification for Stainless Steel Wire.

2. A641: Standard Specification for Zinc–Coated (Galvanized) Carbon Steel Wire.

3. A653: Standard Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process.

4. B164: Standard Specification for Nickel-Copper Alloy Rod, Bar, and Wire

5. B221: Standard Specification for Aluminum and Aluminum-Alloy Extruded Bars, Rods, Wire, Profiles, and Tubes

6. B633: Standard Specification for Electrodeposited Coatings of Zinc on Iron and Steel.

7. C635: Standard Specification for the Manufacture, Performance, and Testing of Metal Suspension Systems or Acoustical Tile and Lay-in Panel Ceilings

8. C636: Standard Practice for Installation of Metal Ceiling Suspension Systems for Acoustical Tile and Lay-In Panels

9. C834: Standard Specification for Latex Sealants

10. D3273: Standard Test Method for Resistance to Growth of Mold on the Surface of Interior Coatings in an Environmental Chamber

11. D3274: Standard Test Method for Evaluating Degree of Surface Disfigurement of Paint Films by Fungal or Algal Growth, or Soil and Dirt Accumulation

12. E84: Standard Test Method for Surface Burning Characteristics of Building Materials

13. E90: Standard Test Method for Laboratory Measurement of Airborne Sound Transmission Loss of Building Partitions and Elements

14. E488: Standard Test Methods for Strength of Anchors in Concrete and Masonry Elements.

15. E795: Standard Practices for Mounting Test Specimens During Sound Absorption Tests

16. E1190: Standard Test Methods for Strength of Power-Actuated Fasteners Installed in Structural Members

17. E1264: Standard Classification for Acoustical Ceiling Products

18. E1512: Standard Test Methods for Testing Bond Performance of Bonded Anchors

19. F593: Standard Specification for Stainless Steel Bolts, Hex Cap Screws, and Studs

20. F594: Standard Specification for Stainless Steel Nuts

21. G21: Standard Practice for Determining Resistance of Synthetic Polymeric Materials to Fungi

1.03 PRE-INSTALLATION MEETINGS:

A. Preinstallation Conference: Conduct conference at Project site.

1.04 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Product Data: For each type of product.

C. Samples: For each exposed product and for each color and texture specified, 6 inches in size.

1. Samples for Initial Selection: For components with factory-applied color finishes.

2. Samples for Verification: For each component indicated and for each exposed finish required, prepared on Samples of size indicated below.

    a. Acoustical Panel: Set of 6-inch square. Samples of each type, color, pattern, and texture.

    b. Exposed Suspension-System Members, Moldings, and Trim: Set of 6-inch-long Samples of each type, finish, and color.

D. Coordination Drawings: Reflected ceiling plans, drawn to scale, on which the following items are shown and coordinated with each other, using input from installers of the items involved:

1. Suspended ceiling components.

2. Structural members to which suspension systems will be attached.

3. Size and location of initial access modules for acoustical panels.

4. Items penetrating finished ceiling including the following:

    a. Lighting fixtures

    b. Air outlets and inlets

    c. Speakers

    d. Sprinklers

    e. Access panels

    f. Perimeter moldings

5. Qualification Data: For testing agency.

6. Product Test Reports: For each acoustical panel ceiling, for tests performed by a qualified testing agency.

7. Evaluation Reports: For each acoustical panel ceiling suspension system and anchor and fastener type, from ICC-ES.

8. Field quality-control reports.

E. Maintenance Data: For finishes to include in maintenance manuals.

1. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

a. Acoustical Ceiling Panels: Full-size panels equal to 2 percent of quantity installed

b. Suspension-System Components: Quantity of each exposed component equal to 2 percent of quantity installed

c. Hold-Down Clips: Equal to 2 percent of quantity installed

d. Impact Clips: Equal to 2 percent of quantity installed

1.05 SUSTAINABLE DESIGN

A. Comply with the requirements specified in Section 01 81 13.01.

1.06 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

1.07 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

B. Deliver acoustical panels, suspension-system components, and accessories to Project site in original, unopened packages and store them in a fully enclosed, conditioned space where they will be protected against damage from moisture, humidity, temperature extremes, direct sunlight, surface contamination, and other causes.

C. Before installing acoustical panels, permit them to reach room temperature and a stabilized moisture content.

D. Handle acoustical panels carefully to avoid chipping edges or damaging units in any way.

1.08 PROJECT/SITE CONDITIONS:

A. Environmental Limitations: Do not install acoustical panel ceilings until spaces are enclosed and weatherproof, wet work in spaces is complete and dry, work above ceilings is complete, and ambient temperature and humidity conditions are maintained at the levels indicated for Project when occupied for its intended use.

PART 2 - PRODUCTS

2.01 PERFORMANCE REQUIREMENTS:

A. Seismic Performance: Acoustical ceiling shall withstand the effects of earthquake motions determined according to ASCE/SEI 7 DEF

B. Surface-Burning Characteristics: Comply with ASTM E84; testing by a qualified testing agency. Identify products with appropriate markings of applicable testing agency.

1. Flame-Spread Index: Comply with ASTM E1264 for Class A materials.

2. Smoke-Developed Index: 50 or less.

C. Dewatering Facility Fire-Resistance Ratings: Comply with ASTM E119; testing by a qualified testing agency. Identify products with appropriate markings of applicable testing agency.

1. Indicate design designations from UL's "Fire Resistance Directory" or from the listings of another qualified testing agency.

2.02 ACOUSTICAL PANELS, GENERAL:

A. Source Limitations:

1. Acoustical Ceiling Panel: Obtain each type from single source from single manufacturer.

2. Suspension System: Obtain each type from single source from single manufacturer.

B. Source Limitations: Obtain each type of acoustical ceiling panel and supporting suspension system from single source from single manufacturer.

C. Recycled Content: Post-consumer recycled content plus one-half of pre-consumer recycled content not less than 50 percent.

D. Glass-Fiber-Based Panels: Made with binder containing no urea formaldehyde.

E. Acoustical Panel Standard: Provide manufacturer's standard panels of configuration indicated that comply with ASTM E1264 classifications as designated by types, patterns, acoustical ratings, and light reflectances unless otherwise indicated.

F. Acoustical Panel Colors and Patterns: Match appearance characteristics indicated for each product type.

1. Where appearance characteristics of acoustical panels are indicated by referencing pattern designations in ASTM E1264 and not manufacturers' proprietary product designations, provide products selected by Engineer from each manufacturer's full

range that comply with requirements indicated for type, pattern, color, light reflectance, acoustical performance, edge detail, and size.

2.03 ACOUSTICAL PANELS:

A. Products: Asbestos free, wet felted mineral fiber faced overlay, antimicrobial treated to inhibit growth of fungus, mold and mildew, factory applied moisture and sag resistant treatment.

B. Manufacturers:

1. Armstrong World Industries, Inc .- Ultima™ High NRC (Basis of Design)

2. CertainTeed Corp.

3. USG Interiors, Inc.; Subsidiary of USG Corporation.

C. Classification: Proved panels as follows:

1. Type and Form: Type IV, mineral base with membrane-faced overlay; Form 2, water felted; with vinyl overlay on face.

2. Pattern: E (lightly textured)

3. Dewatering Facility: Provide fire resistance-rated panels complying with ASTM E1264 for type, form, and pattern.

D. Color: White

E. LR: Not less than 0.90

F. NRC: Not less than 0.75

G. CAC: Not less than 35

H. AC: Not less than 170

I. Edge/Joint Detail: Reveal sized to fit flange of exposed suspension-system members.

J. Thickness: 3/4 inch

K. Modular Size: 24 by 24

L. Broad Spectrum Antimicrobial Fungicide and Bactericide Treatment: Provide acoustical panels treated with manufacturer's standard antimicrobial formulation that inhibits fungus, mold, mildew, and gram-positive and gram-negative bacteria and showing no mold, mildew, or bacterial growth when tested according to ASTM D3273 and evaluated according to ASTM D3274 or ASTM G21.

2.04 METAL SUSPENSION SYSTEMS, GENERAL:

A. Recycled Content: Post-consumer recycled content plus one-half of pre-consumer recycled content not less than 25 percent.

B. Metal Suspension-System Standard: Provide manufacturer's standard direct-hung metal suspension systems of types, structural classifications, and finishes indicated that comply with applicable requirements in ASTM C635.

C. Attachment Devices: Size for five times the design load indicated in ASTM C635, Table 1, "Direct Hung," unless otherwise indicated. Comply with seismic design requirements.

1. Anchors in Concrete: Anchors of type and material indicated below, with holes or loops for attaching hangers of type indicated and with capability to sustain, without failure, a load equal to five times that imposed by ceiling construction, as determined by testing according to ASTM E488 or ASTM E1512 as applicable, conducted by a qualified testing and inspecting agency.

a. Type: Post-installed bonded anchors.

b. Corrosion Protection: Stainless-steel components complying with ASTM F593 and ASTM F594, Group 1 Alloy 304 or 316 for bolts; Alloy 304 or 316 for anchor.

D. Wire Hangers, Braces, and Ties: Provide wires complying with the following requirements:

1. Zinc-Coated, Carbon-Steel Wire: ASTM A641, Class 1 zinc coating, soft temper.

2. Size: Select wire diameter so its stress at three times hanger design load (ASTM C635, Table 1, "Direct Hung") will be less than yield stress of wire, but provide not less than 0.135-inch diameter wire.

E. Hanger Rods: Mild steel, zinc coated or protected with rust-inhibitive paint.

F. Seismic Stabilizer Bars: Manufacturer's standard perimeter stabilizers designed to accommodate seismic forces.

G. Seismic Struts: Manufacturer's standard compression struts designed to accommodate seismic forces.

H. Seismic Clips: Manufacturer's standard seismic clips designed and spaced to secure acoustical panels in place.

I. Hold-Down Clips: Provide 10 feet to the building interior from face of exterior doors, provide manufacturer's standard hold-down clips spaced 24 inches o.c. on all cross tees.

J. Dewatering Facility Impact Clips: Where indicated, provide manufacturer's standard impact-clip system designed to absorb impact forces against acoustical panels.

2.05 METAL SUSPENSION SYSTEM:

A. Manufacturers:

1. Armstrong World Industries, Inc.

2. CertainTeed Corp

3. USG Interiors, Inc.; Subsidiary of USG Corporation

B. Narrow-Face, Capped, Double-Web, Steel Suspension System: Main and cross runners roll formed from cold-rolled steel sheet; pre-painted, electrolytically zinc coated, or hot-dip galvanized according to ASTM A653, not less than G30 coating designation; with prefinished 9/16-inch-wide metal caps on flanges.

1. Structural Classification: Intermediate-duty system

2. End Condition of Cross Runners: Override (stepped) type

3. Face Design: Flat, flush

4. Cap Material: Steel cold-rolled sheet

5. Cap Finish: Painted white

2.06 METAL EDGE MOLDINGS AND TRIM:

A. Manufacturers:

1. Armstrong World Industries, Inc.

2. CertainTeed Corp

3. USG Interiors, Inc.; Subsidiary of USG Corporation

B. Roll-Formed, Sheet-Metal Edge Moldings and Trim: Type and profile indicated or, if not indicated, manufacturer's standard moldings for edges and penetrations that comply with seismic design requirements; formed from sheet metal of same material, finish, and color as that used for exposed flanges of suspension-system runners.

1. Provide manufacturer's standard edge moldings that fit acoustical panel edge details and suspension systems indicated and that match width and configuration of exposed runners unless otherwise indicated.

2. For lay-in panels with reveal edge details, provide stepped edge molding that forms reveal of same depth and width as that formed between edge of panel and flange at exposed suspension member.

3. For circular penetrations of ceiling, provide edge moldings fabricated to diameter required to fit penetration exactly.

2.07 ACCESSORIES:

A. Hold-Down Clips: Manufacturer's standard hold-down.

2.08 ACOUSTICAL SEALANT:

A. Acoustical Sealant: Manufacturer's standard sealant complying with ASTM C834 and effective in reducing airborne sound transmission through perimeter joints and openings in building construction as demonstrated by testing representative assemblies according to ASTM E90.

1. Exposed and Concealed Joints: Non-sag, paintable, non-staining latex sealant.

2. Concealed Joints: Nondrying, nonhardening, non-skinning, non-staining, gunnable, synthetic-rubber sealant.

3. Acoustical sealant shall have a VOC content of 250 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).

PART 3 - EXECUTION

3.01 EXAMINATION:

A. Examine substrates, areas, and conditions, including structural framing to which acoustical panel ceilings attach or abut, with Installer present, for compliance with requirements specified in this and other Sections that affect ceiling installation and anchorage and with requirements for installation tolerances and other conditions affecting performance of acoustical panel ceilings.

B. Examine acoustical panels before installation. Reject acoustical panels that are wet, moisture damaged, or mold damaged.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 PREPARATION:

A. Measure each ceiling area and establish layout of acoustical panels to balance border widths at opposite edges of each ceiling. Avoid using less-than-half-width panels at borders, and comply with layout shown on reflected ceiling plans.

3.03 INSTALLATION:

A. General: Install acoustical panel ceilings to comply with ASTM C636 and seismic design requirements indicated, according to manufacturer's written instructions and CISCA's "Ceiling Systems Handbook."

1. Dewatering Facility: Fire-Rated Assembly: Install fire-rated ceiling systems according to tested fire-rated design.

B. Suspend ceiling hangers from building's structural members and as follows:

1. Install hangers plumb and free from contact with insulation or other objects within ceiling plenum that are not part of supporting structure or of ceiling suspension system.

2. Splay hangers only where required and, if permitted with fire-resistance-rated ceilings (Dewatering facility), to miss obstructions; offset resulting horizontal forces by bracing, countersplaying, or other equally effective means.

3. Where width of ducts and other construction within ceiling plenum produces hanger spacings that interfere with location of hangers at spacings required to support standard suspension-system members, install supplemental suspension members and hangers in form of trapezes or equivalent devices.

4. to ceiling-suspension members and to supports above with a minimum of three tight turns. Connect hangers directly either to structures or to inserts, eye screws, or other devices that are secure and appropriate for substrate and that will not deteriorate or otherwise fail due to age, corrosion, or elevated temperatures.

5. Secure flat, angle, channel, and rod hangers to structure, including intermediate framing members, by attaching to inserts, eye screws, or other devices that are secure and appropriate for both the structure to which hangers are attached and the type of hanger involved. Install hangers in a manner that will not cause them to deteriorate or fail due to age, corrosion, or elevated temperatures.

6. Do not support ceilings directly from permanent metal forms or floor deck. Fasten hangers to cast-in-place hanger inserts, post-installed mechanical or adhesive anchors, or power-actuated fasteners that extend through forms into concrete.

7. When steel framing does not permit installation of hanger wires at spacing required, install carrying channels or other supplemental support for attachment of hanger wires.

8. Do not attach hangers to steel deck tabs.

9. Do not attach hangers to steel roof deck. Attach hangers to structural members.

10. Space hangers not more than 48 inches o.c. along each member supported directly from hangers unless otherwise indicated; provide hangers not more than 8 inches from ends of each member.

11. Size supplemental suspension members and hangers to support ceiling loads within performance limits established by referenced standards and publications.

C. Secure bracing wires to ceiling suspension members and to supports with a minimum of four tight turns. Suspend bracing from building's structural members as required for hangers, without attaching to permanent metal forms, steel deck, or steel deck tabs. Fasten bracing wires into concrete with cast-in-place or post-installed anchors.

D. Install edge moldings and trim of type indicated at perimeter of acoustical ceiling area and where necessary to conceal edges of acoustical panels.

1. Apply acoustical sealant in a continuous ribbon concealed on back of vertical legs of moldings before they are installed.

2. Screw attach moldings to substrate at intervals not more than 16 inches o.c. and not more than 3 inches from ends, leveling with ceiling suspension system to a tolerance of 1/8 inch in 12 feet. Miter corners accurately and connect securely.

3. Do not use exposed fasteners, including pop rivets, on moldings and trim.

E. Install suspension-system runners so they are square and securely interlocked with one another. Remove and replace dented, bent, or kinked members.

F. Install acoustical panels with undamaged edges and fit accurately into suspension-system runners and edge moldings. Scribe and cut panels at borders and penetrations to provide a neat, precise fit.

G. Dewatering Facility: Protect lighting fixtures and air ducts according to requirements indicated for fire-resistance-rated assembly.

H. Dewatering Facility: Where there is an accessible concealed floor or floor/ceiling all fire barriers shall be permanently identified with signs or stenciling in the concealed space and shall comply with all of the following:

1. Be located in accessible concealed floor, floor/ceiling, or attic spaces

2. Be located within 15 feet of the end of each wall and at intervals not exceeding 30 feet measured horizontally along the wall or partition

3. Include lettering not less than 3 inches in height with a minimum 3/8-inch stroke in a contrasting color

4. Identify the wall type and its fire resistive rating as applicable

3.04 CLEANING:

A. Clean exposed surfaces of acoustical panel ceilings, including trim, edge mouldings, and suspension-system members. Comply with manufacturer's written instructions for cleaning and touchup of minor finish damage. Remove and replace ceiling components that cannot be successfully cleaned and repaired to permanently eliminate evidence of damage.

3.05 CONTRACT CLOSEOUT:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 09 90 00

PAINTING AND COATING

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide general information, products and execution for painting and coating as indicated and in compliance with Contract Documents.

L. South Coast Air Quality Management District (SCAQMD):

1. Rule 1113: Architectural Coatings

1.03 DEFINITIONS:

A. Coverage: Total minimum dry film thickness (DFT) in mils or sf/gallon.

B. Paint: The term paint, as used herein, means coating systems materials including primers, sealers, fillers, emulsions, enamels, epoxy, lacquers, and other applied materials, whether used in prime coats, intermediate coats, or finish coats.

C. Gloss Levels: Paint gloss levels specified herein are based on the following ranges: 1.

Description	Gloss Range	ASTM D523 Test Method
Flat	0 to 15	85°
Eggshell	5 to 20	60°
Satin	15 to 35	60°
Semi-Gloss	30 to 65	60°
Gloss	Over 65	60°

1.04 SEQUENCING AND SCHEDULING:

A. Finishes as shown on the architectural Drawings and as specified in Section 09 90 00.

B. Work Not Included:

1. Surfaces in concealed or inaccessible areas such as furred spaces, foundation spaces, pipe or duct chases, shafts, or utility tunnels.

2. Surfaces of anodized or prefinished aluminum, stainless steel, bronze, brass, and chromium plate.

3. Moving parts of operating equipment, mechanical or electrical moving parts, linkages, sensing devices, and motor shafts.

4. Buried concrete surfaces.

5. Non-metallic materials such as glass and porcelain.

6. Prefinished electrical items such as motors, motor control centers, switchboards, switchgear, panelboards, transformers, and disconnect switches.

7. Prefinished architectural items such as acoustical tile, cabinets, building louvers, overhead coiling doors, sectional doors, and wall panels.

1.05 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Product Data:

1. Product and safety data and other information for proposed products.

2. A copy of the Manufacturer's coating application quality assurance manual.

C. Submit the product application procedure, current product data sheet (PDS), safety data sheet (SDS), and a copy of the quality assurance/quality control (QA/QC) report for surface preparation and coating application. Include complete surface preparation and cleaning procedures, as well as application equipment. Include anchor profiles, DFT, adhesion tests, temperature, humidity, holiday tests, and any other measurements taken for quality assurance and quality control during surface preparation and application.

D. Field-Applied Coatings Subject to Immersion Service:

1. Provide complete environmental condition information taken before abrasive blasting or coating. Provide environmental data at 2 hours increments if the prepared surface is not coated within 12 hours. Information provided shall include temperature, relative humidity, location description, time, date, technician name, and company.

2. Provide the Engineer with data from the replica tape used to measure surface preparation and corresponding measurements in mils. Provide location reference information for each replica tape.

3. Submit photos for the field application of coatings. Submit one photo of the field-blasted surface prior to the coating application for each area that is measured for anchor profile. Submit photos of each field-applied coat prior to the application of subsequent coats for each DFT measurement taken based on SSPC PA 2. Photos are not required for shop-applied coating application unless otherwise noted by the Engineer.

E. Submit the final field testing report to the Engineer within 2 weeks of the substantial completion date.

F. Samples:

1. Initial selection: Complete fan deck, color card, or actual color chips illustrating the full range of color availability.

2. Samples: Two 12-inches by 12-inches, illustrating colors, glosses, and textures for each surface finishing product scheduled.

G. Quality Control Submittals:

1. Contract closeout submittals: Warranty.

H. Provide the Engineer with a schedule of systems and locations requiring color selection.

I. Warranty Documentation:

1. Sample warranty

2. Warranty

J. Supplements listed in this Section.

K. Sustainable Design Submittals:

1. As specified in Section 01 81 13.01.

1.06 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.07 SPARE PARTS:

A. Comply with the requirements specified in Section 01 61 00.

1.08 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

B. Installer Qualifications:

1. A minimum of 5 years of documented experience in the Work of this Section.

2. Approved by the Manufacturer.

C. Provide finish coats compatible with substrate materials or with prime coats specified in other sections.

D. First quality preparation, painting, and finishing is required. Dirt, grit, or dust in the paint or finish; runs, sags, or drips of paint or finish; or irregularity of finish is cause for

rejection. Remove rejected finishes; repair, re-prime, and refinish as required to achieve a first quality finish.

E. Regulatory Requirements:

1. Meet federal, state, and local requirements limiting the emission of volatile organic compounds (VOCs).

2. Perform surface preparation and painting in accordance with the recommendations of the following:

a. The Paint Manufacturer's instructions, Product Data Sheets (PDS).

b. Federal, state, and local agencies having jurisdiction.

F. Coatings for Immersion Service: Under the direction of a NACE CIP Level 3:

1. Provide name and contact information.

2. Currently certified by NACE.

3. Attend progress meetings as required.

4. Oversee surface preparation and coating application and approve coating system.

G. Mockup:

1. Size: As required by the Engineer.

2. Before proceeding with Work under this Section, finish one complete space or item of each paint system and color required to show the quality of workmanship, materials, finish, texture, colors, and special details in compliance with the requirements of this Section. Provide one mockup for finishing process related spaces and items and one mockup for finishing architectural finished spaces and items.

3. Once approved, sample spaces and items shall serve as a standard for similar Work throughout the site.

1.09 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00 and Section 01 61 00 of this manual.

B. Delivery, storage, and handling requirements as specified in Section 01 60 00. Specific requirements in addition to Section 01 60 00 shall be:

1. Container label: Include the Manufacturer's name, type of paint, brand name, lot number, brand code, coverage, surface preparation, drying time, cleanup requirements, color designation, and instructions for mixing and reducing.

2. Paint materials: Store at an ambient temperature from 45 degrees F to 90 degrees F in a ventilated area or as required by the Manufacturer's instructions.

1.10 PROJECT/SITE CONDITIONS:

A. Do not apply paint in temperatures or moisture conditions outside of the Manufacturer’s recommended maximum or minimum allowable.

B. Work and storage areas shall be free of dust during the application of paint finishes. Do not apply finishes in spaces with accumulated rubbish, dust, or dirt or where construction activity is present.

C. Do not perform final abrasive blast cleaning whenever the relative humidity exceeds 85 percent, or whenever the surface temperature is less than 5 degrees F above the dew point of ambient air.

D. Primed surfaces shall be top-coated within 2 months or as required by the Paint Manufacturer.

E. Provide a lighting level of 80 foot-candles measured mid-height at the substrate surface.

1.11 WARRANTY:

A. Warranty requirements as specified in Section 01 78 36. Specific requirements in addition to Section 01 78 36 shall be:

1. Warranty for 2 years from the Substantial Completion date for the satisfactory performance and installation of the painting and coating system and associated appurtenances, including correction, or at the option of the Owner, removal and replacement of Work found to be defective. The Owner will be named as the beneficiary.

2. The Contractor and the Paint Manufacturer shall jointly furnish the warranty.

PART 2 - PRODUCTS

2.01 MANUFACTURERS:

A. High Performance Coatings:

1. Ameron Protective Coatings
2. Sherwin Williams
3. Tnemec Coatings

B. Paints:

1. Benjamin Moore Paints
2. PPG Architectural Finishes, Inc.
3. Sherwin Williams

C. Specialty:

1. AkzoNobel/Ceilcote
2. AkzoNobel/Devoe High Performance Coatings
3. Darworth Company

D. Elastomeric Coating:

1. 3M Company
2. AkzoNobel/Polibrid
3. Gaco Western

E. Fusion-Bonded Coating:

1. ABC Coating Company
2. Western Coating, Inc.

F. Testing Equipment:

1. Magnetic type DFT gauge:

a. ElektroPhysic, MikroTest

2. Low-voltage wet sponge electrical holiday detector:

a. Tinker and Rasor

G. Fusion-Bonded Polytetrafluoroethylene Lube:

1. 3M Company, No. 62-4621-4830-5

H. Fusion Bonded Grease Lube:

1. Amrep, RL 736

2. McMaster-Carr Co.

2.02 MATERIALS:

A. Sustainable Design Product Requirements:

1. As specified in Section 01 81 13.01.

2. ISI Envision:

a. Sustainable procurement practices (RA1.2): Maximize the procurement of materials that follow sustainable procurement practices.

b. Recycled materials (RA1.3): Maximize the procurement of materials with recycled content.

c. Locally sourced materials (RA1.4): Maximize the procurement of materials within the radius as specified in Section 01 81 13.01.

B. General:

1. Coatings: Ready-mixed, furnished through one Manufacturer, except field-catalyzed coatings, of good flow and brushing properties, capable of drying or curing free of streaks or sags; provide field-applied primers or undercoats produced by the same Manufacturer as the finish coat(s).

2. Thinners, cleaners, driers, and other additives: As recommended by the Paint Manufacturer.

3. Application equipment: Equipment as recommended by the Paint Manufacturer.

C. Maximum VOC Content; Interior Paints, Coatings, and Accessories:

1. Primers: 150 g/L

2. Flat paints and coatings: 50 g/L

3. Non-flat paints and coatings: 150 g/L

4. Anti-corrosive and anti-rust coatings: 250 g/L

5. Other sealers: 200 g/L

Product	Definition
Acrylic Latex	100% acrylic, water reducible corrosion-resistant coating for light to moderate use exposures, finish as specified
Acrylic Sealer	Clear acrylic
Alkyd Enamel	Optimum quality, medium long oil, finish as specified
Bituminous Paint	Single-component, coal-tar pitch based
Epoxy, Filler/Surfacer	100% solids epoxy trowel Grade filler and surfacer, non-shrinking, suitable for application to concrete. Approved for potable water contact and in accordance with NSF/ANSI 61, where required
Epoxy, High Build	Polyamide epoxy, minimum 69% volume solids, capability of 4 to 8 MDFTPC
Epoxy, High Solids	Polyamide epoxy, 80% volume solids, minimum, suitable for immersion service
Epoxy, Non-skid (Aggregated)	Polyamide or amine converted epoxies aggregated; aggregate may be packaged separately
Epoxy, NSF	Polyamide epoxy, approved for potable water contact and in accordance with NSF/ANSI 61
Epoxy, Primer – Ferrous Metal	Polyamide, anti-corrosive, converted epoxy primer containing rust-inhibitive pigments
Epoxy, Primer – Other	Epoxy primer, high-build, as recommended by the Paint Manufacturer for specific galvanized metal, copper, or non-ferrous metal alloy to be coated
Epoxy, Water Base	2-component, polyamide epoxy emulsion, finish as required
Fusion-Bonded Coating	100% solids, thermosetting, fusion-bonded, dry powder epoxy or polyurethane resin, suitable for the intended service
Fusion-Bonded, TFE Lube or Grease Lube	TFE, liquid coating or open gear grease

Product	Definition
Latex Primer Sealer	Waterborne vinyl acrylic primer/sealer for interior gypsum board and plaster. Capable of providing uniform seal and suitable for use with specified finish coats
Polyurethane, Elastomeric	100% solids, plural component, spray-applied, high build, elastomeric polyurethane coating, suitable for the intended service
Polyurethane, Enamel	2-component, aliphatic or acrylic based polyurethane; high-gloss finish
Rust-Inhibitive Primer	Single package steel primers with anti-corrosive pigment loading
Sanding Sealer	Co-polymer oil, clear, dull luster
Silicone/Silicone Acrylic	Elevated temperature silicone or silicone/acrylic based
Stain, Concrete	Acrylic, water repellent, penetrating stain
Wash Primer	Vinyl butyral acid
Zinc-Rich Primer, Organic	Converted epoxy, epoxy/phenolic or urethane type, minimum 10 pounds metallic zinc content per gallon

D. Maintenance:

1. Extra materials: One gallon of each color and sheen.

2.03 FINISHES:

A. Shop Coating Requirements:

1. Equipment shall be primed and finish coated in the shop by the Manufacturer and touched up in the field with identical material after installation.

2. Where the Manufacturer's standard coating is not suitable for the intended service condition, the Engineer may approve the use of a tie-coat to be used between the Manufacturer's standard coating and the specified field finish. In such cases, tie-coat shall be surface tolerant epoxy as recommended by the Field Finish Coat Manufacturer. Coordinate the details of the Equipment Manufacturer's standard coating with the Paint Manufacturer.

2.04 MIXES:

A. Multiple-Component Coatings:

1. Prepare using each component as packaged by the Paint Manufacturer.

2. No partial batches are permitted.

3. Do not use multiple-component coatings mixed beyond their pot life.

4. Furnish small quantity kits for touchup painting and for painting other small areas.

5. Mix only components specified and furnished by the Paint Manufacturer.

6. Do not intermix additional components for reasons of color or otherwise, even within the same generic type of coating.

7. Colors: Formulate paints with colorants free of lead and lead compounds.

PART 3 - EXECUTION

3.01 PREPARATION:

A. General: Inspect and provide substrate surfaces prepared in accordance with the Contract Documents and the most stringent recommendations of the Paint Manufacturer whose product is to be applied. The more stringent requirements shall apply. If any surface is found to be unsuitable to produce a proper finish, do not apply material until the surfaces are made satisfactory. Application of paint to any surface shall be deemed to be acceptance of that surface and full responsibility shall be borne by the Contractor.

B. Shop Abrasive Blasting:

1. Notify the Engineer at least 7 days prior to the start of shop-blast cleaning to allow for inspection of the Work during surface preparation and shop application of paints.

2. Structural steel and similar items, as approved by the Engineer, may be shop prepared and primed. Centrifugal wheel blast cleaning is an acceptable alternative to shop-blast cleaning.

C. Field Abrasive Blasting: Perform blasting for items and equipment where specified and as required to restore damaged surfaces previously shop-blasted or field-blasted and primed or coated.

D. Metal Surface Preparation:

1. In accordance with the SSPC Specification.

2. The words solvent cleaning, hand tool cleaning, wire brushing, and blast cleaning, or similar words of equal intent in the contract documents or in the Paint Manufacturer's Specification, refer to the applicable SSPC Specification.

3. Where OSHA 29 CFR 1910, OSHA 29 CFR 1926, EPA 40 CFR 261, EPA AP-42, or SSPC PA 10 regulations preclude standard abrasive blast cleaning, wet or vacu-blast methods may be required. The Paint Manufacturer's recommendations for wet-blast additives and first coat application shall apply.

4. Hand tool clean areas that cannot be cleaned by power tool cleaning.

5. Round or chamfer sharp edges and grind smooth burrs, jagged edges, and surface defects.

6. Welds and adjacent areas:

    a. Prepare such that there is the following:

        (1) No undercutting or reverse ridges on weld bead.

        (2) No weld spatter on or adjacent to weld or any area to be painted.

        (3) No sharp peaks or ridges along weld bead.

    b. Grind embedded pieces of electrode or wire flush with the adjacent surface of weld bead.

7. Pre-blast cleaning requirements:

    a. Remove oil, grease, welding fluxes, and other surface contaminants prior to blast cleaning.

    b. Cleaning methods: Steam, open flame, hot water, or cold water with appropriate detergent additives followed with clean water rinsing. Waterjetting in accordance with SSPC/NACE SP WJ-1/NACE WJ-1.

    c. Clean small isolated areas as above or solvent clean with suitable solvent and a clean cloth.

8. Blast cleaning requirements:

    a. Type of equipment and speed of travel: Design to obtain a specified degree of cleanliness; minimum surface preparation is as specified herein and takes precedence over the Paint Manufacturer's recommendations.

    b. Select the type and size of abrasive to produce a surface profile that meets the Paint Manufacturer's recommendations for the particular primer to be used.

c. Use only dry blast cleaning methods.

(1) Do not reuse abrasive, except for designed recyclable systems.

(2) Meet applicable federal, state, and local air pollution and environmental control regulations for blast cleaning, confined space entry (if required), and disposition of spent aggregate and debris.

d. Post-blast cleaning and other cleaning requirements:

(1) Clean surfaces of dust and residual particles from cleaning operations by dry air blast cleaning (no oil or water vapor) or other method prior to painting. Vacuum clean enclosed areas and other areas where dust settling is a problem and wipe with a tack cloth.

(2) Paint surfaces the same day they are blasted. Re-blast surfaces that have begun to rust prior to painting.

9. Concrete Surface Preparation:

a. Do not begin until 30 days after concrete has been placed.

b. In accordance with SSPC/NACE SP 13/NACE No. 6 and ASTM D 4258.

c. Remove grease, oil, dirt, salts or other chemicals, loose materials, or other foreign matter by solvent, detergent, or other suitable cleaning methods.

d. Verify that the required acid-alkali balance has been achieved.

e. Brush-off blast concrete surface to remove loose concrete and laitance and provide a tooth for binding. Upon approval by the Engineer, the surface may be cleaned by the acid etching method. Approval is subject to producing a desired profile equivalent to No. 80 grit flint sandpaper. Acid etching of vertical or overhead surfaces shall not be allowed.

f. Secure the Paint Manufacturer's recommendations for additional preparation, if required, for excessive bug holes exposed after blasting.

g. Concrete wall surface preparation:

(1) Patch tie holes.

(2) Sack-rub with grout to fill voids.

h. Unless otherwise required for proper adhesion, ensure surfaces are dry prior to painting.

10. Plastic Surface Preparation:

    a. Hand sand plastic surfaces to be coated with medium grit sandpaper to provide tooth for the coating system.

    b. Large areas may be power sanded or brush-off blasted, provided sufficient controls are employed so the surface is roughened without removing excess material.

    c. Fiberglass reinforced plastic (FRP) equipment with an integral colored gel coat does not require painting, provided the color is as selected.

11. Non-Ferrous Metal Preparation for Coating: The non-ferrous surface shall be coated within 2 days if it is stored in an environmentally controlled space to avoid coating over the zinc oxide and zinc hydroxide layer that forms. After 2 days, the surface shall be sweep blasted and the coating applied within one hour of the blasting. The blasting shall be performed in accordance with ASTM D6386 and SSPC SP 16, including:

    a. Reduced blast pressure, 40 psi or less.

    b. Reduced blasting dwell time.

    c. Increased distance of blast nozzle from the surface, 18-inches to 24-inches.

    d. Reduced blast angle, 30 degrees to 60 degrees rather than 90 degrees.

    e. A softer blast media: Aluminum/magnesium silicate, corncobs, walnut shells, corundum, limestone, or mineral sands with a Mohr's hardness level 5 or less.

    f. No resurfacing with sanders or grinders.

    g. If the item is stored outside after galvanizing, the surface preparation shall be performed as weathering has begun.

    h. A minimum surface profile of 0.75-mil on the bare metal surface is required.

    i. Intact coatings are required to be roughened to the degree specified for the coating to be used.

12. Provide the Engineer a minimum of 7 days advance notice to the start of field surface preparation Work and coating application Work.

13. Schedule an inspection of cleaned surfaces and all coats prior to successive coat in advance with the Engineer.

14. Factory-Finished Items:

    a. Schedule an inspection with the Engineer before repairing damage to factory-finished items delivered to the site.

    b. Repair abraded or otherwise damaged areas on factory-finished items as recommended by the Paint Manufacturer. Carefully blend repaired areas into the original finish. If required to match colors, provide a full finish coat in the field.

15. Measure the moisture content of surfaces using an electronic moisture meter. Do not apply paint unless the moisture content of surfaces is below the following maximums:

    a. Concrete floors: 8 percent

16. Colors:

    a. Color code non-submerged metal piping; paint fittings and valves the same color as the pipe.

    b. New Work: Color coding in accordance with the piping color code schedule.

    c. Repair Work: Match existing color.

    d. Proprietary identification of colors is for identification only; the Selected Manufacturer may supply matches.

    e. Equipment Colors:

        (1) Equipment includes the machinery or vessel itself and the structural supports and fasteners and attached electrical conduits.

        (2) Paint equipment and piping one color as selected.

        (3) Paint non-submerged portions of equipment the same color as the piping it serves, except as itemized below:

            (a) Dangerous parts of equipment and machinery: OSHA orange.

            (b) Fire protection equipment and apparatus: OSHA red.

            (c) Radiation hazards: OSHA purple.

            (d) Physical hazards in normal operating area and energy lockout devices including, but not limited to, electrical disconnects for equipment and equipment isolation valves in air and liquid lines under pressure: OSHA yellow.

3.02 ERECTION/INSTALLATION/APPLICATION:

A. General:

1. Paint new interior and exterior metal surfaces, except as specified otherwise. Do not paint exterior concrete surfaces unless specified otherwise.

2. Immersion Coatings: Apply coatings to exposed metal subject to immersion service, including but not limited to internal vessel and pipe surfaces, nozzle bores, and carbon steel internals, unless otherwise specified.

   a. Coatings subject to immersion shall be applied by an SSPC QP 1 certified applicator and have a minimum surface preparation of SSPC SP 10/NACE No. 2.

   b. Obtain a full cure for completed system. Consult the Paint Manufacturer's instructions for these requirements. Do not immerse coating until completion of the curing cycle. Environmental conditions recommended by the Manufacturer shall be maintained throughout the duration of the curing cycle.

3. Apply paint in accordance with the contract documents and the Paint Manufacturer's recommendations. The more stringent requirements shall apply. Allow sufficient time between coats to ensure thorough drying or curing of previously applied paint.

4. Vacuum clean surfaces free of loose particles. Use tack cloth just prior to applying the next coat.

5. Fusion-bonded coatings method application: Electrostatic, fluidized bed, or flocking.

6. Coat units or surfaces to be bolted together or joined closely to structures or to one another prior to assembly or installation.

7. On pipelines, terminate coatings along pipe runs to 1-inch inside pipe penetrations.

8. Follow the Manufacturer's recommended storage procedures. Do not store coatings in direct sunlight.

9. Where more than one coat is applied within a given system, alternate colors to provide a visual reference showing the required number of coats have been applied.

B. Workmanship:

1. If surfaces are not in proper shape for coating application, repair, rebuild, or refinish before proceeding with the Work. Assume responsibility for inadequate

Work caused by improper surface preparation. The application of the first coat does not relieve the responsibility for the base. Do not apply any coats on damp or wet surfaces and in no case until the preceding coat has cured. Avoid contamination or damage to prepared or intercoat surfaces. Clean and re-repair as required.

2. Application: Spread materials evenly without runs or sags and thoroughly brush out. Provide a finish that is free of abrasions, dirt, or other debris and uniform in color and appearance.

    a. The number of coats specified is the minimum to be applied. Apply additional coats when undercoats, or other conditions show through the final finish coat until the paint film is of uniform finish, color, and appearance.

3. Roller application: Use a fine nap roller to roll and backroll so a nearly flat or orange peel texture is achieved. Do not use a roller application on metal or wood surfaces. Coating application shall be uniform in color, texture, and shade. Aesthetic defects shall be cause for rejection.

4. Spray application: Apply with airless or air pressure spray equipment as recommended by the Paint Manufacturer for the particular product. Apply each coat in a uniform manner to provide the equivalent thickness of brush coats. Do not double back to build up the film thickness of 2 coats in one pass.

5. Brush application: Brush paint with equipment and the technique required to achieve a flat and smooth surface without brush marks. Brush out and Work paint onto the surfaces in a uniform, even film. Cloudiness, spotting, holidays, laps, brush marks, runs, sags, and other surface imperfections are not acceptable.

6. Replace electrical plates, hardware, light fixture trim, and fittings removed prior to finishing only after finishing has completely dried and hardened. Use workmen skilled in the installation of the items removed; install in a manner that does not void warranties.

C. Shop-Primed and Factory-Finished Surfaces:

1. Schedule an inspection with the Engineer before shop priming or top coating factory-finished items are delivered to the site.

2. Prepare surfaces and spot prime using the specified primer.

3. Apply a mist coat of primer, 1-mil DFT.

4. After welding, prepare and prime holdback areas as required for the paint system. Apply primer in accordance with the Manufacturer's instructions.

D. Manufacturer-Applied Paint Systems:

1. Repair abraded areas on factory-finished items as recommended by the Manufacturer.

2. Carefully blend repaired areas into the original finish.

3. Fusion-bonded coatings: Provide appropriate liquid repair kits for field use.

E. Galvanized Metal, Copper, and Non-Ferrous Metal Alloys:

1. Concealed galvanized, copper, and non-ferrous metal alloy surfaces behind building panels or walls do not require painting.

2. Prepare the surface and apply primer in accordance with the System No. 10 requirements.

3. Apply intermediate and finish coats of the coating system appropriate for the exposure.

F. Porous Surfaces, such as Concrete:

1. Filler/Surfacer: Use the Paint Manufacturer's recommended product to fill air holes, bug holes, and other surface voids or defects.

2. Prime Coat: May be thinned to provide maximum penetration and adhesion.

a. Type and amount of thinning: Determined by the Paint Manufacturer and dependent on surface density and type of coating.

3. Surface specified to receive water base coating: Damp but free of running water, just prior to the application of coating.

G. Film Thickness and Coverage:

1. Number of Coats:

a. The minimum required without regard to coating thickness.

b. Additional coats may be required to obtain the minimum required paint thickness depending on method of application, differences in the Manufacturer's products, and atmospheric conditions.

2. Application Thickness:

a. Do not exceed the Manufacturer's recommendations.

b. Measure using a wet film thickness gauge to ensure proper coating thickness during application.

3. Visually inspect concrete non-ferrous metal, plastic, and wood surfaces to ensure proper and complete coverage has been attained.

4. Give particular attention to edges, angles, flanges, and other similar areas where insufficient film thicknesses are likely to be present, and ensure proper DFT in these areas.

5. Apply additional coats as required to achieve complete hiding of underlying coats. Hiding shall be so complete that additional coats would not increase the hiding.

H. Factory-Applied Priming:

1. Priming or priming and finishing of certain surfaces may be specified to be factory-applied or shop-applied by fabricators.

2. Carefully examine the contract documents for priming or finishing Work installed by other trades to avoid duplications or omissions.

I. Pipe Identification:

1. Pipe labels shall be stenciled/painted on painted pipes and snap-on labels on non-painted piping.

2. Bands on piping shall be:

a. Material: Stenciled/painted on painted pipes and tape on other piping.

b. Frequency: Must have a band/ set of band in each visible section and at bends.

c. Thickness:

(1) Pipe outside diameter less than 2.5-inches = 8-inch band

(2) Pipe outside diameter less than 8-inches and greater than or equal to 2.5-inches = 12-inch band

(3) Pipe outside diameter less than 10-inches and greater than or equal to 8-inches = 24-inch band

(4) Pipe outside diameter greater than or equal to 10-inches = 32-inch band

3. Flow Arrows:

a. Separate from pipe label.

b. Flow arrows should be stenciled/painted on painted pipes and stickers on other piping.

3.03 PROTECTION:

A. Remove, mask, or otherwise protect hardware, lighting fixtures, switchplates, aluminum surfaces, machined surfaces, couplings, shafts, bearings, nameplates on machinery, and other surfaces not specified elsewhere to be painted.

B. Provide drop cloths to prevent paint materials from falling on or marring adjacent surfaces.

C. Protect working parts of mechanical and electrical equipment from damage during surface preparation and the painting process.

D. Mask openings in motors to prevent paint and other materials from entering.

E. Protect surfaces from overspray that are adjacent to or downwind of the Work area.

3.04 QUALITY CONTROL:

A. ORT Pre-Requisite Activities (ORT-PR): The following specified activities will generally conclude with acceptance of the certificate of proper installation (COPI) by the Owner. Compliance with these requirements shall be the sole responsibility of the Contractor. Any modifications, re-testing or additional expense resulting from the failure to pass these testing requirements on the initial tests, including costs incurred by the Owner and the Engineer, will be paid by the Contractor.

B. Testing:

1. Surface Preparation Testing:

a. Measure prepared surface profile using magnetic type gauge or replica tape in accordance with NACE SP0287.

b. Verify surface is free of debris and particulate prior to coating application using clear tape.

2. Thickness Testing:

a. Measure coating thickness specified in mils with magnetic type, DFT gauge, in accordance with SSPC PA 2.

b. Check each coat for correct DFT.

c. Wait a minimum of 1 day after the application of coating before testing.

3. Continuity Testing:

a. Holiday detect coatings 20-mils thick or less, except zinc primer and galvanizing, with low-voltage wet sponge electrical holiday detector in accordance with NACE SP0188.

b. After repaired and recoated areas have dried sufficiently, retest each repaired area.

c. Final tests may also be conducted by the Engineer.

C. Inspection: Leave staging and lighting in place until the Engineer has inspected the surface or coating. Replace staging removed prior to approval by the Engineer. Provide additional staging and lighting as requested by the Engineer.

D. Unsatisfactory Application:

1. If an item has an improper finish color or insufficient film thickness, clean the surface and topcoat with specified paint material to obtain the specified color and coverage. Obtain specific surface preparation information from the Paint Manufacturer.

2. Evidence of runs, bridges, shiners, laps, or other imperfections is cause for rejection.

3. Repair defects in accordance with the written recommendations of the Paint Manufacturer.

E. Damaged Coatings, Pinholes, and Holidays:

1. Feather edges and repair in accordance with the recommendations of the Paint Manufacturer.

2. Hand or power sand visible areas of chipped, peeled, or abraded paint, and feather the edges. Follow with primer and finish coat. Depending on the extent of repair and appearance, a finish sanding and topcoat may be required.

3. Apply finish coats, including touch up and damage-repair coats, in a manner that will present a uniform texture and color-matched appearance.

F. Manufacturer's Services:

1. The Paint Manufacturer's Representative shall be present at the site:

a. On the first day of the application of any coating system.

b. A minimum of 2 additional site inspection visits, to provide the Manufacturer's certificate of proper installation.

c. As required to resolve field problems attributable to or associated with the Manufacturer's product.

d. To verify full cure of coating prior to coated surfaces being placed into immersion service.

3.05 CLEANING:

A. Brush-off Blast Cleaning:

1. The equipment, procedure, and degree of cleaning in accordance with SSPC/NACE SP 7/NACE No. 4 or SSPC SP 16.

2. Abrasive: Wet or dry blasting sand, grit, or nutshell.

3. Select various surface preparation parameters, such as size and hardness of abrasive, nozzle size, air pressure, and nozzle distance from surface such that the surface is cleaned without pitting, chipping, or other damage.

4. Verify parameter selection by blast cleaning a trial area that will not be exposed to view.

5. The Engineer will approve the trial blast cleaned area and, if acceptable, use the area as a representative sample of surface preparation.

6. Repair or replace surface damaged by blast cleaning.

B. Acid Etching:

1. After pre-cleaning, spread the following solution by brush or plastic sprinkling can: One part commercial muriatic acid reduced by 2 parts water by volume. Adding acid to water in these proportions gives an approximate 10 percent solution of HCl.

2. Application:

a. Rate: 2 gallons/100 sf.

b. Work acid solution into the surface by hard-bristled brushes or brooms until complete wetting and coverage is obtained.

c. Acid will react vigorously for a few minutes during which time brushing shall be continued.

d. After bubbling subsides, in approximately 10 minutes, hose down the remaining slurry with high-pressure clean water.

e. Rinse immediately to avoid the formation of salts on the surface that are difficult to remove.

f. Thoroughly rinse to remove any residual acid surface condition that may impair adhesion.

3. Ensure surface is completely dry before the application of paint.

4. Apply acid etching to obtain a grit sandpaper surface profile. If the surface is not achieved, repeat the treatment.

C. Solvent Cleaning:

1. In accordance with SSPC SP 1.

2. Consists of the removal of foreign matter such as oil, grease, soil, drawing and cutting compounds, and any other surface contaminants by using solvents, emulsions, cleaning compounds, steam cleaning, or similar materials and methods that involve a solvent or cleaning action.

D. Power Tool Cleaning: In accordance with SSPC SP 11.

E. Place cloths and waste that might constitute a fire hazard in closed metal containers or destroy at the end of each day.

F. Upon the Substantial Completion date, remove staging, scaffolding, and containers from the site or destroy in a legal manner.

G. Remove paint spots, oil, or stains upon adjacent surfaces and floors and leave the entire job clean.

3.06 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

3.07 SCHEDULES:

A. Paint surfaces in accordance with the following application schedule. In the event of discrepancies or omissions in the following, request clarification from the Engineer before starting the Work.

B. Stripe coat edges and corners for any surface subject to a highly corrosive or submerged environment.

C. System No. 4, Interior and Exterior Exposed *Ferrous* Metal – Highly Corrosive: Structures including, but not limited to, vaults, maintenance holes, reservoirs, tank interiors, and other areas where metal is exposed to high humidity and the possibility of dripping moisture or immersion service. Also includes areas in contact with fumes from chlorine gas, hydrogen sulfide gas, or other corrosive gasses.

Surface Preparation	Paint Material	Minimum Coats, Cover
SSPC SP 10/NACE No. 2	Epoxy, Primer – Ferrous Metal	1 coat, 2.5 MDFT
	Epoxy, High Build	1 coat, 4 MDFT

D. System No. 5, Interior and Exterior Exposed *Ferrous* Metal – Mildly Corrosive: Structures including, but not limited to, above ground buildings, predominantly dry interiors, and other surfaces that will be subjected to minimal or no dripping. Relative humidity exceeding 85 percent during normal operation or presence of corrosive gasses are considered a highly corrosive environment.

Surface Preparation	Paint Material	Minimum Coats, Cover
SSPC SP 10/NACE No. 2	Epoxy, Primer – Ferrous Metal	1 coat, 2.5 MDFT
	Polyurethane, Enamel	2 coats, 3 MDFT

E. System No. 6, Interior and Exterior Exposed *Ferrous* Metal – Atmospheric: Structures including, but not limited to, dry building interiors, electrical rooms, office spaces, or other surfaces that will not be subjected to humidity, corrosive gasses, or dripping moisture.

Surface Preparation	Paint Material	Minimum Coats, Cover
Commercial Blast Cleaning (SP 6/NACE	Rust-Inhibitive Primer	1 coat, 2.5 MDFT
	Alkyd Enamel	2 coats, 4 MDFT

F. System No. 10, Galvanized Metal, Copper, and Non-ferrous Metal Alloy Conditioning:

Surface Preparation	Paint Material	Minimum Coats, Cover
Solvent Clean (SP 1) Followed by Hand Tool (SP 2) or Power Tool (SP 3) or Brush-Off Blast (SP 16)	Wash Primer or The Paint Manufacturer's Recommendation	1 coat, 0.4 MDFT

G. System No. 11, Galvanized Metal Repair:

Surface Preparation	Paint Material	Minimum Coats, Cover
Solvent Clean (SP 1) Followed by Hand Tool	Zinc-Rich Primer, Organic	1 coat, 3 MDFT

Surface Preparation	Paint Material	Minimum Coats, Cover
(SP 2), Power Tool (SP 3), or Brush-off Blast (SP 7/NACE No. 4)		

H. System No. 21, Skid-Resistant – Concrete (Interior):

Surface Preparation	Paint Material	Minimum Coats, Cover
In accordance with Concrete Surface Preparation	Epoxy, Non-skid (Aggregated)	1 coat, 200 sfpg
	40 to 60 mesh silica sand	Broadcast sand into first coat

I. System No. 21A, Skid-Resistant – Concrete (Exterior):

Surface Preparation	Paint Material	Minimum Coats, Cover
In accordance with Concrete Surface Preparation	Polyurethane, Elastomeric	1 coat, 100 sfpg
	35 to 65 mesh silica sand at 8 lbs/100 sf	Broadcast sand into topcoat and backroll to encapsulate sand

J. System No. 23, Chemical-Resistant Wall – Concrete:

Surface Preparation	Paint Material	Minimum Coats, Cover
In accordance with Concrete Surface Preparation	Epoxy, Filler/Surfacer	1 coat, as required to fill voids
	Epoxy, High Build (Gloss)	1 coat, 160 sfpg

K. System No. 24, Plastic and Exposed FRP:

Surface Preparation	Paint Material	Minimum Coats, Cover
In accordance with Plastic and FRP Surface Preparation	Polyurethane, Enamel	1 coat, 320 sfpgpc

L. System No. 27, Aluminum and Dissimilar Metal Insulation:

Surface Preparation	Paint Material	Minimum Coats, Cover
Solvent Clean (SP 1)	Prime in accordance with the Manufacturer's recommendations	
	Bituminous Paint	1 coat, 10 MDFT

M. System No. 29, Fusion-Bonded Coating:

Surface Preparation	Paint Material	Minimum Coats, Cover
SSPC SP 10/NACE No. 2	Fusion-Bonded Coating	1 or 2 coats, 7 MDFT

N. System No. 29A, Fusion-Bonded, Steel Dowel Coating:

Surface Preparation	Paint Material	Minimum Coats, Cover
SSPC SP 10/NACE No. 2 or SSPC SP 8	Fusion-Bonded Coating (100% Solids Epoxy)	1 or 2 coats, 7 MDFT
TFE Lube, Shop-Applied; Grease Lube Alternative, Field-Applied Just Prior to Installation	Fusion-Bonded, TFE Lube or Grease Lube	1 coat, as required

3.08 SUPPLEMENTS:

A. Supplement A – Piping Color Code Schedule (PCCS)

B. Supplement B – Paint System Data Sheet (PSDS)

C. Supplement C – Paint Product Data Sheet (PPDS)

SUPPLEMENT 09 90 00-A – PIPING COLOR CODE SCHEDULE

NOTES:

[1] All pipe system labels shall be black letters with a yellow background, unless noted otherwise.
[2] Copper, stainless steel, and plastic piping are not painted.
[3] Pittsburgh paint color reference is used solely to facilitate color selection. Other Manufacturers listed in the Section are acceptable with similar matching colors.
[4] Pipe system label shall be white letters with a dark green background.

In accordance with ANSI/ASME A13.1 Designation of Colors for items for specifically covered in the PCC.

SUPPLEMENT 09 90 00-B – PAINT SYSTEM DATA SHEET

Complete this PSDS for each coating system. Include all components of the system (surface preparation, primer, intermediate coats, and finish coats). Include all components of a given coating system on a single PSDS.

Paint System Number (from Spec.):		
Paint System Title (from Spec.):		
Coating Supplier:		
Representative:		
Surface Preparation:		
Paint Material (Generic)	**Product Name/Number (Proprietary)**	**Minimum Coats, Coverage**

SUPPLEMENT 09 90 00-C – PAINT PRODUCT DATA SHEET

Complete and attach the Manufacturer's Technical Data Sheet to this PPDS for each product submitted. Provide the Manufacturer's recommendations for the following parameters at temperature (°F)/relative humidity:

Temperature/RH	50/50	70/30	90/25
Induction Time			
Pot Life			
Shelf Life			
Drying Time			
Curing Time			
Minimum Recoat Time			
Maximum Recoat Time			

Provide the Manufacturer's recommendations for the following: Mixing Ratio: _____

Maximum Permissible Thinning: _____

Ambient Temperature Limitations: minimum:_____maximum: ____

Surface Temperature Limitations: minimum:_____maximum: ____

Surface Profile Requirements: minimum:_____maximum: _____

END OF SECTION

SECTION 09 91 00

ARCHITECTURAL PAINTING AND COATING

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide general information, products, and execution for architectural painting and coating as indicated and in compliance with Contract Documents.

1.02 REFERENCES:

A. ASTM International (ASTM):

5. SP WJ-1/NACE WJ-1: Waterjet Cleaning of Metals-Clean to Bare Substrate

L. South Coast Air Quality Management District (SCAQMD):

1. Rule 1113: Architectural Coatings

1.03 DEFINITIONS:

A. Coverage: Total minimum Dry Film Thickness (DFT) in mils or sf/gallon.

B. Paint: The term paint, as used herein, means coating systems materials including primers, sealers, fillers, emulsions, enamels, epoxy, stains, lacquers, varnishes, and other applied materials, whether used in prime coats, intermediate coats, or finish coats.

C. Gloss Levels: Paint gloss levels specified herein are based on the following:

1. MPI Gloss Level 1: Not more than five units at 60 degrees and 10 units at 85 degrees, in accordance with ASTM D523.

2. MPI Gloss Level 2: Not more than 10 units at 60 degrees and 10 to 35 units at 85 degrees, in accordance with ASTM D523.

3. MPI Gloss Level 3: 10 to 25 units at 60 degrees and 10 to 35 units at 85 degrees, in accordance with ASTM D523.

4. MPI Gloss Level 4: 20 to 35 units at 60 degrees and not less than 35 units at 85 degrees, in accordance with ASTM D523.

5. MPI Gloss Level 5: 35 to 70 units at 60 degrees, in accordance with ASTM D523.

6. MPI Gloss Level 6: 70 to 85 units at 60 degrees, in accordance with ASTM D523.

7. MPI Gloss Level 7: More than 85 units at 60 degrees, in accordance with ASTM D523.

1.04 SEQUENCING AND SCHEDULING:

A. Work Not Included:

1. Surfaces in concealed or inaccessible areas such as furred spaces, foundation spaces, pipe or duct chases, shafts, or utility tunnels.

2. Surfaces of anodized or prefinished aluminum, stainless steel, bronze, brass, and chromium plate.

3. Moving parts of operating equipment, mechanical or electrical moving parts, linkages, sensing devices, and motor shafts.

4. Buried concrete surfaces.

5. Nonmetallic materials such as glass and porcelain.

6. Prefinished electrical items such as motors, motor control centers, switchboards, switchgear, panelboards, transformers, and disconnect switches.

7. Prefinished architectural items such as acoustical tile, cabinets, building louvers, overhead coiling doors, sectional doors, and wall panels.

8. Fiber reinforced plastic (FRP) equipment with an integral colored gel coat does not require painting, provided the color is as selected.

1.05 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

1. Sustainable Design Submittals.

B. Product Data:

1. For each type of product. Include preparation requirements and application instructions.

a. Include Printout of current "MPI Approved Products List" for each product category specified, with the proposed product highlighted.

b. Indicate Volatile Organic Compound (VOC) content.

C. Samples:

1. Initial selection: Complete fan deck, color card, or actual color chips illustrating the full range of color availability.

2. Samples for verification: For each type of paint system and in each color and gloss of topcoat.

a. Submit samples on rigid backing, 8 1/2-inches x 11-inches.

b. Label each coat of each sample.

c. Label each sample for location and application area.

D. Quality Control Submittals:

1. Contract closeout submittals: Warranty.

E. Provide the Engineer with a schedule of systems and locations requiring color selection.

F. Supplements listed in this Section.

G. Sustainable Design Submittals:

1. As specified in Section 01 84 13.

1.06 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.07 SPARE PARTS:

A. Comply with the requirements specified in Section 01 61 00.

1.08 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

B. Sustainability Standards Certifications.

C. Manufacturer Qualifications: A minimum of 5 years of documented experience in the Work of this Section.

D. Installer Qualifications:

1. A minimum of 5 years of documented experience in the Work of this Section.

2. Approved by the manufacturer.

E. MPI Standards:

1. Products: In accordance with MPI standards indicated and listed in "MPI Approved Products List."

2. Preparation and workmanship: In accordance with requirements in "MPI Architectural Painting Specification Manual" for products and paint systems indicated.

F. Provide finish coats compatible with substrate materials or with prime coats specified in other Sections.

G. First quality preparation, painting, and finishing is required. Dirt, grit, or dust in the paint or finish; runs, sags, or drips of paint or finish; or irregularity of finish is cause for rejection. Remove rejected finishes; repair, re-prime, and refinish as required to achieve a first quality finish.

H. Regulatory Requirements:

1. Meet federal, state, and local requirements limiting the emission of VOCs.

2. Perform surface preparation and painting in accordance with the recommendations of the following:

a. The Paint Manufacturer’s instructions.

b. Federal, state, and local agencies having jurisdiction.

1.09 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

B. Delivery, storage, and handling requirements as specified in Section 01 60 00. Specific requirements in addition to Section 01 60 00 shall be:

1. Container label: Include the Manufacturer's name, type of paint, brand name, coverage, surface preparation, drying time, cleanup requirements, color designation, and instructions for mixing and reducing.

2. Paint materials: Store at an ambient temperature from 45 degrees F to 90 degrees F in a ventilated area or as required by the Manufacturer's instructions.

1.10 PROJECT/SITE CONDITIONS:

A. Do not apply paint in temperatures or moisture conditions outside of the Manufacturer’s recommended maximum or minimum allowable.

B. Work and storage areas shall be free of dust during the application of paint finishes. Do not apply finishes in spaces with accumulated rubbish, dust, or dirt or where construction activity is present.

C. Apply paints only when temperature of surfaces to be painted and ambient air temperatures are between 50 degrees F and 95 degrees F.

D. Do not apply paints when relative humidity exceeds 85 percent; at temperatures less than 5 degrees F above the dew point; or to damp or wet surfaces.

1.11 WARRANTY:

A. Warranty requirements as specified in Section 01 60 00. Specific requirements in addition to these sections shall be:

1. Warranty for 2 years from the substantial completion date for the satisfactory performance and installation of the painting and coating system and associated appurtenances, including correction, or at the option of the Owner, removal and replacement of Work found to be defective. The Owner will be named as the beneficiary.

2. The Contractor and the Paint Manufacturer shall jointly furnish the warranty.

PART 2 - PRODUCTS

2.01 MANUFACTURERS:

A. Paints:

1. AkzoNobel/Dulux

2. Benjamin Moore Paints

3. PPG Architectural Finishes, Inc.

4. Sherwin Williams

B. Products: Subject to compliance with requirements, provide product listed in the interior painting schedule for the paint category indicated.

2.02 MATERIALS:

A. Sustainable Design Product Requirements:

1. As specified in Section 01 81 13.01.

2. ISI Envision:

a. Sustainable procurement practices (RA1.2): Maximize the procurement of materials that follow sustainable procurement practices.

b. Recycled Materials (RA1.3): Maximize the procurement of materials with recycled content.

c. Locally sourced materials (RA1.4): Maximize the procurement of materials within the radius as specified in Section 01 81 13.01.

B. General:

1. Material compatibility:

a. Materials for use within each paint system shall be compatible with one another and substrates indicated, under conditions of service and application as demonstrated by Manufacturer, based on testing and field experience.

b. For each coat in a paint system, products shall be recommended in writing by the Topcoat Manufacturers for use in paint system and on substrate indicated.

C. VOC Content:

1. Products shall in accordance with VOC limits of authorities having jurisdiction and, for interior paints and coatings applied at Project site.

D. Maintenance:

1. Extra materials: One gallon of each color and sheen for the operations building paints.

E. Colors: As selected by Engineer from Manufacturer's full range in accordance with the procedures specified in Section 01 33 00.

2.03 SPARE PARTS:

A. Shipment requirements for spare parts as specified in Section 01 60 00.

1. Extra materials: One gallon of each color and sheen.

B. Colors: Formulate paints with colorants free of lead and lead compounds.

PART 3 - EXECUTION

3.01 EXAMINATION:

A. Examine substrates and conditions, with applicator present, for compliance with requirements for maximum moisture content and other conditions affecting performance of the Work.

B. Maximum Moisture Content of Substrates: When measured with an electronic moisture meter as follows:

1. Concrete: 12 percent.

2. Gypsum board: 12 percent.

C. Verify suitability of substrates, including surface conditions and compatibility with specified finishes and primers.

D. Begin coating application only after unsatisfactory conditions have been corrected and surfaces are dry.

1. Beginning coating application constitutes Contractor's acceptance of substrates and conditions.

3.02 PREPARATION:

A. In accordance with Manufacturer's written instructions and recommendations in "MPI Architectural Painting Specification Manual" applicable to substrates and paint systems indicated.

B. Remove hardware, covers, plates, and similar items already in place that are removable and are not to be painted. If removal is impractical or impossible because of size or weight of item, provide surface-applied protection before surface preparation and painting.

1. After completing painting operations, use workers skilled in the trades involved to reinstall items that were removed. Remove surface-applied protection if any.

2. Do not paint over labels of independent testing agencies or equipment name, identification, performance rating, or nomenclature plates.

C. Protect and cover items indicated not to be painted with suitable material.

D. Clean substrates of substances that could impair bond of paints, including dust, dirt, oil, grease, and incompatible paints and encapsulants.

1. Remove incompatible primers and re-prime substrate with compatible primers or apply tie coat as required to produce paint systems specified in this Section.

E. Shop Abrasive Blasting:

1. Notify the Engineer at least 7 days prior to the start of shop-blast cleaning to allow for inspection of the Work during surface preparation and shop application of paints.

2. Structural steel and similar items, as approved by the Engineer, may be shop prepared and primed. Centrifugal wheel blast cleaning is an acceptable alternative to shop-blast cleaning.

F. Field Abrasive Blasting: Perform blasting for items and equipment where specified and as required to restore damaged surfaces previously shop-blasted or field-blasted and primed or coated.

G. Metal Surface Preparation:

1. Where indicated, meet requirements of the following SSPC Specifications:

a. Solvent cleaning: SP-1.

b. Hand tool cleaning: SP-2.

c. Power tool cleaning: SP-3.

d. Commercial blast cleaning: SP-6.

2. The words solvent cleaning, hand tool cleaning, wire brushing, and blast cleaning, or similar words of equal intent in the Contract Documents or in the Paint Manufacturer's Specification, refer to the applicable SSPC Specification.

3. Where OSHA 29 CFR 1910, OSHA 29 CFR 1926, EPA 40 CFR 261, EPA AP-42, or SSPC PA 10 regulations preclude standard abrasive blast cleaning, wet or vacu-blast methods may be required. The Paint Manufacturer's recommendations for wet-blast additives and first coat application shall apply.

4. Hand tool clean areas that cannot be cleaned by power tool cleaning.

5. Round or chamfer sharp edges and grind smooth burrs, jagged edges, and surface defects.

6. Welds and adjacent areas:

   a. Prepare such that there is the following:

      (1) No undercutting or reverse ridges on weld bead.

      (2) No weld spatter on or adjacent to weld or any area to be painted.

      (3) No sharp peaks or ridges along weld bead.

   b. Grind embedded pieces of electrode or wire flush with the adjacent surface of weld bead.

7. Pre-blast cleaning requirements:

   a. Remove oil, grease, welding fluxes, and other surface contaminants prior to blast cleaning.

   b. Cleaning methods: Steam, open flame, hot water, or cold water with appropriate detergent additives followed with clean water rinsing. Waterjetting in accordance with SSPC/NACE SP WJ-1/NACE WJ-1.

   c. Clean small, isolated areas as above or solvent clean with suitable solvent and a clean cloth.

8. Blast cleaning requirements:

   a. Type of equipment and speed of travel: Design to obtain a specified degree of cleanliness; minimum surface preparation is as specified herein and takes precedence over the Paint Manufacturer's recommendations.

b. Select the type and size of abrasive to produce a surface profile that meets the Paint Manufacturer's recommendations for the particular primer to be used.

c. Use only dry blast cleaning methods.

d. Do not reuse abrasive, except for designed recyclable systems.

e. Meet applicable federal, state, and local air pollution and environmental control regulations for blast cleaning, confined space entry (if required), and disposition of spent aggregate and debris.

9. Post-blast cleaning and other cleaning requirements:

a. Clean surfaces of dust and residual particles from cleaning operations by dry air blast cleaning (no oil or water vapor) or other method prior to painting. Vacuum clean enclosed areas and other areas where dust settling is a problem and wipe with a tack cloth.

b. Paint surfaces the same day they are blasted. Re-blast surfaces that have begun to rust prior to painting.

H. Gypsum Board Surface Preparation:

1. Allow joint treatment to thoroughly dry. Lightly sand joint treatments and topping compounds to produce a uniform, smooth surface. Wipe or brush free of sanding dust.

2. Fill minor defects with filler compound. Spot prime defects after repair.

I. Shop-Primed Steel Substrates: Clean field welds, bolted connections, and areas where shop paint is abraded. Paint exposed areas with the same material as used for shop priming in accordance with SSPC-PA 1 for touching up shop- primed surfaces.

3.03 APPLICATION:

A. General:

1. Apply paints in accordance with Manufacturer's written instructions and to recommendations in "MPI Manual."

a. Use applicators and techniques suited for paint and substrate indicated.

b. Paint surfaces behind movable equipment and furniture same as similar exposed surfaces.

c. Provide prime coats that are compatible with substrate material. Provide finish coats that are compatible with primers used.

d. Paint interior surfaces of ducts with a flat, non-specular black paint where visible through registers or grilles.

e. The term "exposed surfaces" includes areas visible when permanent or built-in fixtures, grilles, convector covers, covers for finned-tube radiation, and similar components are in place. Extend coatings in these areas, as required, to maintain system integrity and provide desired protection.

f. Paint front and backsides of access panels, removable or hinged covers, and similar hinged items to match exposed surfaces.

g. Primers specified in painting schedules may be omitted on items that are factory primed or factory finished if acceptable to the Topcoat Manufacturers.

h. If undercoats or other conditions show through topcoat, apply additional coats until cured film has a uniform paint finish, color, and appearance.

i. Apply paints to produce surface films without cloudiness, spotting, holidays, laps, brush marks, roller tracking, runs, sags, ropiness, or other surface imperfections. Cut in sharp lines and color breaks.

B. Workmanship:

1. If surfaces are not in proper shape for coating application, repair, rebuild, or refinish before proceeding with the Work. Assume responsibility for inadequate Work caused by improper surface preparation. The application of the first coat does not relieve the responsibility for the base. Do not apply any coats on damp or wet surfaces and in no case until the preceding coat has cured. Avoid contamination or damage to prepared or intercoat surfaces. Clean and re-repair as required.

2. Application: Spread materials evenly without runs or sags and thoroughly brush out. Provide a finish that is free of abrasions, dirt, or other debris and uniform in color and appearance.

a. The number of coats specified is the minimum to be applied. Apply additional coats when undercoats, stains, or other conditions show through the final finish coat until the paint film is of uniform finish, color, and appearance.

3. Roller application: Use a fine nap roller to roll and backroll so a nearly flat or orange-peel texture is achieved. Do not use a roller application on metal or wood surfaces. Coating application shall be uniform in color, texture, and shade. Aesthetic defects shall be cause for rejection.

4. Spray application: Apply with airless or air pressure spray equipment as recommended by the Paint Manufacturer for the particular product. Apply each coat in a uniform manner to provide the equivalent thickness of brush coats. Do not double back to build up the film thickness of 2 coats in one pass.

5. Brush application: Brush paint with equipment and the technique required to achieve a flat and smooth surface without brush marks. Brush out and Work paint onto the surfaces in a uniform, even film. Cloudiness, spotting, holidays, laps, brush marks, runs, sags, and other surface imperfections are not acceptable.

6. Replace electrical plates, hardware, light fixture trim, and fittings removed prior to finishing only after finishing has completely dried and hardened. Use workmen skilled in the installation of the items removed; install in a manner that does not void warranties.

C. Do not paint prefinished items, concealed surfaces, finished metal surfaces, operating parts, and labels.

1. Prefinished items include the following factory-finished components:

a. Architectural woodwork.

b. Acoustical ceiling panels.

c. Finished mechanical and electrical equipment.

d. Light fixtures.

2. Concealed surfaces include walls or ceilings in the following generally inaccessible spaces:

a. Foundation spaces.

b. Furred areas.

c. Ceiling plenums.

d. Duct shafts.

3. Finished metal surfaces include the following:

a. Anodized aluminum.

b. Stainless steel.

c. Chromium plate.

d. Copper and copper alloys.

e. Bronze and brass.

4. Operating parts include moving parts of operating equipment and the following:

a. Valve and damper operators.

b. Linkages.

c. Sensing devices.

d. Motor and fan shafts.

e. Sprinkler heads.

D. Shop-Primed and Factory-Finished Surfaces:

1. Schedule an inspection with the ENGINEER before shop priming or top coating factory-finished items are delivered to the site.

2. Prepare surfaces and spot prime using the specified primer.

3. Apply a mist coat of primer, one-mil DFT.

4. After welding, prepare and prime holdback areas as required for the paint system. Apply primer in accordance with the Manufacturer's instructions.

E. Film Thickness and Coverage:

1. Number of coats:

a. The minimum required without regard to coating thickness.

b. Additional coats may be required to obtain the minimum required paint thickness depending on method of application, differences in the Manufacturer’s products, and atmospheric conditions.

2. Application thickness:

a. Do not exceed the Manufacturer’s recommendations.

b. Measure using a wet film thickness gauge to ensure proper coating thickness during application.

3. Visually inspect concrete, masonry, non-ferrous metal, plastic, and wood surfaces to ensure proper and complete coverage has been attained.

4. Give particular attention to edges, angles, flanges, and other similar areas where insufficient film thicknesses are likely to be present and ensure proper DFT in these areas.

5. Apply additional coats as required to achieve complete hiding of underlying coats. Hiding shall be so complete that additional coats would not increase the hiding.

F. Factory-Applied Priming:

1. Priming or priming and finishing of certain surfaces may be specified to be factory-applied or shop-applied by fabricators.

2. Carefully examine the Contract Documents for priming or finishing Work installed by other trades to avoid duplications or omissions.

3.04 PROTECTION:

A. Remove, mask, or otherwise protect hardware, lighting fixtures, switchplates, aluminum surfaces, machined surfaces, couplings, shafts, bearings, nameplates on machinery, and other surfaces not specified elsewhere to be painted.

B. Provide drop cloths to prevent paint materials from falling on or marring adjacent surfaces.

C. Protect Work of other trades against damage from paint application. Correct damage to Work of other trades by cleaning, repairing, replacing, and refinishing, as approved by ENGINEER, and leave in an undamaged condition.

D. Mask openings in motors to prevent paint and other materials from entering.

E. Protect surfaces from overspray that are adjacent to or downwind of the Work area.

F. After completing paint application, clean spattered surfaces. Remove spattered paints by washing, scraping, or other methods. Do not scratch or damage adjacent finished surfaces.

G. At completion of construction activities of other trades, touch up and restore damaged or defaced painted surfaces.

3.05 QUALITY CONTROL:

A. Dry Film Thickness Testing: Owner will engage the services of a qualified testing and inspecting agency to inspect and test paint for dry film thickness.

1. Contractor shall touch up and restore painted surfaces damaged by testing.

2. If test results show that dry film thickness of applied paint does not in accordance with the Paint Manufacturer's written recommendations, Contractor shall pay for

testing and apply additional coats as needed to provide dry film thickness that complies with the Paint Manufacturer's written recommendations.

B. Inspection: Leave staging and lighting in place until the Engineer has inspected the surface or coating. Replace staging removed prior to approval by the Engineer. Provide additional staging and lighting as requested by the Engineer.

C. Unsatisfactory Application:

1. If an item has an improper finish color or insufficient film thickness, clean the surface and topcoat with specified paint material to obtain the specified color and coverage. Obtain specific surface preparation information from the Paint Manufacturer.

2. Evidence of runs, bridges, shiners, laps, or other imperfections is cause for rejection.

3. Repair defects in accordance with the written recommendations of the Paint Manufacturer.

D. Damaged Coatings, Pinholes, and Holidays:

1. Feather edges and repair in accordance with the recommendations of the Paint Manufacturer.

2. Hand or power sand visible areas of chipped, peeled, or abraded paint, and feather the edges. Follow with primer and finish coat. Depending on the extent of repair and appearance, a finish sanding and topcoat may be required.

3. Apply finish coats, including touch up and damage-repair coats, in a manner that will present a uniform texture and color-matched appearance.

E. Manufacturer’s Services:

1. The Paint Manufacturer’s representative shall be present at the site:

a. On the first day of the application of any coating system.

b. A minimum of 2 additional site inspection visits, to provide the Manufacturer’s certificate of proper installation.

c. As required to resolve field problems attributable to or associated with the Manufacturer’s product.

d. To verify full cure of coating prior to coated surfaces being placed into immersion service.

3.06 CLEANING:

A. Brush-off Blast Cleaning:

1. The equipment, procedure, and degree of cleaning in accordance with SSPC/NACE SP 7/NACE No. 4 or SSPC SP 16.

2. Abrasive: Wet or dry blasting sand, grit, or nutshell.

3. Select various surface preparation parameters, such as size and hardness of abrasive, nozzle size, air pressure, and nozzle distance from surface such that the surface is cleaned without pitting, chipping, or other damage.

4. Verify parameter selection by blast cleaning a trial area that will not be exposed to view.

5. The Engineer will approve the trial blast cleaned area and, if acceptable, use the area as a representative sample of surface preparation.

6. Repair or replace surface damaged by blast cleaning.

B. Acid Etching:

1. After pre-cleaning, spread the following solution by brush or plastic sprinkling can: One part commercial muriatic acid reduced by 2 parts water by volume. Adding acid to water in these proportions gives an approximate 10% solution of HCl.

2. Application:

a. Rate: 2 gallons/100 sf.

b. Work acid solution into the surface by hard-bristled brushes or brooms until complete wetting and coverage is obtained.

c. Acid will react vigorously for a few minutes during which time brushing shall be continued.

d. After bubbling subsides, in approximately 10 minutes, hose down the remaining slurry with high-pressure clean water.

e. Rinse immediately to avoid the formation of salts on the surface that are difficult to remove.

f. Thoroughly rinse to remove any residual acid surface condition that may impair adhesion.

3. Ensure surface is completely dry before the application of paint.

4. Apply acid etching to obtain a grit sandpaper surface profile. If the surface is not achieved, repeat the treatment.

C. Solvent Cleaning:

1. In accordance with SSPC SP 1.

2. Consists of the removal of foreign matter such as oil, grease, soil, drawing and cutting compounds, and any other surface contaminants by using solvents, emulsions, cleaning compounds, steam cleaning, or similar materials and methods that involve a solvent or cleaning action.

D. Power Tool Cleaning: In accordance with SSPC SP 11.

E. Place cloths and waste that might constitute a fire hazard in closed metal containers or destroy at the end of each day.

F. Upon the Substantial Completion date, remove staging, scaffolding, and containers from the site or destroy in a legal manner.

G. Remove paint spots, oil, or stains upon adjacent surfaces and floors and leave the entire job clean.

3.07 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 01.EW1.

3.08 SCHEDULES:

A. Paint surfaces in accordance with the following application schedule. In the event of discrepancies or omissions in the following, request clarification from the Engineer before starting the Work.

B. System No. 101, Exterior Metal Surfaces, including Hollow Metal Doors and Frames, Rolling Door Angle Jambs, Miscellaneous Steel Lintels, Ferrous Steel Beams and Columns:

Surface Preparation	**Water-Based Light Industrial Coating System, MPI EXT 5.1C**	
SSPC/NACE SP 6/NACE No. 3	Prime Coat:	Primer, rust-inhibitive, alkyd MPI #79.
	Intermediate Coat:	Light industrial coating, exterior, water based, matching topcoat.
	Topcoat:	Light industrial coating, exterior, water based, acrylic semi-gloss (MPI Gloss Level 5), MPI #163.

C. System No. 102, Interior Metal Surfaces, including Hollow Metal Doors and Frames, Rolling Door Angle Jambs, Steel Columns, Miscellaneous Steel Lintels:

Surface Preparation	**Water-Based Light Industrial Coating System, MPI EXT 5.1B**	
SSPC/NACE SP 6/NACE No. 3	Prime Coat:	Primer, rust-inhibitive, water based MPI #107.
	Intermediate Coat:	Light industrial coating, interior, water based, matching topcoat.
	Topcoat:	Light industrial coating, interior, water based, acrylic semi-gloss (MPI Gloss Level 5), MPI #153.

D. System No. 103, Interior Metal Surfaces, including Steel Roof Decking, Structural Steel Roof Joists and Framing:

Surface Preparation	**Water-Based Light Industrial Coating System, MPI EXT 5.1L**	
SSPC/NACE SP 6/NACE No. 3 or SSPC SP 8	Prime Coat:	Primer, epoxy, anti-corrosive MPI #101.
	Intermediate Coat:	Epoxy coating, interior, solvent based, matching topcoat.
	Topcoat:	Epoxy coating, interior, solvent based, semi- gloss (MPI Gloss Level 5), MPI #177.

E. System No. 104, Interior Gypsum Board and Plaster (Eggshell):

Surface Preparation	**Latex over Latex Sealer System MPI INT 9.2A (Eggshell)**	
In accordance with Gypsum Board or Plaster Surface Preparation	Prime Coat:	Primer sealer, latex, interior, MPI #50.
	Intermediate Coat:	Latex, interior, matching topcoat.
	Topcoat:	Latex, interior (MPI Gloss Level 3), MPI #52.

F. System No. 105, Interior Gypsum Board and Plaster (Semi-Gloss):

Surface Preparation	**Latex over Latex Sealer System MPI INT 9.2A (Eggshell)**	
In accordance with Gypsum Board or Plaster Surface Preparation	Prime Coat:	Primer sealer, latex, interior, MPI #50.
	Intermediate Coat:	Latex, interior, matching topcoat.
	Topcoat:	Latex, interior (MPI Gloss Level 4), MPI #43.

END OF SECTION

SECTION 09 91 10

SHOP PAINTING

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide shop painting as specified and in compliance with Contract Documents.

1.02 REFERENCES:

A. ASTM International (ASTM):

1. B117: Standard Practice for Operating Salt Spray (Fog) Apparatus.

2. D870: Standard Practice for Testing Water Resistance of Coatings Using Water Immersion

3. D4541: Standard Test Method for Pull-Off Strength of Coatings Using Portable Adhesion Testers

4. D4544: Standard Practice for Estimating Peat Deposit Thickness

5. D4585: Standard Practice for Testing Water Resistance of Coatings Using Controlled Condensation

6. G8: Standard Test Methods for Cathodic Disbonding of Pipeline Coatings

B. The Society for Protective Coatings (SSPC):

1. SP6: Commercial Blast Cleaning

2. SP10: Near-White Blast Cleaning

1.03 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Manufacturer's specifications and data on the proposed primers and detailed surface preparation, application procedures and dry mil thicknesses, including list of items and surfaces to receive shop painting.

1.04 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

1.05 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

B. Deliver materials to application area in original, unbroken containers, plainly marked with name and analysis of product, manufacturer's name, and shelf lift date. Do not store or use contaminated, outdated, prematurely opened, or diluted materials.

C. Store coated items to prevent damage or dirtying of coatings. Avoid need for special cleaning, and store coated items out of contact with ground or pavement. Place suitable blocking under coated items during storage.

D. Do not expose surfaces to weather for more than six months before being topcoated, or less time if recommended by coating manufacturer.

E. Protect surfaces not to receive paint coatings during surface preparation, cleaning, and painting.

F. Protect coatings from damage during shipment and handling by padding, blocking, use canvas or nylon slings, and use care when handling.

G. At time of delivery of shop painted items to job site, ensure coatings are undamaged and in good condition.

1.06 PROJECT/SITE CONDITIONS:

A. Environmental Requirements:

1. Comply with manufacturer's recommendations as to environmental conditions under which coatings and coating systems can be applied.

2. Do not apply coatings when dust is being generated.

PART 2 - PRODUCTS

2.01 MATERIALS:

A. Coatings are divided into the following service types, as determined by conditions:

1. Non-Potable Water:

a. All ferrous metals not subject to potable water provide one coat with a dry film thickness of 2.5 to 3.0 mils.

b. Manufacturers:

(1) Series 1 Prime made by Tnemec Co.

(2) Carbozinc 859 by Carboline Co.

(3) Multiprime EFD Epoxy Fast Day Inhibitive Primer 94-109 made by PPG Protective & Marine Coatings (4.0 – 6.0 DFT).

c. Performance Data:

(1) ASTM- D4541- Adhesion – No less than 1250 psi pull

(2) ASTM- D4585- Humidity- no affect after 4800 hours with< 1% rust

(3) ASTM- B117 Salt Spray- No cracking , delamination or >1/64 creep after 9800 hours

2. Potable Water:

a. Ferrous metals submerged or which are subject to splash action in contact with potable water, provide one coat with a dry mil thickness of 3.0 to 3.5 mils of a certified NSF Standard 61 product.

b. Manufacturers:

(1) 94 H20 Urethane Zinc Rich Primer made by Tnemec Co.

(2) Carboguard 561 made by Carboline Co.

(3) Aquapon High Build Potable Water Epoxy 95-132 Series made by PPG Protective & Marine Coatings (4.0 – 6.0 DFT).

c. Performance Data:

(1) ASTM –D4541 Adhesion no less than 1700 psi

(2) ASTM-G8 Method A Cathodic Disbondment- No affect after 30 days

(3) ASTM D870 Immersion – No affect after 22 months

(4) ASTM B117 Salt Spray- no affect of coating film, < $1/16^{th}$ creep after 9900 hours

B. Shop prime with primers guaranteed by the manufacturer to be compatible with their corresponding primers and finish coats specified in Division 09 “Field Painting” Section for use in the field and which are recommended for use together.

PART 3 - EXECUTION

3.01 APPLICATION:

A. Surface Preparation and Priming:

1. Sandblast clean in accordance with SSPC-SP-6, Commercial Grade, immediately prior to priming non-submerged components scheduled for priming, as defined above.

2. Sandblast clean in accordance with SSPC-SP-10, Near White, immediately prior to priming submerged components scheduled for priming, as defined above.

3. Before priming, provide surfaces dry and free of dust, oil, grease and other foreign material.

4. Shop prime in accordance with accepted manufacturer's printed recommendations.

B. Non-primed Surfaces: Apply accepted coating in accordance with manufacturer's printed recommendation.

3.02 TOUCH-UP:

A. Repair or replace damaged or defective coated areas. Resultant shop painting: Paint items as specified.

B. Remove damaged or defective coatings by specified blast cleaning to meet surface cleaning requirements, just before recoating. When small areas of coating need touch up, surface preparation may be done with suitable power needle gun to match specified blast cleaning.

3.03 CONTRACT CLOSEOUT:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 09 91 13

SPECIAL LININGS AND COATINGS

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide special linings and coatings as indicated and in compliance with Contract Documents.

1. Section Includes:

a. Coat surfaces to include:

(1) Surfaces described in Room Finish Schedule and notes on Drawings

(2) Concrete tanks

1.02 REFERENCES:

A. ASTM International (ASTM):

1. B117: Standard Practice for Operating Salt Spray (Fog) Apparatus.

2. C413: Standard Test Method for Absorption of Chemical-Resistant Mortars, Grouts, and Monolithic Surfacings, and Polymer Concretes

3. C579: Standard Test Methods for Compressive Strength of Chemical-Resistant Mortars, Grouts, Monolithic Surfacings, and Polymer Concretes

4. C580: Standard Test Method for Flexural Strength and Modulus of Elasticity of Chemical-Resistant Mortars, Grouts, Monolithic Surfacings, and Polymer Concretes

5. C868: Standard Test Method for Chemical Resistance of Protective Linings

6. C882: Standard Test Method for Bond Strength of Epoxy-Resin Systems Used with Concrete by Slant Shear

7. D53: Specification for Rubber Belting for Power Transmission

8. D579: Standard Specification for Greige Woven Glass Fabrics

9. D638: Standard Test Method for Tensile Properties of Plastics

10. D790: Standard Test Methods for Flexural Properties of Unreinforced and Reinforced Plastics and Electrical Insulating Materials

11. D810: Methods of Test for Sulfated Residue, Lead, Iron and Copper in Lubricating Oils

12. D3359: Standard Test Methods for Measuring Adhesion by Tape Test

13. D4060: Standard Test Method for Abrasion Resistance of Organic Coatings by the Taber Abraser

14. D4541: Standard Test Method for Pull-Off Strength of Coatings Using Portable Adhesion Testers

15. D4585: Standard Practice for Testing Water Resistance of Coatings Using Controlled Condensation

16. E84: Standard Test Method for Surface Burning Characteristics of Building Materials

17. E377: Standard Practice for Internal Temperature Measurements in Low-Conductivity Materials

B. The Society for Protective Coatings (SSPC):

1. SP1: Solvent Cleaning

2. SP5: White Metal Blast Cleaning

3. SP6: Commercial Blast Cleaning

4. SP7: Brush-Off Blast Cleaning

5. SP10: Near-White Blast Cleaning

6. SP12: Surface Preparation of Metals by Waterjetting Prior to Recoating

7. SP13: Surface Preparation of Concrete

1.03 DEFINITIONS:

A. Definitions.

1. Coatings: Heavy duty finishes for use on any surfaces, especially surfaces subject to submerged, high moisture, splash or chemical environment.

2. Ambient Conditions:

a. Chemical: Surface subject to corrosive chemical splash or fumes.

b. Moist: Surface subject to wet areas such as shower rooms and rooms with open tanks.

c. Normal: Surface subject to normal temperatures and humidity such as found in offices and corridors.

3. Splash: Surface subject to frequent washing and chemical splash.

4. Submerged P: Surface submerged in potable water plus 1 feet-0 inches above high liquid level.

5. Submerged NP: Surface submerged in non-potable liquid such as sewage and sludge plus 1 foot-0 inches above high liquid level.

B. First Coat: Field prime, factory prime, or shop prime. When only one coat is required, first coat is finish coat.

C. Second or Third Coats: Successive finish coats applied over first coat.

1.04 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Product Data:

1. Submit manufacturer's literature stating application recommendations and generic makeup of each type of coating scheduled.

2. Substitutions: For coatings not specified, provide substitute manufacturer's product data sheets, ASTM certified performance criteria, MSDS and other relevant data for Engineer to perform proper evaluation 10-days prior to bid date.

C. Samples:

1. Actual color samples available for each type of coating scheduled.

2. Two 4 inches by 4 inches steel panels for each method of metal preparation specified. Panel shall be representative of steel used and prevented from deterioration of surface quality. Upon acceptance by Engineer, panel shall be preserved as reference source for inspection.

D. Miscellaneous:

1. Certification:

a. Certification by the manufacturer that products supplied comply with local regulations controlling use of volatile organic compounds (VOCs).

2. Schedules:

   a. Submit schedule of proposed coating systems within 30 calendar days of Award of Contract.

   b. Schedule of proposed coating systems shall identify same information as shown in coating schedule.

1.05 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

B. Applicator Qualifications:

1. Engage an experienced applicator who has successfully completed coating system applications similar in material and extent to those indicated for Project.

2. Ensure that mixing and installation of protective coating is performed by applicators licensed by the coating manufacturer.

3. Submit four copies of a notarized statement from the manufacturer's authorized technical representative certifying the Contractor is qualified to apply the protective coating.

C. Single-Source Responsibility:

1. Provide coating material produced by same manufacturer for each system. Use only thinners recommended by manufacturer and only within recommended limits.

D. Manufacturer shall supply products that comply with local restrictions controlling use of volatile organic compounds (VOCs).

1.06 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

B. Deliver material in original, sealed, unopened packages and containers bearing manufacturer’s name. Each container shall have manufacturer’s printed label stating type of coating, color of coating, instructions for reducing, and spreading rate.

C. Protect and heat or cool material storage location to maintain temperature ranges recommended by coating manufacturer for most sensitive coating, but not less than 55 degrees F.

D. Keep storage area neat and clean and replace or repair damage thereto or to its surroundings.

E. Avoid danger of fire. Deposit cleaning rags and waste materials in metal containers having tight covers or remove from building each night. Provide fire extinguishers of type recommended by coating manufacturer in areas of storage and where finishing is occurring. Allow no smoking or open containers of solvents. Store solvents in safety cans. Give special attention to possible hazards in areas of existing buildings.

F. Empty containers shall have labels canceled and be clearly marked as to use.

G. Upon Substantial Completion, remaining material will become property of Owner. Seal material for storage, marked as to contents and shelf life, and store where required by Engineer.

1.07 PROJECT/SITE CONDITIONS:

A. Environmental Requirements:

1. Do not apply exterior coating in cold, foggy, damp or rainy weather.

2. Apply no finish in rooms where dust is being generated.

3. Do not apply exterior coating when temperature is lower than 50 degrees F or as required by manufacturer.

4. Maintain interior temperature and relative humidity of space, as recommended by coating manufacturer, 24 hours before applying and until coating is cured.

B. Protection:

1. Cover materials and surfaces, including floors, adjoining or below Work with clean drop cloths or canvas.

2. Remove hardware, accessories, plates, lighting fixtures, and similar items or provide protection by masking. Upon completion, replace above items or remove protection and clean.

3. Maintain manufacturer’s environmental requirements while coating dries.

1.08 MANUFACTURER'S RECOMMENDATIONS:

A. Conform to manufacturer's printed instructions for surface preparation, use, safety requirements, mixing, application, curing and intercoat precautions for protective coating. Submit to Engineer, four copies of these printed instructions and manufacturer's product data sheets, 30 days prior to application of coating.

PART 2 - PRODUCTS

2.01 MATERIALS:

A. Provide only high-grade products of nationally known manufacturer's having an established good reputation in the field. Provide products having a minimum of five years' similar, satisfactory field service and suitable for the intended service. Apply products specified except, when permitted by the Engineer, other acceptable equivalent products may be applied if the Contractor satisfactorily proves that they are equivalent to the specified item in quality, durability, performing the required function, abrasion resistance, chemical resistance, adhesion, efficiency in protecting the substrate from corrosion and deterioration, life expectancy and recoating cycles, solids content by volume, film thickness per coat, mil. feet per gallon, coverage per gallon, total cost of services, ease of application, ease of repairing damaged areas, and other pertinent criteria. In any one coating system, provide compatible coatings. Provide only products of one manufacturer in any one coating system. Touch-up with coatings as originally applied. Provide materials meeting air pollution requirements in the area where they are applied.

B. Apply materials within the manufacturer's recommended shelf life.

C. After review, submit list of coating products that will be used on the job, 30 days prior to application of coatings.

D. Deliver materials to the application area in their original, unopened containers plainly marked with the name and analysis of the product, the producer's name and the shelf life date. Do not use contaminated, outdated, prematurely opened, or diluted material. Do not modify or extend coatings and only use in accordance with the coating manufacturer's current printed instructions.

2.02 CONCRETE TANKS, MANHOLES, WET WELLS, HOLDING TANKS (PC-1):

A. Manufacturers:

1. Sherwin-Williams Company, Cleveland, Ohio.

B. The following list specifies the material requirement for surfacing system. The acceptable products are as following:

1. Sherwin-Williams Dura-Plate High Performance System:

a. Base Coat: Dura-Plate 2300, apply resurfacer coat as needed to fill bug holes and voids.

b. Topcoat: Dura-Plate, 80 to 125 mils (DFT).

2. Performance Criteria – Products shall meet the minimum as listed.

   a. Patching Compound: Cementitious Epoxy

   b. Bond Strength: ASTM C882 – No less than 1030 psi slant shear average 3 pulls

   c. Flexural Strength: ASTM C580 – No less than 1250 psi, no less than 897,000 PSI flexural modules of elasticity

   d. Compressive Strength: ASTM C579 – No less than 5100 psi average six pulls

   e. H2S Lining: Epoxy Mortar

   f. Abrasion: ASTM D4060 no less than 90 mg loss

   g. Adhesion: ASTM D4541 – Steel – 900 psi, Concrete – Type V test- no less than 700 psi

   h. Chemical Resistance: ASTM C868 Atlas Cell – 100 days in 25 percent sulfuric acid no erosion, blistering, softening or loss of adhesion

   i. Humidity: ASTM 4585 – No less than 4000 hours

   j. SWAT Test: H2S autoclave 150 degrees, 500 ppm, H2S 4000 ppm NaCl 10 percent H2So4 – No blistering cracking loss of adhesion or loss of electrical impedance after 28 days

   k. Water Absorption: ASTM C 413- No more than 0.18 water absorption

2.03 MATERIALS:

A. Coatings:

1. Color shall be formed of pigments free of lead, lead compounds or other materials which might be affected by presence of hydrogen sulfide or other gases likely to be present at Project.

2. Coatings shall meet surface burning characteristics as required by code and established by ASTM E84.

PART 3 - EXECUTION

3.01 EXAMINATION:

A. If surfaces to be finished cannot be put into proper condition for finishing by customary cleaning, sanding, and puttying operations or if surfaces were improperly primed by others, report defects to Engineer, in writing, or assume responsibility and correct unsatisfactory finish resulting from improper surfaces. Commencement of Work indicates acceptance of surfaces.

B. Materials removed and replaced to correct defects due to Work placed on unsuitable surfaces shall be at Contractor's expense.

C. Where surface dryness is questioned, test with dampness indicating instrument. Do not apply coatings over surfaces where moisture content exceeds that permitted in manufacturer's printed instructions.

D. Provide coats compatible with the surface and prior coats.

3.02 APPICATION OF PROTECTIVE COATING SYSYEMS:

A. Hoisting, Scaffolding, Staging, And Planking: Provide, set-up, and maintain all required hoists, scaffolds, and staging and planking, and perform all access related hoisting work required to complete the work of this section as indicated and specified.

1. Scaffolds shall have solid backs and floors to prevent dropping materials from there to the floors or ground below.

B. Environmental Requirements: Comply with the Manufacturer's recommendations as to environmental conditions under which resurfacing system materials can be applied.

1. Do not apply resurfacing system materials when dust is in work site.

2. The Contractor shall provide all temporary lighting during the work.

C. Protection: Cover or otherwise protect finish work or other surfaces not being resurfaced.

1. Erect and maintain protective tarps, enclosures and/or maskings to contain debris (such as dust or airborne particles resulting from surface preparation) generated during any and all work activities. This includes, but is not limited to the use of dust/debris collection apparatus.

D. Initial Inspection of Surfaces to be Coated:

1. It is the responsibility of the Contractor to inspect and report unacceptable concrete substrate surface conditions to the Engineer prior to the commencement of surface preparation activities. Unacceptable surface conditions are defined as

the presence of cracked surfaces or concrete deteriorated to a depth of greater than 1-inch or otherwise unable to withstand surface preparation as specified herein.

E. Thinners and Solvents:

1. The Contractor shall use only solvents and thinners as recommended by the manufacturer.

3.03 SURFACE PREPARATION REQUIREMENTS:

A. General: All specified surface preparation shall be performed in accordance with the latest version of the SSPC, NACE, ICRI and other standards referenced in this section.

1. Concrete surfaces shall be abraded to produce a minimum surface profile of equal to 40 grit sandpaper with no loose concrete remaining. This preparation will be followed by vacuum cleaning to remove all dust, dirt or friable substances leaving clean, dust free surfaces for resurfacing.

2. Oil and grease shall be removed before mechanical cleaning is started via an alkaline-based emulsifying detergent as recommended by the resurfacing material manufacturer. Where mechanical cleaning is accomplished by blast cleaning, the abrasive used shall be washed, graded and free of contaminants that might interfere with the adhesion of the resurfacing materials.

3. The air used for blast cleaning shall be free of oil and moisture to not cause contamination of the surfaces to be resurfaced.

4. Clean cloths and clean fluids shall be used in solvent cleaning.

5. Cleaning and resurfacing shall be scheduled so that dust and other contaminants from the cleaning process will not fall on wet, newly resurfaced areas.

6. Prepare concrete joint and install sealant following resurfacing material installation.

B. Initial Cleaning/Decontamination:

1. All existing areas to be resurfaced shall be pressure washed with a 2500-5000 psi containing an alkaline - based detergent to remove all loose materials, acid constituents, grease, oil, and other contaminants (use potable water only, not plant water).

2. Verify that the pH of the cleaned concrete surfaces to be coated is within the range of 9 to 11. Application of coating materials outside this range will not be permitted without written approval from the Engineer.

C. Abrasive Blast Cleaning:

1. Used or spent blast abrasive shall not be reused on work covered by this section.

2. The compressed air used for blast cleaning will be filtered free of condensed water or oil. Moisture traps will be cleaned at least once every four hours or more frequently as is appropriate.

3. Oil separators shall be installed just downstream of compressor discharge valves and at the discharge of the blast pot discharges. Oil separators shall be cleaned at least once every four hours or more frequently as is appropriate.

4. A paper blotter test shall be performed by the Contractor when requested by the Engineer or the Engineer's representative to determine if the air is sufficiently free of oil and moisture.

5. Regulators, gauges, filters, and separators will be in good working order for all of the compressor air lines to blasting nozzles at all times during this work.

6. An air dryer or drying unit shall be installed which dries the compressed air prior to blast connections. This dryer shall be used and maintained for the duration of surface preparation work.

7. The quality, volume, and velocity of life support and ventilation air used during surface preparation shall be in accordance with applicable safety standards and to ensure adequate visibility and proper dissipation of volatiles without impacting the prepared surface or the health of the public or personnel working for the Contractor, Subcontractors, Engineer, Engineer's Representatives, or anyone who may be affected by on-site maintenance coating work activities.

8. The abrasive blast nozzles used shall be the venturi or other high velocity type supplied with a minimum of 100 psig air pressure and the necessary volume to obtain the required blast cleaning production rates and specified degree of cleanliness.

9. The Contractor must provide adequate ventilation for airborne particulate evacuation and lighting (meeting all pertinent safety standards) to optimize visibility for both blast cleaning and observation of the substrate during surface preparation work.

10. All phases of surface preparation work specified herein must be inspected by the Engineer before the Contractor proceeds with the subsequent phase of surface preparation.

11. If, between final surface preparation work and coating application, contamination of the prepared and cleaned substrate occurs, or if the prepared steel's appearance

darkens or changes color, reblasting will be required until the specified degree of cleanliness is established.

3.04 SPECIFIC SURFACE PREPARATION REQUIREMENT:

A. In addition to the Section 3.02 requirements, the Contractor will follow the requirements of this section.

B. When the floor area is scheduled to receive a mortar application to pitch the floor, the walls above the floor shall be sawcut to a depth of 1/2-inch at a height from 0 feet-0 inches to 0 feet-6 inches above the floor. The cut shall be straight and level.

C. The Contractor shall notify the Engineer should jobsite conditions prevent the above operations and/or applications.

D. In all cases of surface Preparation the Manufacturer printed recommendations shall be adhered to for steel and concrete substrates

3.05 APPLICATION REQUIREMENTS:

A. General: Field Quality Control Inspection and Testing

B. Inspection by the Engineer or others does not limit the Contractor's responsibilities for quality control inspection and testing as specified herein or as required by the Manufacturer's instructions.

C. Perform the quality control procedures listed below in conjunction with the requirements of this Section.

1. Inspect all materials upon receipt to ensure that all are supplied by the Manufacturer.

2. Provide specified storage conditions for the resurfacing system materials, solvents, and abrasives.

3. Inspect and record findings for the degree of cleanliness of substrates using. The pH of the concrete substrate will be measured using pH indicating papers. pH testing is to be performed once every 50 square feet. Acceptable pH values shall be between 9.0 and 11.0 as measured by a full range (1-12) color indicating pH paper with readable color calibrations and a scale at whole numbers (minimum). Use Hydrion Insta-Check Jumbo 0-13 or 1-12. The paper shall be touched to the surface once using moderate gloved finger pressure. The surface shall not be wiped or moved laterally to disturb the surface during pH testing. Following the one touch, lift the paper vertically to not "wipe" the surface. Compare the color indicated with the scale provided and record the pH.

4. Inspect and record substrate profile (anchor pattern). Surfaces shall be abraded, as a minimum, equal to the roughness of 40 grit sand paper.

5. Measure and record ambient air temperature once every two hours of each shift using a thermometer and measure and record substrate temperature once every two hours using a surface thermometer.

6. Measure and record relative humidity every two hours of each shift using a sling psychrometer in accordance with ASTM E337.

7. Provide correct mixing of resurfacing materials in accordance with the Manufacturer's instructions.

8. Inspect and record that the "pot life" of resurfacing materials are not exceeded during installation.

9. Verify curing of the resurfacing materials in accordance with the Manufacturer's instructions.

10. Upon full cure of the mortar and lining material, and before the topcoat/gelcoat is applied, the installed system shall be checked by high voltage spark detection in accordance with NACE RP0188-88BN to verify a pinhole-free surface. Voltage shall be set at 11,000 volts. Areas which do not pass the spark detection test shall be corrected at no cost to the Owner and rechecked. Upon completion of the lining system installation the lined area shall be cleaned and prepared to permit close visual inspection by the Engineer or the Engineer's Representative. Any and all deficiencies or defective work (not in compliance with this section or related sections) will be marked for repair or removal/replacement by the Contractor at no additional cost to the Owner.

3.06 ACCEPTANCE CRITERIA:

A. Acceptance Criteria For Surface Preparation Work:

1. All surfaces shall be prepared in accordance with the specification and referenced standards therein.

B. Acceptance Criteria for Coating System Application Work:

1. Acceptable coating work will be based upon the following:

a. No pock-marks, trowel marks, depressions, unconsolidated areas, waviness or ridges, pinholes or holidays in either size or frequency.

b. No intercoat bond failures between lifts.

c. Proper curing of coatings.

2. Resurfaced areas shall pitch to drains.

3. There shall be no areas that puddle when flood tested.

4. The Engineer or Engineer's Representative shall, at their discretion, inspect the following:

    a. Profile and degree of cleanliness of substrate.

    b. Thickness of materials/coverage rate confirmation..

    c. Ambient temperature and humidity requirements, and substrate temperature.

    d. Curing and recoat times.

    e. Proper curing of the resurfacing materials.

5. Rework required on any holidays or any other inadequacies found by the Engineer or the Engineer's Representative in the quality of the coating work shall be marked. Such areas shall be recleaned and reworked by the Contractor according to these specifications and the manufacturer's recommendations at no additional cost to the Owner.

6. The Contractor is responsible for keeping the Engineer informed of all progress so that inspection for quality can be achieved.

7. The Contractor is ultimately responsible for the quality performance of the applied materials and workmanship. Inspections by the Engineer or the Engineer's Representative do not limit this responsibility.

3.07 FINAL INSPECTION:

A. Perform a final inspection to determine whether the resurfacing system work meets the requirements of the specifications. The Engineer and the Engineer's Representative will conduct final inspection with the Contractor.

3.08 CLEANUP:

A. Upon completion of work, the Contractor shall remove surplus materials, equipment, protective coverings, and accumulated rubbish, and thoroughly clean all surfaces and repair any work-related damage. The surrounding surface areas including roadways, and all other surfaces shall be restored to their pre-project condition. Areas not to be resurfaced shall be masked using duct tape or other protection materials to prevent these surfaces from being resurfaced.

    1. Ensure straight even termination of resurfacing/topcoat materials on wall edges and flush with embedded steel. The Contractor must follow the minimum and maximum recoat

    2. Limitation times and related temperature range restrictions between successive lifts for all products specified herein per Manufacturer's stated requirements.

3. All equipment and procedures used for resurfacing system application shall be as recommended by the Manufacturer.

4. Unless specified elsewhere herein, the Contractor shall comply with the Manufacturer's most recent written instructions with respect to the following:

    a. Mixing of All Materials

    b. Protection and Handling of All Materials

    c. Recoat Limitation and Cure Times

    d. Minimum Ambient and Substrate Temperatures, Substrate's Degree of Dryness, Relative Humidity, and Dew Point of Air

    e. Application

    f. Final Curing

    g. Use of Proper Application Equipment

5. Curing of Resurfacing System:

    a. The applied resurfacing system shall be protected from damage during curing and shall be cured as recommended by the Manufacturer. Ambient conditions shall be controlled by the Contractor during curing to ensure the minimum air temperature and minimum relative humidity as required by the Manufacturer are maintained.

B. Patching And Surfacing The Concrete: Pre-dampen concrete surfaces prior to applying mortar and surfacer).Trowel apply mortar Series 218 or 217 on all ceilings, walls and floors to fill all large spalls, deep voids and rebuild concrete at joints, etc.

1. Apply mortar in maximum 1-1/2 inch lifts (layers) filling deepest areas first.

2. Trowel apply surfacer on all ceilings, walls and floors to fill bug holes, and surface uneven concrete with exposed aggregate

3. Apply surfacer at minimum 1/16-inch and maximum 1/4-inch as a surfacer and maximum 1/2-inch as hole filler.

4. Do not apply successive lifts until previous lift has cured for 12 hours minimum but not longer than 24 hours at 75 degrees F. If 24 hours has elapsed re-scarify surfaces to receive additional resurfacing materials

C. Chemical Resistant Lining:

1. General Note: The Contractor is advised that with all thick-film, quick curing materials applied to concrete surfaces, outgassing of the concrete can occur. Possible remedies include applying materials when the temperature of the concrete surfaces are descending, or applying a thin 1/8-inch layer of the specified surfacing material. Other remedies may exist, and may be submitted for the Engineer's approval.

3.09 NONSKID SURFACE AT CONTAINMENT AREAS:

A. Evenly and uniformly broadcast a sufficient quantity of 50 to 90 sieve size silica blasting sand on top of the last top coat before it cures, in order to create a nonskid surface.

B. Sand floor areas for the nonskid surface. After surfaces have cured, vacuum clean excess sand from the areas.

3.10 FIELD QUALITY CONTROL:

A. Sampling of Materials:

1. Engineer reserves right to select unopened containers of materials furnished for project and have materials tested at an independent testing laboratory. Owner will pay for first tests.

2. Retests of rejected materials and tests of replacement materials shall be paid for by Contractor.

3. Remainder of contents of containers not required for testing will be returned to Contractor.

B. Coverage:

1. Before beginning Work, finish one complete room, space surface, or item of each color scheme required, showing selected colors, finished texture, material, and workmanship. After approval, sample rooms or items shall serve as standard for similar Work throughout building.

2. If coverage is not acceptable to Engineer, Engineer reserves right to require extra application of paint at no extra cost to Owner.

3. Work at site where coat of material is applied will be inspected by Engineer before application of succeeding specified coat, otherwise no credit for coat applied will be given and Contractor automatically assumes responsibility to recoat Work in question. Furnish Engineer report of particular coat applied and when completed for inspection to comply with above.

3.11 CONTRACT CLOSEOUT:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

DIVISION 10

SPECIALTIES

Page Intentionally Left Blank

SECTION 10 14 00

SIGNAGE

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide general information, products, and execution for signage as indicated and in compliance with Contract Documents.

1.02 REFERENCES:

A. American National Standards Institute (ANSI):

1. A117.1: Accessible and Usable Buildings and Facilities.

B. American Architectural Manufacturers Association (AAMA):

1. 611: Voluntary Specification for Anodized Architectural Aluminum

1.03 DEFINITIONS:

A. Accessible: In accordance with the ICC/ANSI A117.1-2009 American.

1.04 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Warranty documentation as specified in Section 01 61 00.

C. Submit the following as specified in Section 01 33 00.

1. Product Data: For each type of product.

2. Shop Drawings:

a. Include fabrication and installation details and attachments to other Work.

b. Show sign mounting heights, locations of supplementary supports to be provided by others, and accessories.

c. Show message list, typestyles, graphic elements, including raised characters and Braille, and layout for each sign at least half size.

3. Samples for Verification: For each type of sign assembly showing all components and with the required finish(es), in Manufacturer's standard size unless otherwise indicated and as follows:

   a. Interior signs: Full-size sample

   b. Dimensional letters: Full-size sample.

4. Sign Schedule: Use same designations specified or as shown on the Drawings in a sign schedule.

5. Qualification Data: For installer and Manufacturer.

6. Sample Warranty: For special warranty.

7. Maintenance Data: For signs to include in maintenance manuals.

D. Sustainable Design Submittals:

1. As specified in Section 01 81 13.01.

E. O&M data requirements as specified in Section 01 78 23.

1.05 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.06 SPARE PARTS:

A. Comply with the requirements specified in Section 01 61 00.

1.07 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

B. Installer Qualifications: An entity that employs installers and supervisors who are trained and approved by Manufacturer.

C. Thermal Movements: For exterior signs, allow for thermal movements from ambient and surface temperature changes.

D. Temperature Change: 180 degrees F, material surfaces.

E. Accessibility Standard: In accordance with applicable provisions in the U.S. Architectural & Transportation Barriers Compliance Board's ADA-ABA Accessibility Guidelines for Buildings and Facilities and ICC A117.1 for signs.

1.08 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

1. Package signs, labeled in name groups.

2. Store adhesive attachment tape at ambient room temperatures.

1.09 PROJECT/SITE CONDITIONS:

A. Field Measurements: Verify locations of anchorage devices and electrical service embedded in permanent construction by other installers by field measurements before fabrication, and indicate measurements on shop Drawings.

B. Do not install signs when ambient temperature is lower than recommended by Manufacturer.

C. Maintain this minimum during and after installation of signs.

1.10 COORDINATION:

A. Furnish templates for placement of sign-anchorage devices embedded in permanent construction by other installers.

B. Furnish templates for placement of electrical service embedded in permanent construction by other installers

1.11 WARRANTY:

A. Warranty requirements as specified in Section 01 78 36. Specific requirements in addition to Section 01 78 36 shall be:

1. Special Warranty: Manufacturer agrees to repair or replace components of signs that fail in materials or workmanship within specified warranty period.

a. Failures include, but are not limited to, the following:

(1) Deterioration of finishes beyond normal weathering.

(2) Deterioration of embedded graphic image.

(3) Separation or delamination of sheet materials and components.

b. Warranty Period: Five years from date of substantial completion.

PART 2 - PRODUCTS

2.01 MANUFACTURERS:

A. Exterior and Interior Signs:

1. ASI Sign Systems, Inc.

2. Mohawk Sign Systems

B. Dimensional Letters and Numbers:

1. A.R.K. Ramos

2. ASI Sign Systems, Inc.

3. Metal Arts; Div of L&H Mfg

4. Signature Sign Signs, Inc.

C. Hazardous Material Signs:

1. Brady Signmark

2. Emedco

D. Fire Extinguisher Signs:

1. Accuform

2. Brady Corporation

3. Emedco

2.02 MATERIALS:

A. Sustainable Design Product Requirements:

1. As specified in Section 01 81 13.01.

2. ISI Envision:

a. Sustainable procurement practices (RA1.2): Maximize the procurement of materials that follow sustainable procurement practices.

b. Recycled materials (RA1.3): Maximize the procurement of materials with recycled content.

c. Locally sourced materials (RA1.4): Maximize the procurement of materials within the radius as specified in Section 01 81 13.01.

B. Panel-Sign Materials:

1. Aluminum sheet and plate: ASTM B209, alloy and temper recommended by aluminum producer and finisher for type of use and finish required

2. Aluminum extrusions: ASTM B221, alloy and temper recommended by aluminum producer and finisher for type of use and finish required.

3. Acrylic sheet: ASTM D4802, category as standard with Manufacturer for each sign, Type UVF (UV filtering).

4. Plastic-laminate sheet: NEMA LD 3, general-purpose HGS Grade, 0.048-inches nominal thickness.

5. Vinyl film: UV-resistant vinyl film of nominal thickness required, with pressure-sensitive, permanent adhesive on back; die cut to form characters or images as required and suitable for exterior applications.

2.03 COMPONENTS:

A. Interior Signs:

1. Type: One-piece melamine plastic laminate with contrasting color core, non-static, fire retardant, self-extinguishing, matte finish.

2. Thickness: 1/8-inches.

3. Tactile characters/symbols raised 1/32-inches from the sign plate face.

4. Braille: Text shall be accompanied by Grade 2 Braille.

5. Character color: To be selected from Manufacturer's full color range.

6. Background color: To be selected from the Manufacturer's full color range.

7. Characters – Restroom Signs:

a. Height: 5/8-inches

b. Style: As shown on Drawings

c. Width to height ratio: As shown on Drawings

d. Stroke width to height ratio: As shown on Drawings

8. Characters – Room Signs:

    a. Height: 5/8-inches

    b. Style: As shown on Drawings

    c. Width to height ratio: As shown on Drawings

    d. Stroke width to height ratio: As shown on Drawings

9. Character placement: Centered.

10. Corners: Square.

11. Edges: Square.

12. Border: 3/8-inches wide.

13. Use: In accordance with the Contract Documents.

B. Hazardous Material Signals:

1. In accordance with NFPA 704.

2. Material: Reflective sheeting applied to 0.040-inches thick aluminum.

3. Background, letters, and numbers: Die cut vinyl with pressure-sensitive adhesive.

4. Use: In accordance with the Contract Documents.

C. Emergency Eye Wash and Shower Signs:

1. Material: Reflective sheeting applied to 0.060-inches thick aluminum plate.

2. Reflective sheeting: Type 1, tested in accordance with ASTM D4956.

3. Character color: To be selected from the Manufacturer's full color range.

4. Background color: To be selected from the Manufacturer's full color range. Profile: Rounded corners with 3/16-inches mounting holes.

5. Use: In accordance with the Contract Documents.

6. Size: As shown on the Drawings.

D. Confine Space Signs:

1. Material: Reflective sheeting applied to 0.060-inches thick aluminum plate.

2. Reflective sheeting: Type 1, tested in accordance with ASTM D4956.

3. Character color: To be selected from the Manufacturer's full color range.

4. Background color: To be selected from the Manufacturer's full color range. Profile: Rounded corners with 3/16-inches mounting holes.

5. Use: In accordance with the Contract Documents.

6. Size: As shown on the Drawings.

E. Dimensional Numbers:

1. Waterjet cut characters with smooth flat faces, sharp corners, and formed lines and profiles, free from pits, scale, holes or other defects. Construct to receive mounting studs.

2. Material: Aluminum 5052 Alloy, 1/2-inches thick.

3. Finish: Painted face and returns, letters sprayed with acrylic polyurethane baked semi-gloss finish, 1.75 mils nominal thickness.

   a. Color: Custom color to match sample provided by Engineer.

4. Letter style: Letters to be twentieth century font, 18 inches high on exterior building identification numbers.

5. Text: As shown on the Drawings.

F. Exterior Signs:

1. Material: Reflective sheeting applied to 0.060-inches thick aluminum plate.

2. Reflective sheeting: Type 1, tested in accordance with ASTM D4956.

3. Character color: To be selected from the Manufacturer's full color range.

4. Background color: To be selected from the Manufacturer's full color range. Profile: Rounded corners with 3/16-inches mounting holes.

5. Use: In accordance with the Contract Documents.

6. Size: As shown on the Drawings.

7. Text: As shown on the Drawings. To be approved by Engineer.

8. Transportation control and regulation signs: In accordance with MUTCD, latest edition.

G. Fire Extinguisher Signs:

1. Material: 0.040-inches thick aluminum plate

2. Size: As shown on Drawings

3. Character color: White

4. Background color: Red

5. Text: FIRE EXTINGUISHER

6. Use: In accordance with the Contract Documents

2.04 FABRICATION:

A. Regional Materials: Panel signs shall be manufactured within 500 miles of Project site.

B. General: Provide Manufacturer's standard sign assemblies in accordance with requirements specified in this Section.

1. Preassemble signs and assemblies in the shop to greatest extent possible. Disassemble signs and assemblies only as necessary for shipping and handling limitations. Clearly mark units for reassembly and installation; apply markings in locations concealed from view after final assembly.

2. Mill joints to a tight, hairline fit. Form assemblies and joints exposed to weather to resist water penetration and retention.

3. In accordance with AWS for recommended practices in welding and brazing. Provide welds and brazes behind finished surfaces without distorting or discoloring exposed side. Clean exposed welded and brazed connections of flux, and dress exposed and contact surfaces.

4. Conceal connections if possible; otherwise, locate connections where they are inconspicuous.

5. Internally brace signs for stability and for securing fasteners.

6. Provide rebates, lugs, and brackets necessary to assemble components and to attach to existing Work. Drill and tap for required fasteners. Use concealed fasteners where possible; use exposed fasteners that match sign finish.

C. Surface-Engraved Graphics: Machine engrave characters and other graphic devices into panel surface as shown on the Drawings to produce precisely formed copy, incised to uniform depth.

1. Engraved metal: Fill engraved graphics with Manufacturer's standard baked enamel.

2. Engraved opaque acrylic sheet: Fill engraved graphics with Manufacturer's standard enamel.

3. Face-engraved clear acrylic sheet: Fill engraved copy with Manufacturer's standard enamel. Apply Manufacturer's standard opaque background color coating to back face of acrylic sheet.

D. Shop- and Subsurface-Applied Vinyl: Align vinyl film in final position and apply to surface. Firmly press film from the middle outward to obtain good bond without blisters or fishmouths.

E. Brackets: Fabricate brackets, fittings, and hardware for bracket-mounted signs to suit sign construction and mounting conditions as shown on the Drawings. Modify Manufacturer's standard brackets as required.

1. Aluminum brackets: Factory finish brackets with baked-enamel or powder-coat finish to match sign-background color unless otherwise indicated.

F. Dimensional Letters and Numbers:

1. Fabricated characters: Fabricate letters and numbers to required sizes and styles, using metals and thicknesses as shown on the Drawings. Form exposed faces and sides of characters to produce surfaces free from warp and distortion. Include internal bracing for stability and attachment of mounting accessories in accordance with requirements specified for finish, style, and size.

2.05 ACCESSORIES:

A. Fasteners and Anchors: Manufacturer's standard as required for secure anchorage of signage, noncorrosive and compatible with each material joined, and in accordance with the following:

1. Use concealed fasteners and anchors unless indicated to be exposed.

2. For exterior exposure, furnish nonferrous-metal devices unless otherwise indicated.

3. Exposed metal-fastener components, general:

a. Fabricated from same basic metal and finish of fastened metal unless otherwise indicated.

b. Fastener Heads: For nonstructural connections, use flathead or oval countersunk screws and bolts with tamper-resistant Allen-head spanner-head or one-way-head slots unless otherwise indicated.

4. Sign Mounting Fasteners:

a. Concealed studs: Concealed (blind), threaded studs welded or brazed to back of sign material or screwed into back of sign assembly, unless otherwise indicated.

5. Inserts: Furnish inserts to be set by other trades into concrete or masonry Work.

2.06 FINISHES:

A. General Finish Requirements:

1. Protect mechanical finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipping.

2. Appearance of finished Work: Noticeable variations in same piece are not acceptable. Variations in appearance of adjoining components are acceptable if they are within the range of accepted Samples and are assembled or installed to minimize contrast.

3. Directional finishes: Run grain with long dimension of each piece and perpendicular to long dimension of finished trim or border surface unless otherwise indicated.

4. Organic, anodic, and chemically produced finishes: Apply to formed metal after fabrication but before applying contrasting polished finishes on raised features unless otherwise indicated.

PART 3 - EXECUTION

3.01 PREPARATION:

A. Examine substrates, areas, and conditions, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of signage Work.

B. Verify that sign-support surfaces are within tolerances to accommodate signs without gaps or irregularities between backs of signs and support surfaces unless otherwise indicated.

C. Verify that anchor inserts are correctly sized and located to accommodate signs.

D. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 INSTALLATION:

A. General: Install signs using mounting methods as shown on the Drawings and in accordance with Manufacturer's written instructions.

1. Notify Engineer in writing of sign installation at least 21 days in advance. Engineer will assign exact location for each sign.

2. Install signs level, plumb, true to line, and at locations and heights as shown on the Drawings, with sign surfaces free of distortion and other defects in appearance.

3. Install signs so they do not protrude or obstruct in accordance with the accessibility standard.

4. Before installation, verify that sign surfaces are clean and free of materials or debris that would impair installation.

5. Corrosion protection: Coat concealed surfaces of exterior aluminum in contact with grout, concrete, masonry, wood, or dissimilar metals, with a heavy coat of bituminous paint.

B. Room-Identification Signs and Other Accessible Signage: Install in locations on walls as shown on the Drawings.

C. Mounting Methods:

1. Concealed studs: Using a template, drill holes in substrate aligning with studs on back of sign. Remove loose debris from hole and substrate surface.

a. Masonry Substrates: Fill holes with adhesive. Leave recess space in hole for displaced adhesive. Place sign in position and push until flush to surface, embedding studs in holes. Temporarily support sign in position until adhesive fully sets.

b. Thin or hollow surfaces: Place sign in position and flush to surface, install washers and nuts on studs projecting through opposite side of surface, and tighten.

2. Through fasteners: Drill holes in substrate using predrilled holes in sign as template. Countersink holes in sign if required. Place sign in position and flush to surface. Install through fasteners and tighten.

3. Brackets: Remove loose debris from substrate surface and install backbar or bracket supports in position so that signage is correctly located and aligned.

4. Adhesive: Clean bond-breaking materials from substrate surface and remove loose debris. Apply linear beads or spots of adhesive symmetrically to back of sign and of suitable quantity to support weight of sign after cure without slippage. Keep

adhesive away from edges to prevent adhesive extrusion as sign is applied and to prevent visibility of cured adhesive at sign edges. Place sign in position, and push to engage adhesive. Temporarily support sign in position until adhesive fully sets.

D. Field-Applied, Vinyl-Character Signs: Clean and dry substrate. Align sign characters in final position before removing release liner. Remove release liner in stages, and apply and firmly press characters into final position. Press from the middle outward to obtain good bond without blisters or fishmouths. Remove carrier film without disturbing applied vinyl film.

E. Signs Mounted on Glass: Provide opaque sheet matching sign material and finish onto opposite side of glass to conceal back of sign.

3.03 REPAIR/RESTORATION:

A. Remove and replace damaged or deformed signs and signs that do not in accordance with specified requirements. Replace signs with damaged or deteriorated finishes or components that cannot be successfully repaired by finish touchup or similar minor repair procedures.

3.04 CLEANING:

A. Remove temporary protective coverings and strippable films as signs are installed.

B. On completion of installation, clean exposed surfaces of signs in accordance with Manufacturer's written instructions, and touch up minor nicks and abrasions in finish. Maintain signs in a clean condition during construction and protect from damage until acceptance by Owner.

3.05 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

Page Intentionally Left Blank

SECTION 10 28 13

TOILET ACCESSORIES

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide toilet accessories as indicated and in compliance with Contract Documents.

1.02 REFERENCES:

A. ASTM International (ASTM):

1. A666: Standard Specification for Annealed or Cold-Worked Austenitic Stainless Steel Sheet, Strip, Plate, and Flat Bar

2. A1008: Standard Specification for Steel, Sheet, Cold-Rolled, Carbon, Structural, High-Strength Low-Alloy, High-Strength Low-Alloy with Improved Formability, Solution Hardened, and Bake Hardenable

3. B456: Standard Specification for Electrodeposited Coatings of Copper Plus Nickel Plus Chromium and Nickel Plus Chromium

4. C1503: Standard Specification for Silvered Flat Glass Mirror

5. F446: Standard Practice for Conducting Force Controlled Constant Amplitude Axial Fatigue Tests of Metallic Materials

B. Business + Institutional Furniture Manufacturers Association (BIFMA)

1. M7.1: Standard Test Method for Determining VOC Emissions

2. e3: Furniture Sustainability Standard

C. California Air Resources Board (CARB):

1. 2007: Suggested Control Measure for Architectural Coatings

D. California Department of Public Health (CDPH):

1. Standard Method v1.1: Standard Method for the Testing & Evaluation of VOC Emissions

E. Institute for Sustainable Infrastructure (ISI):

1. Envision – v3

F. National Fire Protection Association (NFPA):

1. 70: National Electrical Code

G. South Coast Air Quality Management District (SCAQMD):

1. Rule 1113: Architectural Coatings

2. Rule 1168: Adhesive and Sealant Applications

1.03 COORDINATION:

A. Coordinate accessory locations with other Work to prevent interference with clearances required for access by people with disabilities, and for proper installation, adjustment, operation, cleaning, and servicing of accessories.

B. Deliver inserts and anchoring devices set into concrete or masonry as required to prevent delaying the Work.

1.04 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Warranty documentation as specified in Section 01 61 00.

C. O&M documentation as specified in Section 01 78 23.

D. Submittals:

1. Product data – For each type of product.

a. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes

b. Include anchoring and mounting requirements, including requirements for cutouts in other Work and substrate preparation

c. Include electrical characteristics

2. Samples: Full size, for each exposed product and for each finish specified

a. Approved full-size Samples will be returned and may be used in the Work.

b. Product schedule: Indicating types, quantities, sizes, and installation locations by room of each accessory required.

(1) Identify locations using room designations as shown on the Drawings.

(2) Identify accessories using designations as shown on the Drawings.

E. Informational Submittals:

1. Sample warranty: For manufacturer's special warranty

F. Closeout Submittals:

1. Maintenance data: For accessories to include in maintenance manuals

G. Sustainable Design Submittals:

1. As specified in Section 01 81 13.01.

H. O&M Special Requirements:

1. O&M data requirements as specified in Section 01 78 23.

1.05 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.06 SPARE PARTS:

A. Comply with the requirements specified in Section 01 61 00.

1.07 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

B. Provide electrical components, devices, and accessories listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

1.08 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

1.09 WARRANTY:

A. Warranty requirements as specified in Section 01 78 36. Specific requirements in addition to these sections shall be:

1. Manufacturer's special warranty for mirrors: Manufacturer agrees to repair or replace mirrors that fail in materials or workmanship within specified warranty period.

a. Failures include, but are not limited to, visible silver spoilage defects

b. Warranty period: 15 years from date of substantial completion

PART 2 - PRODUCTS

2.01 MANUFACTURERS:

A. Manufacturers:

1. A & J Washroom Accessories, Inc.

2. American Specialties, Inc.

3. Bobrick Washroom Equipment, Inc.

4. Bradley Corporation

5. GAMCO Specialty Accessories; a division of Bobrick Washroom Equipment, Inc.

B. Source Limitations: Obtain public-use washroom accessories from single manufacturer.

2.02 MATERIALS:

A. Sustainable Design Product Requirements:

1. As specified in Section 01 81 13.01.

2. ISI Envision:

a. Support sustainable procurement practices (RA1.1): Maximize the procurement of materials that follow sustainable procurement practices.

b. Use recycled materials (RA1.2): Maximize the procurement of materials with recycled content.

B. Stainless Steel: ASTM A666, Type 304, 0.031-inches minimum nominal thickness unless otherwise indicated.

C. Steel Sheet: ASTM A1008, Designation CS (cold rolled, commercial steel), 0.036-inches minimum nominal thickness.

D. Fasteners: Screws, bolts, and other devices of same material as accessory unit and tamper-and-theft resistant where exposed, and of galvanized steel where concealed.

E. Chrome Plating: ASTM B456, Service Condition Number SC 2 (moderate service).

F. Mirrors: ASTM C1503, Mirror Glazing Quality, clear-glass mirrors, nominal 6.0 mm thick.

2.03 COMPONENTS:

A. Washroom Accessories:

1. Toilet Tissue (Roll) Dispenser:

a. Basis of Design Product: Bobrick B-2892

b. Mounting: Surface mounted

c. Operation: Holder accommodates two standard-core toilet tissue rolls for non-controlled delivery. Tumbler lock secures spindles in place; spindles can only be removed after unlocking with furnished key.

d. Capacity: Designed for two standard 6-inches diameter tissue rolls.

e. Material and finish: Satin-finish cast aluminum bracket with molded high impact plastic spindles.

2. Paper Towel Dispenser and Trash Receptacle:

a. Basis of Design Product: Bobrick B-3699

b. Mounting: Surface mounted

c. Minimum towel-dispenser capacity: 350 C-fold or 475 multifold towels

d. Material and finish: Stainless steel, No. 4 finish (satin)

e. Lockset: Tumbler type

f. Waste receptacle: Removable stainless steel container with hemmed top edges

g. Minimum waste-receptacle capacity: 2 gallons

3. Soap Dispenser (wall mounted):

a. Basis of Design Product: Bobrick B-2112

b. Description: Body to be 0.0312-inches thick stainless steel of drawn one-piece seamless construction, with a locked, hinged stainless steel lid for refilling, satin finish.

c. Mounting: Vertically oriented, surface mounted with concealed mounting bracket and wall plate.

d. Capacity: 40 fluid ounces

e. Valve: Black molded plastic push button and spout

f. Operation: Piston pressed down to dispense soap, refill accomplished by removal of piston, spout, and supply assembly from top, or removing container from bottom of assembly.

g. Locking; escutcheon locks to body with concealed locking mechanism opened with key provided.

4. Grab Bar:

a. Basis of Design Product: Bobrick B-5800 Series

b. Mounting: Flanges with concealed fasteners

c. Materials:

(1) Grab bars: Stainless steel, 0.05-inches thick tubing

(2) Concealed mounting flanges: Stainless steel, 0.125-inches thick plate.

(3) Snap flange covers: Stainless steel, 0.031-inches thick plate.

d. Finish: Smooth, No. 4 finish (satin) on ends and slip-resistant texture in grip area.

e. Outside diameter: 1 1/2-inches

f. Configuration and length: As shown on Drawings

(1) Water closet types: Provide one of each at each accessible water closet stall.

(a) 42-inches horizontal at side wall

(b) 36-inches horizontal at back wall

(c) 18-inches vertical bar at side wall

5. Sanitary Napkin and Tampon Dispenser:

a. Basis of Design Product: Bobrick B-2706 25

b. Mounting: Surface mounted

c. Capacity: 30 tampons and 20 napkins

d. Operation: Single coin (25 cents)

e. Exposed Material and Finish: Stainless steel, No. 4 finish (satin)

f. Lockset: Tumbler type with separate lock and key for coin box

6. Sanitary Napkin Disposal:

a. Basis of Design Product: Bobrick B-245

b. Mounting: Surface mounted

c. Door or cover: Self-closing, top disposal-opening cover and container with integral finger depression for opening cover

d. Material and finish: Stainless steel, No. 4 finish (satin) with all welded construction with radiused face and corners.

(1) Container: Stainless steel, 0.0312-inches thick plate

(2) Cover: Stainless steel, 0.031-inches thick plate. Drawn seamless construction and secured to container with full length stainless steel piano hinge.

7. Glass Mirror:

a. Basis of Design Product: Bobrick B-292 2436

b. Frame: Stainless-steel angle, 0.05-inches thick with galvanized steel back

c. Corners: Manufacturer's standard

d. Integral shelf: Stainless-steel, 0.05-inches thick, 4-inches deep

e. Hangers: Produce rigid, tamper- and theft-resistant installation, using method indicated below.

(1) One-piece, galvanized-steel, wall-hanger device with spring-action locking mechanism to hold mirror unit in position with no exposed screws or bolts.

(2) Wall bracket of galvanized steel, equipped with concealed locking devices requiring a special tool to remove.

8. Toilet Seat Cover Dispenser

a. Basis of Design Product: Bobrick B-4221

b. Satin-finish stainless steel

c. Dispenses 250 single or half fold toilet seat covers or one box

d. Fills from bottom

B. Custodial Accessories:

1. Mop and Broom Holder with Utility Shelf:

a. Basis of Design Product: Bobrick B-239 x 34

b. Description: Unit with shelf, hooks, holders, suspended beneath shelf. Stainless steel shelf with exposed edges turned down not less than 1/2-inches and supported by two triangular brackets welded to shelf underside.

c. Length: 34-inches

d. Hooks: Four

e. Mop/Broom holders: Three, spring-loaded, rubber hat, cam type

f. Material and finish: Stainless steel, No. 4 finish (satin)

(1) Shelf: Not less than nominal 0.05-inches thick stainless steel

2.04 FABRICATION:

A. General: Fabricate units with tight seams and joints, and exposed edges rolled. Hang doors and access panels with full- length, continuous hinges. Equip units for concealed anchorage and with corrosion-resistant backing plates.

B. Keys: Provide universal keys for internal access to accessories for servicing and resupplying. Provide minimum of six keys to Owner's representative.

PART 3 - EXECUTION

3.01 ERECTION/INSTALLATION/APPLICATION:

A. Install accessories in accordance with Manufacturers' written instructions, using fasteners appropriate to substrate indicated and recommended by the Unit Manufacturer. Install units level, plumb, and firmly anchored in locations and at heights as shown on the Drawings.

B. Grab Bars: Install to withstand a downward load of at least 250 lbf, when tested in accordance with ASTM F446.

3.02 CLEANING:

A. Remove temporary labels and protective coatings.

B. Clean and polish exposed surfaces in accordance with Manufacturer's written instructions.

3.03 ADJUSTING:

A. Adjust accessories for unencumbered, smooth operation. Replace damaged or defective items.

3.04 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

Page Intentionally Left Blank

SECTION 10 40 00

FIREFIGHTING EQUIPMENT

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide firefighting equipment as indicated and in compliance with Contract Documents.

1. Section includes:

a. Firefighting Equipment

(1) Portable hand-carried fire extinguishers

(2) Fire extinguisher mounting brackets

1.02 REFERENCES:

A. Aluminum Association (AA):

D. ASTM International (ASTM):

1. A666: Standard Specification for Annealed or Cold-Worked Austenitic Stainless Steel Sheet, Strip, Plate, and Flat Bar.

2. A1008: Standard Specification for Steel, Sheet, Cold-Rolled, Carbon, Structural, High-Strength Low-Alloy, High-Strength Low-Alloy with Improved Formability, Solution Hardened, and Bake Hardenable.

3. B36: Standard Specification for Brass Plate, Sheet, Strip, And Rolled Bar

4. B209: Standard Specification for Aluminum and Aluminum-Alloy Sheet and Plate

5. B221: Standard Specification for Aluminum and Aluminum-Alloy Extruded Bars, Rods, Wire, Profiles, and Tubes.

6. C1036: Standard Specification for Flat Glass

7. C1048: Standard Specification for Heat-Treated Flat Glass - Kind HS, Kind FT Coated and Uncoated Glass

8. D4802: Standard Specification for Poly(Methyl Methacrylate) Acrylic Plastic Sheet

9. E814: Standard Test Method for Fire Tests of Penetration Firestop Systems

E. National Association of Architectural Metal Manufacturers (NAAMM):

1. Metal Finishes Manual for Architectural and Metal Products.

F. National Fire Protection Association (NFPA):

1. 10: Portable Fire Extinguishers

G. The Society for Protective Coatings (SSPC):

1. SP5: White Metal Blast Cleaning

2. SP8: Pickling

1.03 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

1. Submit manufacturer's product data, shop drawings, catalogs and brochures for all items specified.

2. Fire Extinguishers: Include rating and classification.

3. Submit manufacturer's installation instructions.

1.04 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.05 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

B. Regulatory Requirements: Provide equipment in accordance with federal, state, and local safety codes. Provide revisions or additions to equipment necessitated by such codes at no additional cost.

C. Source Limitations: Obtain fire extinguishers and fire-protection cabinets through one source from a single manufacturer.

D. NFPA Compliance: Fabricate and label fire extinguishers to comply with NFPA 10 "Portable Fire extinguishers."

E. Fire Extinguishers: Listed and labeled for type, rating, and classification by an independent testing agency acceptable to authorities having jurisdiction.

1. Provide fire extinguishers approved, listed, and labeled by FMG.

1.06 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

B. Deliver equipment in manufacturer's original unopened and undamaged packages.

C. Clearly identify manufacturer, brand name, contents, stock number and order number on each package. Damaged packages that may affect conditions of contents are not acceptable.

D. Store in original packaging under protective cover and protect from damage. Stack containers in accordance with manufacturer's recommendations.

E. Handle equipment in manner to prevent damage to products and finishes.

1.07 WARRANTY:

A. Comply with general requirements specified in Section 01 78 36.

B. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components of portable fire extinguishers that fail in materials or workmanship within specified warranty period.

1. Failures include, but are not limited to, following:

a. Failure of hydrostatic test according to NFPA 10.

b. Faulty operation of valves or release levers.

2. Warranty Period: Six years from date of Substantial Completion.

PART 2 - PRODUCTS

2.01 GENERAL:

A. Use of manufacturer’s name and model or catalog number for purpose of establishing standard of quality and general configuration only. Model numbers listed reference to first manufacturer listed.

B. Fabricate, assemble, erect, and place in operating condition in conformance with drawings, specifications, engineering data, instructions, approved submittals, and recommendations of equipment manufacturer.

2.02 FIREFIGHTING EQUIPMENT:

A. Portable Hand-Carried Fire Extinguishers:

1. Fire Extinguishers: Type, size, and capacity for each fire protection cabinet and mounting bracket indicated.

a. Manufacturers:

(1) Badger Fire Protection; a Kidde company

(2) Buckeye Fire Equipment Company

(3) J. L. Industries, Inc.; a division of Activar Construction Products Group

b. Valves: Manufacturer's standard.

c. Handles and Levers: Stainless steel.

d. Instruction Labels: Include pictorial marking system complying with NFPA 10, Appendix B and bar coding for documenting fire extinguisher location, inspections, maintenance, and recharging.

2. Multipurpose Dry-Chemical Type in Aluminum Container: 4-A:60-B:C, 10-lb with monoammonium phosphate-based dry chemical in enameled-aluminum container.

B. Fire Extinguisher Mounting Brackets:

1. Mounting Brackets: Manufacturer's standard galvanized steel, designed to secure fire extinguisher to wall or structure, of sizes required for types and capacities of fire extinguishers indicated, with plated or red baked-enamel finish.

2. Manufacturers:

a. Badger Fire Protection; a Kidde company

b. Buckeye Fire Equipment Company

c. J. L. Industries, Inc.; a Division of Activar Construction Products Group

3. Identification: Lettering complying with authorities having jurisdiction for letter style, size, spacing, and location. Locate as indicated by Engineer.

a. Identify bracket-mounted fire extinguishers with the words "FIRE EXTINGUISHER" in red letter decals applied to mounting surface.

(1) Orientation: Vertical

PART 3 - EXECUTION

3.01 EXAMINATION:

A. Examine firefighting equipment for proper charging and tagging.

1. Remove and replace damaged, defective, or undercharged fire extinguishers.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 FIRE EXTINGUISHER INSTALLATION:

A. General: Install fire extinguishers and mounting brackets in locations indicated and in compliance with requirements of authorities having jurisdiction.

B. Mounting Brackets:

1. 54 inches above finished floor to top of fire extinguisher.

2. Fasten mounting brackets to surfaces, square and plumb, at locations indicated.

3.03 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

DIVISION 13

SPECIAL CONSTRUCTION

Page Intentionally Left Blank

SECTION 13 12 41

EQUIPMENT ENCLOSURES

PART 1 GENERAL

1.01 DESCRIPTION:

A. Section Includes:

1. Fiberglass reinforced plastic (FRP) custom equipment enclosures.

1.02 QUALITY ASSURANCE

A. Except as modified or supplemented herein, materials and construction methods shall comply with applicable provisions of ASTM C582.

B. Manufacturer Qualifications: Equipment enclosures shall be manufactured and erected by firm with minimum of 3 yrs experience in structures of size and character specified.

C. Equipment enclosures shall be end products of a single manufacturer to achieve standardization for appearance.

1.03 SYSTEM DESCRIPTION

A. Design Requirements:

1. Equipment enclosure shall be clear span, designed to be self-supporting from periphery structure.

2. Design Loads: See Section 01 41 20 Seismic and Wind Requirements

3. Dimensions: As shown on Drawings.

1.04 SUBMITTALS

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Shop Drawings:

1. Include plans and elevations, design loads, fabrication details indicating laminate thicknesses and panel depths and widths, location of openings, hardware, doors, hinges, door seals, and size and location of anchor bolts.

C. Stamped by Professional Engineer registered in State of Utah.

D. Samples:

1. Color charts and samples of colors available from manufacturer.

1.05 DELIVERY, STORAGE, AND HANDLING

A. Store on manufacturer's site and job site, and protect during shipment to prevent panel warping and fracturing.

1.06 WARRANTY:

A. Provide manufacturer’s standard warranty form in which manufacturer agrees to repair finish or replace components that show evidence of deterioration of factory-applied finishes within specified warranty period.

1. Warranty Period: 2 years from date of Substantial Completion.

PART 2 PRODUCTS

2.01 EQUIPMENT ENCLOSURES

1. Manufacturers:

a. Basis of Design: Customized version of 200-095 Enclosure by Tracom.

b. RM Products Ltd.

2. Chemical-resistant polyester resins containing UV inhibitors capable of withstanding continuous exposure to environment at Project site and during plant operation.

3. Suitable for service in temperature range of -30°F to +120°F.

B. Glass Reinforcing:

1. Combination of chopped strand mat and woven roving, treated with finish compatible to resin being used.

C. Insulation: R 7 insulation minimum.

2.02 ACCESSORIES

A. Concrete Anchors:

1. Stainless steel wedge anchors.

2. Manufacturers:

a. Stud Anchor by Hilti, Inc.

b. Redhead Wedge Anchor by ITT Phillips Drill Division.

c. Rawl Stud by Rawl Plug Company, Inc.

d. Or approved equal.

B. Fasteners: Stainless steel hex bolts, flat washers, and hex nuts of size as determined by manufacturer.

C. Front Doors:

1. Double door with active and inactive leaf constructed of fiberglass over insulation core. Provide surface-mounted bolts at top and bottom of inactive leaf for stainless steel hinges, latch without lock on active leaf. Provide tubular hydraulic closure and safety chain on active leaf.

D. Top Access Door.

1. Leaf constructed of fiberglass over insulation core. Provide surface-mounted bolts at continuous stainless steel piano hinge with latch with lock. Provide tubular hydraulic closure and safety chain.

E. Louvers

1. (4) Fixed, passive screened ventilation louvers

F. Neoprene Gasket:

1. Soft, closed cell, neoprene gasket material.

2. Suitable for exposure to sewage and sewage gases.

3. Thickness shall be as indicated, but in no case less than 1/4 in.

2.03 FABRICATION

A. Construct walls and roof panels from structural system utilizing double fiberglass reinforced polyester skins over insulation; bond to skins to prevent separation.

B. Color: As selected by ENGINEER.

C. Provide fiberglass blocking encased in FRP to anchor doors and windows, and to make panel joints.

D. Provide fiberglass mounting flange around the exterior of the enclosure for drilling and anchoring to concrete.

E. Resin seal cut or drilled laminate edges.

2.04 SOURCE QUALITY CONTROL

A. Loss of bond between insulation and laminate may cause reduction in panel strength and, therefore is cause for rejection.

PART 3 EXECUTION

3.01 EXAMINATION

A. Check slab where equipment enclosure is to be erected to determine if support surface is level and free of depressions or humps exceeding 1/4 in. in 10 ft, which may prevent sealing of base to curb or slab or produce deformation in anchor flange.

B. Do not proceed with erection until deficiencies are corrected.

3.02 INSTALLATION

A. Install buildings at locations indicated on Drawings.

B. Gasket field joints and where building rests on supporting structures. Space bolts at distance to compress gasket between bolts.

C. Use washers against fiberglass surfaces to minimize local stresses.

D. Adjust doors, and hardware to provide free, smooth operation.

END OF SECTION

SECTION 13 34 19

METAL BUILDING SYSTEMS

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide design, materials and erection of metal building(s) on concrete foundations as indicated and in compliance with Contract Documents.

B. Make minor dimensional modifications to the foundations as may be required for the specific building provided. All modifications are subject to the acceptance of the Engineer.

C. The building manufacturer to provide a delegated design submittal for the design of the entire building system including the parts that are specified in other sections.

2. See drawing 0100-S001

3. Society for Protective Coatings Standards

4. Federal, Military, and Commercial Standards

5. ASTM Standards

1.03 ADMINISTRATIVE REQUIREMENTS:

A. Pre-installation Meeting: Prior to erection of framing, conduct pre-installation meeting at site attended by Owner, Engineer, manufacturer's technical representative, inspection agency and related trade contractors.

B. Coordinate work of Division 08 Sections "Plastic Doors and Frames" and "Door Hardware" and openings and penetrations and manufacturer's accessories with installation of metal panels.

1.04 DEFINITIONS:

A. Traditional Metal Building System: Building system using either continuous or simple span "Z" purlins for support of roof covering material.

B. Gable Symmetrical: Continuous frame building with ridge in center of building, consisting of tapered or straight columns and tapered or straight rafters. Sidewall girts may be continuous (by-passing columns) or simple span (flush in column line). Rafters may or may not have interior columns.

C. Roof Slope: Pitch expressed as inches of rise for each 12 inches (305 mm) of horizontal run.

D. Building Eave Height: Nominal dimension measured from finished floor to top flange of eave strut.

E. Building Width: Measured from outside to outside of side wall secondary structural member.

F. Building Length: Measured from outside to outside of end wall secondary structural member.

G. Auxiliary Loads: Dynamic loads induced by cranes, conveyors, or material handling systems.

H. Collateral Loads: Weight of any non-moving equipment or material, such as ceilings, electrical or mechanical equipment, sprinkler systems, plumbing, or ceilings.

I. Dead Load: Actual weight of building system as supplied by manufacturer supported by given member.

J. Floor Live Loads: Loads induced on floor system by building occupants and possessions including but not limited to furniture and equipment.

K. Roof Live Loads: Loads produced by maintenance activities, rain, erection activities, and or movable or moving loads but not including wind, snow, seismic, crane, or dead loads.

L. Roof Snow Loads: Gravity load induced by weight of snow or ice on roof, assumed to act on horizontal projection of roof.

M. Seismic Loads: Loads acting in any direction on structural system due to action of an earthquake.

N. Structural Engineer: Structural Engineer licensed in the State of Utah.

O. Wind Loads: Loads on structure induced by forces of wind blowing from any horizontal direction.

1.05 SYSTEM DESCRIPTION:

A. General: Provide a complete, integrated set of metal building system manufacturer's standard mutually dependent components and assemblies that form a metal building system capable of withstanding structural and other loads, thermally induced movement, and exposure to weather without failure or infiltration of water into building interior. Include primary and secondary framing, metal roof panels, metal wall panels, and accessories complying with requirements indicated.

1. Provide metal building system of size and with spacings, slopes, and spans indicated.

B. Primary Frame Type: Solid-member, structural-framing system without interior columns. Clear Span rigid frame with straight depth column and rafter sections of shop welded steel plates.

C. End-Wall and Side-Wall Framing: Manufacturer's standard, for buildings not required to be expandable, consisting of primary frames, x-braced capable of supporting one-half of a bay design load, and end-wall and side-wall columns.

D. Secondary Frame Type: Manufacturer's standard purlins and exterior-framed girts.

E. Exterior Metal Wall System: Field-assembled, exposed fastener, metal wall panels with continuous rigid foam insulation board, and faced fiberglass insulation.

F. Roof System: Mechanically seamed (double folded), concealed fastener, trapezoidal seam metal roof panels with two layers of fiberglass insulation.

G. Snow guards where indicated on drawings.

1.06 SYSTEM PERFORMANCE REQUIREMENTS

A. Design pre-engineered building in accordance with the specified building code, ASCE 7, the minimum loads shown on the Drawings and these specifications. Where requirements conflict, the more stringent requirement shall apply. Design of structures using MBMA loading combinations alone is unacceptable and will be cause for rejection. Failure to provide a complete listing of support reactions as specified will be cause for rejection. Partial or incomplete submittals will not be reviewed.

B. Design rigid frames as pinned base frames. Provide cross-bracing to resist lateral loads only where indicated on the drawings. Provide pinned base portal frames to resist lateral loads where indicated on the drawings or where cross-bracing is not indicated. Cantilever columns shall not be used.

C. Structural Performance: Provide metal building systems capable of withstanding the effects of gravity loads and the following loads and stresses within limits and under conditions indicated:

1. Design Loads: As required by ASCE 7, "Minimum Design Loads for Buildings and Other Structures" and the International Building Code, 2009 Edition, but not less than the minimum design loads shown on the drawings. Where requirements conflict, the more stringent requirement shall apply.

2. Dead Loads: Dead load shall include weight of building frames, girts, purlins, wall and ceiling panels, insulation, ceilings, liner panels and other building components.

3. Roof Live Loads: Design roof areas for a minimum of 25 psf live load in addition to calculated dead loads. Design roof areas for the appropriate wind and snow loads. Determine ponding effects due to roof deck and framing deflections by rational analysis to assure stability under ponding conditions. Include an additional 10 psf collateral dead load minimum.

4. Roof Snow Loads:

   a. Include vertical loads induced by the weight of snow, but not less than 25 psf. Allow for unbalanced and drift loads.

   b. Consider roof loads resulting from unbalanced snow, drifting and the impact of adjacent structures or obstructions. Consider the additional loading due to rainfall on snow where appropriate.

5. Wind Loads:

   a. Include horizontal loads induced by a basic wind speed (3 second gust) corresponding to 90 mph wind speed.

b. Wall and roof pressures and pressures for the design of components and cladding shall be obtained from ASCE 7-10, but the design wind load shall not be less than that determined by the International Building Code, 2009 Edition.

6. Piping, Equipment and Collateral Loads. Design pre-engineered building and components for the actual piping, duct, conduit and equipment loads to be supported by the member. As a minimum, use a uniform piping load of 10 pounds per square foot of tributary area or a concentrated load of 2000 pounds located at any point along the length of the member, whichever produces the most severe condition.

7. The Pre-engineered Building Manufacturer shall obtain from the Contractor and coordinate information for all additional loads required for the design.

8. Load Combinations: Design metal building systems to withstand the most critical effects of load factors and load combinations as required by ASCE 7, "Minimum Design Loads for Buildings and Other Structures" and the International Building Code, 2009 Edition.

9. Deflection Limits: Engineer assemblies to withstand design loads with total load deflections no greater than the following:

   (1) Purlins and Rafters: Vertical deflection of 1/360 of the span.

   (2) Rigid Frames: Vertical deflection of 1/360 of the span.

   (3) Girts: Horizontal deflection of 1/240 of the span.

   (4) Metal Roof Panels: Vertical deflection of 1/240 of the span.

   (5) Metal Wall Panels: Horizontal deflection of 1/240 of the span.

   (6) Building Lateral drift: Horizontal deflection of 1/60 of the building height.

10. Design secondary framing system to accommodate deflection of primary building structure and construction tolerances, and to maintain clearances at openings.

11. Design wall girts for support of liner panels and attached piping.

12. Provide metal panel assemblies capable of withstanding the effects of loads and stresses indicated, based on testing according to ASTM E 1592.

13. The Pre-engineered Building Manufacturer shall design the roof purlins for lateral loads for the lateral support of the interior masonry partition at the roof and provide any supplemental framing required for this lateral support. Design purlins for a reaction at the top of the partition due to a lateral load of 5 psf acting on the wall.

D. Seismic Performance: Design and engineer metal building systems capable of withstanding the effects of earthquake motions determined in accordance with ASCE 7, "Minimum Design Loads for Buildings and Other Structures", the International Building Code, 2009 Edition, but not less than the minimum earthquake design data shown on the drawings. Where requirements conflict, the more stringent requirement shall apply.

E. Make dimensional modifications to the foundations as may be required for the specific building provided. All modifications are subject to the acceptance of the Engineer. Modifications to building pier and footing sizes based on the column and base plate sizes, anchor bolt locations and design loads submitted by the building manufacturer shall be made at no additional cost to the Owner.

F. The building manufacturer is responsible for the design of the entire building system including the parts that are specified in other sections.

G. The building manufacturer is responsible for designing and providing supplemental supports for support of equipment, mechanical ducts, electrical conduits and process piping from roof and walls.

H. Thermal Movements: Provide metal panel systems that allow for thermal movements resulting from the following maximum change (range) in ambient and surface temperatures by preventing buckling, opening of joints, overstressing of components, failure of joint sealants, failure of connections, and other detrimental effects. Base engineering calculation on surface temperatures of materials due to both solar heat gain and nighttime-sky heat loss.

1. Temperature Change (Range): 120 degrees F, ambient; 180 degrees F, material surfaces.

2. Thermal Performance: Provide metal panel assemblies with the following minimum R-values for opaque elements when tested according to ASTM C 1363 or ASTM C 518. Alternatively, U value methodology in accordance with 2018 IECC Energy Code chapter 4 Table C402.1.4 (U-Factor Method) shall be acceptable in lieu of using the prescriptive value below for R Value. Metal Roof Panel Assemblies:

    a. R-Value: R-19+ R-11 liner system

3. Metal Wall Panel Assemblies:

    a. R-Value: R-13 + R-13ci

I. Air Infiltration for Metal Roof Panels: Air leakage through assembly of not more than 0.07 cfm/sq. ft. (0.36 L/s per sq. m) when tested according to ASTM E 1680 at static-air-pressure difference of 6.24 lbf/sq. ft. (300 Pa).

J. Air Infiltration for Metal Wall Panels: Air leakage through assembly of not more than 0.006 cfm/sq. ft. (0.03 L/s per sq. m) of wall area when tested according to ASTM E 1680 at static-air-pressure difference of 6.24 lbf/sq. ft. (300 Pa).

K. Water Penetration for Metal Roof Panels: No water penetration when tested according to ASTM E 1646 at a static pressure of 12 lbf/sq. ft. (575 Pa).

L. Water Penetration for Metal Wall Panels: No water penetration when tested according to ASTM E 1646 at a static pressure of 20 lbf/sq. ft. (958 Pa).

M. Wind-Uplift Resistance: Provide metal roof panel assemblies that comply with UL 580 for Class 90.

1.07 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

1. Delegated-Design Submittal: For metal building system, including analysis data signed and sealed by the qualified professional engineer responsible for their preparation.

2. Qualifications Statement: For engineer performing delegated design: Licensed in Utah and with a minimum of 2 years engineering metal building systems.

3. Completely detailed shop drawings for all members. Indicate all dimensions, architectural details, connections, openings and lifting devices. Mark each member for identification. Show mark on erection plan and place legibly on member at time of manufacture. Do not fabricate members before shop drawings are accepted by the Engineer.

4. Manufacturer's specifications and product data for all items specified including anchor bolt plans and sizes, locations of primary and secondary framing members and bracing.

5. Drawings of modifications or changes in architectural features or details which are necessitated by design requirements. Make all such modifications without additional compensation.

6. Shop drawings shall include as minimum information:

a. Drawings shall bear the seal and signature of a structural engineer licensed in Utah.

b. Codes to which the design conforms.

c. Span, depth, camber, weight and spacing of building elements.

d. All lateral bracing elements and connections.

e. Building component interface connection bolts and welds.

f. Gravity, wind and seismic design loadings, including concentrated loads and their points of application.

g. Tabulated vertical and horizontal support reactions for each basic load case and for each of the various loading combinations used in the design of the building frame at each support location for use in design verification of foundations. Submittals containing tabulations of only the basic load cases that do not include load combinations will be rejected.

h. Member material specifications, sizes and gages.

i. Bridging member sizes, connections and locations.

j. Roof and wall panel layouts.

k. Door, window, louver and finish hardware schedules.

l. Roof openings, and railings and snow retention system.

m. Show welding in conformance with AISC Detailing Manual, AISC Manual and AWS Structural Welding Code.

n. Submit the welding procedure for each type of weld prior to welding.

o. Qualification test reports bearing witness certification by an independent testing laboratory for each welder, welding operator and tacker to be employed in the work.

p. Mill certificates and copy of reports for all analyses and tests required by referenced ASTM Standard Specifications and AWS Structural Welding Code.

q. Show all piping, electrical and communications penetrations on walls and roof.

7. Manufacturers Qualifications: MBMA Member and AISC Certified Manufacturer.

8. Certificate stating that the surface preparation and shop painting conforms to specifications.

   a. Provide specified shop coatings with type, brand and manufacturer.

   b. Provide paint manufacturer's current printed recommendations and product data sheets for each product used.

c. Provide shop painting applicator's correspondence for determining compatibility of shop coatings with field applied paint coatings and for selecting manufacturer producing field paint coatings.

9. Certificate stating that the zinc coating conforms to the ASTM specified requirements.

10. Manufacturer’s product data, material descriptions, dimensions of individual components and profiles, and finishes for the following:

    a. Roof panels

    b. Wall panels

    c. Wall liner panels

    d. Trim and closures

    e. Doors and frames

    f. Thermal insulation and vapor-retarder facings

    g. Windows

    h. Storefront

    i. Louvers

    j. Skylights

    k. Gutters and downspouts

    l. Roof curbs and flashing

    m. Snow retention system

11. For the following products, in manufacturer’s standard sizes, submit range of color, texture, and pattern variations expected, in the profile and style indicated. Prepare samples from the same material to be used for the Work.

    a. Roof Panels: 12 inches x 12 inches

    b. Wall Panels: 12 inches x 12 inches

B. Submit a comprehensive calculation package for all framing, bracing, and covering components. Calculations shall present codes and standards used, member stress values and associated deflections. Calculations shall be signed and sealed by a professional engineer registered in Utah.

C. Submit a comprehensive loading report package including all foundation reactions as specified in sufficient time to allow 60 calendar days for the Engineer to review the submittal and redesign the foundations, as required, based upon the reactions submitted with the shop drawings. The 60 day period for review and redesign of foundation will not commence until a complete submittal with all of the specified loading combinations and reactions is received. The review and redesign period shall not be a basis for a delay claim, nor shall the delay of the start of the review due to receipt of an incomplete submittal.

D. Provide dimensions of members at all critical points and changes in section.

E. Provide dead loads of all building components (panels, insulation, ceilings, skylights, frames, etc.) used in the design.

F. Provide size, spacing locations and design loads of all anchor bolt groups referenced to the building lines shown on the contract drawings.

G. Provide magnitudes and locations of all piping and equipment loads based upon the actual piping and equipment sizes, content and locations to be installed. Provide this information to the building designer for incorporation into the design of the pre-engineered building.

H. Provide pressure diagrams for all wind loadings considered in the design of the structure.

I. Provide calculated maximum vertical deflections of all primary and secondary members under the various live and wind loads and the maximum deflections under total load. Provide maximum lateral deflections at eaves of all frames in both primary directions.

J. Accessory Drawings: Include details of the following items, at a scale of not less than 1-1/2 inches per 12 inches:

1. Flashing and trim

2. Gutters

3. Downspouts

1.08 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

B. Professional Structural Engineer Qualifications: Structural engineer who is legally qualified to practice in the State of Illinois and who is experienced in providing engineering services of kind indicated.

C. Erector Qualifications: An experienced erector who has specialized in erecting and installing work similar in material, design, and extent to that indicated for this Project and who is acceptable to manufacturer.

D. Manufacturer Qualifications: A qualified manufacturer and member of MBMA.

1. AISC Certification for Category MB: An AISC-Certified Manufacturer that designs and produces metal building systems and components in an AISC-Certified Facility.

2. Engineering Responsibility: Preparation of Shop Drawings and comprehensive engineering analysis by a qualified professional engineer.

E. Source Limitations: Obtain primary metal building system components, including structural framing and metal panel assemblies, through one source from a single manufacturer.

F. Welding: Qualify procedures and personnel according to AWS D1.1, "Structural Welding Code--Steel," and AWS D1.3, "Structural Welding Code--Sheet Steel."

G. Regulatory Requirements: Fabricate and label structural framing to comply with special inspection requirements at point of fabrication for welding and other connections required by authorities having jurisdiction.

H. Structural Steel: Comply with AISC's "Specification for Structural Steel Buildings--Allowable Stress Design, Plastic Design," or AISC's "Load and Resistance Factor Design Specification for Structural Steel Buildings," for design requirements and allowable stresses.

I. Cold-Formed Steel: Comply with AISI's "Specification for the Design of Cold-Formed Steel Structural Members," or AISI's "Load and Resistance Factor Design Specification for Steel Structural Members," for design requirements and allowable stresses.

J. Surface-Burning Characteristics: Provide field-insulated metal panels having thermal insulation and vapor-retarder-facing materials with the following surface-burning characteristics as determined by testing identical products per ASTM E 84 by UL or another testing and inspecting agency acceptable to authorities having jurisdiction:

1. Flame-Spread Index: 25 or less, unless otherwise indicated.

2. Smoke-Developed Index: 450 or less, unless otherwise indicated.

1.09 DELIVERY, STORAGE, AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

B. Deliver components, sheets, panels, and other manufactured items so as not to be damaged or deformed. Package metal panels for protection during transportation and handling. Transport, handle and store materials to protect from weather, rusting, corrosion or other damage.

C. Unload, store, and erect metal panels in a manner to prevent bending, warping, twisting, and surface damage. Store building components off the ground on supports.

D. Stack metal panels horizontally on platforms or pallets, covered with suitable weathertight and ventilated covering. Store metal panels to ensure dryness and with positive slope for drainage of water. Do not store metal panels in contact with other materials that might cause staining, denting, or other surface damage. Cover and protect from snow, rain and ground splatter.

E. Use nylon slings or padded cables for handling material. Do not drop or drag material.

1.10 PROJECT CONDITIONS

A. Weather Limitations: Proceed with installation only when weather conditions permit metal panels to be installed according to manufacturers' written instructions and warranty requirements.

B. Field Measurements:

1. Established Dimensions for Foundations: Comply with established dimensions on approved anchor-bolt plans, establishing foundation dimensions and proceeding with fabricating structural framing without field measurements. Coordinate anchor-bolt installation to ensure that actual anchorage dimensions correspond to established dimensions.

2. Established Dimensions for Metal Panels: Where field measurements cannot be made without delaying the Work, either establish framing and opening dimensions and proceed with fabricating metal panels without field measurements or allow for field trimming metal panels. Coordinate construction to ensure that actual building dimensions, locations of structural members, and openings correspond to established dimensions.

1.11 COORDINATION

A. Coordinate size and location of concrete foundations and casting of anchor-bolt inserts into foundation walls and footings. Concrete, reinforcement, and formwork requirements are specified in Division 03 Section "Cast-in-Place Concrete."

B. Coordinate installation of floor, roof, and wall penetrations.

C. Coordinate metal panel assemblies with rain drainage work, flashing, trim, and construction of supports and other adjoining work to provide a leakproof, secure, and noncorrosive installation.

D. Coordinate installation of all openings per approved shop drawings and requirements specified in Division 08.

1.12 WARRANTY:

A. Special Warranty on Metal Panel Finishes: Manufacturer's standard form in which manufacturer agrees to repair finish or replace metal panels that show evidence of deterioration of factory-applied finishes within specified warranty period.

1. Fluoropolymer Finish: Deterioration includes, but is not limited to, the following:

a. Color fading more than 5 Hunter units when tested according to ASTM D2244.

b. Chalking in excess of a No. 8 rating when tested according to ASTM D4214.

c. Cracking, checking, peeling, or failure of paint to adhere to bare metal.

2. Finish Warranty Period: 20 years from date of Substantial Completion.

B. Special Weathertightness Warranty for Standing-Seam Metal Roof Panels: Manufacturer's standard form in which manufacturer agrees to repair or replace standing-seam, metal roof panel assemblies that fail to remain weathertight, including leaks, within specified warranty period.

1. Warranty Period: 20 years from date of Substantial Completion.

PART 2 - PRODUCTS

2.01 MANUFACTURERS:

A. Basis of Design Manufacturer: Ceco Building Systems (www.cecobuildings.com). Other acceptable manufacturers include:

1. A&S Building Systems.

a. Mesco Building Solutions.

b. Metallic Building Systems.

2. Star Building Systems.

3. Varco-Pruden Buildings; a division of Blue Scope Buildings, North America, Inc.

4. Butler Manufacturing company; a division of Blue Scope Buildings, North America, Inc.

5. American Building Systems.

6. Or Approved Equal.

2.02 PERFORMANCE/DESIGN CRITERIA:

A. Design pre-engineered building in accordance with the specified building code, ASCE 7 and these specifications. Design of structures using MBMA loading combinations alone is unacceptable and will be cause for rejection. Failure to provide a complete listing of support reactions as specified will be cause for rejection. Partial or incomplete submittals will not be reviewed.

B. Design Loads:

1. Loading Combinations: Proportion structures and components for loading combinations and load factors as prescribed in the applicable building code and in the code governing the particular material. As a minimum, the most severe effects of the following load factors and combinations from ASCE 7 shall be considered.

2. The design of the structural system shall be sufficient to resist the following loads in addition to equipment and structure dead load:

a. Dead Loads: Dead load shall include weight of building frames, girts, purlins, wall and ceiling panels, insulation, ceilings, skylights and other building components.

b. Roof Live Loads: Design roof areas for a minimum live load as stated in Structural drawings in addition to calculated dead loads. Design roof areas for the appropriate wind and snow loads. Determine ponding effects due to roof deck and framing deflections by rational analysis to assure stability under ponding conditions.

c. Snow Loads: Design structures for the appropriate snow loads based on location, use, type of structure and roof slope. Unless more severe conditions are warranted, the snow load shall be calculated from the snow criteria stated on Structural Drawings.

d. Consider roof loads resulting from unbalanced snow, drifting and the impact of adjacent structures or obstructions. Consider the additional loading due to rainfall on snow where appropriate.

e. Wind Loads: Determine the design wind pressures by using the appropriate design equations of ASCE 7. See Section 01 41 20 for Wind design criteria.

f. Seismic Loads: Base seismic loads on ASCE 7. Seismic analysis shall be by the Equivalent Lateral Force Analysis Method. Do not use The Simplified Analysis Method. See Section 01 41 20 for Seismic design criteria.

g. Piping and Equipment Loads: Design pre-engineered building and components for the actual piping and equipment loads to be supported by the member. As a minimum, use a uniform collateral load of 10 pounds per square

foot of tributary area or a concentrated load of 1000 pounds located at any point along the length of a primary member and 500 pounds located at any point along the length of a secondary member, whichever produces the most severe condition.

h. Transporting and Handling: Design roof frames for loads resulting from transporting and installation.

C. Reference pre-engineered building columns, anchor bolts and components to the building lines indicated on the contract drawings. Alternate building or reference lines shall not be used and will be cause for rejection.

D. Limit vertical deflections of all elements to 1/240th of the span individually and collectively.

E. Lateral drift of the building (sidesway) shall be limited to H/60 where H is the height of the building.

F. Design rigid frames as pinned base frames. Provide cross-bracing to resist lateral loads only where indicated on the drawings. Provide pinned base portal frames to resist lateral loads only where indicated on the drawings. Cantilever columns shall not be used.

G. The roof coverings shall be designed for the specified live load and the wind load, and shall carry an Underwriters' Laboratories wind uplift Class 90 rating. Deflection of the roof panels shall not exceed 1/180th of its span when supporting these loads.

H. Roof bracing of the IPS building: Bracing cannot occur within the plan extents of the roof skylights so that the skylights can be used for removal of equipment within the building. The building designer shall design all applicable bracing elements to satisfy all loading and deflection requirements stated.

I. The Pre-engineered Building Manufacturer shall obtain from the Contractor and coordinate information for all additional loads required for the design. The contractor shall not construct the foundation until all building load reactions are reviewed and accepted by the Engineer.

2.03 STRUCTURAL FRAMING:

A. Primary and endwall framing, bracing and secondary structural framing shall be the standard of the building manufacturer except as specified herein and indicated on the drawings. Provide bracing system as required at the roof. Provide diagonal rods, single strut, or chevron bracing in walls. Bracing shall not interfere with windows, doors, louvers, or furnishings.

1. Hot-rolled shapes: ASTM A 36 or ASTM A 992, minimum yield of 36 ksi (248 MPa) or 50 ksi (345 MPa).

2. Built-up sections:

    a. Webs:

        (1) ASTM A 1011 or ASTM A1018, SS or HSLAS, Grade 55 (380) for webs 3/16 inch (4.76 mm) thick and thinner.

        (2) ASTM A 572 Grade 50 (340) or ASTM A572 Grade 55 (380) or ASTM A 529 Grade 55 for webs thicker than 3/16 inch (4.76 mm).

    b. Flanges: ASTM A 529 Grade 55 (380) or ASTM A 572 Grade 50 (340) or 55 (380).

3. Round tube: ASTM A 500, Grade B or C with minimum yield strength of 42 ksi (290 MPa).

4. Square and rectangular tube: ASTM A 500, Grade B or C, minimum yield strength of 42 ksi (290 MPa).

5. Cold-formed C sections: ASTM A 1011, Grade 55 (380), or ASTM A 653, Grade 55 (380).

6. X-bracing: ASTM A 529 or A 572 for rod bracing 36 ksi (248 MPa) or 50 ksi (345 MPa), ASTM A 36 for angle bracing or ASTM A 475 for cable bracing.

B. Secondary structural framing: consisting of purlins, girts, braces, supports and accessories shall be rolled formed sections.

1. Purlins, girts, and eave struts: ASTM A 1011 Grade 55 (380), or ASTM A 653, Grade 55 (380).

2. Thickness as required by design. Minimum Uncoated Thickness:

    a. 16 gauge: 0.056 inch (1.421 mm) minimum uncoated thickness.

3. Finish: Gray Shop Coat. Shop coat only intended to provide temporary protection during transportation and erection.

C. Bolts:

1. Rigid Frame Connections: Provide High Strength Bolts, Nuts and Washers:

    a. Bolts: ASTM F 3125 Grade A325 Heavy Hex Structural Type I.

    b. Washers: ASTM F 436 Type 1 Hardened Steel.

c. Nuts: ASTM A 563 Grade C Heavy Hex. Nuts shall be wax coated by emulsion such that the torque required to complete a Rotational Capacity (RC) test shall be reduced by 40% from the un-waxed state.

d. Coating: ASTM F 1941 Electrodeposited Yellow Zinc.

2. Other Connections: Provide High Strength or Machine Bolts as required by manufacturer design:

a. High Strength Bolts and Nuts:

b. Bolts: ASTM F 3125 Grade A325 Heavy Hex Structural Type I.

c. Nuts: ASTM A 563 Grade C Heavy Hex.

d. Coating: ASTM F 1941 Electrodeposited Yellow Zinc.

3. Machine Bolts:

a. Bolts: ASTM A 307 Grade Carbon Steel.

b. Nuts: ASTM A 563 Grade A Hex Nut.

c. Coating: ASTM F 1941 Electrodeposited Clear Zinc.

D. Hot dip galvanize primary and end wall framing in accordance with ASTM A123 and A153. Hot dip galvanize secondary structural framing consisting of purlins, girts, braces and supports in accordance with ASTM A653 with G90 (Z275) coating designation; mill phosphatized.

E. After galvanizing, Shop paint primary and end wall framing, secondary structural framing consisting of purlins, girts braces and supports with system No. 102 per Section 09 91 00 Architectural Painting and Coating.

2.04 METAL WALL PANELS:

A. Material: Aluminum-Zinc-Alloy-Coated Steel Sheet: ASTM A792, structural quality, Grade 50, Coating Class AZ50, prepainted by the coil-coating process per ASTM A755.

B. Large Tapered-Rib-Profile, Exposed Fastener Metal Panels: Structural metal panel consisting of formed metal sheet with trapezoidal major ribs with intermediate stiffening ribs symmetrically placed between major ribs, installed by lapping edges of adjacent panels.

1. Basis of Design: Ceco, PBR Panel.

a. Coverage Width: 36 inches.

b. Major Rib Spacing: 12 inches.

c. Rib Height: 1-1/4 inch.

d. Nominal Coated Thickness: 26 gauge.

e. Panel Surface: Smooth.

2. Exterior Finish: Fluoropolymer Two-Coat System (PVDF): 0.2 – 0.3 mil primer with 0.7 - 0.8 mil 70 percent PVDF fluoropolymer color coat.

a. Signature 300.

3. Color: As selected from manufacturer's standard colors.

2.05 METAL ROOF PANELS

A. Material: Aluminum-Zinc-Alloy-Coated Steel Sheet: ASTM A792, structural quality, Grade 50, Coating Class AZ50, prepainted by the coil-coating process per ASTM A755.

B. Mechanically Seamed, Concealed Fastener, Trapezoidal Seam Metal Roof Panels: Structural metal roof panel consisting of formed metal sheet with raised trapezoidal ribs at panel edges, installed by lapping and mechanically interconnecting edges of adjacent panels, and attaching panels to supports using concealed clips and fasteners in a weathertight installation.

1. Basis of Design: Ceco, Double-Lok.

a. Panel width: 18 inches wide x 3 inches high.

b. Joint Type: Double folded.

c. Thickness: 24 gauge.

d. Roof Slope: 1:12.

2. Exterior Finish: Fluoropolymer Two-Coat System (PVDF): 0.2 – 0.3 mil primer with 0.7 - 0.8 mil 70 percent PVDF fluoropolymer color coat.

a. Signature 300.

3. Color: As selected from manufacturer's standard colors.

2.06 METAL ROOF PANEL ACCESSORIES

A. General: Provide complete metal roof panel assembly incorporating trim, copings, fasciae, gutters and downspouts, and miscellaneous flashings, in manufacturer's standard profiles.

Provide required fasteners, closure strips, splice plates, support plates, and sealants as indicated in manufacturer's written instructions.

B. Flashing and Trim: Match material, thickness, and finish of metal panel face sheet.

C. Closure Strips: Closed-cell, expanded, cellular, rubber or crosslinked, polyolefin-foam or closed-cell laminated polyethylene; minimum 1-inch- (25-mm-) thick, flexible closure strips; cut or premolded to match metal roof panel profile. Provide closure strips where necessary to ensure weathertight construction.

D. Two Piece Floating Clips: ASTM C645, with ASTM A653, G90 hot-dip galvanized zinc coating, configured for concealment in panel joints, and identical to clips utilized in tests demonstrating compliance with performance requirements.

E. Panel Fasteners: Fasteners as recommended by metal panel manufacturer for corrosive environments.

F. Joint Sealers: Manufacturer's standard or recommended liquid and preformed sealers and tapes and as follows:

1. Factory-Applied Seam Sealant: Manufacturer's standard type.

2. Tape Sealers: Manufacturer's standard non-curing butyl tape, AAMA 809.2.

G. Thermal Spacer Blocks: Where metal panels attach directly to purlins, provide thermal spacer blocks of thickness required to provide 1 inch standoff; fabricated from extruded polystyrene

1. Thermal requirements: R-5 minimum.

H. Pipe Penetration Flashing: Approved by metal roof panel manufacturer.

1. Pipe flashing: Formed aluminum membrane-mounting flashing flange and sleeve with collared opening and pressure-sealed conically shaped EPDM protective rubber cap sized for piping indicated on Drawings. Provide stainless-steel snaplock swivel clamps.

I. Snow Guards: Approved by metal roof panel manufacturer.

1. Retention Type: Fence-style snow retention system installed perpendicular to the roofing ribs.

a. Manufacturer: S-5! ColorGard or equal.

b. Color: Finish to match roof system.

J. Eave trim conditions

1. Gutters: Formed from minimum 0.0159-inch- (0.40-mm-) thick, metallic-coated steel sheet or aluminum-zinc alloy-coated steel sheet prepainted with coil coating; finished to match roof fascia and rake trim. Match profile of gable trim, complete with end pieces, outlet tubes, and other special pieces as required. Fabricate in minimum 96-inch- (2438-mm-) long sections, sized according to SMACNA's "Architectural Sheet Metal Manual."

2. Gutter Supports: Fabricated from same material and finish as gutters; spaced 36 inches (900 mm) o.c.

3. Strainers: Bronze, copper, or aluminum wire ball type at outlets.

4. Downspouts: Formed from 0.0159-inch- (0.4-mm-) thick, zinc-coated (galvanized) steel sheet or aluminum-zinc alloy-coated steel sheet prepainted with coil coating; finished to match metal wall panels. Fabricate in minimum 10-foot- long sections, complete with formed elbows and offsets.

2.07 PANEL SEALANTS:

A. Sealant Tape: Pressure-sensitive, 100 percent solids, gray polyisobutylene compound sealant tape with release-paper backing. Provide permanently elastic, non-sag, nontoxic, non-staining tape 1/2 inch wide and 1/8 inch thick.

B. Joint Sealant: ASTM C920; one-part elastomeric polyurethane, polysulfide, or silicone-rubber sealant; of type, grade, class, and use classifications required to seal joints in panels and remain weathertight; and as recommended by metal building system manufacturer.

2.08 INSULATION:

A. Glass-Fiber Blanket: ASTM C991 for flexible fibrous glass insulation for metal buildings, Type I.

1. Manufacturer: Owens Corning; EcoTouch or equal.

a. Roof First Layer: Laminated; Draped over roof purlins.

b. Roof Second Layer: Unfaced; Installed parallel to roof purlins.

c. Wall: Laminated

B. Polyisocyanurate Board: ASTM C1289, Type 1, Class 1.

1. Wall: continuous insulation barrier on exterior face of girts.

C. Polyisocyanurate Board: ASTM C1289, Type 1, Class 1.

1. Wall: continuous insulation barrier on exterior face of girts.

2.09 METAL WALL LINER PANEL:

A. Flush-Profile, Metal Liner Panels Solid panels formed with vertical panel edges and intermediate stiffening ribs symmetrically spaced between panel edges; with flush or overlapping joint between panels; designed for interior side of metal wall panel assemblies and installed by lapping and interconnecting side edges of adjacent panels and mechanically attaching through panel to supports using concealed fasteners and factory-applied sealant in side laps.

B. Material: Zinc-coated (galvanized) or aluminum-zinc alloy-coated steel sheet 0.030-inchnominal uncoated steel thickness.

C. Exterior Finish: Fluoropolymer Two-Coat System (PVDF): 0.2 – 0.3 mil primer with 0.7 - 0.8 mil 70 percent PVDF fluoropolymer color coat.

1. Signature 300.

D. Color: As selected from manufacturer's standard colors.

E. Panel Coverage: 12 inches

F. Panel Height: 1.5 inches

2.10 DOORS, WINDOWS, STOREFRONT, SKYLIGHTS AND LOUVERS:

A. Provide as specified and as shown on the drawings.

2.11 FRAMING FOR OPENINGS:

A. Provide structural steel framing members for doors, windows, storefront, skylights, and louvers. Fabricate the members of structural steel and of sufficient size to support the weight and resulting loads of each item.

B. Provide finish for framing the same as primary and secondary framing.

2.12 ROOF CURBS:

A. Fabricated from minimum 0.0428-inch thick, aluminum-zinc alloy-coated steel sheet pre-painted with coil coating; finished to match metal roof panels; with welded top box and bottom skirt, wood nailer, and integral full-length cricket; capable of withstanding loads of specified skylights and fall protection system of size and height indicated.

1. Curb Sub-framing: Minimum 0.0528-inch thick, angle- C-, or Z-shaped steel sheet.

2. Insulation: 1-inch thick, rigid type.

B. Provide design of, furnish and install roof curbs for roof hatches indicated on drawings. Coordinate to ensure curbs meet requirements to suit the roof hatches to be installed.

2.13 SNOW RETENTION SYSTEM:

A. Manufacturers:

1. S-5 Color Gard manufactured by Metal Roof Innovations, Ltd., Colorado Springs, Co.

B. Description:

1. Aluminum standing seam roof clamps shall be 6061-T6 extruded aluminum conforming to ASTM B221. Carbon steel or plastic parts not acceptable. Clamps attach to standing seams using a minimum of two (2) stainless steel set screws. Clamp spacing shall be at every second seam.

2. Cross member shall be continuous and shall be 6061-T6 extruded aluminum conforming to ASTM B221. Provide cross member with receptacle in face for insertion of color strip. Color strip shall be same material, finish and color as roof panels specified.

3. Fasteners and clamp hardware shall be 300 series stainless steel.

4. Provide continuous finished roof panel strips for insertion into crossmember receptacle.

5. Finish and color to match roof panels.

2.14 PRECAST CONCRETE SPLASH BLOCKS

A. Normal weight, air entrained concrete achieving 5,000 psi compressive strength in 28 days. Manufacturer’s standard method of reinforcement for size as indicated on drawings.

1. Height: 3” nominal

2. Finish: smooth, as-cast surface; natural concrete color.

2.15 SHOP PAINTING:

A. Paint primary and end wall framing, secondary structural framing consisting of purlins, girts, braces and support as specified herein.

B. Surface Preparation:

1. Protect all structural steel as specified herein and followed by field painting as specified. Do not paint steel to be completely encased in concrete.

2. Complete all welding before beginning surface preparation and shop painting except when size of members, field erection procedures or other approved necessity requires welding after shop priming.

3. Prepare surfaces of steel by removing all weld spatter, flux, residue, burrs and metal surface defects before cleaning.

   a. Grind sharp edges and corners smooth and eliminate pinholes and unevenness adversely affecting coating thickness and longevity.

   b. Level rough, uneven surfaces and fill depressions to produce a base satisfactory for specified primers and finishes with even transitions which permit consistent film thickness at inside and outside corners.

   c. Do no cleaning or priming until surface preparation is acceptable.

4. Clean structural steel surfaces in conformance with SSPC-SP6 - Commercial Blast Cleaning. Clean structural steel surfaces to be immersed to near white metal in conformance with SSPC-SP10.

5. Prime clean dry surfaces before rusting, contamination or deterioration starts. Prime within eight hours of cleaning under ideal conditions or sooner if conditions are not ideal. Protect cleaned surfaces to prevent deterioration before coating. Re-clean as specified herein just before priming if blast cleaned area is not primed within eight hours of cleaning.

6. Clean and paint surfaces inaccessible after assembly before assembly unless such areas are seal welded.

7. Apply coating to prepared, clean, dry surfaces in conformance with paint manufacturer's current printed recommendations and as specified herein.

8. Hold back coatings which would be damaged by field welding and welding heat from areas to be welded until welding is completed. Re-clean and recoat substrate as specified herein for original coats for areas of held back coatings when coated areas have had coating damaged by welding.

9. Perform coating operations only during suitable ambient and surface conditions, moderate temperatures, low humidity and low air movement. Protect from precipitation and intense sunlight.

10. Immediately after surface preparation, mix and apply coatings to produce a complete, tenacious, continuous bonded film, uniform in thickness and without

defects. Provide a coating with film thickness not less than specified and with no runs, sags, skips, holidays, pinholes or blisters.

11. Remove damaged or defective coatings by specified cleaning to meet surface cleaning requirements immediately before recoating.

C. Finish Coating

1. Roof panels, wall panels, liner panels, gutters, canopy framing, downspouts, snow retention system, trim, flashing and accessories shall receive the following shop applied finishes:

a. High-Performance Organic Finish (2-Coat Fluoropolymer): AA-C12C40R1x (Chemical Finish: Cleaned with inhibited chemicals; Chemical Finish: conversion coatings; Organic Coating: manufacturer's standard 2-coat, thermocured system consisting of specially formulated inhibitive primer and fluoropolymer color topcoat containing not less than 70 percent polyvinylidene fluoride resin by weight), with a minimum total dry film thickness of 1.0 mil. Prepare, pretreat, and apply coating to exposed metal surfaces to comply with AAMA 2605 and with coating and resin manufacturers' written instructions, except as modified below:

(1) Humidity Resistance: 2000 hours

(2) Salt-Spray Resistance: 2000 hours

b. Concealed Finish: Apply pretreatment and manufacturer's standard white or light-colored backer finish, consisting of prime coat and wash coat with a total minimum dry film thickness of 0.5 mil.

2. Surface preparation, mixing, application and safety requirements shall be in accordance with the paint manufacturer's printed instructions and as specified.

2.16 GALVANIZING:

A. Provide hot-dip galvanizing in conformance with ASTM A123, Grade 100 to all steel indicated or specified to be galvanize coated.

B. Provide hot-dip galvanizing, in conformance with ASTM A153, to all bolts, nuts and washers that will be used with galvanized steel.

C. Complete all fabrication and prepare surfaces of steel by removing all weld spatter, flux, residue, burrs and metal surface defects before galvanizing. Clean weldments with power wire brush prior to galvanizing.

D. Provide steel dipped into solution of zinc chloride plus ammonium chloride immediately prior to galvanizing. Do not use galvanizing process utilizing flux blanket overlaying molten zinc.

E. SSPC–SP16 treat all pieces that will be in contact with or encased in concrete or masonry after galvanizing.

1. Two coats of one of the following coating systems shall be applied :

a. Series 161 HS Tneme-Fascure by Tnemec Co. Inc., Kansas City, MD

b. Kop-Coat Super Hi-Gard by Kop-Coat Inc., Pittsburgh, PA

c. Valspar-Series 89 by Valspar Corp., Baltimore, MD

2. Prepare the steel surface in conformance with the manufacturer's printed instructions for the preparation of all non-ferrous metals before applying the initial coat of the two coat system.

F. Tap bolt nuts after hot-dip galvanizing in conformance with ASTM A563.

G. Inspect galvanized material for compliance with these specifications. Mark the material with a clearly visible stamp indicating the name of the galvanizer, the ASTM number and the weight of zinc coating in ounces per square foot.

2.17 GALVANIZE TOUCH-UP:

A. Touch-up abraded hot-dip galvanized areas by the brush applied method with zinc-rich coatings having dry film thickness of not less than 6 mils. Repair galvanize using paints containing zinc dust in conformance with ASTM A780.

B. Touch-up all damaged galvanized surfaces with one of the following zinc rich coatings:

1. Endupor, zinc-rich coating by Dampney Manufacturing Co., Everett, MA

2. ZiRP, zinc-rich coating by Duncan Galvanizing Corp., Everett, MA

3. ZRC Cold Galvanizing Compound by ZRC Chemical Products Co., Division of Norfolk Corp., Quincy, MA

PART 3 - EXECUTION

3.01 EXAMINATION

A. Examine substrates, areas, and conditions, with Erector present, for compliance with requirements for installation tolerances and other conditions affecting performance of work.

B. Before erection proceeds, survey elevations and locations of concrete- and masonry-bearing surfaces and locations of anchor rods, bearing plates, and other embedment’s to

receive structural framing, with Erector present, for compliance with requirements and metal building system manufacturer's tolerances.

C. Proceed with erection only after unsatisfactory conditions have been corrected.

3.02 PREPARATION

A. Clean and prepare surfaces to be coated according to manufacturer's written instructions for each particular substrate condition.

B. Provide temporary shores, guys, braces, and other supports during erection to keep structural framing secure, plumb, and in alignment against temporary construction loads and loads equal in intensity to design loads. Remove temporary supports when permanent structural framing, connections, and bracing are in place, unless otherwise indicated.

3.03 FABRICATION:

A. Fabricate each element and connection as indicated on the shop drawings accepted by the Engineer.

B. General:

1. Shop-fabricate framing members for field bolted assembly.

2. Surfaces of bolted connections: Smooth and free from burrs and distortions.

3. Shop connections to conform to manufacturer's standard design practices.

4. Mark framing members with identifying mark.

5. Welding to conform to AWS D1.1 and AWS D1.3 as applicable.

6. Tolerances: Comply with MBMA's "Metal Building Systems Manual": Chapter IV, Section 9, "Fabrication and Erection Tolerances."

C. Primary Framing:

1. Plates, stiffeners, and related members: Factory welded base plates, splice plates, cap plates, and stiffeners into place on structural members.

2. Bolt holes and related machining: Shop fabricate base plates, splices and flanges to include bolt connection holes. Shop-fabricate webs to include bracing holes.

3. Secondary structural connections (purlins and girts): Ordinary (not pretensioned) bolted connections with welded clips.

4. Welding inspection: Per IAS AC472 Part A.

D. Zee Purlins:

1. Fabricate purlins from cold-formed Z-shaped sections with stiffened flanges.

2. Size flange stiffeners to comply with requirements of AISI S100.

3. Purlin flanges unequal in width for easier nesting during erection.

4. Purlins pre-punched at factory to provide for field bolting to rigid frame clips.

5. Eave Struts:

6. Fabricate eave struts from cold-formed unsymmetrical C-shaped sections with stiffened flanges.

7. Size flange stiffeners to comply with requirements of AISI S100.

8. No welded splices permitted.

9. Eave Struts pre-punched at factory to provide for field bolting to rigid frame clips.

E. Girts: Simple or continuous span as required by design. Connection bolts will install through webs, not flanges.

F. Bracing:

1. Diagonal Bracing:

a. Diagonal bracing in roof and sidewalls shall be used to resist lateral loads in structure.

b. Furnish to length and equipped with hillside washers and nuts at each end.

c. Bracing may consist of rods threaded at each end or galvanized cable with suitable threaded end anchors.

d. If load requirements dictate, bracing may be of structural angle or pipe, bolted in place.

2. Flange Braces: Brace compression flange of primary framing laterally with angles connecting to purlin or girt webs so that flange compressive stress is within allowable limits for any combination of loading.

3. Bridging:

a. Laterally brace top chord of long bay purlins with horizontal bridging if roof system being used will not supply adequate lateral support to top chord.

G. Metal Panels: Fabricate and finish metal panels at the factory to greatest extent possible, by manufacturer's standard procedures and processes, as necessary to fulfill indicated performance requirements. Comply with indicated profiles and with dimensional and structural requirements.

1. Provide panel profile, including major ribs and intermediate stiffening ribs, if any, for full length of metal panel.

H. Standing Seam Panels:

1. Provide factory fabricated and finished metal panels and accessories meeting performance requirements, indicated profiles and structural requirements.

2. Fabricate metal joints configured to accept applied sealant providing weathertight seal and preventing metal to metal contact and minimizing noise resulting from thermal movement.

3. Fabricate panels in continuous lengths for full length of detailed runs, except where otherwise indicated on drawings.

4. Sheet Metal Flashing and Trim: Fabricate or install flashing and trim to comply with manufacturer’s written instructions and construction drawings.

5. Configure Double-Lok panels with interlocking edges with factory applied hot-melt mastic inside female seam. Female side snaps over male side and when seamed creates continuous lock, forming 360 degree Pittsburgh seam.

6. Notch Double-Lok panels at factory at both ends so that field installation can commence or terminate from either end of building.

7. Maximum panel length: 45 feet (13 716 mm) unless otherwise indicated.

I. End Laps:

1. Fabricate with 16 gauge backup plates and eight end lap joint fasteners installed in six pre-punched holes in flat and in dimples in trapezoidal legs.

2. Apply mastic between panels and secure with self-drilling fasteners through panels and backup plate.

3. Through roof fasteners may be used only at end laps and eaves.

3.04 ERECTION OF STRUCTURAL FRAMING

A. Erect metal building system according to manufacturer's written erection instructions and erection drawings.

B. Do not field cut, drill, or alter structural members without written approval from metal building system manufacturer's professional engineer.

C. Set structural framing accurately in locations and to elevations indicated and according to AISC specifications referenced in this Section. Maintain structural stability of frame during erection.

D. Base Plates: Clean concrete bearing surfaces of bond-reducing materials and roughen surfaces prior to setting plates. Clean bottom surface of plates.

1. Set plates for structural members on wedges, shims, or setting nuts as required.

2. Tighten anchor rods after supported members have been positioned and plumbed. Do not remove wedges or shims but, if protruding, cut off flush with edge of plate before packing with grout.

3. Promptly pack grout solidly between bearing surfaces and plates so no voids remain. Neatly finish exposed surfaces; protect grout and allow to cure. Comply with manufacturer's written installation instructions for shrinkage-resistant grouts.

E. Align and adjust structural framing before permanently fastening. Before assembly, clean bearing surfaces and other surfaces that will be in permanent contact with framing. Perform necessary adjustments to compensate for discrepancies in elevations and alignment.

1. Level and plumb individual members of structure.

2. Make allowances for difference between temperature at time of erection and mean temperature when structure will be completed and in service.

F. Primary Framing and End Walls: Erect framing true to line, level, plumb, rigid, and secure. Level baseplates to a true even plane with full bearing to supporting structures, set with double-nutted anchor bolts. Use grout to obtain uniform bearing and to maintain a level base-line elevation. Moist cure grout for not less than seven days after placement.

1. Make field connections using high-strength bolts installed according to RCSC's "Specification for Structural Joints Using ASTM A 325 or A 490 Bolts" for type of bolt and type of joint specified.

a. Joint Type: Snug tightened or pretensioned.

G. Secondary Framing: Erect framing true to line, level, plumb, rigid, and secure. Fasten secondary framing to primary framing using clips with field connections using non-high-strength bolts.

1. Provide rake or gable purlins with tight-fitting closure channels and fasciae.

2. Locate and space wall girts to suit openings such as doors and windows.

3. Provide supplemental framing at entire perimeter of openings, including doors, windows, louvers, and other penetrations of roof and walls.

H. Bracing: Install bracing in roof and sidewalls where indicated on erection drawings.

1. Tighten rod and cable bracing to avoid sag.

2. Locate interior end-bay bracing only where indicated.

I. Framing for Openings: Provide shapes of proper design and size to reinforce openings and to carry loads and vibrations imposed, including equipment furnished under mechanical and electrical work. Securely attach to structural framing.

J. Erection Tolerances: Maintain erection tolerances of structural framing within AISC's "Code of Standard Practice for Steel Buildings and Bridges."

3.05 METAL PANEL INSTALLATION, GENERAL

A. Examination: Examine primary and secondary framing to verify that structural panel support members and anchorages have been installed within alignment tolerances required by manufacturer.

1. Examine roughing-in for components and systems penetrating metal panels to verify actual locations of penetrations relative to seam locations of metal panels before metal panel installation.

B. General: Anchor metal panels and other components of the Work securely in place, with provisions for thermal and structural movement.

1. Field cut metal panels as required for doors, louvers, and other openings. Cut openings as small as possible, neatly to size required, and without damage to adjacent metal panel finishes.

a. Field cutting of metal panels by torch is not permitted unless approved in writing by manufacturer.

2. Install metal panels perpendicular to structural supports, unless otherwise indicated.

3. Flash and seal metal panels with weather closures at perimeter of openings and similar elements. Fasten with self-tapping screws.

4. Locate and space fastenings in uniform vertical and horizontal alignment.

5. Locate metal panel splices over, but not attached to, structural supports with end laps in alignment. Stagger panel splices and end laps to avoid a four-panel lap splice condition.

6. Lap metal flashing over metal panels to allow moisture to run over and off the material.

C. Metal Protection: Where dissimilar metals will contact each other or corrosive substrates, protect against galvanic action by painting contact surfaces with bituminous coating, by applying rubberized-asphalt underlayment to each contact surface, or by other permanent separation as recommended by metal roof panel manufacturer.

D. Joint Sealers: Install gaskets, joint fillers, and sealants where indicated and where required for weatherproof performance of metal panel assemblies. Provide types of gaskets, fillers, and sealants indicated or, if not indicated, types recommended by metal panel manufacturer.

1. Seal metal panel end laps with double beads of tape or sealant, full width of panel. Seal side joints where recommended by metal panel manufacturer.

2. Prepare joints and apply sealants to comply with requirements in Division 07 Section "Joint Sealants."

3.06 METAL WALL PANEL INSTALLATION

A. General: Install metal wall panels in orientation, sizes, and locations indicated on Drawings. Install panels perpendicular to girts, extending full height of building, unless otherwise indicated. Anchor metal wall panels and other components of the Work securely in place, with provisions for thermal and structural movement.

1. Unless otherwise indicated, begin metal panel installation at corners with center of rib lined up with line of framing.

2. Shim or otherwise plumb substrates receiving metal wall panels.

3. When two rows of metal panels are required, lap panels 4 inches minimum.

4. When building height requires two rows of metal panels at gable ends, align lap of gable panels over metal wall panels at eave height.

5. Rigidly fasten base end of metal wall panels and allow eave end free movement due to thermal expansion and contraction. Predrill panels.

6. Flash and seal metal wall panels with weather closures at eaves, rakes, and at perimeter of all openings. Fasten with self-tapping screws.

7. Install screw fasteners in predrilled holes.

8. Install flashing and trim as metal wall panel work proceeds.

9. Apply elastomeric sealant continuously between metal base channel (sill angle) and concrete, and elsewhere as indicated, or if not indicated, as necessary for waterproofing.

10. Align bottom of metal wall panels and fasten with blind rivets, bolts, or self-tapping screws.

11. Provide weatherproof escutcheons for pipe and conduit penetrating exterior walls.

B. Field-Assembled, Metal Wall Panels: Install metal wall panels on exterior side of girts. Attach metal wall panels to supports with fasteners as recommended by manufacturer.

1. Field-Insulated Assemblies: Install thermal insulation as specified. Fasten with exposed fasteners as recommended by manufacturer.

2. Install full height liner panels on all wall at interior side of girts.

3.07 METAL ROOF PANEL INSTALLATION:

A. General: Provide metal roof panels of full length from eave to ridge, unless otherwise indicated or restricted by shipping limitations.

1. Install ridge caps as metal roof panel work proceeds.

2. Flash and seal metal roof panels with weather closures at eaves and rakes. Fasten with self-tapping screws.

B. Mechanically-Seamed, Trapezoidal Standing Seam Metal Roof Panels: Install weathertight metal panel system in accordance with manufacturer's written instructions, approved shop drawings, and project drawings. Install metal roof panels in orientation, sizes and locations indicated, free of waves, warps, buckles, fastening stresses and distortions. Anchor panels and other components securely in place. Provide for thermal and structural movement.

C. Attach panels to supports using clips, screws, fasteners and sealants recommended by manufacturer and indicated on approved shop drawings.

1. Fasten metal panels to supports with concealed clips at each location indicated on approved shop drawings, with spacing and fasteners recommended by manufacturer.

2. Seamed Joint: Crimp standing seams with manufacturer-approved, motorized seamer tool so clip, metal roof panel, and factory-applied sealant are completely engaged.

3. Provide weatherproof jacks for pipe and conduit penetrating metal panels of types recommended by manufacturer.

4. Dissimilar Materials: Where elements of metal panel system will come into contract with dissimilar materials, treat faces and edges in contact with dissimilar materials as recommended by manufacturer.

3.08 THERMAL INSULATION INSTALLATION FOR FIELD-ASSEMBLED METAL PANELS

A. General: Install insulation concurrently with metal wall panel installation, in thickness indicated to cover entire wall, according to manufacturer's written instructions.

1. Set vapor-retarder-faced units with vapor retarder to warm side of construction, unless otherwise indicated. Do not obstruct ventilation spaces, except for firestopping.

2. Tape joints and ruptures in vapor retarder and seal each continuous area of insulation to surrounding construction to ensure airtight installation.

3. Install factory-laminated, vapor-retarder-faced blankets straight and true in one-piece lengths with both sets of facing tabs sealed to provide a complete vapor retarder.

4. Install blankets straight and true in one-piece lengths. Install vapor retarder over insulation with both sets of facing tabs sealed to provide a complete vapor retarder.

B. Blanket Roof Insulation: Comply with the following installation method:

1. Over-Purlin-with-Spacer-Block Installation: Extend insulation and vapor retarder over and perpendicular to top flange of secondary framing members. Install layer of filler insulation over first layer to fill space formed by metal roof panel standoffs. Hold in place by panels fastened to standoffs.

2. Thermal Spacer Blocks: Where metal roof panels attach directly to purlins, install thermal spacer blocks.

C. Blanket Wall Insulation: Extend insulation and vapor retarder over and perpendicular to top flange of secondary framing members. Hold in place by metal wall panels fastened to secondary framing.

1. Retainer Strips: Install retainer strips at each longitudinal insulation joint, straight and taut, nesting with secondary framing to hold insulation in place.

D. Board Wall Insulation: Extend board insulation in field-assembled metal wall panel assembly in thickness indicated to cover entire wall.

3.09 DOOR AND FRAME INSTALLATION

A. General: Install doors and frames plumb, rigid, properly aligned, and securely fastened in place according to manufacturer's written instructions. Coordinate installation with wall

flashings and other components. Seal perimeter of each door frame with elastomeric sealant used for metal wall panels.

1. Reference Division 08 Section “Doors and Frames” for erection tolerances and touch-up requirements.

3.10 ACCESSORY INSTALLATION

A. General: Install accessories with positive anchorage to building and weathertight mounting and provide for thermal expansion. Coordinate installation with flashings and other components.

1. Install components required for a complete metal roof panel assembly including trim, copings, ridge closures, seam covers, flashings, sealants, gaskets, fillers, closure strips, and similar items.

2. Install components for a complete metal wall panel assembly including trim, copings, corners, seam covers, flashings, sealants, gaskets, fillers, closure strips, and similar items.

3. Where dissimilar metals will contact each other or corrosive substrates, protect against galvanic action by painting contact surfaces with bituminous coating, by applying rubberized-asphalt underlayment to each contact surface, or by other permanent separation as recommended by manufacturer.

B. Flashing and Trim: Comply with performance requirements, manufacturer's written installation instructions, and SMACNA's "Architectural Sheet Metal Manual." Provide concealed fasteners where possible and set units true to line and level as indicated. Install work with laps, joints, and seams that will be permanently watertight and weather resistant.

1. Install exposed flashing and trim that is without excessive oil canning, buckling, and tool marks and that is true to line and levels indicated, with exposed edges folded back to form hems. Install sheet metal flashing and trim to fit substrates and to result in waterproof and weather-resistant performance.

2. Expansion Provisions: Provide for thermal expansion of exposed flashing and trim. Space movement joints at a maximum of 10 feet with no joints allowed within 24 inches of corner or intersection. Where lapped or bayonet-type expansion provisions cannot be used or would not be sufficiently weather resistant and waterproof, form expansion joints of intermeshing hooked flanges, not less than 1 inch deep, filled with mastic sealant (concealed within joints).

C. Gutters: Join sections with riveted and soldered or lapped and sealed joints. Attach gutters to eave with gutter hangers spaced not more than 4 feet o.c. using manufacturer's standard fasteners. Provide end closures and seal watertight with sealant. Provide for thermal expansion.

D. Downspouts: Join sections with 1-1/2-inch telescoping joints. Provide fasteners designed to hold downspouts securely 1 inch away from walls; locate fasteners at top and bottom and at approximately 60 inches o.c. in between.

1. Provide elbows at base of downspouts to direct water away from building.

E. Pipe Flashing: Form flashing around pipe penetration and metal roof panels. Fasten and seal to panel as recommended by manufacturer.

3.11 CLEANING AND PROTECTION

A. Repair damaged galvanized coatings on galvanized items with galvanized repair paint according to ASTM A 780 and manufacturer's written instructions.

B. Touchup Painting: After erection, promptly clean, prepare, and prime or reprime field connections, rust spots, and abraded surfaces of prime-painted structural framing, and accessories.

1. Clean and prepare surfaces by SSPC-SP 2, "Hand Tool Cleaning," or SSPC-SP 3, "Power Tool Cleaning."

2. Apply a compatible primer of same type as shop primer used on adjacent surfaces.

C. Metal Panels: Remove temporary protective coverings and strippable films, if any, as metal panels are installed. On completion of metal panel installation, clean finished surfaces as recommended by metal panel manufacturer. Maintain in a clean condition during construction.

1. Replace metal panels that have been damaged or have deteriorated beyond successful repair by finish touchup or similar minor repair procedures.

3.12 WELDING:

A. Conform to requirements of AWS Structural Welding Code and as indicated or specified.

B. No field welding permitted unless indicated on Engineer accepted fabrication shop drawings.

C. No field welding permitted on galvanized steel.

3.13 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

DIVISION 22

PLUMBING

Page Intentionally Left Blank

SECTION 22 05 00

PLUMBING SYSTEMS

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide new and modify existing plumbing systems as indicated and in compliance with Contract Documents.

B. The Work of this Section shall include all labor, materials, tools, equipment and appurtenances, and performing all operations necessary to furnish and install complete and operable systems in accordance with this Section of these Specifications, the Drawings, and the codes and standards listed herein.

C. Coordinate with the Local Water Utility as to any Local restrictions or requirements relative to backflow prevention devices and metering.

D. Limits of Work shall be as indicated on the Drawings. Items of Work shall consist of the following:

1. All plumbing removals indicated.

2. Domestic hot and cold-water piping to plumbing fixtures.

3. Domestic tempered water piping to emergency eyewash/showers.

4. Provide backflow preventers where indicated in domestic water piping for connection by other Sections to process equipment and hydronic heating systems

5. Drain-waste-vent sanitary piping from plumbing fixtures and floor drains.

6. Special waste and vent system for laboratory.

7. Domestic water heaters, electric water heaters, potable water well tanks, plumbing fixtures, roof drains, floor drains. Furnish roof drains to roofing trade for all roofs.

E. Compliance Requirements of Plumbing Systems:

1. American Iron and Steel (AIS) Requirements for WIFIA Projects:

a. Consolidated Appropriations Act of 2014 P.L. 113-76 – Iron and Steel products made primarily of iron or steel that are permanently incorporated into the project shall use iron and steel that are produced in the United States.

b. Listed Plumbing Products include:

(1) Lined or unlined pipes and fittings (includes pipe used as wall and floor sleeves)

(2) Tanks

(3) Flanges

(4) Pipe Clamps and Restraints (includes hangars and supports)

(5) Valves

(6) Sinks

c. Throughout this Division, AIS Compliance will be noted for materials and components that align with the products indicated.

d. Mechanical equipment, components, and systems are not considered construction materials. This excludes plumbing itmes from AIS compliance, including:

(1) Pumps (including strainers)

(2) Water Heaters

(3) Controls and Switches (including sensors)

(4) VFD Drives

(5) Emergency Fixtures (including showers and eyewashes)

(6) Water Meters

(7) Filters and Aerators

F. Section Includes:

1. Piping materials and installation instructions common to most piping systems

2. Joining Materials

3. Transition fittings

4. Dielectric fittings

5. Mechanical sleeve seals

6. Sleeves

7. Escutcheons

8. Grout

9. Trap Primer Piping

10. Strainers

11. Valve Boxes

12. Freeze Protection Enclosures

13. Expansion Tanks

14. Electric Trap Primers

15. Hoses

16. Drip Pans

17. Access Panels

18. Potable Water Well Tanks and Accessories

1.02 DEFINITIONS:

A. Architect: Where used in this section and other subsequent sections, Architect is intended to refer to the lead design consulting firm, as well as its associated consulting engineers. On projects where the lead design consulting firm is an engineer, rather than an architect, Architect shall refer to the lead consulting engineer.

B. Finished Spaces: Spaces other than mechanical and electrical equipment rooms, furred spaces, pipe chases, unheated spaces immediately below roof, spaces above ceilings, unexcavated spaces, crawlspaces, and tunnels.

C. Exposed, Interior Installations: Exposed to view indoors. Examples include finished occupied spaces and mechanical equipment rooms.

D. Exposed, Exterior Installations: Exposed to view outdoors or subject to outdoor ambient temperatures and weather conditions. Examples include rooftop locations.

E. Concealed, Interior Installations: Concealed from view and protected from physical contact by building occupants. Examples include above ceilings and in chases.

F. Concealed, Exterior Installations: Concealed from view and protected from weather conditions and physical contact by building occupants but subject to outdoor ambient temperatures. Examples include installations within unheated shelters.

G. The following are industry abbreviations for plastic materials:

1. CPVC: Chlorinated polyvinyl chloride plastic

2. PE: Polyethylene plastic.

3. PVC: Polyvinyl chloride plastic.

H. The following are industry abbreviations for rubber materials:

1. EPDM: Ethylene-propylene-diene terpolymer rubber.

2. NBR: Acrylonitrile-butadiene rubber.

1.03 REFERENCES:

A. Except as specified herein, the latest edition of the standards listed below form a part of this Specification to the extent referenced in this Section. Where earlier editions of standards are adopted as referenced in applicable codes, those shall govern. The publications are referred to within the text by the basic designation only.

B. In each of the standards referred to herein, consider the advisory provisions to be mandatory, as though the word, "shall" had been substituted for "should" wherever it appears.

C. American National Standards Institute (ANSI):

1. Z358.1: Emergency Eyewash and Shower Equipment

D. American Society of Mechanical Engineers (ASME):

1. A112.18.1M: Plumbing Fixture Fittings

2. A112.21.1M: Floor Drains

3. A112.21.2M: Roof Drains

4. A112.36.2M: Cleanouts

5. B16.1: Cast Iron Pipe Flanges and Flanged Fittings

6. B16.3: Malleable Iron Threaded Fittings

7. B16.12: Cast Iron Threaded Drainage Fittings

8. B16.18: Cast Copper Alloy Solder Joint Pressure Fittings

9. B16.22: Wrought Copper and Copper Alloy Solder Joint Pressure Fittings

10. B16.23: Cast Copper Alloy Solder Joint Draining Fittings - DWV

11. B16.24: Cast Copper Alloy Pipe Flanges and Flanged Fittings Class 150, 300, 400, 600, 900, 1500, and 2500

12. B16.26: Cast Copper Alloy Fittings for Flared Copper Tubes

13. B16.29: Wrought Copper and Wrought Copper Alloy Solder Joint Draining Fittings - DWV

14. B16.32: Cast Copper Alloy Joint Fittings for Solvent Draining Systems

15. B16.50: Wrought Copper and Copper Alloy Braze-Joint Pressure Fittings

16. B40.1: Pressure Gauges and Gauge Attachments

E. American Society of Sanitary Engineering (ASSE):

1. 1003: Water Pressure Reducing Valves

2. 1013: Reduced Pressure Principle Backflow Preventers and Reduced Pressure Fire Protection Principle Backflow Preventers

3. 1015: Double Check Backflow Prevention Assemblies and Double Check Fire Protection Backflow Prevention Assemblies

4. 1017: Temperature Actuated Mixing Valves for Hot Water Distribution Systems

5. 1018: Trap Seal Primer Valves - Potable, Water Supplied

6. 1019: Vacuum Breaker Wall Hydrants, Freeze Resistant, Automatic Draining Type

7. 1071: Temperature Actuated Mixing Valves for Plumbed Emergency Equipment

F. ASTM International (ASTM):

1. A47: Ferritic Malleable Iron Castings

2. A53: Pipe, Steel, Black and Hot-Dipped, Zinc-Coated, Welded and Seamless

3. A74: Cast Iron Soil Pipe and Fittings

4. A126: Gray Iron Castings for Valves, Flanges and Pipe Fittings

5. A183: Carbon Steel Track Bolts and Nuts

6. A518: Corrosion-Resistant High-Silicon Iron Castings

7. A536: Ductile Iron Castings

8. B32: Solder Metal

9. B42: Seamless Copper Pipe, Standard Sizes

10. B88: Seamless Copper Water Tube

11. B306: Copper Drainage Tube (DWV)

12. B584: Copper Alloy Sand Castings for General Applications

13. C564: Rubber Gaskets for Cast Iron Soil Pipe and Fittings

14. D2000: Rubber Products in Automotive Applications

15. D2665: Poly (Vinyl Chloride) (PVC) Plastic Drain, Waste, and Vent Pipe and Fittings

16. D2846: Chlorinated Poly (Vinyl Chloride) (CPVC) Plastic Hot - and Cold-Water Distribution Systems

17. F441: Chlorinated Poly (Vinyl Chloride) (CPVC) Plastic Pipe, Schedules 40 and 80

G. American Water Works Association (AWWA):

1. C104: Cement-Mortar Lining for Ductile-Iron Pipe and Fittings for Water

2. C105: Polyethylene Encasement for Ductile-Iron Pipe Systems

3. C110: Ductile-Iron and Gray-Iron Fittings, 3 In. through 48 In., for Water

4. C111: Rubber-Gasket Joints for Ductile-Iron Pressure Pipe and Fittings

5. C115: Flanged Ductile-Iron Pipe with Ductile-Iron or Gray-Iron Threaded Flanges

6. C151: Ductile-Iron Pipe, Centrifugally Cast, for Water

7. C500: Metal-Seated Gate Valves for Water Supply Service

8. C509: Resilient-Seated Gate Valves for Water Supply Service

9. C651: Disinfecting Water Mains

10. C700: Cold-Water meters – Displacement Type, Bronze Main Case

11. C701: Cold-Water Meters-Turbine Type, for Customer Service

12. C702: Cold-Water meters – Compound Type

13. C707: Encoder Type, Remote Registration Systems for Cold-Water Meters

14. D100: Welded Steel Tanks for Water Storage

H. American Welding Society (AWS):

1. A5.8: Filler Metals for Brazing and Braze Welding

2. BRH: Brazing Handbook

I. Cast Iron Soil Pipe Institute (CISPI):

1. 301: Hubless Cast Iron Soil Pipe and Fittings for Sanitary and Storm Drain, Waste and Vent Piping Applications

2. 310: Coupling for Use in Connection with Hubless Cast Iron Soil Pipe and Fittings for Sanitary and Storm Drain, Waste, and Vent Piping Applications

3. HSN-85: Neoprene Rubber Gaskets for Hub and Spigot Cast Iron Soil Pipe and Fittings

J. Foundation for Cross-Connection Control And Hydraulic Research (FCCCHR):

1. FCCCHR List: List of Approved Backflow Prevention Assemblies

K. Manufacturers Standardization Society of the Valve and Fittings Industry (MSS):

1. SP-58: Pipe Hangers and Supports - Materials, Design, Manufacture, Selection, Application and Installation

2. SP-70: Cast Iron Gate Valves, Flanged and Threaded Ends

3. SP-71: Gray Iron Swing Check Valves, Flanged and Threaded Ends

4. SP-80: Bronze Gate, Globe, Angle and Check Valves

5. SP-85: Cast Iron Globe & Angle Valves, Flanged and Threaded Ends

6. SP-110: Ball Valves Threaded, Socket Welding, Solder Joints, Grooved and Flared Ends

L. Plumbing and Drainage Institute (PDI):

1. WH 201: Water Hammer Arresters

M. Sheet Metal and Air Conditioning Contractors National Association (SMACNA):

1. SMACNA Seismic Restraint Unit: Seismic Restraint Manual: Guidelines for Mechanical Systems

N. Underwriters Laboratories (UL):

1. 1453: Electric Booster and Commercial Storage Tank Water Heaters

1.04 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00:

1. Shop Drawings:

a. Coordination Drawings: Prepare as specified in Paragraph "Cooperation and Coordination with Other Trades" of this Section.

2. Product Data: For each product, provide descriptive data to show the specific manufacturer, model, type, size, capacity, curves, wiring diagrams, options, etc. of each item. Where products are available with Energy Star labeling, they shall be provided.

3. Certification: Submit documentation certifying completion of the following items in compliance with this Section.

a. Tests

b. Flushing

c. Manufacturers' services

d. Disinfection

4. Test Reports: Prepare as specified in Part 3 of this section.

a. Pressure tests

b. Backflow preventer tests

c. Functional testing

5. Certificates and Licenses: Prepare as specified in Part 1 of this section.

a. Qualifications of Installer

b. Qualifications of Construction Supervisor

6. Operation and Maintenance Manuals: Prepare manuals in accordance with Section 01 78 23.

7. Closeout Submittals:

a. Record Drawings: Prepare as specified in Part 1 of this section.

B. Welding certificates.

1.05 QUALITY ASSURANCE:

A. Provide in accordance with Section 01 45 00.

B. Provisions:

1. Drawings and specification direct attention to certain features of equipment, but do not purport to cover all details entering into design and construction of the equipment, controls, or appurtenances.

2. Consideration shall be given only to products of manufacturers who demonstrate successful experience in manufacture, operation, and servicing equipment of type, size, performance, and reliability equal to that specified. Equipment and components shall be the product of a single manufacturer insofar as possible.

3. Equipment furnished to fit within the space allocated with adequate clearance for proper operation and maintenance.

C. Workmanship and Design:

1. Provide equipment such that all parts are designed for continuous and uninterrupted service, and such that lubrication, adjustment, or replacement of parts is possible without manufacturer's assistance. Corresponding parts of multiple units shall be interchangeable.

2. Install equipment that complies with state, local and federal codes and regulations.

D. Alternate Equipment and Arrangement:

1. If any equipment submitted for acceptance requires arrangement differing from that indicated or specified, Contractor to prepare and submit for review, detailed structural, mechanical and electrical drawings, and equipment lists showing all necessary changes and all special features of equipment proposed. Changes are at no additional compensation to the Contractor.

E. Qualifications of Installer:

1. Prior to installation, submit data showing the name and license of the installing contractor and that he has successfully installed systems of the same type and design as specified herein. Data shall include names and locations of at least two installations of such systems. Indicate type and design of each system and certify that each system has performed satisfactorily in the manner intended for not less than 18 months. The installing contractor shall be licensed to perform applicable plumbing systems installation in the state in which the project is located.

F. Qualifications of Construction Supervisor:

1. Provide a Construction Supervisor with a minimum of 5 years of experience in plumbing construction supervision who shall be responsible for the installation of the Work of this Section of the Specifications. The Construction Supervisor shall be licensed to perform applicable plumbing systems supervision in the state in which the project is located. Prior to installation, submit data for acceptance showing the name and license of the Construction Supervisor.

G. Steel Support Welding: Qualify processes and operators according to AWS D1.1, "Structural Welding Code--Steel."

H. Comply with provisions in ASME B31 Series, "Code for Pressure Piping."

I. Certify that each welder has passed AWS qualification tests for welding processes involved and that certification is current.

J. Electrical Characteristics for Plumbing Equipment: Equipment of higher electrical characteristics may be furnished provided such proposed equipment is approved in writing and connecting electrical services, circuit breakers, and conduit sizes are appropriately modified. If minimum energy ratings or efficiencies are specified, equipment shall comply with requirements.

K. The Contractor shall be responsible for the field verification of existing conditions prior to submitting bids.

L. The Contractor shall be responsible for reporting any existing damaged equipment or systems to the Owner prior to any work.

1.06 DELIVERY, STORAGE, AND HANDLING

A. Provide in accordance with APWA Section 01 66 00 and as specified.

B. Shipping:

1. Equipment, material and spare parts are to be shipped completely assembled except where partial disassembly is required by transportation regulations or for protection of components.

C. Receiving:

1. Inspect and inventory items upon delivery to site.

2. Store and safeguard equipment, material and spare parts in accordance with manufacturer's recommendations.

D. Deliver pipes and tubes with factory-applied end caps. Maintain end caps through shipping, storage, and handling to prevent pipe end damage and to prevent entrance of dirt, debris, and moisture.

E. Store plastic pipes protected from direct sunlight. Support to prevent sagging and bending.

1.07 COORDINATION:

A. Arrange for pipe spaces, chases, slots, and openings in building structure during progress of construction, to allow for plumbing installations.

B. Coordinate installation of required supporting devices and set sleeves in poured-in-place concrete and other structural components as they are constructed.

C. Coordinate requirements for access panels and doors for plumbing items requiring access that are concealed behind finished surfaces.

D. The Contractor shall coordinate with Owner for all new to existing connections, system shutdowns and restart-up.

E. For work in existing occupied facilities, coordinate all service shut-downs with Owner. Contractor shall request service interruptions a minimum of 72 hours prior to desired time of interruption. The Owner reserves the right to reject or change requested time of service interruption.

1.08 COOPERATION AND COORDINATION WITH OTHER TRADES:

A. Work shall be performed in cooperation with other trades on the project and so scheduled as to allow efficient completion of the project. Materials and equipment shall be installed as fast as conditions will permit, and installed properly.

B. Furnish to all other trades advance information on location and size of all concrete pads, chases, frames, boxes, pits, sleeves, and openings needed for the Work, and also furnish layout information and shop drawings necessary to permit other trades affected by the Work to install their work properly coordinated and without delay.

C. Where there is evidence that Work installed interferes with the work of other Sections, assist in working out space conditions to make satisfactory adjustments.

D. With the acceptance of the Engineer and without extra cost to the Owner, make reasonable modifications in Work specified under this Section required to coordinate with normal structural interference's, or for proper execution of specified work.

E. If work is installed before coordinating with other trades so as to cause interference with the work of such trades, make all necessary changes in Work under this Section of the at no additional cost to the Owner.

F. Protect all materials and work of other trades from damage that may be caused by the Work required under this Section and be responsible for repairing any damages caused by such work without any additional cost to the Owner.

G. Follow Drawings in layout work. Check drawings of, and coordinate with, other trades to verify special provisions, installation requirements and spaces in which Work provided under this Section will be installed. Maintain maximum headroom or space conditions at all points. Where headroom or space conditions appear inadequate, notify the Engineer before proceeding.

H. Attend regular coordination and job progress meetings required.

1.09 PERFORMANCE REQUIREMENTS – GENERAL:

A. Plumbing Demolition:

1. Where indicated on plans, disconnect, demolish, and remove plumbing systems, equipment, and components indicated to be removed.

a. Piping to be Removed: Remove portion of piping indicated to be removed and cap or plug remaining piping with same or compatible piping material.

b. Piping to be Abandoned in Place: Drain piping and cap or plug piping with same or compatible piping material.

c. Equipment to be Removed: Disconnect and cap services and remove equipment.

d. Equipment to be Removed and Reinstalled: Disconnect and cap services and remove, clean, and store equipment; when appropriate, reinstall, reconnect, and make equipment operational.

e. Equipment to be Removed and Salvaged: Disconnect and cap services and remove equipment, tag and deliver to Owner.

2. If pipe, insulation, or equipment to remain is damaged in appearance or is unserviceable, notify Architect before proceeding.

B. Piping Systems – Common Requirements:

1. Install piping according to the following requirements and Division 22 sections specifying piping systems.

2. Drawing plans, schematics, and diagrams indicate general location and arrangement of piping systems. Indicated locations and arrangements were used to size pipe and calculate friction loss, expansion, equipment sizing, and other design considerations. Install piping as indicated unless deviations to layout are approved on Coordination Drawings.

3. Install piping in concealed locations, unless otherwise indicated and except in equipment rooms and service areas.

4. Install piping indicated to be exposed and piping in equipment rooms and service areas at right angles or parallel to building walls. Diagonal runs are prohibited unless specifically indicated otherwise.

5. Install piping above accessible ceilings to allow sufficient space for ceiling panel removal and to coordinate with other services occupying that space.

6. Install piping to permit valve servicing.

7. Install piping at indicated slopes.

8. Install piping free of sags and bends.

9. Install fittings for changes in direction and branch connections.

10. Install piping to allow application of insulation.

11. Select system components with pressure rating equal to or greater than system operating pressure.

12. Install escutcheons for penetrations of walls, ceilings, and floors according to the following:

13. New Piping:

    a. Piping with Fitting or Sleeve Protruding from Wall: One-piece, deep-pattern type with polished chrome-plated finish.

    b. Chrome-Plated Piping: One-piece, cast-brass or stamped steel type with polished chrome-plated finish.

    c. Insulated Piping at Wall and Ceiling Penetrations in Finished Spaces: One-piece, cast-brass or stamped-steel type with polished chrome-plated finish.

    d. Bare Piping at Wall and Floor Penetrations in Finished Spaces: One-piece, cast-brass or stamped steel type with polished chrome-plated finish.

    e. Bare Piping at Ceiling Penetrations in Finished Spaces: One-piece, cast-brass or stamped steel type with polished chrome-plated finish.

    f. Bare Piping in Unfinished Service Spaces: One-piece, cast-brass or stamped steel type with polished chrome-plated finish.

14. Sleeves are not required for core-drilled holes.

15. Permanent sleeves are not required for holes formed by removable PE sleeves.

16. Install sleeves for pipes passing through concrete and masonry walls, gypsum-board partitions, concrete floors, and roof slabs.

17. Cut sleeves to length for mounting flush with both surfaces.

    a. Exception: Extend sleeves installed in floors of mechanical equipment areas or other wet areas 2 inches above finished floor level. Extend cast-iron sleeve fittings below floor slab as required to secure clamping ring if ring is specified.

18. Install sleeves in new walls and slabs as new walls and slabs are constructed.

19. Install sleeves that are large enough to provide 1/4-inch annular clear space between sleeve and pipe or pipe insulation. Use the following sleeve materials:

    a. Steel Pipe Sleeves: For pipes smaller than NPS 6.

    b. Steel Sheet Sleeves: For pipes NPS 6 and larger, penetrating gypsum-board partitions.

    c. Stack Sleeve Fittings: For pipes penetrating floors with membrane waterproofing. Secure flashing between clamping flanges. Install section of cast-iron soil pipe to extend sleeve to 2 inches above finished floor level.

        (1) Seal space outside of sleeve fittings with grout.

20. Except for underground wall penetrations, seal annular space between sleeve and pipe or pipe insulation, using joint sealants appropriate for size, depth, and location of joint. Refer to Section 07 92 00 for materials and installation.

21. Aboveground, Exterior-Wall Pipe Penetrations: Seal penetrations using sleeves and mechanical sleeve seals. Select sleeve size to allow for 1-inch annular clear space between pipe and sleeve for installing mechanical sleeve seals.

    a. Install steel pipe for sleeves smaller than 6 inches in diameter.

    b. Install cast-iron "wall pipes" for sleeves 6 inches and larger in diameter.

    c. Mechanical Sleeve Seal Installation: Select type and number of sealing elements required for pipe material and size. Position pipe in center of sleeve. Assemble mechanical sleeve seals and install in annular space between pipe and sleeve. Tighten bolts against pressure plates that cause sealing elements to expand and make watertight seal.

22. Underground, Exterior-Wall Pipe Penetrations: Install cast-iron "wall pipes" for sleeves. Seal pipe penetrations using mechanical sleeve seals. Select sleeve size to

allow for 1-inch annular clear space between pipe and sleeve for installing mechanical sleeve seals.

a. Mechanical Sleeve Seal Installation: Select type and number of sealing elements required for pipe material and size. Position pipe in center of sleeve. Assemble mechanical sleeve seals and install in annular space between pipe and sleeve. Tighten bolts against pressure plates that cause sealing elements to expand and make watertight seal.

23. Fire-Barrier Penetrations: Maintain indicated fire rating of walls, partitions, ceilings, and floors at pipe penetrations. Seal pipe penetrations with firestop materials. Refer to Section 07 84 00 for materials.

24. Verify final equipment locations for roughing-in.

25. Refer to equipment specifications in other Sections of these Specifications for roughing-in requirements.

C. Piping Joint Construction:

1. Join pipe and fittings according to the following requirements and Division 22 sections specifying piping systems.

2. Ream ends of pipes and tubes and remove burrs. Bevel plain ends of steel pipe.

3. Remove scale, slag, dirt, and debris from inside and outside of pipe and fittings before assembly.

4. Soldered Joints: Apply ASTM B813, water-flushable flux, unless otherwise indicated, to tube end. Construct joints according to ASTM B828 or CDA's "Copper Tube Handbook," using lead-free solder alloy complying with ASTM B32.

5. Brazed Joints: Construct joints according to AWS's "Brazing Handbook," "Pipe and Tube" Chapter, using copper-phosphorus brazing filler metal complying with AWS A5.8.

6. Threaded Joints: Thread pipe with tapered pipe threads according to ASME B1.20.1. Cut threads full and clean using sharp dies. Ream threaded pipe ends to remove burrs and restore full ID. Join pipe fittings and valves as follows:

a. Apply appropriate tape or thread compound to external pipe threads unless dry seal threading is specified.

b. Damaged Threads: Do not use pipe or pipe fittings with threads that are corroded or damaged. Do not use pipe sections that have cracked or open welds.

7. Welded Joints: Construct joints according to AWS D10.12, using qualified processes and welding operators according to Part 1 "Quality Assurance" Article.

8. Flanged Joints: Select appropriate gasket material, size, type, and thickness for service application. Install gasket concentrically positioned. Use suitable lubricants on bolt threads.

9. Plastic Piping Solvent-Cement Joints: Clean and dry joining surfaces. Join pipe and fittings according to the following:

    a. Comply with ASTM F402 for safe-handling practice of cleaners, primers, and solvent cements.

    b. ABS Piping: Join according to ASTM D2235 and ASTM D2661 appendixes.

    c. CPVC Piping: Join according to ASTM D2846 appendix.

    d. PVC Pressure Piping: Join schedule number ASTM D1785, PVC pipe and PVC socket fittings according to ASTM D2672. Join other-than-schedule-number PVC pipe and socket fittings according to ASTM D2855.

    e. PVC Non-pressure Piping: Join according to ASTM D2855.

    f. PVC to ABS Non-pressure Transition Fittings: Join according to ASTM D3138 appendix.

10. Plastic Pressure Piping Gasketed Joints: Join according to ASTM D3139.

11. Plastic Non-pressure Piping Gasketed Joints: Join according to ASTM D3212.

12. PE Piping Heat-Fusion Joints: Clean and dry joining surfaces by wiping with clean cloth or paper towels. Join according to ASTM D2657.

    a. Plain-End Pipe and Fittings: Use butt fusion

    b. Plain-End Pipe and Socket Fittings: Use socket fusion

13. Fiberglass Bonded Joints: Prepare pipe ends and fittings, apply adhesive, and join according to pipe manufacturer's written instructions.

D. Piping Connections:

1. Make connections according to the following, unless otherwise indicated:

    a. Install unions, in piping NPS 2 and smaller, adjacent to each valve and at final connection to each piece of equipment.

b. Install flanges, in piping NPS 2-1/2 and larger, adjacent to flanged valves and at final connection to each piece of equipment.

c. Dry Piping Systems: Install dielectric coupling and flanges to connect piping materials of dissimilar metals.

d. Wet Piping Systems: Install dielectric coupling and nipple fittings to connect piping materials of dissimilar metals.

E. Equipment Installation – Common Requirements:

1. Install equipment to allow maximum possible headroom unless specific mounting heights are indicated.

2. Install equipment level and plumb, parallel and perpendicular to other building systems and components in exposed interior spaces, unless otherwise indicated.

3. Install plumbing equipment to facilitate service, maintenance, and repair or replacement of components. Connect equipment for ease of disconnecting, with minimum interference to other installations. Extend grease fittings to accessible locations.

4. Install equipment to allow right of way for piping installed at required slope.

F. Painting:

1. Painting of plumbing systems, equipment, and components is specified in Division 09.

2. Damage and Touchup: Repair marred and damaged factory-painted finishes with materials and procedures to match original factory finish.

G. Concrete Bases:

1. Concrete Bases: Anchor equipment to concrete base according to equipment manufacturer's written instructions and according to seismic codes at Project.

a. Construct concrete bases of dimensions indicated, but not less than 4 inches larger in both directions than supported unit.

b. Install dowel rods to connect concrete base to concrete floor. Unless otherwise indicated, install dowel rods on 18-inch centers around the full perimeter of the base.

c. Install epoxy-coated anchor bolts for supported equipment that extend through concrete base, and anchor into structural concrete floor.

d. Place and secure anchorage devices. Use supported equipment manufacturer's setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.

e. Install anchor bolts to elevations required for proper attachment to supported equipment.

f. Install anchor bolts according to anchor-bolt manufacturer's written instructions.

g. Use 3000-psi, 28-day compressive-strength concrete and reinforcement as specified in Division 03.

H. Supports and Anchorages:

1. Erection of Metal Supports and Anchorages:

a. Refer to Division 05 for structural steel.

b. Refer to painting requirements as specified in Division 09 sections.

c. Cut, fit, and place miscellaneous metal supports accurately in location, alignment, and elevation to support and anchor plumbing materials and equipment.

d. Field Welding: Comply with AWS D1.1.

2. Erection of Wood Supports and Anchorages:

a. Cut, fit, and place wood grounds, nailers, blocking, and anchorages to support, and anchor plumbing materials and equipment.

b. Select fastener sizes that will not penetrate members if opposite side will be exposed to view or will receive finish materials. Tighten connections between members. Install fasteners without splitting wood members.

c. Attach to substrates as required to support applied loads.

d. All wood products shall be treated to be fire resistant.

I. Grouting:

1. Mix and install grout for plumbing equipment base bearing surfaces, pump and other equipment base plates, and anchors.

2. Clean surfaces that will come into contact with grout.

3. Provide forms as required for placement of grout.

4. Avoid air entrapment during placement of grout.

5. Place grout, completely filling equipment bases.

6. Place grout on concrete bases and provide smooth bearing surface for equipment.

7. Place grout around anchors.

8. Cure placed grout.

PART 2 - PRODUCTS

2.01 MANUFACTURERS:

A. In other Part 2 articles where subparagraph titles below introduce lists, the following requirements apply for product selection:

1. Manufacturers: Subject to compliance with requirements, provide products by the manufacturers specified.

2.02 PIPE, TUBE, AND FITTINGS:

A. Refer to individual Division 22 piping Sections for pipe, tube, and fitting materials and joining methods.

B. AIS Compliance of these materials is required. Refer to Section 22 05 00, 1.01 E for description.

C. Pipe Threads: ASME B1.20.1 for factory-threaded pipe and pipe fittings.

2.03 JOINING MATERIALS:

A. Refer to individual Division 22 piping sections for special joining materials not listed below.

B. Pipe-Flange Gasket Materials: Suitable for chemical and thermal conditions of piping system contents.

1. ASME B16.21, non-metallic, flat, asbestos-free, 1/8-inch maximum thickness unless thickness or specific material is indicated.

a. Full-Face Type: For flat-face, Class 125, cast-iron and cast-bronze flanges.

b. Narrow-Face Type: For raised-face, Class 250, cast-iron and steel flanges.

2. AWWA C110, rubber, flat face, 1/8 inch thick, unless otherwise indicated; and full-face or ring type, unless otherwise indicated.

C. Flange Bolts and Nuts: ASME B18.2.1, carbon steel, unless otherwise indicated. AIS Compliance of these materials is required. Refer to Section 22 05 00, 1.01 E for description.

D. Plastic, Pipe-Flange Gasket, Bolts, and Nuts: Type and material recommended by piping system manufacturer, unless otherwise indicated.

E. Solder Filler Metals: ASTM B32, lead-free 95-5 tin-antimony alloy. Include water-flushable flux according to ASTM B813.

F. Brazing Filler Metals: AWS A5.8, BCuP Series, copper-phosphorus alloys for general-duty brazing, unless otherwise indicated; and AWS A5.8, BAg1, silver alloy for copper tubing, unless otherwise indicated.

G. Welding Filler Metals: Comply with AWS D10.12 for welding materials appropriate for wall thickness and chemical analysis of steel pipe being welded.

H. Solvent Cements for Joining Plastic Piping:

1. ABS Piping: ASTM D2235.

2. CPVC Piping: ASTM F493.

3. PVC Piping: ASTM D2564. Include primer according to ASTM F656.

4. PVC to ABS Piping Transition: ASTM D3138.

I. Fiberglass Pipe Adhesive: As furnished or recommended by pipe manufacturer.

2.04 TRANSITION FITTINGS:

A. AWWA Transition Couplings: Same size as, and with pressure rating at least equal to and with ends compatible with, piping to be joined.

1. Manufacturers:

a. Cascade Waterworks Mfg. Co.

b. Dresser Industries, Inc.; DMD Division

c. Ford Meter Box Company, Incorporated (The); Pipe Products Division

d. JCM Industries

e. Smith-Blair, Inc.

f. Viking Johnson

2. Underground Piping NPS 1-1/2 and Smaller: Manufactured fitting or coupling.

3. Underground Piping NPS 2 and Larger: AWWA C219, metal sleeve-type coupling.

4. Aboveground Pressure Piping: Pipe fitting.

B. Plastic-to-Metal Transition Fittings: PVC one-piece fitting with manufacturer's Schedule 80 equivalent dimensions; one end with threaded brass insert, and one solvent-cement-joint end.

1. Manufacturers:

a. Eslon Thermoplastics

C. Plastic-to-Metal Transition Adaptors: One-piece fitting with manufacturer's SDR 11 equivalent dimensions; one end with threaded brass insert, and one solvent-cement-joint end.

1. Manufacturers:

a. Thompson Plastics, Inc.

D. Plastic-to-Metal Transition Unions: MSS SP-107, PVC four-part union. Include brass end, solvent-cement-joint end, rubber O-ring, and union nut.

1. Manufacturers:

a. NIBCO, Inc.

b. NIBCO, Inc.; Chemtrol Division

E. Flexible Transition Couplings for Underground Non-pressure Drainage Piping: ASTM C1173 with elastomeric sleeve, ends same size as piping to be joined, and corrosion-resistant metal band on each end.

1. Manufacturers:

a. Cascade Waterworks Mfg. Co.

b. Fernco, Inc.

c. Mission Rubber Company

d. Plastic Oddities, Inc.

2.05 DIELECTRIC FITTINGS:

A. Description: Combination fitting of copper alloy and ferrous materials with threaded, solder-joint, plain, or weld-neck end connections that match piping system materials.

B. AIS Compliance of these materials is required. Refer to Section 22 05 00, 1.01 E for description.

C. Insulating Material: Suitable for system fluid, pressure, and temperature.

D. Dielectric Flanges: Factory-fabricated, companion-flange assembly, for 150- or 300-psig minimum working pressure as required to suit system pressures.

1. Manufacturers:

a. Epco Sales, Inc.

b. Watts Industries, Inc.; Water Products Division

E. Dielectric-Flange Kits: Companion-flange assembly for field assembly. Include flanges, full-face- or ring-type neoprene or phenolic gasket, phenolic or polyethylene bolt sleeves, phenolic washers, and steel backing washers.

1. AIS Compliance of these materials is required. Refer to Section 22 05 00, 1.01 E for description.

2. Manufacturers:

a. Advance Products & Systems, Inc.

b. Calpico, Inc.

c. Central Plastics Company

d. Pipeline Seal and Insulator, Inc.

3. Separate companion flanges and steel bolts and nuts shall have 150- or 300-psig minimum working pressure where required to suit system pressures.

F. Dielectric Waterway Fittings: Electroplated steel nipple with inert and noncorrosive, thermoplastic lining; threaded ends; and 300-psig minimum working pressure at 225 degrees F.

1. Manufacturers:

a. Perfection Corp.

b. Precision Plumbing Products, Inc.

c. Sioux Chief Manufacturing Co., Inc.

d. Victaulic

2.06 MECHANICAL SLEEVE SEALS:

A. Description: Modular sealing element unit, designed for field assembly, to fill annular space between pipe and sleeve.

1. Manufacturers:

a. Metraflex Co

b. Pipeline Seal and Insulator, Inc.

c. Garlock Sealing Technologies

2. Sealing Elements: EPDM interlocking links shaped to fit surface of pipe. Include type and number required for pipe material and size of pipe.

3. Pressure Plates: Carbon steel. Include two for each sealing element.

4. Connecting Bolts and Nuts: Carbon steel with corrosion-resistant coating of length required to secure pressure plates to sealing elements. Include one for each sealing element.

2.07 SLEEVES:

A. AIS Compliance of these materials is required. Refer to Section 22 05 00, 1.01 E for description.

B. Galvanized-Steel Sheet: 0.0239-inch minimum thickness; round tube closed with welded longitudinal joint.

C. Steel Pipe: ASTM A53, Type E, Grade B, Schedule 40, galvanized, plain ends.

D. Cast Iron: Cast or fabricated "wall pipe" equivalent to ductile-iron pressure pipe, with plain ends and integral waterstop, unless otherwise indicated.

E. Stack Sleeve Fittings: Manufactured, cast-iron sleeve with integral clamping flange. Include clamping ring and bolts and nuts for membrane flashing.

F. Underdeck Clamp: Clamping ring with set screws.

G. Molded PE: Reusable, PE, tapered-cup shaped, and smooth-outer surface with nailing flange for attaching to wooden forms.

2.08 ESCUTCHEONS:

A. Description: Manufactured wall and ceiling escutcheons and floor plates, with an ID to closely fit around pipe, tube, and insulation of insulated piping and an OD that completely covers opening.

B. One-Piece, Deep-Pattern Type: Deep-drawn, box-shaped brass with polished chrome-plated finish.

C. One-Piece, Cast-Brass Type: With set screw and polished chrome-plated finish.

D. Split-Casting, Cast-Brass Type: With concealed hinge and set screw and polished chrome-plated finish.

E. One-Piece, Stamped-Steel Type: With set screw or spring clips and polished chrome-plated finish.

F. Split-Plate, Stamped-Steel Type: With concealed or exposed-rivet hinge, set screw or spring clips, and polished chrome-plated finish.

G. One-Piece, Floor-Plate Type: Cast-iron floor plate.

H. Split-Casting, Floor-Plate Type: Cast brass with concealed hinge and set screw.

2.09 GROUT:

A. Description: ASTM C1107, Grade B, non-shrink and nonmetallic, dry hydraulic-cement grout.

1. Characteristics: Post-hardening, volume-adjusting, non-staining, non-corrosive, non-gaseous, and recommended for interior and exterior applications.

2. Design Mix: 5000-psi, 28-day compressive strength.

3. Packaging: Premixed and factory packaged.

2.10 TRAP PRIMER PIPING:

A. ASTM F876/877, NSF 14 and 61, cross-linked polyethylene tubing minimum 150 psig and minimum 75 degree F rated, compression fitting or mechanical insert fitting joints. Provide minimum number of joints in embedded tubing.

B. AIS Compliance of these materials is required. Refer to Section 22 05 00, 1.01 E for description.

2.11 STRAINERS:

A. Strainers shall have blow-off outlet with pipe nipple and gate valve or ball valve with discharge pipe nipple. Copper alloy or cast-iron body. Provide stainless steel strainer element with perforations of 0.047 inch.

2.12 VALVE BOXES:

A. For each buried valve provide cast-iron, ductile-iron, or plastic box of a suitable size. Provide cast-iron, ductile-iron, or plastic cover respectively for the box with the word "WATER" cast on the cover. Plastic boxes shall be constructed of ABS plastic or inorganic fiber-reinforced black polyolefin plastic. Coat cast-iron and ductile-iron boxes with bituminous paint.

2.13 FREEZE PROTECTION ENCLOSURE:

A. Provide factory-fabricated freeze-proof, weatherproof enclosure with ASSE 1060 certification for protecting water service equipment. The enclosure shall be constructed fiberglass reinforced plastic or minimum 0.05-inch thick reinforced aluminum sheeting with factory-applied fluropolymer coating. Enclosures shall have series 300 stainless steel fasteners and hardware, and have EPDM elastomer gasketing. Wood construction shall not be acceptable. Provide with minimum 1-1/2-inches thick unicellular, non-wicking, polyisocyanurate insulation. Enclosure shall be of modular design, have access doors with locking handles and shall be fully accessible for maintenance. Enclosure shall be provided with unidirectional drain ports that shall be designed to discharge full flow from enclosed piping and equipment and prevent intrusion of debris and/or vermin. Enclosure shall be shop manufactured; field construction is not acceptable. Enclosure shall be of dimensions indicated and anchored to a concrete slab sized in accordance with enclosure manufacturer’s requirements.

B. Enclosure manufacturer shall factory-furnish and install electric heaters (where scheduled on drawings)of capacity, quantity as indicated on the drawings, designed to maintain a minimum internal temperature of 40 degrees F. Heaters shall be UL certified and shall be NEC approved for submersion.

C. Enclosure shall have minimum internal dimensions of 26 inches wide x 70 inches long x 45 inches high, with larger sizes as specified on the drawings.

2.14 EXPANSION TANKS:

A. NSF 61; diaphragm type expansion tanks designed for use in potable water systems; butyl diaphragm, polypropylene liner, welded steel shell; constructed, tested hydrostatically and certified in accordance with ASME BPVC SEC VIII D1. Tank shall be equipped with all necessary fittings including stainless steel system connection and welded air charge fitting with plastic cap. Tank and fittings shall have 125 psig minimum working pressure and 180 degrees F minimum operating temperature.

B. Tanks shall be factory pre-charged and field-adjusted to match incoming water pressure.

C. AIS Compliance of these materials is required. Refer to Section 22 05 00, 1.01 E for description.

2.15 ELECTRIC TRAP PRIMER:

A. Trap primer valve and control all housed in moisture proof enclosure complete with UL listed electrical assembly consisting of circuit breaker, switch, and timer solenoid valve designed to operate on 120 VAC, single phase power. Unit shall be rated for minimum range of 32 to 120 degrees F and 20 to 125 psig, minimum 2 ounces water at 20 psig per trap served. Inlet and outlet piping connections shall be 1/2-inch NPT.

1. Provide distribution unit to serve up to four (4) traps where required.

2.16 HOSE:

A. Kink resistant reinforced rubber hose, corrosion resistant metal couplings, minimum 5 year warranty; size and length as indicated.

B. Provide pipe escutcheons in finished spaces. Pipe escutcheons shall be of stainless steel, anodized aluminum or chrome-plated brass, solid or split hinged.

2.17 DRIP PANS:

A. Examine all Drawings and in cooperation with the Electrical Trade confirm the final location of all new electrical equipment to be installed in the vicinity of new and existing piping. All overhead piping containing liquid or vapor shall be no closer than 3 feet from a vertical line to electrical equipment including, but not limited to, electric motors, controllers, switchboards, panelboards, and similar equipment. Piping is not permitted in Electrical Rooms and stairwells unless specifically serving that room.

B. Where the installation of new and existing plumbing systems piping does not comply with the requirements of the foregoing paragraph, where feasible the piping shall be relocated. Where not feasible, provide drip pans as specified below, except as otherwise indicated on the Drawings.

C. Provide drip pans fabricated from 14-gauge steel sheet and with edges turned up 2-1/2-inches. Reinforce top edge, either by structural angles or by rolling top over 1/4-inch rod made of same material as drip pan sheet metal. Provide hole and 1 inch threaded half coupling for low point drain. Provide hanging brackets of sufficient quantity made of same material as drip pan sheet metal for connecting threaded rods used for suspended drip pans. All joints shall be welded watertight and entire and welded assembly sandblasted, degreased and hot dipped galvanized after fabrication.

D. Locate drip pans under piping passing over or within 3 feet horizontally of material and equipment defined above, and elsewhere as indicated. Hang from structure with rods and

building attachments, fasten rods to brackets on sides of drip pan. Carefully pitch to the drip pan low point for drainage. Brace to prevent sagging or swaying. Drip pans shall be installed within 12 inches below piping.

E. Provide 1-inch schedule 40 hot dipped galvanized steel drain line from each drip pan and terminate 6 inches above the floor at nearest floor drain.

2.18 ACCESS PANELS:

A. Access panels shall give access to each valve and cleanout in concealed spaces above non removable (hard) suspended ceilings, and to all other concealed parts of the system. Access panels shall be located where indicated on the Drawings, or where otherwise require accessibility for the proper inspection, operation and maintenance of the system.

B. Access panels shall be Milcor Type M, 16 inch by 16 inch minimum, as manufactured by Inryco, Inc. Door shall be constructed of 18 gage galvanized steel with frame constructed of 16 gage galvanized steel. Casing bead shall be galvanized steel. Hinges shall be steel concealed spring type with steel pin. Locks shall be flush, screwdriver operated, with metal cam. Prime coat shall be factory applied rust-inhibitive light grey paint. Provide masonry anchors where required.

PART 3 - EXECUTION

3.01 INSTALLATION:

A. Installation, workmanship, inspection, and testing shall be in accordance with the specified Plumbing Code, Energy Conservation Code, and Building Code with the additions specified herein. Install piping straight and true to bear evenly on hangers and supports. Keep the interior and ends of new piping and existing piping affected by the Work thoroughly cleaned of water and foreign matter. Keep piping systems clean during installation by means of plugs or other acceptable methods. When work is not in progress, securely close open ends of piping to prevent entry of water and foreign matter. Inspect piping before placing into position. When fixtures require both hot water and cold water supplies, provide the hot water supply to the left of the cold water supply. Plastic piping shall not penetrate fire walls or fire floors and shall be used on one side of fire walls and fire floors not closer than 6 inches to the penetration. Plastic DWV piping shall not be permitted in more than two-story buildings. Cast-iron DWV piping only shall be provided in more than two-story buildings. Copper tube extracted joints shall not be permitted.

B. Piping shall not be permitted in Electrical Rooms and stairwells unless specifically serving that room.

C. Piping and other apparatus shall not be installed in such a manner so as to interfere with the full swing of doors, movement of personnel and equipment, and access to other equipment.

D. Install aboveground pressurized piping to permit draining of all sections of each piping systems without traps. Pitch piping back to system low points. Provide drain valves at all piping low points.

E. Make provisions for pipe expansion and contraction with suitable anchors and offsets, expansion joints, or expansion loops. Install piping to allow freedom of movement in all planes without imposing undue stress on any section of the main piping, branch piping, equipment and structure.

F. Buried Piping:

1. Pipe bedding and compacted backfill to a point 12 inches above crown of buried pipe shall be provided under this Section of the Specifications in accordance with the requirements of Section 31 23 33.

2. Pipe bedding shall be 6 inches deep. Bedding and compacted backfill shall be non-corrosive material such as cleaned washed sand, and contain no stones, metal, rubbish of any kind, frozen material, organic matter, or any other material capable of damaging piping or coating, and/or of settling.

3. Where feasible, install buried lines in a single trench. Trenches shall be wide enough to permit at least 6 inches spacing between lines and the sides and floor of the trench.

4. Terminate buried piping not more than 6 inches above finished ground surface or floor slab-on-grade, or from foundation wall inside surface.

5. Make provisions in buried piping for differential settlement.

6. Completely encase buried copper tubing, ductile-iron piping, and cast-iron piping with polyethylene tube or sheet in accordance with AWWA C105.

G. Threaded Connections:

1. Jointing compound for pipe threads shall be polytetrafluoroethylene (PTFE) pipe thread paste, pipe cement and oil, or PTFE powder and oil; apply only on male threads. Provide exposed ferrous pipe threads with one coat of primer applied to a minimum dry film thickness of 1.0 mil. Do not thread metal pipe into plastic piping.

H. Soldered Connections:

1. Soldering shall be performed in accordance with best soldering practice. Before soldering copper tubing joints, both the outside of the tube and the inside of the fitting shall be cleaned with a wire fitting brush until the entire joint surface is bright and clean. Provide suitable flux for use with solder. Surplus soldering material shall be removed at all joints. Piping shall be supported prior to soldering and not be sprung or forced.

2. For solder end valves, remove stems and washers and other items subject to damage by heat during installation. Reassemble valve after soldering is complete. Valves without heat sensitive parts do not require disassembly but shall be fully opened during soldering.

I. Brazed Connections:

1. Brazing of copper tubing joints shall be performed in accordance with AWS BRH, except as modified herein. During brazing, the pipe and fittings shall be continuously purged with a pressure regulated inert gas, such as nitrogen, to prevent the formation of scale. Before brazing, both the outside of the tube and the inside of the fitting shall be cleaned with a wire fitting brush until the entire joint surface is bright and clean. Brazing flux shall not be used. Surplus brazing material shall be removed at all joints. Piping shall be supported prior to brazing and not be sprung or forced.

J. Flanged Connections:

1. Flanges shall be faced true, and made square and tight.

K. Seismic Bracing Requirements:

1. Piping and equipment shall be supported and braced to resist seismic loads where required by the specified Building Code. Provide seismic restraints in accordance with the SMACNA Seismic Restraint Unit.

L. Pipe Through-Penetrations:

1. Furnish pipe sleeves where piping passes through walls, floors, ceilings, roofs, and partitions. Sleeves will be installed and secured in proper position and location during construction by the trade whose element will be penetrated. Such trades include concrete, masonry, steel siding in the case of a steel building, and dry wall in the case of framed construction. Core drilling of masonry and concrete may be provided by this Section in lieu of pipe sleeves when cavities in the core-drilled holes are completely grouted smooth. Furnish sleeves of sufficient length to pass through entire thickness of walls, floors, ceilings, roofs, and partitions.

2. Pipe Penetrations Through Building Interior Construction: Provide not less than 1/4-inch space between exterior of piping or pipe insulation and interior of sleeve or core-drilled hole. Firmly pack space with mineral wool insulation. For non-fire rated assemblies, seal at both ends of the sleeve or core-drilled hole with plastic waterproof cement which will dry to a firm but pliable mass or silicone. Seal both ends of penetrations through fire rated assemblies to maintain fire resistive integrity with UL listed fill, void, or cavity material.

3. Pipe Penetrations Through Building Exterior Construction: Provide a mechanically adjustable segmented elastomeric seal, with sleeve sized as recommended by seal manufacturer.

4. Extend sleeves in floor slabs 2 inches above the finished floor, except sleeves are not required where drain, waste and vent piping passes through concrete floor slabs located on grade. Sleeves through walls shall terminate flush with the finished surface on either side of the wall.

M. Cross Connection and Interconnections:

1. No equipment, devices or piping shall be installed which will provide a cross or interconnection between a domestic water supply and a drainage, soil or waste pipe which will permit or make possible the backflow of sewage, polluted water or waste into the domestic water supply system.

N. Connections to Existing Water Supply Systems:

1. Use tapping or drilling machine valve and mechanical joint type sleeves for connections to be made under pressure. Bolt sleeves around the main piping; bolt valve conforming to AWWA C500 to the branch connection. Open valve, attach drilling machine, make tap, close valve, and remove drilling machine, without interruption of service. Notify the Engineer in writing at least 7 days prior to connection date and receive acceptance before any service is interrupted. Furnish materials required to make connections into the existing water supply systems and perform excavating, backfilling, surface restoration and other incidental labor. Furnish the labor and the tapping or drilling machine for making the actual connections to the existing systems.

3.02 DISINFECTION:

A. Disinfect the new water piping and existing water piping affected by the Work in accordance with the specified Plumbing Code with the additions specified herein or AWWA C651 whichever is more stringent. Fill piping systems with chlorine solution and allow solution to stand. Following the required standing time, flush solution from the systems with domestic water until maximum residual chlorine content is within the range of 0.2 to 0.5 ppm, or the residual chlorine content of domestic water supply. Obtain at least two consecutive satisfactory bacteriological samples from new and existing water piping, analyzed by a certified laboratory, and submit results prior to the new and existing water piping being placed into service. Disinfection of systems supplied by non-potable water (service water) is not required.

B. Where it is not possible to disinfect a potable water storage tank as specified above, the entire interior of the tank shall be swabbed with a solution which contains 200 parts per million of available chlorine; and the solution shall than be allowed to stand 3 hours before the tank is flushed and returned to service.

C. For a potable water filter or similar device, the dosage shall be determined by the State Department of Environmental Protection.

3.03 PAINTING:

A. Field painting of above ground plumbing piping shall be provided under this Section in accordance with Section 09 90 00.

B. Field touch up all damaged factory or shop applied coatings for material and equipment furnished under this Section in accordance with the manufacturer's recommendation.

C. Do not apply field painting and touch-up until after installation and testing is completed and system accepted.

3.04 CONTRACT CLOSEOUT:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

Page Intentionally Left Blank

SECTION 22 05 13

COMMON MOTOR REQUIREMENTS FOR PLUMBING EQUIPMENT

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide general requirements for single-phase and polyphase, general-purpose, horizontal, small and medium, squirrel-cage induction motors for use on alternating-current power systems up to 600 V and installed at equipment manufacturer's factory or shipped separately by equipment manufacturer for field installation as indicated and in compliance with Contract Documents.

1.02 REFERENCES:

A. National Electrical Manufacturers Association (NEMA):

1. MG1: Motors and Generators

1.03 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

1.04 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.05 SPARE PARTS:

A. Comply with the requirements specified in Section 01 61 00.

1.06 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

1.07 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

1.08 COORDINATION:

A. Coordinate features of motors, installed units, and accessory devices to be compatible with the following:

1. Motor controllers.

2. Torque, speed, and horsepower requirements of the load.

3. Ratings and characteristics of supply circuit and required control sequence.

4. Ambient and environmental conditions of installation location.

PART 2 - PRODUCTS

2.01 GENERAL MOTOR REQUIREMENTS:

A. Comply with NEMA MG 1 unless otherwise indicated.

B. Comply with IEEE 841 for severe-duty motors.

2.02 MOTOR CHARACTERISTICS:

A. Duty: Continuous duty at ambient temperature of 104 degrees F and at altitude of 4200 feet above sea level.

B. Capacity and Torque Characteristics: Sufficient to start, accelerate, and operate connected loads at designated speeds, at installed altitude and environment, with indicated operating sequence, and without exceeding nameplate ratings or considering service factor.

2.03 POLYPHASE MOTORS:

A. Description: NEMA MG 1, Design B, medium induction motor

B. Efficiency: Premium efficient, as defined in NEMA MG 1

C. Service Factor: 1.15

D. Multispeed Motors: Variable torque

1. For motors with 2:1 speed ratio, consequent pole, single winding

2. For motors with other than 2:1 speed ratio, separate winding for each speed

E. Multispeed Motors: Separate winding for each speed

F. Rotor: Random-wound, squirrel cage

G. Bearings: Redressable, shielded, antifriction ball bearings suitable for radial and thrust loading

H. Temperature Rise: Match insulation rating

I. Insulation: Class F

J. Code Letter Designation:

1. Motors 15 HP and Larger: NEMA starting Code F

2. Motors Smaller than 15 HP: Manufacturer's standard starting characteristic

K. Enclosure Material: Cast iron for motor frame sizes 324T and larger; rolled steel for motor frame sizes smaller than 324T.

2.04 ADDITIONAL REQUIREMENTS FOR POLYPHASE MOTORS:

A. Motors Used with Reduced-Voltage and Multispeed Controllers: Match wiring connection requirements for controller with required motor leads. Provide terminals in motor terminal box, suited to control method.

B. Motors Used with Variable-Frequency Controllers: Ratings, characteristics, and features coordinated with and approved by controller manufacturer.

1. Windings: Copper magnet wire with moisture-resistant insulation varnish, designed and tested to resist transient spikes, high frequencies, and short time rise pulses produced by pulse-width-modulated inverters.

2. Inverter-Duty Motors: Class F temperature rise; Class H insulation.

3. Thermal Protection: Comply with NEMA MG 1 requirements for thermally protected motors.

2.05 SINGLE-PHASE MOTORS:

A. Motors larger than 1/20 hp shall be one of the following, to suit starting torque and requirements of specific motor application:

1. Permanent-split capacitor

2. Split phase

3. Capacitor start, inductor run

4. Capacitor start, capacitor run

B. Multispeed Motors: Variable-torque, permanent-split-capacitor type.

C. Bearings: Prelubricated, antifriction ball bearings or sleeve bearings suitable for radial and thrust loading.

D. Motors 1/20 HP and Smaller: Shaded-pole type.

E. Thermal Protection: Internal protection to automatically open power supply circuit to motor when winding temperature exceeds a safe value calibrated to temperature rating of motor insulation. Thermal-protection device shall automatically reset when motor temperature returns to normal range.

PART 3 - EXECUTION

3.01 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 22 05 19

METERS AND GAGES FOR PLUMBING PIPING

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide meters and gages for plumbing piping as indicated and in compliance with Contract Documents.

1. Thermometers

2. Pressure Gages

3. Test Plugs

1.02 REFERENCES:

A. American Society of Mechanical Engineers (ASME):

1. B1.1: Unified Inch Screw Threads (UN and UNR Thread Form)

2. B1.20.1: Pipe Threads, General Purpose (Inch)

3. B40.100: Pressure Gauges and Gauge Attachments

4. B40.200: Thermometers, Direct Reading and Remote Reading

1.03 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Product Data: For each type of product. Submit manufacturer's technical product data, including installation instructions for each type of meter and gage. Include scale range, ratings, and calibrated performance curves, certified where indicated. Submit meter and gage schedule showing manufacturer's figure number, scale range, location, and accessories for each meter and gage.

C. Product Certificates: For each type of meter and gage.

D. Operation and Maintenance Data: For each type of meters and gages to include in operation and maintenance manuals.

1.04 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.05 SPARE PARTS:

A. Comply with the requirements specified in Section 01 61 00.

1.06 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

B. Manufacturer's Qualifications: Firms regularly engaged in manufacturer of meters and gages, of types and sizes required, whose products have been in satisfactory use in similar service for not less than 5 years.

C. Codes and Standards:

1. UL Compliance: Comply with applicable UL standards pertaining to meters and gages.

2. ANSI and ISA Compliance: Comply with applicable portions of ANSI and Instrument Society of America (ISA) standards pertaining to construction and installation of meters and gages.

D. Certification: Provide meters and gages whose accuracies, under specified operating conditions, are certified by manufacturer.

1.07 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

PART 2 - PRODUCTS

2.01 METAL-CASE, LIQUID-IN-GLASS THERMOMETERS:

A. Manufacturers:

1. Palmer - Wahl Instruments Inc.

2. Miljoco Co.

3. Trerice, H. O. Co.

4. Weiss Instruments, Inc.

5. Weksler Instruments Operating Unit; Dresser Industries; Instrument Division.

B. Case: Die-cast aluminum or brass, 7 inches to 9 inches long.

C. Tube: Red or blue reading, organic-liquid filled, with magnifying lens.

D. Tube Background: Satin-faced, nonreflective aluminum with permanently etched scale markings.

E. Window: Glass.

F. Connector: Adjustable type, 180 degrees in vertical plane, 360 degrees in horizontal plane, with locking device.

G. Stem: Copper-plated steel, aluminum, or brass for thermowell installation and of length to suit installation.

H. Accuracy: Plus or minus 1 scale division.

2.02 DIRECT-MOUNTING, VAPOR-ACTUATED DIAL THERMOMETERS:

A. Manufacturers:

1. Miljoco Co

2. Trerice, H. O. Co.

3. Weiss Instruments, Inc.

4. Weksler Instruments Operating Unit; Dresser Industries; Instrument Division

B. Type: Vapor Tension, Universal Angle Brass.

C. Case: Liquid-filled type, metal, 4-1/2-inch diameter.

D. Element: Bourdon tube.

E. Movement: Brass precision geared.

F. Dial: Satin-faced, nonreflective aluminum with permanently etched scale markings.

G. Pointer: Red or other dark-color metal.

H. Window: Glass.

I. Ring: Brass or Stainless steel.

J. Connector: Adjustable type, 180 degrees in vertical plane, 360 degrees in horizontal plane, with locking device.

K. Thermal System: Liquid-filled bulb in copper-plated steel, aluminum, or brass stem for thermowell installation and of length to suit installation.

L. Accuracy: Plus or minus 1 scale division.

2.03 BIMETALLIC-ACTUATED DIAL THERMOMETERS:

A. Manufacturers:

1. Ernst Gage Co.

2. Eugene Ernst Products Co.

3. Miljoco Co.

4. Trerice, H. O. Co.

5. Weiss Instruments, Inc.

6. Weksler Instruments Operating Unit; Dresser Industries; Instrument Division

B. Type: Bi-metal stainless steel case and stem.

C. Description: Direct-mounting, bimetallic-actuated dial thermometers complying with ASME B40.3.

D. Case: Liquid-filled type, stainless steel with 3-inch to 5-inch diameter

E. Element: Bimetal coil

F. Dial: 1 inch diameter, dust and leak proof

G. Pointer: Red or other dark-color metal

H. Window: Glass

I. Ring: Stainless steel

J. Connector: Adjustable angle type

K. Stem: 1/8 inch diameter with nominal length of 5 inches

L. Accuracy: 0.5 percent of dial range

2.04 DIGITAL THERMOMETERS:

A. Manufacturers:

1. Weksler Glass Thermometer Corporation

2. Weiss Instruments, Inc.

B. Case: High Impact ABS, black plastic

C. Range: -40 degrees to 300 degrees F

D. Display: LCD, 3/8 inches

E. Accuracy: 1 percent of reading

F. Lux Rating: 10 Lux (1 foot candle)

2.05 THERMOWELLS:

A. Manufacturers: Same as manufacturer of thermometer being used.

B. Description: Provide thermowells constructed of brass or stainless steel, pressure rated to match piping system design pressure. Provide 2: extension for insulated piping. Provide cap nut with chain fastened permanently to thermometer well.

2.06 PRESSURE GAGES:

A. Manufacturers:

1. AMETEK, Inc.; U.S. Gauge Division

2. Miljoco Co

3. Trerice, H. O. Co.

4. Weiss Instruments, Inc.

5. Weksler Instruments Operating Unit; Dresser Industries; Instrument Division

B. General use type complying with ANSI B40, Grade A.

C. Case: Liquid-filled type, drawn steel or Brass, 4-1/2-inch diameter.

D. Pressure-Element Assembly: Phosphor bronze Bourdon tube.

E. Pressure Connection: Brass, NPS 1/4, bottom-outlet type unless back-outlet type is indicated.

F. Movement: Mechanical, with link to pressure element and connection to pointer.

G. Dial: White coated aluminum with permanently etched scale markings.

H. Pointer: Red or other dark-color metal.

I. Window: Glass.

J. Ring: Brass or Stainless steel.

K. Accuracy: Grade A, 1 percent scale.

L. Pressure Range:

1. Vacuum: 30-in. Hg of vacuum to 15 psig of pressure

2. Water: 0-100 psi

M. Pressure-Gage Fittings:

1. Valves: NPS 1/4 brass or stainless-steel needle type.

2. Snubbers: ASME B40.5, NPS 1/4 brass bushing with corrosion-resistant, porous-metal disc of material suitable for system fluid and working pressure.

2.07 TEST PLUGS:

A. Manufacturers:

1. MG Piping Products Co.

2. Miljoco Co.

3. Peterson Equipment Co., Inc.

4. Trerice, H. O. Co.

5. Watts Industries, Inc.; Water Products Division

B. Description: Corrosion-resistant brass or stainless-steel body with core inserts and gasketed and threaded cap, with extended stem for units to be installed in insulated piping.

C. Minimum Pressure and Temperature Rating: 500 psig at 200 degrees F.

D. Core Inserts: One or two self-sealing rubber valves.

1. Insert material for water service at 20 to 200 degrees F shall be CR.

2. Insert material for water service at minus 30 to plus 275 degrees F shall be EPDM.

2.08 SIGHT FLOW INDICATORS:

A. Description: Piping inline-installation device for visual verification of flow.

B. Construction: Bronze or stainless-steel body, with sight glass and paddle wheel indicator, and threaded or flanged ends.

C. Minimum Pressure Rating: 150 psig

D. Minimum Temperature Rating: 200 degrees F

E. End Connections for NPS 2 and Smaller: Threaded

F. End Connections for NPS 2-1/2 and Larger: Flanged

PART 3 - EXECUTION

3.01 INSTALLATION:

A. Install thermowells with socket extending to center of pipe and in vertical position in piping tees.

B. Install thermowells of sizes required to match thermometer connectors. Include bushings if required to match sizes.

C. Install thermowells with extension on insulated piping.

D. Fill thermowells with heat-transfer medium.

E. Install direct-mounted thermometers in thermowells and adjust vertical and tilted positions.

F. Install remote-mounted thermometer bulbs in thermowells and install cases on panels; connect cases with tubing and support tubing to prevent kinks. Use minimum tubing length.

G. Install direct-mounted pressure gages in piping tees with pressure gage located on pipe at the most readable position.

H. Install remote-mounted pressure gages on panel.

I. Install valve and snubber in piping for each pressure gage for fluids.

J. Install test plugs in piping tees.

K. Install thermometers in the following locations:

1. Inlet and outlet of each water heater.

2. Inlets and outlets of each domestic water heat exchanger.

3. Inlet and outlet of each domestic hot-water storage tank.

L. Install pressure gages in the following locations:

1. Building water service entrance into building.

2. Inlet and outlet of each pressure-reducing valve.

3. Suction and discharge of each domestic water pump.

3.02 CONNECTIONS:

A. Install meters and gages adjacent to machines and equipment to allow service and maintenance of meters, gages, machines, and equipment.

3.03 ADJUSTING:

A. Adjust faces of meters and gages to proper angle for best visibility.

3.04 APPLICATIONS:

A. Thermometer Applications:

1. Install thermometers in the outlet of each domestic water heater and each domestic, hot-water storage tank.

2. Install liquid-filled-case-type, bimetallic-actuated dial thermometers at suction and discharge of each pump.

3. Thermometer stems shall be of length to match thermowell insertion length.

4. Provide the following temperature ranges for thermometers:

a. Domestic Hot Water: 30 to 180 degrees F, with 2-degree scale divisions

b. Domestic Cold Water: 0 to 100 degrees F, with 2-degree scale divisions

B. Gage Applications:

1. Install pressure gages at discharge of each water service into building.

2. Install pressure gages for discharge of each pressure-reducing valve.

3. Install pressure gages at suction and discharge of each pump.

4. Install pressure gages at suction and discharge of each domestic water pump shall.

5. Provide the following pressure ranges for thermometers:

a. Scale Range for Water Service Piping: 0 to 100 psi

b. Scale Range for Domestic Water Piping: 0 to 100 psi

3.05 INSTALLATIONS:

1. Install direct-mounting thermometers and adjust vertical and tilted positions.

2. Install remote-mounting dial thermometers on panel, with tubing connecting panel and thermometer bulb supported to prevent kinks. Use minimum tubing length.

3. Install thermowells with socket extending a minimum of 2 inches into fluid to center of pipe and in vertical position in piping tees where thermometers are indicated.

4. Install direct-mounting pressure gages in piping tees with pressure gage located on pipe at most readable position.

5. Install remote-mounting pressure gages on panel.

6. Install needle-valve and snubber fitting in piping for each pressure gage.

7. Install test plugs in tees in piping.

8. Install permanent indicators on walls or brackets in accessible and readable positions.

9. Install connection fittings for attachment to portable indicators in accessible locations.

10. Install thermometers and gages adjacent to machines and equipment to allow service and maintenance for thermometers, gages, machines, and equipment.

11. Adjust faces of thermometers and gages to proper angle for best visibility.

3.06 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

Page Intentionally Left Blank

SECTION 22 05 23

VALVES FOR PLUMBING PIPING

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide valves for plumbing piping as indicated and in compliance with Contract Documents.

1. Ball Valves:

a. Brass ball valves

b. Bronze ball valves

c. Steel ball valves

d. Iron ball valves

e. CPVC ball valves

f. PVC ball valves

2. Butterfly Valves:

a. Iron, grooved-end butterfly valves

b. CPVC butterfly valves

c. PVC butterfly valves

d. Chainwheels

3. Check Valves:

a. Bronze lift check valves

b. Bronze swing check valves

c. Iron swing check valves

d. Iron swing check valves with closure control

e. Iron, grooved-end swing check valves

f. Iron, center-guided check valves

g. Iron, plate-type check valves

h. CPVC ball check valves

i. PVC ball check valves

4. Gate Valves:

a. Bronze gate valves

b. Iron gate valves

c. CPVC gate valves

d. PVC gate valves

e. Chainwheels

2. 372: Drinking water System Components – Lead Content

1.03 DEFINITIONS:

A. CWP: Cold working pressure

B. EPDM: Ethylene propylene-diene terpolymer rubber

C. NBR: Acrylonitrile-butadiene, Buna-N, or nitrile rubber

D. NRS: Non-rising stem

E. OS&Y: Outside screw and yoke

F. RS: Rising stem

1.04 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Product Data: For each type of valve.

1. Certification that products comply with NSF 61 and NSF 372.

1.05 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.06 SPARE PARTS:

A. Comply with the requirements specified in Section 01 61 00.

1.07 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

1.08 DELIVERY, STORAGE, AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

B. Prepare valves for shipping as follows:

1. Protect internal parts against rust and corrosion.

2. Protect threads, flange faces, and soldered ends.

3. Set ball valves open to minimize exposure of functional surfaces.

C. Use the following precautions during storage:

1. Maintain valve end protection.

2. Store valves indoors and maintain at higher-than-ambient-dew-point temperature. If outdoor storage is necessary, store valves off the ground in watertight enclosures.

D. Use sling to handle large valves; rig sling to avoid damage to exposed parts. Do not use operating handles or stems as lifting or rigging points.

PART 2 - PRODUCTS

2.01 GENERAL REQUIREMENTS FOR VALVES:

A. Source Limitations for Valves: Obtain each type of valve from single source from single manufacturer.

B. AIS Compliance of these materials is required. Refer to Section 22 05 00, 1.01 E for description.

C. ASME Compliance:

1. ASME B1.20.1 for threads for threaded end valves

2. ASME B16.1 for flanges on iron valves

3. ASME B16.5 for flanges on steel valves

4. ASME B16.10 and ASME B16.34 for ferrous valve dimensions and design criteria

5. ASME B16.18 for solder-joint connections

6. ASME B31.9 for building services piping valves

D. AWWA Compliance: Comply with AWWA C606 for grooved-end connections.

E. NSF Compliance: NSF 61 and NSF 372 for valve materials for potable-water service.

F. Bronze valves shall be made with dezincification-resistant materials. Bronze valves made with copper alloy (brass) containing more than 15 percent zinc are not permitted.

G. Valve Pressure-Temperature Ratings: Not less than indicated and as required for system pressures and temperatures.

H. Valve Sizes: Same as upstream piping unless otherwise indicated.

I. Valve Bypass and Drain Connections: MSS SP-45.

J. Valve Actuator Types:

1. Gear Actuator: For quarter-turn valves NPS 4 and larger.

2. Handlever: For quarter-turn valves smaller than NPS 4.

3. Chainwheel: Device for attachment to gear, handlever, or stem; of size and with chain for mounting height, according to "Valve Installation" Article

K. Valves in Insulated Piping:

1. Include 2-inch stem extensions.

2. Extended operating handles of nonthermal-conductive material and protective sleeves that allow operation of valves without breaking vapor seals or disturbing insulation.

3. Memory stops that are fully adjustable after insulation is applied.

2.02 BRASS BALL VALVES:

A. Brass Ball Valves, One-Piece:

1. Compliance: AIS Compliance required. Manufacturer listed is the Basis of Design for performance product requirements. Contractor to submit compliant manufacturer if Basis of Design cannot certify AIS compliance.

2. Manufacturers:

a. Dezurik

b. Apollo Flow Controls

c. American Valve, Inc.

d. Kitz Corporation

3. Description:

a. Standard: MSS SP-110.

b. CWP Rating: 400 psig.

c. Body Design: One piece.

d. Body Material: Forged brass or bronze.

e. Ends: Threaded and soldered.

f. Seats: PTFE.

g. Stem: Brass or stainless steel.

h. Ball: Chrome-plated brass or stainless steel.

i. Port: Reduced.

B. Brass Ball Valves, Two-Piece with Full Port and Brass Trim, Threaded or Soldered Ends:

1. Compliance: AIS Compliance required. Manufacturer listed is the Basis of Design for performance product requirements. Contractor to submit compliant manufacturer if Basis of Design cannot certify AIS compliance.

2. Manufacturers:

a. American Valve, Inc.

b. Apollo Flow Controls

c. Crane

d. Milwaukee Valve Company

e. NIBCO Inc.

f. WATTS

3. Description:

a. Standard: MSS SP-110 or MSS SP-145.

b. CWP Rating: 600 psig.

c. Body Design: Two piece.

d. Body Material: Forged brass.

e. Ends: Threaded and soldered.

f. Seats: PTFE.

g. Stem: Brass.

h. Ball: Chrome-plated brass.

i. Port: Full.

C. Brass Ball Valves, Two-Piece with Full Port and Stainless-Steel Trim, Threaded or Soldered Ends:

1. Compliance: AIS Compliance required. Manufacturer listed is the Basis of Design for performance product requirements. Contractor to submit compliant manufacturer if Basis of Design cannot certify AIS compliance.

2. Manufacturers:

    a. Apollo Flow Controls

    b. Hammond Valve

    c. Kitz Corporation

    d. Milwaukee Valve Company

    e. NIBCO Inc.

3. Description:

    a. Standard: MSS SP-110 or MSS SP-145.

    b. CWP Rating: 600 psig.

    c. Body Design: Two piece.

    d. Body Material: Forged brass.

    e. Ends: Threaded and soldered.

    f. Seats: PTFE.

    g. Stem: Stainless steel.

    h. Ball: Stainless steel, vented.

    i. Port: Full.

D. Brass Ball Valves, Two-Piece with Regular Port and Brass Trim:

1. Compliance: AIS Compliance required. Manufacturer listed is the Basis of Design for performance product requirements. Contractor to submit compliant manufacturer if Basis of Design cannot certify AIS compliance.

2. Manufacturers:

    a. Apollo Flow Controls

    b. Hammond Valve

    c. Milwaukee Valve Company

    d. NIBCO Inc.

    e. WATTS

3. Description:

    a. Standard: MSS SP-110.

    b. CWP Rating: 600 psig.

    c. Body Design: Two piece.

    d. Body Material: Forged brass.

    e. Ends: Threaded and soldered.

    f. Seats: PTFE.

    g. Stem: Brass.

    h. Ball: Chrome-plated brass.

    i. Port: Regular.

E. Brass Ball Valves, Two-Piece with Regular Port and Stainless-Steel Trim:

1. Compliance: AIS Compliance required. Manufacturer listed is the Basis of Design for performance product requirements. Contractor to submit compliant manufacturer if Basis of Design cannot certify AIS compliance.

2. Manufacturers:

    a. Jamesbury; Metso

3. Description:

    a. Standard: MSS SP-110.

    b. CWP Rating: 600 psig.

    c. Body Design: Two piece.

    d. Body Material: Brass or bronze.

    e. Ends: Threaded and soldered.

    f. Seats: PTFE.

    g. Stem: Stainless steel.

    h. Ball: Stainless steel, vented.

    i. Port: Regular.

F. Brass Ball Valves, Three-Piece with Full Port and Brass Trim:

1. Compliance: AIS Compliance required. Manufacturer listed is the Basis of Design for performance product requirements. Contractor to submit compliant manufacturer if Basis of Design cannot certify AIS compliance.

2. Manufacturers:

   a. Jomar Valve

   b. Kitz Corporation

   c. WATTS

3. Description:

   a. Standard: MSS SP-110.

   b. CWP Rating: 600 psig.

   c. Body Design: Three piece.

   d. Body Material: Forged brass.

   e. Ends: Threaded and soldered.

   f. Seats: PTFE.

   g. Stem: Brass.

   h. Ball: Chrome-plated brass.

   i. Port: Full.

G. Brass Ball Valves, Three-Piece with Full Port and Stainless-Steel Trim:

1. Compliance: AIS Compliance required. Manufacturer listed is the Basis of Design for performance product requirements. Contractor to submit compliant manufacturer if Basis of Design cannot certify AIS compliance.

2. Manufacturers:

   a. Marwin Valve; Richards Industries

3. Description:

   a. Standard: MSS SP-110.

   b. CWP Rating: 600 psig.

c. Body Design: Three piece.

d. Body Material: Forged brass.

e. Ends: Threaded and soldered.

f. Seats: PTFE.

g. Stem: Stainless steel.

h. Ball: Stainless steel, vented.

i. Port: Full.

2.03 BRONZE BALL VALVES:

A. Bronze Ball Valves, One-Piece with Bronze Trim:

1. Compliance: AIS Compliance required. Manufacturer listed is the Basis of Design for performance product requirements. Contractor to submit compliant manufacturer if Basis of Design cannot certify AIS compliance.

2. Manufacturers:

a. Apollo Flow Controls

b. FNW; Ferguson Enterprises

c. NIBCO Inc.

d. WATTS

3. Description:

a. Standard: MSS SP-110.

b. CWP Rating: 400 psig.

c. Body Design: One piece.

d. Body Material: Bronze.

e. Ends: Threaded.

f. Seats: PTFE.

g. Stem: Bronze.

h. Ball: Chrome-plated brass.

i. Port: Reduced.

B. Bronze Ball Valves, One-Piece with Stainless-Steel Trim:

1. Compliance: AIS Compliance required. Manufacturer listed is the Basis of Design for performance product requirements. Contractor to submit compliant manufacturer if Basis of Design cannot certify AIS compliance.

2. Manufacturers:

a. Apollo Flow Controls

b. NIBCO Inc.

c. WATTS

3. Description:

a. Standard: MSS SP-110.

b. CWP Rating: 600 psig.

c. Body Design: One piece.

d. Body Material: Bronze.

e. Ends: Threaded.

f. Seats: PTFE.

g. Stem: Stainless steel.

h. Ball: Stainless steel, vented.

i. Port: Reduced.

C. Bronze Ball Valves, Two-Piece with Full Port, and Bronze or Brass Trim, Threaded or Soldered Ends:

1. Compliance: AIS Compliance required. Manufacturer listed is the Basis of Design for performance product requirements. Contractor to submit compliant manufacturer if Basis of Design cannot certify AIS compliance.

2. Manufacturers:

a. Apollo Flow Controls

b. Crane

c. Hammond Valve

d. Milwaukee Valve Company

e. NIBCO Inc.

f. WATTS

g. Zurn Industries

3. Description:

a. Standard: MSS SP-110 or MSS-145.

b. CWP Rating: 600 psig.

c. Body Design: Two piece.

d. Body Material: Bronze.

e. Ends: Threaded and soldered.

f. Seats: PTFE.

g. Stem: Bronze or brass.

h. Ball: Chrome-plated brass.

i. Port: Full.

D. Bronze Ball Valves, Two-Piece with Full Port and Stainless-Steel Trim:

1. Manufacturers:

a. Compliance: AIS Compliance required. Manufacturer listed is the Basis of Design for performance product requirements. Contractor to submit compliant manufacturer if Basis of Design cannot certify AIS compliance.

b. Apollo Flow Controls

c. Crane

d. Hammond Valve

e. Milwaukee Valve Company

f. NIBCO Inc.

g. WATTS

2. Description:

a. Standard: MSS SP-110 or MSS-145.

b. CWP Rating: 600 psig.

c. Body Design: Two piece.

d. Body Material: Bronze.

e. Ends: Threaded or soldered.

f. Seats: PTFE.

g. Stem: Stainless steel.

h. Ball: Stainless steel, vented.

i. Port: Full.

E. Bronze Ball Valves, Two-Piece with Regular Port and Bronze or Brass Trim:

1. Compliance: AIS Compliance required. Manufacturer listed is the Basis of Design for performance product requirements. Contractor to submit compliant manufacturer if Basis of Design cannot certify AIS compliance.

2. Manufacturers:

a. Apollo Flow Controls

b. Hammond Valve

c. Milwaukee Valve Company

d. NIBCO Inc.

e. WATTS

3. Description:

a. Standard: MSS SP-110.

b. CWP Rating: 600 psig.

c. Body Design: Two piece.

d. Body Material: Bronze.

e. Ends: Threaded.

f. Seats: PTFE.

g. Stem: Bronze or brass.

h. Ball: Chrome-plated brass.

i. Port: Regular.

F. Bronze Ball Valves, Two-Piece with Regular Port and Stainless-Steel Trim:

1. Compliance: AIS Compliance required. Manufacturer listed is the Basis of Design for performance product requirements. Contractor to submit compliant manufacturer if Basis of Design cannot certify AIS compliance.

2. Manufacturers:

a. Apollo Flow Controls

b. Hammond Valve

c. NIBCO Inc.

d. WATTS

3. Description:

a. Standard: MSS SP-110.

b. CWP Rating: 600 psig.

c. Body Design: Two piece.

d. Body Material: Bronze.

e. Ends: Threaded.

f. Seats: PTFE.

g. Stem: Stainless steel.

h. Ball: Stainless steel, vented.

i. Port: Regular.

G. Bronze Ball Valves, Three-Piece with Full Port and Bronze or Brass Trim:

1. Compliance: AIS Compliance required. Manufacturer listed is the Basis of Design for performance product requirements. Contractor to submit compliant manufacturer if Basis of Design cannot certify AIS compliance.

2. Manufacturers:

    a. Apollo Flow Controls

    b. Crane

    c. Hammond Valve

    d. Milwaukee Valve Company

    e. NIBCO Inc.

    f. WATTS

3. Description:

    a. Standard: MSS SP-110.

    b. CWP Rating: 600 psig.

    c. Body Design: Three piece.

    d. Body Material: Bronze.

    e. Ends: Threaded.

    f. Seats: PTFE.

    g. Stem: Bronze or brass.

    h. Ball: Chrome-plated brass.

    i. Port: Full.

H. Bronze Ball Valves, Three-Piece with Full Port and Stainless-Steel Trim:

1. Compliance: AIS Compliance required. Manufacturer listed is the Basis of Design for performance product requirements. Contractor to submit compliant manufacturer if Basis of Design cannot certify AIS compliance.

2. Manufacturers:

    a. Apollo Flow Controls

    b. Hammond Valve

    c. Milwaukee Valve Company

    d. NIBCO Inc.

e. WATTS

3. Description:

a. Standard: MSS SP-110.

b. CWP Rating: 600 psig.

c. Body Design: Three piece.

d. Body Material: Bronze.

e. Ends: Threaded.

f. Seats: PTFE.

g. Stem: Stainless steel.

h. Ball: Stainless steel, vented.

i. Port: Full.

I. Bronze Ball Valves, Three-Piece with Regular Port and Bronze Trim:

1. Compliance: AIS Compliance required. Manufacturer listed is the Basis of Design for performance product requirements. Contractor to submit compliant manufacturer if Basis of Design cannot certify AIS compliance.

2. Manufacturers:

a. Apollo Flow Controls

b. Jamesbury; Metso

c. NIBCO Inc.

3. Description:

a. Standard: MSS SP-110.

b. CWP Rating: 600 psig.

c. Body Design: Three piece

d. Body Material: Bronze

e. Ends: Threaded or soldered.

f. Seats: PTFE.

g. Stem: Bronze.

h. Ball: Chrome-plated brass.

i. Port: Regular.

J. Bronze Ball Valves, Three-Piece with Regular Port and Stainless-Steel Trim:

1. Compliance: AIS Compliance required. Manufacturer listed is the Basis of Design for performance product requirements. Contractor to submit compliant manufacturer if Basis of Design cannot certify AIS compliance.

2. Manufacturers:

a. Apollo Flow Controls

b. Jamesbury; Metso

c. NIBCO Inc.

3. Description:

a. Standard: MSS SP-110.

b. CWP Rating: 600 psig.

c. Body Design: Three piece.

d. Body Material: Bronze.

e. Ends: Threaded or soldered.

f. Seats: PTFE.

g. Stem: Stainless steel.

h. Ball: Stainless steel, vented.

i. Port: Regular.

K. Bronze Ball Valves, Two-Piece, Safety-Exhaust:

1. Compliance: AIS Compliance required. Manufacturer listed is the Basis of Design for performance product requirements. Contractor to submit compliant manufacturer if Basis of Design cannot certify AIS compliance.

2. Manufacturers:

a. Apollo Flow Controls

b. Jamesbury; Metso

c. NIBCO Inc.

3. Description:

a. Standard: MSS SP-110.

b. CWP Rating: 600 psig.

c. Body Design: Two piece.

d. Body Material: Bronze, ASTM B584, Alloy C844.

e. Ends: Threaded.

f. Seats: PTFE.

g. Stem: Stainless steel.

h. Ball: Chrome-plated brass, with exhaust vent opening for pneumatic applications.

i. Port: Full.

2.04 STEEL BALL VALVES:

A. Steel Ball Valves with Full Port, Class 150:

1. Compliance: AIS Compliance required. Manufacturer listed is the Basis of Design for performance product requirements. Contractor to submit compliant manufacturer if Basis of Design cannot certify AIS compliance.

2. Manufacturers:

a. Apollo Flow Controls

b. Jamesbury; Metso

c. NIBCO Inc.

3. Description:

a. Standard: MSS SP-72.

b. CWP Rating: 285 psig.

c. Body Design: Split body.

d. Body Material: Carbon steel, ASTM A216, Type WCB.

e. Ends: Flanged or threaded.

f. Seats: PTFE.

g. Stem: Stainless steel.

h. Ball: Stainless steel, vented.

i. Port: Full.

B. Steel Ball Valves with Regular Port, Class 150:

1. Compliance: AIS Compliance required. Manufacturer listed is the Basis of Design for performance product requirements. Contractor to submit compliant manufacturer if Basis of Design cannot certify AIS compliance.

2. Manufacturers:

a. Apollo Flow Controls

b. Jamesbury; Metso

c. NIBCO Inc.

3. Description:

a. Standard: MSS SP-72.

b. CWP Rating: 285 psig.

c. Body Design: Uni-body.

d. Body Material: Carbon steel, ASTM A216, Type WCB.

e. Ends: Flanged or threaded.

f. Seats: PTFE.

g. Stem: Stainless steel.

h. Ball: Stainless steel, vented.

i. Port: Regular.

2.05 IRON BALL VALVES:

A. Compliance: AIS Compliance required. Manufacturer listed is the Basis of Design for performance product requirements. Contractor to submit compliant manufacturer if Basis of Design cannot certify AIS compliance.

B. Iron Ball Valves, Class 125:

1. Manufacturers:

a. American Valve, Inc.

b. Apollo Flow Controls

c. Kitz Corporation

d. WATTS

e. Zurn Industries

2. Description:

a. Standard: MSS SP-72.

b. CWP Rating: 200 psig.

c. Body Design: Split body.

d. Body Material: ASTM A126, gray iron.

e. Ends: Flanged or threaded.

f. Seats: PTFE.

g. Stem: Stainless steel.

h. Ball: Stainless steel.

i. Port: Full.

2.06 CPVC BALL VALVES:

A. CPVC Union Ball Valves:

1. Manufacturers:

a. American Valve, Inc.

b. Georg Fischer Inc.

c. Hayward Flow Control

d. IPEX USA

e. NIBCO Inc.

f. Spears Manufacturing Company

g. Thermoplastic Valves, Inc

2. Description:

a. Standard: MSS SP-122.

b. Pressure Rating and Temperature: 125 psig at 73 degrees F.

c. Body Material: CPVC.

d. Body Design: Union type.

e. End Connections for Valves NPS 2 and Smaller: Detachable, socket or threaded.

f. End Connections for Valves NPS 2-1/2 to NPS 4: Detachable, socket or threaded.

g. Ball: CPVC; full port.

h. Seals: PTFE or EPDM-rubber O-rings.

i. Handle: Tee shaped.

B. CPVC Non-Union Ball Valves:

1. Manufacturers:

a. American Valve, Inc.

b. Legend Valve & Fitting Inc.

c. NIBCO Inc.

d. Spears Manufacturing Company

e. Thermoplastic Valves, Inc.

2. Description:

a. Standard: MSS SP-122.

b. Pressure Rating and Temperature: 125 psig at 73 degrees F.

c. Body Material: CPVC.

d. Body Design: Non-union type.

e. End Connections: Socket or threaded.

f. Ball: CPVC; full or reduced port.

g. Seals: PTFE or EPDM-rubber O-rings.

h. Handle: Tee shaped.

2.07 PVC BALL VALVES:

A. PVC Union Ball Valves:

1. Manufacturers:

a. American Valve, Inc.

b. Georg Fischer Inc.

c. Hayward Flow Control

d. Legend Valve & Fitting Inc.

e. IPEX USA

f. NIBCO Inc.

g. Spears Manufacturing Company

h. Thermoplastic Valves, Inc.

2. Description:

a. Standard: MSS SP-122.

b. Pressure Rating and Temperature: 125 psig at 73 degrees F.

c. Body Material: PVC.

d. Body Design: Union type.

e. End Connections for Valves NPS 2 and Smaller: Detachable, socket or threaded.

f. End Connections for Valves NPS 2-1/2 to NPS 4: Detachable, socket or threaded.

g. Ball: PVC; full port.

h. Seals: PTFE or EPDM-rubber O-rings.

i. Handle: Tee shaped.

B. PVC Non-Union Ball Valves:

1. Manufacturers:

a. American Valve, Inc.

b. Georg Fischer Inc.

c. Hayward Flow Control

d. Legend Valve & Fitting Inc.

e. IPEX USA

f. NIBCO Inc.

g. Spears Manufacturing Company

h. Thermoplastic Valves, Inc.

2. Description:

a. Standard: MSS SP-122.

b. Pressure Rating and Temperature: 125 psig at 73 degrees F.

c. Body Material: PVC.

d. Body Design: Non-union type.

e. End Connections: Socket or threaded.

f. Ball: PVC; full or reduced port.

g. Seals: PTFE or EPDM-rubber O-rings.

h. Handle: Tee shaped.

2.08 IRON, SINGLE-FLANGE BUTTERFLY VALVES:

A. Iron, Single-Flange Butterfly Valves with Aluminum-Bronze Disc:

1. Compliance: AIS Compliance required. Manufacturer listed is the Basis of Design for performance product requirements. Contractor to submit compliant manufacturer if Basis of Design cannot certify AIS compliance.

2. Manufacturers:

a. Apollo Flow Controls

b. DeZURIK

c. Hammond Valve

d. Jenkins Valves

e. Kitz Corporation

f. Legend Valve & Fitting Inc.

g. Milwaukee Valve Company

h. NIBCO Inc.

i. Red-White Valve Corp.

j. Stockham

k. WATTS

3. Description:

a. Standard: MSS SP-67, Type I.

b. CWP Rating: 200 psig.

c. Body Design: Lug type; suitable for bidirectional dead-end service at rated pressure without use of downstream flange.

d. Body Material: ASTM A126, cast iron or ASTM A536, ductile iron.

e. Seat: EPDM.

f. Stem: One- or two-piece stainless steel.

g. Disc: Aluminum bronze.

B. Iron, Single-Flange Butterfly Valves with Ductile-Iron Disc:

1. Compliance: AIS Compliance required. Manufacturer listed is the Basis of Design for performance product requirements. Contractor to submit compliant manufacturer if Basis of Design cannot certify AIS compliance.

2. Manufacturers:

   a. American Valve, Inc.

   b. Apollo Flow Controls

   c. DeZURIK

   d. Hammond Valve

   e. Jenkins Valves

   f. Kitz Corporation

   g. Legend Valve & Fitting Inc.

   h. Milwaukee Valve Company

   i. NIBCO Inc.

   j. Red-White Valve Corp.

   k. Stockham

   l. WATTS

3. Description:

   a. Standard: MSS SP-67, Type I.

   b. CWP Rating: 200 psig.

   c. Body Design: Lug type; suitable for bidirectional dead-end service at rated pressure without use of downstream flange.

   d. Body Material: ASTM A126, cast iron or ASTM A536, ductile iron.

   e. Seat: EPDM.

   f. Stem: One- or two-piece stainless steel.

   g. Disc: Nickel-plated or nickel-coated ductile iron.

C. Iron, Single-Flange Butterfly Valves with Stainless-Steel Disc:

1. Compliance: AIS Compliance required. Manufacturer listed is the Basis of Design for performance product requirements. Contractor to submit compliant manufacturer if Basis of Design cannot certify AIS compliance.

2. Manufacturers:

   a. American Valve, Inc.

   b. Apollo Flow Controls

   c. DeZURIK

   d. Hammond Valve

   e. Jenkins Valves

   f. Kitz Corporation

   g. Legend Valve & Fitting Inc.

   h. Milwaukee Valve Company

   i. NIBCO Inc.

   j. Red-White Valve Corp.

   k. Stockham

   l. WATTS

3. Description:

   a. Standard: MSS SP-67, Type I.

   b. CWP Rating, NPS 12 and Smaller: 200 psig.

   c. Body Design: Lug type; suitable for bidirectional dead-end service at rated pressure without use of downstream flange.

   d. Body Material: ASTM A126, cast iron or ASTM A536, ductile iron.

   e. Seat: EPDM.

   f. Stem: One- or two-piece stainless steel.

   g. Disc: Stainless steel.

2.09 DUCTILE-IRON, GROOVED-END BUTTERFLY VALVES:

A. Ductile Iron, Grooved-End Butterfly Valves, 175 CWP:

1. Compliance: AIS Compliance required. Manufacturer listed is the Basis of Design for performance product requirements. Contractor to submit compliant manufacturer if Basis of Design cannot certify AIS compliance.

2. Manufacturers:

a. Kennedy Valve Company

b. Tyco by Johnson Controls Company

c. Victaulic Company

d. Zurn Industries

3. Description:

a. Standard: MSS SP-67, Type I.

b. CWP Rating: 175 psig.

c. Body Material: Coated, ductile iron.

d. Stem: Two-piece stainless steel.

e. Disc: Coated, ductile iron.

f. Seal: EPDM.

B. Ductile Iron, Grooved-End Butterfly Valves, 300 CWP:

1. Compliance: AIS Compliance required. Manufacturer listed is the Basis of Design for performance product requirements. Contractor to submit compliant manufacturer if Basis of Design cannot certify AIS compliance.

2. Manufacturers:

a. Kennedy Valve Company

b. NIBCO Inc.

c. Tyco by Johnson Controls Company

d. Victaulic Company

3. Description:

a. Standard: MSS SP-67, Type I.

b. CWP Rating, NPS 8 and Smaller: 300 psig.

c. CWP Rating, NPS 10 and Larger: 200 psig.

d. Body Material: Coated, ductile iron.

e. Stem: Two-piece stainless steel.

f. Disc: Coated, ductile iron.

g. Seal: EPDM.

2.10 CPVC BUTTERFLY VALVES:

1. Manufacturers:

a. Georg Fischer Inc.

b. Hayward Flow Control

c. NIBCO Inc.

d. Spears Manufacturing Company

e. Thermoplastic Valves, Inc.

B. Description:

1. Pressure Rating and Temperature: 125 psig at 73 degrees F.

2. Body Material: CPVC.

3. Body Design: Lug or wafer type.

4. Seat: EPDM rubber.

5. Seals: PTFE or EPDM-rubber O-rings.

6. Disc: CPVC.

7. Stem: Stainless steel.

8. Handle: Lever.

2.11 PVC BUTTERFLY VALVES:

A. Manufacturers:

1. American Valve, Inc
2. Georg Fischer Inc.
3. Hayward Flow Control
4. Legend Valve & Fitting Inc.
5. IPEX USA
6. NIBCO Inc.
7. Spears Manufacturing Company
8. Thermoplastic Valves, Inc.

B. Description:

1. Pressure Rating and Temperature: 125 psig at 73 degrees F.
2. Body Material: PVC.
3. Body Design: Lug or wafer type.
4. Seat: EPDM rubber.
5. Seals: PTFE or EPDM-rubber O-rings.
6. Disc: PVC.
7. Stem: Stainless steel.
8. Handle: Lever.

2.12 BRONZE LIFT CHECK VALVES:

A. Bronze Lift Check Valves with Bronze Disc, Class 125:

1. Compliance: AIS Compliance required. Manufacturer listed is the Basis of Design for performance product requirements. Contractor to submit compliant manufacturer if Basis of Design cannot certify AIS compliance.
2. Manufacturers:
   a. Crane
   b. Jenkins Valves
   c. Stockham

3. Description:

    a. Standard: MSS SP-80, Type 1.

    b. CWP Rating: 200 psig.

    c. Body Design: Vertical flow.

    d. Body Material: ASTM B61 or ASTM B62, bronze.

    e. Ends: Threaded or soldered. See valve schedule articles.

    f. Disc: Bronze.

B. Bronze Lift Check Valves with Nonmetallic Disc, Class 125:

1. Compliance: AIS Compliance required. Manufacturer listed is the Basis of Design for performance product requirements. Contractor to submit compliant manufacturer if Basis of Design cannot certify AIS compliance.

2. Manufacturers:

    a. Hammond Valve

    b. Jenkins Valves

    c. Kitz Corporation

    d. Milwaukee Valve Company

    e. NIBCO Inc.

    f. Red-White Valve Corp.

    g. WATTS

3. Description:

    a. Standard: MSS SP-80, Type 2.

    b. CWP Rating: 200 psig.

    c. Body Design: Vertical flow.

    d. Body Material: ASTM B61 or ASTM B62, bronze.

    e. Ends: Threaded or soldered. See valve schedule articles.

    f. Disc: NBR, PTFE.

2.13 BRONZE SWING CHECK VALVES:

A. Bronze Swing Check Valves with Bronze Disc, Class 125:

1. Compliance: AIS Compliance required. Manufacturer listed is the Basis of Design for performance product requirements. Contractor to submit compliant manufacturer if Basis of Design cannot certify AIS compliance.

2. Manufacturers:

a. American Valve, Inc.

b. Apollo Flow Controls

c. Crane

d. Hammond Valve

e. Jenkins Valves

f. Kitz Corporation

g. Milwaukee Valve Company

h. NIBCO Inc.

i. Red-White Valve Corp.

j. Stockham

k. WATTS

3. Description:

a. Standard: MSS SP-80, Type 3.

b. CWP Rating: 200 psig.

c. Body Design: Horizontal flow.

d. Body Material: ASTM B62, bronze.

e. Ends: Threaded or soldered. See valve schedule articles.

f. Disc: Bronze.

B. Bronze Swing Check Valves with Nonmetallic Disc, Class 125:

1. Compliance: AIS Compliance required. Manufacturer listed is the Basis of Design for performance product requirements. Contractor to submit compliant manufacturer if Basis of Design cannot certify AIS compliance.

2. Manufacturers:

    a. Apollo Flow Controls

    b. Crane

    c. Hammond Valve

    d. Jenkins Valves

    e. Kitz Corporation

    f. Milwaukee Valve Company

    g. NIBCO Inc.

    h. Red-White Valve Corp.

    i. Stockham

    j. WATTS

3. Description:

    a. Standard: MSS SP-80, Type 4.

    b. CWP Rating: 200 psig.

    c. Body Design: Horizontal flow.

    d. Body Material: ASTM B62, bronze.

    e. Ends: Threaded or soldered. See valve schedule articles.

    f. Disc: PTFE.

C. Bronze Swing Check Valves with Bronze Disc, Class 150:

1. Compliance: AIS Compliance required. Manufacturer listed is the Basis of Design for performance product requirements. Contractor to submit compliant manufacturer if Basis of Design cannot certify AIS compliance.

2. Manufacturers:

    a. American Valve, Inc.

b. Apollo Flow Controls

c. Crane

d. Jenkins Valves

e. Kitz Corporation

f. Milwaukee Valve Company

g. NIBCO Inc.

h. Red-White Valve Corp.

i. Stockham

3. Description:

a. Standard: MSS SP-80, Type 3.

b. CWP Rating: 300 psig.

c. Body Design: Horizontal flow.

d. Body Material: ASTM B62, bronze.

e. Ends: Threaded or soldered. See valve schedule articles.

f. Disc: Bronze.

D. Bronze Swing Check Valves with Nonmetallic Disc, Class 150:

1. Compliance: AIS Compliance required. Manufacturer listed is the Basis of Design for performance product requirements. Contractor to submit compliant manufacturer if Basis of Design cannot certify AIS compliance.

2. Manufacturers:

a. Crane

b. Hammond Valve

c. Jenkins Valves

d. Milwaukee Valve Company

e. NIBCO Inc.

f. WATTS

3. Description:

a. Standard: MSS SP-80, Type 4.

b. CWP Rating: 300 psig.

c. Body Design: Horizontal flow.

d. Body Material: ASTM B62, bronze.

e. Ends: Threaded or soldered. See valve schedule articles.

f. Disc: PTFE.

2.14 IRON SWING CHECK VALVES:

A. Iron Swing Check Valves with Metal Seats, Class 125:

1. Compliance: AIS Compliance required. Manufacturer listed is the Basis of Design for performance product requirements. Contractor to submit compliant manufacturer if Basis of Design cannot certify AIS compliance.

2. Manufacturers:

a. Apollo Flow Controls

b. Crane

c. Hammond Valve

d. Jenkins Valves

e. Kitz Corporation

f. Legend Valve & Fitting Inc.

g. Milwaukee Valve Company

h. NIBCO Inc.

i. Red-White Valve Corp.

j. Stockham

k. WATTS

3. Description:

a. Standard: MSS SP-71, Type I.

b. CWP Rating: 200 psig.

c. Body Design: Clear or full waterway.

d. Body Material: ASTM A126, gray iron with bolted bonnet.

e. Ends: Flanged or threaded. See valve schedule articles.

f. Trim: Bronze.

g. Gasket: Asbestos free.

B. Iron Swing Check Valves with Nonmetallic-to-Metal Seats, Class 125:

1. Compliance: AIS Compliance required. Manufacturer listed is the Basis of Design for performance product requirements. Contractor to submit compliant manufacturer if Basis of Design cannot certify AIS compliance.

2. Manufacturers:

a. Crane

b. Stockham

3. Description:

a. Standard: MSS SP-71, Type I.

b. CWP Rating: 200 psig.

c. Body Design: Clear or full waterway.

d. Body Material: ASTM A126, gray iron with bolted bonnet.

e. Ends: Flanged or threaded. See valve schedule articles.

f. Trim: Composition.

g. Seat Ring: Bronze.

h. Disc Holder: Bronze.

i. Disc: PTFE.

j. Gasket: Asbestos free.

C. Iron Swing Check Valves with Metal Seats, Class 250:

1. Compliance: AIS Compliance required. Manufacturer listed is the Basis of Design for performance product requirements. Contractor to submit compliant manufacturer if Basis of Design cannot certify AIS compliance.

2. Manufacturers:

   a. Apollo Flow Controls

   b. Crane

   c. Hammond Valve

   d. Jenkins Valves

   e. Milwaukee Valve Company

   f. NIBCO Inc.

   g. Stockham

   h. WATTS

3. Description:

   a. Standard: MSS SP-71, Type I.

   b. CWP Rating: 500 psig.

   c. Body Design: Clear or full waterway.

   d. Body Material: ASTM A126, gray iron with bolted bonnet.

   e. Ends: Flanged or threaded. See valve schedule articles.

   f. Trim: Bronze.

   g. Gasket: Asbestos free.

2.15 IRON SWING CHECK VALVES WITH CLOSURE CONTROL:

A. Iron Swing Check Valves with Lever- and Spring-Closure Control, Class 125:

1. Compliance: AIS Compliance required. Manufacturer listed is the Basis of Design for performance product requirements. Contractor to submit compliant manufacturer if Basis of Design cannot certify AIS compliance.

2. Manufacturers:

a. Crane

b. Hammond Valve

c. Jenkins Valves

d. Milwaukee Valve Company

e. NIBCO Inc.

f. Stockham

g. WATTS

3. Description:

a. Standard: MSS SP-71, Type I.

b. CWP Rating: 200 psig.

c. Body Design: Clear or full waterway.

d. Body Material: ASTM A126, gray iron with bolted bonnet.

e. Ends: Flanged or threaded. See valve schedule articles.

f. Trim: Bronze.

g. Gasket: Asbestos free.

h. Closure Control: Factory-installed exterior lever and weight.

B. Iron Swing Check Valves with Lever and Weight-Closure Control, Class 125:

1. Compliance: AIS Compliance required. Manufacturer listed is the Basis of Design for performance product requirements. Contractor to submit compliant manufacturer if Basis of Design cannot certify AIS compliance.

2. Manufacturers:

   a. Apollo Flow Controls

   b. Crane

   c. Hammond Valve

   d. Jenkins Valves

   e. Milwaukee Valve Company

   f. NIBCO Inc.

   g. Stockham

   h. WATTS

3. Description:

   a. Standard: MSS SP-71, Type I.

   b. CWP Rating: 200 psig.

   c. Body Design: Clear or full waterway.

   d. Body Material: ASTM A126, gray iron with bolted bonnet.

   e. Ends: Flanged or threaded. See valve schedule articles.

   f. Trim: Bronze.

   g. Gasket: Asbestos free.

   h. Closure Control: Factory-installed exterior lever and weight.

2.16 IRON, GROOVED-END SWING CHECK VALVES:

A. Iron, Grooved-End Swing Check Valves, 300 CWP:

1. Compliance: AIS Compliance required. Manufacturer listed is the Basis of Design for performance product requirements. Contractor to submit compliant manufacturer if Basis of Design cannot certify AIS compliance.

2. Manufacturers:

a. Anvil International

b. Tyco by Johnson Controls Company

c. Victaulic Company

3. Description:

a. CWP Rating: 300 psig.

b. Body Material: ASTM A536, ductile iron.

c. Seal: EPDM.

d. Disc: Spring operated, ductile iron or stainless steel.

2.17 IRON, CENTER-GUIDED, SPRING-LOADED CHECK VALVES:

A. Iron, Compact-Wafer, Center-Guided Check Valves with Metal Seat, Class 125:

1. Compliance: AIS Compliance required. Manufacturer listed is the Basis of Design for performance product requirements. Contractor to submit compliant manufacturer if Basis of Design cannot certify AIS compliance.

2. Manufacturers:

a. Anvil International

b. APCO Willamette Valve and Primer Corporation

c. Hammond Valve

d. Jenkins Valves

e. Milwaukee Valve Company

f. NIBCO Inc.

g. WATTS

3. Description:

a. Standard: MSS SP-125.

b. CWP Rating: 200 psig.

c. Body Material: ASTM A126, gray iron.

d. Style: Compact wafer, spring loaded.

e. Seat: Bronze.

B. Iron Globe, Center-Guided Check Valves with Metal Seat, Class 125:

1. Compliance: AIS Compliance required. Manufacturer listed is the Basis of Design for performance product requirements. Contractor to submit compliant manufacturer if Basis of Design cannot certify AIS compliance.

2. Manufacturers:

a. APCO Willamette Valve and Primer Corporation

b. Hammond Valve

c. Milwaukee Valve Company

d. NIBCO Inc.

e. WATTS.

3. Description:

a. Standard: MSS SP-125.

b. CWP Rating: 200 psig.

c. Body Material: ASTM A126, gray iron.

d. Style: Globe, spring loaded.

e. Ends: Flanged.

f. Seat: Bronze.

C. Iron, Compact-Wafer, Center-Guided Check Valves with Metal Seat, Class 150:

1. Compliance: AIS Compliance required. Manufacturer listed is the Basis of Design for performance product requirements. Contractor to submit compliant manufacturer if Basis of Design cannot certify AIS compliance.

2. Manufacturers:

   a. APCO Willamette Valve and Primer Corporation

   b. Crispin Valve

   c. Val-Matic Valve & Manufacturing Corp.

3. Description:

   a. Standard: MSS SP-125.

   b. CWP Rating: 300 psig.

   c. Body Material: ASTM A395 or ASTM A536, ductile iron.

   d. Style: Compact wafer, spring loaded.

   e. Seat: Bronze.

D. Iron Globe, Center-Guided Check Valves with Metal Seat, Class 150:

1. Compliance: AIS Compliance required. Manufacturer listed is the Basis of Design for performance product requirements. Contractor to submit compliant manufacturer if Basis of Design cannot certify AIS compliance.

2. Manufacturers:

   a. APCO Willamette Valve and Primer Corporation

   b. Crispin Valve

   c. Val-Matic Valve & Manufacturing Corp.

3. Description:

   a. Standard: MSS SP-125.

   b. CWP Rating: 300 psig.

   c. Body Material: ASTM A395 or ASTM A536, ductile iron.

   d. Style: Globe, spring loaded.

e. Ends: Flanged.

f. Seat: Bronze.

E. Iron, Compact-Wafer, Center-Guided Check Valves with Metal Seat, Class 250:

1. Compliance: AIS Compliance required. Manufacturer listed is the Basis of Design for performance product requirements. Contractor to submit compliant manufacturer if Basis of Design cannot certify AIS compliance.

2. Manufacturers:

a. APCO Willamette Valve and Primer Corporation

b. Crispin Valve

c. Hammond Valve

d. Milwaukee Valve Company

e. NIBCO Inc.

f. Val-Matic Valve & Manufacturing Corp.

3. Description:

a. Standard: MSS SP-125.

b. CWP Rating: 400 psig.

c. Body Material: ASTM A126, gray iron.

d. Style: Compact wafer, spring loaded.

e. Seat: Bronze.

F. Iron Globe, Center-Guided Check Valves with Metal Seat, Class 250:

1. Compliance: AIS Compliance required. Manufacturer listed is the Basis of Design for performance product requirements. Contractor to submit compliant manufacturer if Basis of Design cannot certify AIS compliance.

2. Manufacturers:

a. APCO Willamette Valve and Primer Corporation

b. Crispin Valve

c. Hammond Valve

d. Milwaukee Valve Company

e. NIBCO Inc.

f. Val-Matic Valve & Manufacturing Corp.

3. Description:

a. Standard: MSS SP-125.

b. CWP Rating: 400 psig.

c. Body Material: ASTM A126, gray iron.

d. Style: Globe, spring loaded.

e. Ends: Flanged.

f. Seat: Bronze.

G. Iron, Compact-Wafer, Center-Guided Check Valves with Metal Seat, Class 300:

1. Compliance: AIS Compliance required. Manufacturer listed is the Basis of Design for performance product requirements. Contractor to submit compliant manufacturer if Basis of Design cannot certify AIS compliance.

2. Manufacturers:

a. APCO Willamette Valve and Primer Corporation

b. Crispin Valve

c. Val-Matic Valve & Manufacturing Corp.

3. Description:

a. Standard: MSS SP-125.

b. CWP Rating: 500 psig.

c. Body Material: ASTM A395 or ASTM A536, ductile iron.

d. Style: Compact wafer, spring loaded.

e. Seat: Bronze.

H. Iron Globe, Center-Guided Check Valves with Metal Seat, Class 300:

1. Compliance: AIS Compliance required. Manufacturer listed is the Basis of Design for performance product requirements. Contractor to submit compliant manufacturer if Basis of Design cannot certify AIS compliance.

2. Manufacturers:

   a. APCO Willamette Valve and Primer Corporation

   b. Crispin Valve

   c. Val-Matic Valve & Manufacturing Corp.

3. Description:

   a. Standard: MSS SP-125.

   b. CWP Rating: 500 psig.

   c. Body Material: ASTM A395 or ASTM A536, ductile iron.

   d. Style: Globe, spring loaded.

   e. Ends: Flanged.

   f. Seat: Bronze.

I. Iron, Compact-Wafer, Center-Guided Check Valves with Resilient Seat, Class 125:

1. Compliance: AIS Compliance required. Manufacturer listed is the Basis of Design for performance product requirements. Contractor to submit compliant manufacturer if Basis of Design cannot certify AIS compliance.

2. Manufacturers:

   a. APCO Willamette Valve and Primer Corporation

   b. Crispin Valve

   c. Hammond Valve

   d. Milwaukee Valve Company

   e. NIBCO Inc.

   f. Val-Matic Valve & Manufacturing Corp.

3. Description:

a. Standard: MSS SP-125.

b. CWP Rating: 200 psig.

c. Body Material: ASTM A126, gray iron.

d. Style: Compact wafer, spring loaded.

e. Seat: EPDM or NBR.

J. Iron Globe, Center-Guided Check Valves with Resilient Seat, Class 125:

1. Compliance: AIS Compliance required. Manufacturer listed is the Basis of Design for performance product requirements. Contractor to submit compliant manufacturer if Basis of Design cannot certify AIS compliance.

2. Manufacturers:

a. Anvil International

b. APCO Willamette Valve and Primer Corporation

c. Apollo Flow Controls

d. Crispin Valve

e. Hammond Valve

f. Milwaukee Valve Company

g. NIBCO Inc.

h. Val-Matic Valve & Manufacturing Corp.

i. Zurn Industries

3. Description:

a. Standard: MSS SP-125.

b. CWP Rating: 200 psig.

c. Body Material: ASTM A126, gray iron.

d. Style: Globe, spring loaded.

e. Ends: Flanged.

f. Seat: EPDM or NBR.

K. Iron, Compact-Wafer, Center-Guided Check Valves with Resilient Seat, Class 150:

1. Compliance: AIS Compliance required. Manufacturer listed is the Basis of Design for performance product requirements. Contractor to submit compliant manufacturer if Basis of Design cannot certify AIS compliance.

2. Manufacturers:

a. APCO Willamette Valve and Primer Corporation

b. Crispin Valve

c. Val-Matic Valve & Manufacturing Corp.

3. Description:

a. Standard: MSS SP-125.

b. CWP Rating: 300 psig.

c. Body Material: ASTM A395 or ASTM A536, ductile iron.

d. Style: Compact wafer, spring loaded.

e. Seat: EPDM or NBR.

L. Iron, Globe, Center-Guided Check Valves with Resilient Seat, Class 150:

1. Compliance: AIS Compliance required. Manufacturer listed is the Basis of Design for performance product requirements. Contractor to submit compliant manufacturer if Basis of Design cannot certify AIS compliance.

2. Manufacturers:

a. APCO Willamette Valve and Primer Corporation

b. Crispin Valve

c. Val-Matic Valve & Manufacturing Corp.

3. Description:

a. Standard: MSS SP-125.

b. CWP Rating: 300 psig.

c. Body Material: ASTM A395 or ASTM A536, ductile iron.

d. Style: Globe, spring loaded.

e. Ends: Flanged.

f. Seat: EPDM or NBR.

M. Iron, Compact-Wafer, Center-Guided Check Valves with Resilient Seat, Class 250:

1. Compliance: AIS Compliance required. Manufacturer listed is the Basis of Design for performance product requirements. Contractor to submit compliant manufacturer if Basis of Design cannot certify AIS compliance.

2. Manufacturers:

a. APCO Willamette Valve and Primer Corporation

b. Crispin Valve

c. Hammond Valve

d. Milwaukee Valve Company

e. NIBCO Inc.

f. Val-Matic Valve & Manufacturing Corp.

3. Description:

a. Standard: MSS SP-125.

b. CWP Rating: 400 psig.

c. Body Material: ASTM A126, gray iron.

d. Style: Compact wafer, spring loaded.

e. Seat: EPDM or NBR.

N. Iron Globe, Center-Guided Check Valves with Resilient Seat, Class 250:

1. Compliance: AIS Compliance required. Manufacturer listed is the Basis of Design for performance product requirements. Contractor to submit compliant manufacturer if Basis of Design cannot certify AIS compliance.

2. Manufacturers:

a. APCO Willamette Valve and Primer Corporation

b. Crispin Valve

c. Hammond Valve

d. Milwaukee Valve Company

e. NIBCO Inc.

f. Val-Matic Valve & Manufacturing Corp.

3. Description:

a. Standard: MSS SP-125.

b. CWP Rating: 400 psig.

c. Body Material: ASTM A126, gray iron.

d. Style: Globe, spring loaded.

e. Ends: Flanged.

f. Seat: EPDM or NBR.

O. Iron, Compact-Wafer, Center-Guided Check Valves with Resilient Seat, Class 300:

1. Compliance: AIS Compliance required. Manufacturer listed is the Basis of Design for performance product requirements. Contractor to submit compliant manufacturer if Basis of Design cannot certify AIS compliance.

2. Manufacturers:

a. APCO Willamette Valve and Primer Corporation

b. Crispin Valve

c. Val-Matic Valve & Manufacturing Corp.

3. Description:

a. Standard: MSS SP-125.

b. CWP Rating: 500 psig.

c. Body Material: ASTM A395 or ASTM A536, ductile iron.

d. Style: Compact wafer, spring loaded.

e. Seat: EPDM or NBR.

P. Iron Globe, Center-Guided Check Valves with Resilient Seat, Class 300:

1. Compliance: AIS Compliance required. Manufacturer listed is the Basis of Design for performance product requirements. Contractor to submit compliant manufacturer if Basis of Design cannot certify AIS compliance.

2. Manufacturers:

a. APCO Willamette Valve and Primer Corporation

b. Crispin Valve

c. Val-Matic Valve & Manufacturing Corp.

3. Description:

a. Standard: MSS SP-125.

b. CWP Rating: 500 psig.

c. Body Material: ASTM A395 or ASTM A536, ductile iron.

d. Style: Globe, spring loaded.

e. Ends: Flanged.

f. Seat: EPDM or NBR.

2.18 IRON, PLATE-TYPE CHECK VALVES:

A. Iron, Dual-Plate Check Valves with Metal Seat, Class 125:

1. Compliance: AIS Compliance required. Manufacturer listed is the Basis of Design for performance product requirements. Contractor to submit compliant manufacturer if Basis of Design cannot certify AIS compliance.

2. Manufacturers:

a. APCO Willamette Valve and Primer Corporation

b. Crane

c. Keckley Company

3. Standard: API 594.

4. CWP Rating: 200 psig.

5. Body Design: Wafer, spring-loaded plates.

6. Body Material: ASTM A126, gray iron.

7. Seat: Bronze.

B. Iron, Dual-Plate Check Valves with Metal Seat, Class 150:

1. Compliance: AIS Compliance required. Manufacturer listed is the Basis of Design for performance product requirements. Contractor to submit compliant manufacturer if Basis of Design cannot certify AIS compliance.

2. Manufacturers:

a. APCO Willamette Valve and Primer Corporation

b. Crane

c. Val-Matic Valve & Manufacturing Corp.

3. Standard: API 594.

4. CWP Rating: 300 psig.

5. Body Design: Wafer, spring-loaded plates.

6. Body Material: ASTM A395 or ASTM A536, ductile iron.

7. Seat: Bronze.

C. Iron, Dual-Plate Check Valves with Metal Seat, Class 250:

1. Compliance: AIS Compliance required. Manufacturer listed is the Basis of Design for performance product requirements. Contractor to submit compliant manufacturer if Basis of Design cannot certify AIS compliance.

2. Manufacturers:

a. APCO Willamette Valve and Primer Corporation

b. Crane

3. Standard: API 594.

4. CWP Rating: 400 psig.

5. Body Design: Wafer, spring-loaded plates.

6. Body Material: ASTM A126, gray iron.

7. Seat: Bronze.

D. Iron, Dual-Plate Check Valves with Metal Seat, Class 300:

1. Compliance: AIS Compliance required. Manufacturer listed is the Basis of Design for performance product requirements. Contractor to submit compliant manufacturer if Basis of Design cannot certify AIS compliance.

2. Manufacturers:

   a. APCO Willamette Valve and Primer Corporation

   b. Crane

   c. Val-Matic Valve & Manufacturing Corp.

3. Standard: API 594.

4. CWP Rating: 500 psig.

5. Body Design: Wafer, spring-loaded plates.

6. Body Material: ASTM A395 or ASTM A536, ductile iron.

7. Seat: Bronze.

E. Iron, Single-Plate Check Valves with Resilient Seat, Class 125:

1. Compliance: AIS Compliance required. Manufacturer listed is the Basis of Design for performance product requirements. Contractor to submit compliant manufacturer if Basis of Design cannot certify AIS compliance.

2. Manufacturers:

   a. Flo Fab Inc.

   b. Keckley Company

   c. Sure Flow Equipment Inc.

3. Standard: API 594.

4. CWP Rating: 200 psig.

5. Body Design: Wafer, spring-loaded plate.

6. Body Material: ASTM A126, gray iron.

7. Seat: EPDM or NBR.

F. Iron, Dual-Plate Check Valves with Resilient Seat, Class 125:

1. Compliance: AIS Compliance required. Manufacturer listed is the Basis of Design for performance product requirements. Contractor to submit compliant manufacturer if Basis of Design cannot certify AIS compliance.

2. Manufacturers:

   a. APCO Willamette Valve and Primer Corporation

   b. Crane

   c. Keckley Company

   d. NIBCO Inc.

   e. WATTS

3. Standard: API 594.

4. CWP Rating: 200 psig.

5. Body Design: Wafer, spring-loaded plates.

6. Body Material: ASTM A126, gray iron.

7. Seat: EPDM or NBR.

G. Iron, Dual-Plate Check Valves with Resilient Seat, Class 150:

1. Compliance: AIS Compliance required. Manufacturer listed is the Basis of Design for performance product requirements. Contractor to submit compliant manufacturer if Basis of Design cannot certify AIS compliance.

2. Manufacturers:

   a. APCO Willamette Valve and Primer Corporation.

   b. Crane

   c. Val-Matic Valve & Manufacturing Corp.

3. Standard: API 594.

4. CWP Rating: 300 psig.

5. Body Design: Wafer, spring-loaded plates.

6. Body Material: ASTM A395 or ASTM A536, ductile iron.

7. Seat: EPDM or NBR.

H. Iron, Wafer, Single-Plate Check Valves with Resilient Seat, Class 250:

1. Compliance: AIS Compliance required. Manufacturer listed is the Basis of Design for performance product requirements. Contractor to submit compliant manufacturer if Basis of Design cannot certify AIS compliance.

2. Manufacturers:

a. Sure Flow Equipment Inc.

3. Standard: API 594.

4. CWP Rating: 400 psig.

5. Body Design: Wafer, spring-loaded plate.

6. Body Material: ASTM A126, gray iron.

7. Seat: EPDM or NBR.

I. Iron, Dual-Plate Check Valves with Resilient Seat, Class 250:

1. Compliance: AIS Compliance required. Manufacturer listed is the Basis of Design for performance product requirements. Contractor to submit compliant manufacturer if Basis of Design cannot certify AIS compliance.

2. Manufacturers:

a. APCO Willamette Valve and Primer Corporation

b. Crane

c. Sure Flow Equipment Inc.

3. Standard: API 594.

4. CWP Rating: 400 psig.

5. Body Design: Wafer, spring-loaded plates.

6. Body Material: ASTM A126, gray iron.

7. Seat: EPDM or NBR.

J. Iron, Dual-Plate Check Valves with Resilient Seat, Class 300:

1. Compliance: AIS Compliance required. Manufacturer listed is the Basis of Design for performance product requirements. Contractor to submit compliant manufacturer if Basis of Design cannot certify AIS compliance.

2. Manufacturers:

a. APCO Willamette Valve and Primer Corporation

b. Val-Matic Valve & Manufacturing Corp.

3. Standard: API 594.

4. CWP Rating: 500 psig.

5. Body Design: Wafer, spring-loaded plates.

6. Body Material: ASTM A395 or ASTM A536, ductile iron.

7. Seat: EPDM or NBR.

2.19 CPVC BALL CHECK VALVES:

A. Manufacturers:

1. American Valve, Inc.

2. Georg Fischer Inc.

3. Hayward Flow Control

4. Legend Valve & Fitting Inc.

5. IPEX USA.

6. NIBCO Inc.

7. Spears Manufacturing Company

8. Thermoplastic Valves, Inc.

B. Description:

1. Pressure Rating and Temperature: 125 psig at 73 degrees F.

2. Body Material: CPVC.

3. Body Design: Union-type ball check.

4. End Connections for Valves NPS 2 and Smaller: Detachable, socket or threaded.

5. End Connections for Valves NPS 2-1/2 to NPS 4: Detachable, socket or threaded

6. Ball: CPVC.

7. Seals: EPDM- or FKM-rubber O-rings.

2.20 PVC BALL CHECK VALVES:

A. Manufacturers:

1. American Valve, Inc.

2. Georg Fischer Inc.

3. Hayward Flow Control

4. Legend Valve & Fitting Inc.

5. IPEX USA

6. NIBCO Inc.

7. Spears Manufacturing Company

8. Thermoplastic Valves, Inc.

B. Description:

1. Pressure Rating and Temperature: 125 psig at 73 degrees F.

2. Body Material: PVC.

3. Body Design: Union-type ball check.

4. End Connections for Valves NPS 2 and Smaller: Detachable, socket or threaded.

5. End Connections for Valves NPS 2-1/2 to NPS 4: Detachable, socket or threaded.

6. Ball: PVC.

7. Seals: EPDM- or FKM-rubber O-rings.

2.21 BRONZE GATE VALVES:

A. Bronze Gate Valves, NRS, Class 125:

1. Compliance: AIS Compliance required. Manufacturer listed is the Basis of Design for performance product requirements. Contractor to submit compliant manufacturer if Basis of Design cannot certify AIS compliance.

2. Manufacturers:

a. American Valve, Inc.

b. Apollo Flow Controls

c. Crane

d. Hammond Valve

e. Jenkins Valves

f. Kitz Corporation

g. Legend Valve & Fitting Inc.

h. Milwaukee Valve Company

i. NIBCO Inc.

j. Red-White Valve Corp.

k. Stockham

l. WATTS

3. Description:

a. Standard: MSS SP-80, Type 1.

b. CWP Rating: 200 psig.

c. Body Material: Bronze with integral seat and screw-in bonnet.

d. Ends: Threaded or solder joint.

e. Stem: Bronze.

f. Disc: Solid wedge; bronze.

g. Packing: Asbestos free.

h. Handwheel: Malleable iron, bronze, or aluminum.

B. Bronze Gate Valves, RS, Class 125:

1. Compliance: AIS Compliance required. Manufacturer listed is the Basis of Design for performance product requirements. Contractor to submit compliant manufacturer if Basis of Design cannot certify AIS compliance.

2. Manufacturers:

a. American Valve, Inc.

b. Apollo Flow Controls

c. Crane

d. Hammond Valve

e. Jenkins Valves

f. Kitz Corporation

g. Legend Valve & Fitting Inc.

h. Milwaukee Valve Company

i. NIBCO Inc.

j. Red-White Valve Corp.

k. Stockham

l. WATTS

3. Description:

a. Standard: MSS SP-80, Type 2.

b. CWP Rating: 200 psig.

c. Body Material: Bronze with integral seat and screw-in bonnet.

d. Ends: Threaded or solder joint.

e. Stem: Bronze.

f. Disc: Solid wedge; bronze.

g. Packing: Asbestos free.

h. Handwheel: Malleable iron, bronze, or aluminum.

C. Bronze Gate Valves, NRS, Class 150:

1. Compliance: AIS Compliance required. Manufacturer listed is the Basis of Design for performance product requirements. Contractor to submit compliant manufacturer if Basis of Design cannot certify AIS compliance.

2. Manufacturers:

a. Apollo Flow Controls

b. Hammond Valve

c. Kitz Corporation

d. Milwaukee Valve Company

e. NIBCO Inc.

f. Red-White Valve Corp.

g. WATTS

3. Description:

a. Standard: MSS SP-80, Type 1.

b. CWP Rating: 300 psig.

c. Body Material: Bronze with integral seat and union-ring bonnet.

d. Ends: Threaded.

e. Stem: Bronze.

f. Disc: Solid wedge; bronze.

g. Packing: Asbestos free.

h. Handwheel: Malleable iron, bronze, or aluminum.

D. Bronze Gate Valves, RS, Class 150:

1. Compliance: AIS Compliance required. Manufacturer listed is the Basis of Design for performance product requirements. Contractor to submit compliant manufacturer if Basis of Design cannot certify AIS compliance.

2. Manufacturers:

a. Apollo Flow Controls

b. Crane

c. Hammond Valve

d. Kitz Corporation

e. Milwaukee Valve Company

f. NIBCO Inc.

g. Stockham

h. WATTS

3. Description:

a. Standard: MSS SP-80, Type 2.

b. CWP Rating: 300 psig.

c. Body Material: Bronze with integral seat and union-ring bonnet.

d. Ends: Threaded.

e. Stem: Bronze.

f. Disc: Solid wedge; bronze.

g. Packing: Asbestos free.

h. Handwheel: Malleable iron, bronze, or aluminum.

2.22 IRON GATE VALVES:

A. Iron Gate Valves, NRS, Class 150:

1. Compliance: AIS Compliance required. Manufacturer listed is the Basis of Design for performance product requirements. Contractor to submit compliant manufacturer if Basis of Design cannot certify AIS compliance.

2. Manufacturers:

a. Apollo Flow Controls

b. Crane

c. Hammond Valve

d. Jenkins Valves

e. Kitz Corporation

f. Legend Valve & Fitting Inc.

g. Milwaukee Valve Company

h. NIBCO Inc.

i. Red-White Valve Corp

j. Stockham

k. WATTS

l. Zurn Industries

3. Description:

a. Standard: MSS SP-70, Type I.

b. CWP Rating: 200 psig.

c. Body Material: Gray iron with bolted bonnet.

d. Ends: Flanged.

e. Trim: Bronze.

f. Disc: Solid wedge.

g. Packing and Gasket: Asbestos free.

B. Iron Gate Valves, OS&Y, Class 125:

1. Compliance: AIS Compliance required. Manufacturer listed is the Basis of Design for performance product requirements. Contractor to submit compliant manufacturer if Basis of Design cannot certify AIS compliance.

2. Manufacturers:

a. Apollo Flow Controls

b. Crane

c. Hammond Valve

d. Jenkins Valves

e. Kitz Corporation

f. Legend Valve & Fitting Inc.

g. Milwaukee Valve Company

h. NIBCO Inc

i. Red-White Valve Corp

j. Stockham

k. WATTS

3. Description:

a. Standard: MSS SP-70, Type I.

b. CWP Rating: 200 psig.

c. Body Material: Gray iron with bolted bonnet.

d. Ends: Flanged.

e. Trim: Bronze.

f. Disc: Solid wedge.

g. Packing and Gasket: Asbestos free.

C. Iron Gate Valves, NRS, Class 250:

1. Compliance: AIS Compliance required. Manufacturer listed is the Basis of Design for performance product requirements. Contractor to submit compliant manufacturer if Basis of Design cannot certify AIS compliance.

2. Manufacturers:

a. Apollo Flow Controls

b. Crane

c. NIBCO Inc.

d. Stockham

3. Description:

a. Standard: MSS SP-70, Type I.

b. CWP Rating: 500 psig.

c. Body Material: Gray iron with bolted bonnet.

d. Ends: Flanged.

e. Trim: Bronze.

f. Disc: Solid wedge.

g. Packing and Gasket: Asbestos free.

D. Iron Gate Valves, OS&Y, Class 250:

1. Compliance: AIS Compliance required. Manufacturer listed is the Basis of Design for performance product requirements. Contractor to submit compliant manufacturer if Basis of Design cannot certify AIS compliance.

2. Manufacturers:

a. Apollo Flow Controls

b. Crane

c. Hammond Valve

d. Milwaukee Valve Company

e. Stockham

f. WATTS

3. Description:

a. Standard: MSS SP-70, Type I.

b. CWP Rating: 500 psig.

c. Body Material: Gray iron with bolted bonnet.

d. Ends: Flanged.

e. Trim: Bronze.

f. Disc: Solid wedge.

g. Packing and Gasket: Asbestos free.

2.23 CPVC GATE VALVES:

A. Manufacturers:

1. Spears Manufacturing Company

B. Description:

1. Pressure Rating and Temperature: 125 psig at 73 degrees F.

2. Body Material: CPVC.

3. Body Design: Non-rising stem.

4. End Connections for Valves NPS 2 and Smaller: Socket or threaded.

5. End Connections for Valves NPS 2-1/2 to NPS 4: Socket or threaded.

6. Gate and Stem: Plastic.

7. Seals: EPDM rubber.

8. Handle: Wheel.

2.24 PVC GATE VALVES:

A. Manufacturers:

1. Spears Manufacturing Company

B. Description:

1. Pressure Rating and Temperature: 125 psig at 73 degrees F

2. Body Material: PVC

3. Body Design: Non-rising stem

4. End Connections for Valves NPS 2 and Smaller: Socket or threaded

5. End Connections for Valves NPS 2-1/2 to NPS 4: Socket or threaded

6. Gate and Stem: Plastic

7. Seals: EPDM rubber

8. Handle: Wheel

2.25 CHAINWHEELS:

A. Manufacturers:

1. Babbit Steam Specialty Co.

2. Roto Hammer Industries

3. Trumbull Industries

B. Description: Valve actuation assembly with sprocket rim, chain guides, chain, and attachment brackets for mounting chainwheels directly to hand wheels.

1. Sprocket Rim with Chain Guides: Ductile or cast iron, of type and size required for valve. Include zinc or epoxy coating.

2. Chain: Hot-dip galvanized steel, of size required to fit sprocket rim.

PART 3 - EXECUTION

3.01 EXAMINATION:

A. Examine valve interior for cleanliness, freedom from foreign matter, and corrosion. Remove special packing materials, such as blocks, used to prevent disc movement during shipping and handling.

B. Operate valves in positions from fully open to fully closed. Examine guides and seats made accessible by such operations.

C. Examine threads on valve and mating pipe for form and cleanliness.

D. Examine mating flange faces for conditions that might cause leakage. Check bolting for proper size, length, and material. Verify that gasket is of proper size, that its material composition is suitable for service, and that it is free from defects and damage.

E. Do not attempt to repair defective valves; replace with new valves.

3.02 VALVE INSTALLATION:

A. Install valves with unions or flanges at each piece of equipment arranged to allow service, maintenance, and equipment removal without system shutdown.

B. Locate valves for easy access and provide separate support where necessary.

C. Install valves in horizontal piping with stem at or above center of pipe.

D. Install valves in position to allow full stem movement.

E. Install chainwheels on operators for butterfly valves NPS 4 and larger and more than 96 inches above floor. Extend chains to 60 inches above finished floor.

F. Check Valves: Install check valves for proper direction of flow.

1. Swing Check Valves: In horizontal position with hinge pin level.

2. Center-Guided and Plate-Type Check Valves: In horizontal or vertical position, between flanges.

3. Lift Check Valves: With stem upright and plumb.

G. Install valve tags. Comply with requirements in Section 22 05 53.

H. Install valve tags. Comply with requirements in Section 22 05 53 for valve tags and schedules.

3.03 GENERAL REQUIREMENTS FOR VALVE APPLICATIONS:

A. If valves with specified CWP ratings are unavailable, the same types of valves with higher CWP ratings may be substituted.

B. Select valves with the following end connections:

1. For Copper Tubing, NPS 2 and Smaller: Threaded ends except where solder-joint valve-end option is indicated in valve schedules below.

2. For Copper Tubing, NPS 2-1/2 to NPS 4: Flanged ends except where threaded valve-end option is indicated in valve schedules below.

3. For Copper Tubing, NPS 5 and Larger: Flanged ends.

4. For Steel Piping, NPS 2 and Smaller: Threaded ends.

5. For Steel Piping, NPS 2-1/2 to NPS 4: Flanged ends except where threaded valve-end option is indicated in valve schedules below.

6. For Steel Piping, NPS 5 and Larger: Flanged ends.

3.04 DOMESTIC HOT- AND COLD-WATER VALVE SCHEDULE:

A. Pipe NPS 2 and Smaller:

1. Brass ball valve, one piece. Provide with threaded or solder-joint ends.

2. Bronze ball valve, one piece with bronze or stainless steel trim. Provide with threaded or solder-joint ends.

3. Brass ball valves, two-piece with full port and brass or stainless steel trim. Provide with threaded or solder-joint ends.

4. Bronze ball valves, two-piece with full port and brass or stainless-steel trim. Provide with threaded or solder-joint ends.

5. Brass ball valves, three-piece with full port and brass or stainless steel trim.

6. Bronze ball valves, three-piece with full port and bronze or brass or stainless steel trim.

7. Bronze ball valves, two-piece with regular port and bronze or stainless-steel trim.

B. Pipe NPS 2-1/2 and Larger:

1. Steel and Iron Valves, NPS 2-1/2 to NPS 4: May be provided with threaded ends instead of flanged ends.

2. Steel ball valves, Class 150 with full port.

3. Iron ball valves, Class 150.

C. CPVC Pipe NPS 2 and Smaller: Union-ball valve.

D. PVC Pipe NPS 2 and Smaller: Union-ball valve.

3.05 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

Page Intentionally Left Blank

SECTION 22 05 29

HANGERS AND SUPPORTS FOR PLUMBING PIPING AND EQUIPMENT

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide hangers and supports for plumbing piping and equipment as indicated and in compliance with Contract Documents.

1. Metal pipe hangers and supports
2. Trapeze pipe hangers
3. Fiberglass pipe hangers
4. Metal framing systems
5. Fiberglass strut systems
6. Thermal hanger-shield inserts
7. Fastener systems
8. Pipe stands
9. Pipe-positioning systems
10. Equipment supports

1.03 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Shop Drawings: Show fabrication and installation details and include calculations for the following:

1. Trapeze pipe hangers.

2. Metal framing systems.

3. Fiberglass strut systems.

4. Pipe stands.

5. Equipment supports.

C. Delegated-Design Submittal: For trapeze hangers indicated to comply with performance requirements and design criteria, including analysis data signed and sealed by the qualified professional engineer responsible for their preparation.

1. Detail fabrication and assembly of trapeze hangers.

2. Include design calculations for designing trapeze hangers.

D. Welding certificates.

1.04 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.05 SPARE PARTS:

A. Comply with the requirements specified in Section 01 61 00.

1.06 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

B. Structural-Steel Welding Qualifications: Qualify procedures and personnel according to AWS D1.1.

C. Pipe Welding Qualifications: Qualify procedures and operators according to 2015 ASME Boiler and Pressure Vessel Code, Section IX.

1.07 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

PART 2 - PRODUCTS

2.01 PERFORMANCE REQUIREMENTS:

A. Delegated Design: Engage a qualified professional engineer, as defined in Section 01 45 00, to design trapeze pipe hangers and equipment supports.

B. AIS Compliance of these materials is required. Refer to Section 22 05 00, 1.01 E for description.

C. Structural Performance: Hangers and supports for plumbing piping and equipment shall withstand the effects of gravity loads and stresses within limits and under conditions indicated according to ASCE/SEI 7.

1. Design supports for multiple pipes, including pipe stands, capable of supporting combined weight of supported systems, system contents, and test water.

2. Design equipment supports capable of supporting combined operating weight of supported equipment and connected systems and components.

3. Design seismic-restraint hangers and supports for piping and equipment and obtain approval from authorities having jurisdiction.

2.02 METAL PIPE HANGERS AND SUPPORTS:

A. Carbon-Steel Pipe Hangers and Supports:

1. Compliance: AIS Compliance required. Manufacturer listed is the Basis of Design for performance product requirements. Contractor to submit compliant manufacturer if Basis of Design cannot certify AIS compliance.

2. Description: MSS SP-58, Types 1 through 58, factory-fabricated components.

3. Galvanized Metallic Coatings: Pre-galvanized, hot-dip galvanized, or electro-galvanized.

4. Nonmetallic Coatings: Plastic coated or epoxy powder coated.

5. Padded Hangers: Hanger with fiberglass or other pipe insulation pad or cushion to support bearing surface of piping.

6. Hanger Rods: Continuous-thread rod, nuts, and washer made of carbon steel.

B. Stainless-Steel Pipe Hangers and Supports:

1. Compliance: AIS Compliance required. Manufacturer listed is the Basis of Design for performance product requirements. Contractor to submit compliant manufacturer if Basis of Design cannot certify AIS compliance.

2. Description: MSS SP-58, Types 1 through 58, factory-fabricated components.

3. Padded Hangers: Hanger with fiberglass or other pipe insulation pad or cushion to support bearing surface of piping.

4. Hanger Rods: Continuous-thread rod, nuts, and washer made of stainless steel.

C. Copper Pipe and Tube Hangers:

1. Compliance: AIS Compliance required. Manufacturer listed is the Basis of Design for performance product requirements. Contractor to submit compliant manufacturer if Basis of Design cannot certify AIS compliance.

2. Description: MSS SP-58, Types 1 through 58, copper-coated-steel, factory-fabricated components.

3. Hanger Rods: Continuous-thread rod, nuts, and washer made of stainless steel.

2.03 TRAPEZE PIPE HANGERS:

A. Compliance: AIS Compliance required. Manufacturer listed is the Basis of Design for performance product requirements. Contractor to submit compliant manufacturer if Basis of Design cannot certify AIS compliance.

B. Description: MSS SP-58, Type 59, shop- or field-fabricated pipe-support assembly, made from structural-carbon-steel shapes, with MSS SP-58 carbon-steel hanger rods, nuts, saddles, and U-bolts.

2.04 METAL FRAMING SYSTEMS:

A. MFMA Manufacturer Metal Framing Systems:

1. Compliance: AIS Compliance required. Manufacturer listed is the Basis of Design for performance product requirements. Contractor to submit compliant manufacturer if Basis of Design cannot certify AIS compliance.

2. Manufacturers:

a. G-STRUT

b. Powerstrut Corp.

c. Unistrut Corp.

3. Description: Shop- or field-fabricated pipe-support assembly, made of steel channels, accessories, fittings, and other components for supporting multiple parallel pipes.

4. Standard: Comply with MFMA-4, factory-fabricated components for field assembly.

5. Channels: Continuous slotted Carbon-steel channel with inturned lips.

6. Channel Width: Selected for applicable load criteria.

7. Channel Nuts: Formed or stamped nuts or other devices designed to fit into channel slot and, when tightened, prevent slipping along channel.

8. Hanger Rods: Continuous-thread rod, nuts, and washer made of stainless steel

9. Metallic Coating: Hot-dip galvanized

10. Paint Coating: Green epoxy, acrylic, or urethane

11. Plastic Coating: PVC

B. Non-MFMA Manufacturer Metal Framing Systems:

1. Compliance: AIS Compliance required. Manufacturer listed is the Basis of Design for performance product requirements. Contractor to submit compliant manufacturer if Basis of Design cannot certify AIS compliance.

2. Manufacturers:

a. Anvil International

b. CADDY

c. Empire Industries, Inc.

d. MIRO Industries

3. Description: Shop- or field-fabricated pipe-support assembly, made of steel channels, accessories, fittings, and other components for supporting multiple parallel pipes.

4. Standard: Comply with MFMA-4, factory-fabricated components for field assembly.

5. Channels: Continuous slotted carbon-steel channel with inturned lips

6. Channel Width: Select for applicable load criteria

7. Channel Nuts: Formed or stamped nuts or other devices designed to fit into channel slot and, when tightened, prevent slipping along channel

8. Hanger Rods: Continuous-thread rod, nuts, and washer made of carbon steel

9. Metallic Coating: Hot-dip galvanized

10. Paint Coating: Green epoxy, acrylic, or urethane

11. Plastic Coating: PVC

2.05 THERMAL HANGER-SHIELD INSERTS:

A. Insulation-Insert Material for Cold Piping: ASTM C552, Type II cellular glass with 100-psig minimum compressive strength and vapor barrier.

B. Insulation-Insert Material for Hot Piping: Water-repellent-treated, ASTM C533, Type I calcium silicate with 100-psig minimum compressive strength.

C. For Trapeze or Clamped Systems: Insert and shield shall cover entire circumference of pipe.

D. For Clevis or Band Hangers: Insert and shield shall cover lower 180 degrees of pipe.

E. Insert Length: Extend 2 inches beyond sheet metal shield for piping operating below ambient air temperature.

2.06 FASTENER SYSTEMS:

A. Powder-Actuated Fasteners: Threaded-steel stud, for use in hardened Portland cement concrete, with pull-out, tension, and shear capacities appropriate for supported loads and building materials where used.

B. Mechanical-Expansion Anchors: Insert-wedge-type anchors, for use in hardened Portland cement concrete, with pull-out, tension, and shear capacities appropriate for supported loads and building materials where used.

1. Indoor Applications: stainless steel

2. Outdoor Applications: Stainless steel

2.07 PIPE STANDS:

A. General Requirements for Pipe Stands: Shop- or field-fabricated assemblies made of manufactured corrosion-resistant components to support roof-mounted piping.

B. Compact Pipe Stand:

1. Description: Single base unit with integral-rod roller, pipe clamps, or V-shaped cradle to support pipe, for roof installation without membrane penetration.

2. Base: Single, vulcanized rubber, molded polypropylene, or polycarbonate

3. Hardware: Galvanized steel or polycarbonate

4. Accessories: Protection pads

C. Low-Profile, Single-Base, Single-Pipe Stand:

1. Description: Single base with vertical and horizontal members, and pipe support, for roof installation without membrane protection.

2. Base: Single, vulcanized rubber, molded polypropylene, or polycarbonate

3. Vertical Members: Two galvanized-steel, continuous-thread, 1/2-inch rods

4. Horizontal Member: Adjustable horizontal, galvanized-steel pipe support channels

5. Pipe Supports: Roller

6. Hardware: Galvanized steel

7. Accessories: Protection pads

8. Height: 12 inches above roof

D. High-Profile, Single-Base, Single-Pipe Stand:

1. Description: Single base, vertical and horizontal members, and pipe support, for roof installation without membrane penetration.

2. Base: Single vulcanized rubber or molded polypropylene

3. Vertical Members: Two galvanized-steel, continuous-thread, 1/2-inch rods

4. Horizontal Member: One adjustable-height, galvanized-steel, pipe-support slotted channel or plate

5. Pipe Supports: Clevis hanger

6. Hardware: Stainless steel

7. Accessories: Protection 1/2-inch, continuous-thread, stainless-steel rod

8. Height: 36 inches above roof

E. High-Profile, Multiple-Pipe Stand:

1. Description: Assembly of bases, vertical and horizontal members, and pipe supports, for roof installation without membrane penetration.

2. Bases: Two or more; molded polypropylene

3. Vertical Members: Two or more, galvanized-steel channels

4. Horizontal Members: One or more, adjustable-height, galvanized-steel pipe support

5. Pipe Supports: Strut clamps

6. Hardware: Galvanized steel

7. Accessories: Protection pads, 1/2-inch, continuous-thread rod

8. Height: 36 inches above roof

F. Curb-Mounted-Type Pipe Stands: Shop- or field-fabricated pipe supports made from structural-steel shapes, continuous-thread rods, and rollers, for mounting on permanent stationary roof curb.

2.08 PIPE-POSITIONING SYSTEMS:

A. Description: IAPMO PS 42 positioning system composed of metal brackets, clips, and straps for positioning piping in pipe spaces; for plumbing fixtures in commercial applications.

2.09 EQUIPMENT SUPPORTS:

A. Description: Welded, shop- or field-fabricated equipment support made from structural-carbon-steel shapes.

1. Compliance: AIS Compliance required. Manufacturer listed is the Basis of Design for performance product requirements. Contractor to submit compliant manufacturer if Basis of Design cannot certify AIS compliance.

2.10 MATERIALS:

A. Aluminum: ASTM B221

B. Carbon Steel: ASTM A1011

C. Structural Steel: ASTM A36 carbon-steel plates, shapes, and bars; black and galvanized

D. Stainless Steel: ASTM A240

E. Grout: ASTM C1107, factory-mixed and -packaged, dry, hydraulic-cement, non-shrink and nonmetallic grout; suitable for interior and exterior applications

1. Properties: Non-staining, noncorrosive, and nongaseous

2. Design Mix: 5000-psi, 28-day compressive strength

PART 3 - EXECUTION

3.01 APPLICATION:

A. Comply with requirements in Section 07 84 00 for firestopping materials and installation, for penetrations through fire-rated walls, ceilings, and assemblies.

B. Strength of Support Assemblies: Where not indicated, select sizes of components, so strength will be adequate to carry present and future static loads within specified loading limits. Minimum static design load used for strength determination shall be weight of supported components plus 200 pounds.

3.02 HANGER AND SUPPORT INSTALLATION:

A. Metal Pipe-Hanger Installation: Comply with MSS SP-58. Install hangers, supports, clamps, and attachments as required to properly support piping from building structure.

B. Metal Trapeze Pipe-Hanger Installation: Comply with MSS SP-58. Arrange for grouping of parallel runs of horizontal piping, and support together on field-fabricated trapeze pipe hangers.

1. Pipes of Various Sizes: Support together and space trapezes for smallest pipe size, or install intermediate supports for smaller-diameter pipes as specified for individual pipe hangers.

2. Field fabricate from ASTM A36 carbon-steel shapes selected for loads being supported. Weld steel according to AWS D1.1.

C. Fiberglass Pipe-Hanger Installation: Comply with applicable portions of MSS SP-58. Install hangers and attachments as required to properly support piping from building structure.

D. Metal Framing System Installation: Arrange for grouping of parallel runs of piping, and support together on field-assembled metal framing systems.

E. Thermal Hanger-Shield Installation: Install in pipe hanger or shield for insulated piping.

F. Fastener System Installation:

1. Install powder-actuated fasteners for use in lightweight concrete or concrete slabs less than 4 inches thick in concrete, after concrete is placed and completely cured. Use operators that are licensed by powder-actuated tool manufacturer. Install fasteners according to powder-actuated tool manufacturer's operating manual.

2. Install mechanical-expansion anchors in concrete, after concrete is placed and completely cured. Install fasteners according to manufacturer's written instructions.

G. Pipe Stand Installation:

1. Pipe Stand Types, except Curb-Mounted Type: Assemble components and mount on smooth roof surface. Do not penetrate roof membrane.

2. Curb-Mounted-Type Pipe Stands: Assemble components or fabricate pipe stand and mount on permanent, stationary roof curb. See Section 07 72 00 for curbs.

H. Pipe-Positioning-System Installation: Install support devices to make rigid supply and waste piping connections to each plumbing fixture.

I. Install hangers and supports complete with necessary attachments, inserts, bolts, rods, nuts, washers, and other accessories.

J. Equipment Support Installation: Fabricate from welded-structural-steel shapes.

K. Install hangers and supports to allow controlled thermal and seismic movement of piping systems, to permit freedom of movement between pipe anchors, and to facilitate action of expansion joints, expansion loops, expansion bends, and similar units.

L. Install lateral bracing with pipe hangers and supports to prevent swaying.

M. Install building attachments within concrete slabs or attach to structural steel. Install additional attachments at concentrated loads, including valves, flanges, and strainers, NPS 2-1/2 and larger and at changes in direction of piping. Install concrete inserts before concrete is placed; fasten inserts to forms, and install reinforcing bars through openings at top of inserts.

N. Load Distribution: Install hangers and supports, so that piping live and dead loads and stresses from movement will not be transmitted to connected equipment.

O. Pipe Slopes: Install hangers and supports to provide indicated pipe slopes and to not exceed maximum pipe deflections allowed by ASME B31.9 for building services piping.

P. Insulated Piping:

1. Attach clamps and spacers to piping.

   a. Piping Operating Above Ambient Air Temperature: Clamp may project through insulation.

   b. Piping Operating Below Ambient Air Temperature: Use thermal hanger-shield insert with clamp sized to match OD of insert.

   c. Do not exceed pipe stress limits allowed by ASME B31.9 for building services piping.

2. Install MSS SP-58, Type 39 protection saddles if insulation without vapor barrier is indicated. Fill interior voids with insulation that matches adjoining insulation.

   a. Option: Thermal hanger-shield inserts may be used. Include steel weight-distribution plate for pipe NPS 4 and larger if pipe is installed on rollers.

3. Install MSS SP-58, Type 40 protective shields on cold piping with vapor barrier. Shields shall span an arc of 180 degrees.

   a. Option: Thermal hanger-shield inserts may be used. Include steel weight-distribution plate for pipe NPS 4 and larger if pipe is installed on rollers.

4. Shield Dimensions for Pipe: Not less than the following:

   a. NPS 1/4 to NPS 3-1/2: 12 inches long and 0.048 inch thick

   b. NPS 4: 12 inches long and 0.06 inch thick

   c. NPS 5 and NPS 6: 18 inches long and 0.06 inch thick

   d. NPS 8 to NPS 14: 24 inches long and 0.075 inch thick

   e. NPS 16 to NPS 24: 24 inches long and 0.105 inch thick

5. Pipes NPS 8 and Larger: Include wood or reinforced calcium-silicate-insulation inserts of length at least as long as protective shield.

6. Thermal Hanger Shields: Install with insulation of same thickness as piping insulation.

3.03 EQUIPMENT SUPPORTS:

A. Fabricate structural-steel stands to suspend equipment from structure overhead or to support equipment above floor.

B. Grouting: Place grout under supports for equipment, and make bearing surface smooth.

C. Provide lateral bracing, to prevent swaying, for equipment supports.

3.04 METAL FABRICATIONS:

A. Cut, drill, and fit miscellaneous metal fabrications for trapeze pipe hangers and equipment supports.

B. Fit exposed connections together to form hairline joints. Field weld connections that cannot be shop welded because of shipping size limitations.

C. Field Welding: Comply with AWS D1.1 procedures for shielded, metal arc welding; appearance and quality of welds; and methods used in correcting welding work; and with the following:

1. Use materials and methods that minimize distortion and develop strength and corrosion resistance of base metals.

2. Obtain fusion without undercut or overlap.

3. Remove welding flux immediately.

4. Finish welds at exposed connections, so no roughness shows after finishing and so contours of welded surfaces match adjacent contours.

3.05 ADJUSTING:

A. Hanger Adjustments: Adjust hangers to distribute loads equally on attachments and to achieve indicated slope of pipe.

B. Trim excess length of continuous-thread hanger and support rods to 1-1/2 inches.

3.06 PAINTING:

A. Touchup: Clean field welds and abraded, shop-painted areas. Paint exposed areas immediately after erecting hangers and supports. Use same materials as those used for shop painting. Comply with SSPC-PA 1 requirements for touching up field-painted surfaces.

1. Apply paint by brush or spray to provide a minimum dry film thickness of 2.0 mils.

B. Touchup: Cleaning and touchup painting of field welds, bolted connections, and abraded, shop-painted areas on miscellaneous metal are specified in Section 09 90 00.

C. Galvanized Surfaces: Clean welds, bolted connections, and abraded areas, and apply galvanizing-repair paint to comply with ASTM A780.

3.07 HANGER AND SUPPORT SCHEDULE:

A. Specific hanger and support requirements are in Sections specifying piping systems and equipment.

B. Comply with MSS SP-58 for pipe-hanger selections and applications that are not specified in piping system Sections.

C. Use hangers and supports with galvanized metallic coatings for piping and equipment that will not have field-applied finishes.

D. Use nonmetallic coatings on attachments for electrolytic protection where attachments are in direct contact with copper tubing.

E. Use carbon-steel pipe hangers and supports, metal trapeze pipe hangers, and metal framing systems and attachments for general service applications.

F. Use stainless-steel pipe hangers, and stainless-steel attachments for hostile environment applications.

G. Use copper-plated pipe hangers and copper attachments for copper piping and tubing.

H. Use padded hangers for piping that is subject to scratching.

I. Use thermal hanger-shield inserts for insulated piping and tubing.

J. Horizontal-Piping Hangers and Supports: Unless otherwise indicated and except as specified in piping system Sections, install the following types:

1. Adjustable, Steel Clevis Hangers (MSS Type 1): For suspension of non-insulated or insulated, stationary pipes NPS 1/2 to NPS 30.

2. Yoke-Type Pipe Clamps (MSS Type 2): For suspension of up to 1050 degrees F pipes NPS 4 to NPS 24, requiring up to 4 inches of insulation.

3. Carbon- or Alloy-Steel, Double-Bolt Pipe Clamps (MSS Type 3): For suspension of pipes NPS 3/4 to NPS 36, requiring clamp flexibility and up to 4 inches of insulation.

4. Steel Pipe Clamps (MSS Type 4): For suspension of cold and hot pipes NPS 1/2 to NPS 24 if little or no insulation is required.

5. Pipe Hangers (MSS Type 5): For suspension of pipes NPS 1/2 to NPS 4, to allow off-center closure for hanger installation before pipe erection.

6. Adjustable, Swivel Split- or Solid-Ring Hangers (MSS Type 6): For suspension of non-insulated, stationary pipes NPS 3/4 to NPS 8.

7. Adjustable, Steel Band Hangers (MSS Type 7): For suspension of non-insulated, stationary pipes NPS 1/2 to NPS 8.

8. Adjustable Band Hangers (MSS Type 9): For suspension of non-insulated, stationary pipes NPS 1/2 to NPS 8.

9. Adjustable, Swivel-Ring Band Hangers (MSS Type 10): For suspension of non-insulated, stationary pipes NPS 1/2 to NPS 8.

10. Split Pipe Ring with or without Turnbuckle Hangers (MSS Type 11): For suspension of non-insulated, stationary pipes NPS 3/8 to NPS 8.

11. Extension Hinged or Two-Bolt Split Pipe Clamps (MSS Type 12): For suspension of non-insulated, stationary pipes NPS 3/8 to NPS 3.

12. U-Bolts (MSS Type 24): For support of heavy pipes NPS 1/2 to NPS 30.

13. Clips (MSS Type 26): For support of insulated pipes not subject to expansion or contraction.

14. Pipe Saddle Supports (MSS Type 36): For support of pipes NPS 4 to NPS 36, with steel-pipe base stanchion support and cast-iron floor flange or carbon-steel plate.

15. Pipe Stanchion Saddles (MSS Type 37): For support of pipes NPS 4 to NPS 36, with steel-pipe base stanchion support and cast-iron floor flange or carbon-steel plate, and with U-bolt to retain pipe.

16. Adjustable Pipe Saddle Supports (MSS Type 38): For stanchion-type support for pipes NPS 2-1/2 to NPS 36 if vertical adjustment is required, with steel-pipe base stanchion support and cast-iron floor flange.

17. Single-Pipe Rolls (MSS Type 41): For suspension of pipes NPS 1 to NPS 30, from two rods if longitudinal movement caused by expansion and contraction occurs.

18. Adjustable Roller Hangers (MSS Type 43): For suspension of pipes NPS 2-1/2 to NPS 24, from single rod if horizontal movement caused by expansion and contraction occurs.

19. Complete Pipe Rolls (MSS Type 44): For support of pipes NPS 2 to NPS 42 if longitudinal movement caused by expansion and contraction occurs but vertical adjustment is unnecessary.

20. Pipe Roll and Plate Units (MSS Type 45): For support of pipes NPS 2 to NPS 24 if small horizontal movement caused by expansion and contraction occurs and vertical adjustment is unnecessary.

21. Adjustable Pipe Roll and Base Units (MSS Type 46): For support of pipes NPS 2 to NPS 30 if vertical and lateral adjustment during installation, in addition to expansion and contraction, is required.

K. Vertical-Piping Clamps: Unless otherwise indicated and except as specified in piping system sections, install the following types:

1. Extension Pipe or Riser Clamps (MSS Type 8): For support of pipe risers NPS 3/4 to NPS 24.

2. Carbon- or Alloy-Steel Riser Clamps (MSS Type 42): For support of pipe risers NPS 3/4 to NPS 24 if longer ends are required for riser clamps.

L. Hanger-Rod Attachments: Unless otherwise indicated and except as specified in piping system Sections, install the following types:

1. Steel Turnbuckles (MSS Type 13): For adjustment of up to 6 inches for heavy loads.

2. Steel Clevises (MSS Type 14): For 120 to 450 degrees F piping installations.

3. Swivel Turnbuckles (MSS Type 15): For use with MSS Type 11 split pipe rings.

4. Malleable-Iron Sockets (MSS Type 16): For attaching hanger rods to various types of building attachments.

5. Steel Weldless Eye Nuts (MSS Type 17): For 120 to 450 degrees F piping installations.

M. Building Attachments: Unless otherwise indicated and except as specified in piping system Sections, install the following types:

1. Steel or Malleable-Concrete Inserts (MSS Type 18): For upper attachment to suspend pipe hangers from concrete ceiling.

2. Top-Beam C-Clamps (MSS Type 19): For use under roof installations with bar-joist construction, to attach to top flange of structural shape.

3. Side-Beam or Channel Clamps (MSS Type 20): For attaching to bottom flange of beams, channels, or angles.

4. Center-Beam Clamps (MSS Type 21): For attaching to center of bottom flange of beams.

5. Welded Beam Attachments (MSS Type 22): For attaching to bottom of beams if loads are considerable and rod sizes are large.

6. C-Clamps (MSS Type 23): For structural shapes.

7. Top-Beam Clamps (MSS Type 25): For top of beams if hanger rod is required tangent to flange edge.

8. Side-Beam Clamps (MSS Type 27): For bottom of steel I-beams.

9. Steel-Beam Clamps with Eye Nuts (MSS Type 28): For attaching to bottom of steel I-beams for heavy loads.

10. Linked-Steel Clamps with Eye Nuts (MSS Type 29): For attaching to bottom of steel I-beams for heavy loads, with link extensions.

11. Malleable-Beam Clamps with Extension Pieces (MSS Type 30): For attaching to structural steel.

12. Welded-Steel Brackets: For support of pipes from below or for suspending from above by using clip and rod. Use one of the following for indicated loads:

    a. Light (MSS Type 31): 750 pounds

    b. Medium (MSS Type 32): 1500 pounds

    c. Heavy (MSS Type 33): 3000 pounds

13. Side-Beam Brackets (MSS Type 34): For sides of steel or wooden beams.

14. Plate Lugs (MSS Type 57): For attaching to steel beams if flexibility at beam is required.

15. Horizontal Travelers (MSS Type 58): For supporting piping systems subject to linear horizontal movement where headroom is limited.

N. Saddles and Shields: Unless otherwise indicated and except as specified in piping system Sections, install the following types:

1. Steel-Pipe-Covering Protection Saddles (MSS Type 39): To fill interior voids with insulation that matches adjoining insulation.

2. Protection Shields (MSS Type 40): Of length recommended in writing by manufacturer to prevent crushing insulation.

3. Thermal Hanger-Shield Inserts: For supporting insulated pipe.

O. Spring Hangers and Supports: Unless otherwise indicated and except as specified in piping system Sections, install the following types:

1. Restraint-Control Devices (MSS Type 47): Where indicated to control piping movement.

2. Spring Cushions (MSS Type 48): For light loads if vertical movement does not exceed 1-1/4 inches.

3. Spring-Cushion Roll Hangers (MSS Type 49): For equipping Type 41 roll hanger with springs.

4. Spring Sway Braces (MSS Type 50): To retard sway, shock, vibration, or thermal expansion in piping systems.

5. Variable-Spring Hangers (MSS Type 51): Preset to indicated load, and limit variability factor to 25 percent to allow expansion and contraction of piping system from hanger.

6. Variable-Spring Base Supports (MSS Type 52): Preset to indicated load, and limit variability factor to 25 percent to allow expansion and contraction of piping system from base support.

7. Variable-Spring Trapeze Hangers (MSS Type 53): Preset to indicated load, and limit variability factor to 25 percent to allow expansion and contraction of piping system from trapeze support.

8. Constant Supports: For critical piping stress and if necessary to avoid transfer of stress from one support to another support, critical terminal, or connected equipment. Include auxiliary stops for erection, hydrostatic test, and load-adjustment capability. These supports include the following types:

    a. Horizontal (MSS Type 54): Mounted horizontally.

    b. Vertical (MSS Type 55): Mounted vertically.

    c. Trapeze (MSS Type 56): Two vertical-type supports and one trapeze member.

P. Comply with MSS SP-58 for trapeze pipe-hanger selections and applications that are not specified in piping system Sections.

Q. Comply with MFMA-103 for metal framing system selections and applications that are not specified in piping system Sections.

R. Use mechanical-expansion anchors instead of building attachments where required in concrete construction.

S. Use pipe-positioning systems in pipe spaces behind plumbing fixtures to support supply and waste piping for plumbing fixtures.

3.08 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

Page Intentionally Left Blank

SECTION 22 05 33

HEAT TRACING SYSTEMS

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide plumbing piping heat tracing as shown on Drawings for freeze prevention, domestic hot-water-temperature maintenance, and snow and ice melting on roofs and in gutters and downspouts with the following electric heating cables as indicated and in compliance with Contract Documents.

1. Plastic insulated, series resistance

2. Self-regulating, parallel resistance

3. Constant wattage

1.02 REFERENCES:

A. Institute of Electrical and Electronics Engineers (IEEE):

1. 515.1: Testing, Design, Installation, and Maintenance of Electrical Resistance Trace Heating for Commercial Applications

B. National Fire Protection Association (NFPA):

1. 70: National Electrical Code.

1.03 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Product Data: For each type of product.

1. Include rated capacities, operating characteristics, and furnished specialties and accessories.

2. Schedule heating capacity, length of cable, spacing, and electrical power requirement for each electric heating cable required.

C. Shop Drawings: For electric heating cable.

1. Include plans, elevations, sections, and attachment details.

2. Include diagrams for power, signal, and control wiring.

D. Field quality-control reports.

E. Sample Warranty: For special warranty.

F. Operation and Maintenance Data: For electric heating cables to include in operation and maintenance manuals.

1.04 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.05 SPARE PARTS:

A. Comply with the requirements specified in Section 01 61 00.

1.06 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

1.07 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

1.08 WARRANTY:

A. Special Warranty: Manufacturer agrees to repair or replace electric heating cable that fails in materials or workmanship within specified warranty period.

1. Warranty Period: Three from date of Substantial Completion.

PART 2 - PRODUCTS

2.01 SELF-REGULATING, PARALLEL-RESISTANCE HEATING CABLES:

A. Manufacturers:

1. Chromalox

2. Delta-Therm

3. Raychem

B. Comply with IEEE 515.1.

C. The self-regulating heating cable shall consist of two (2) 16 AWG nickel-copper bus wires embedded in parallel in a self-regulating polymer core that varies its power output to respond to temperature all along its length, allowing the heating cable to be but to length in the field. The heating cable shall be covered by a radiation-crosslinking modi-

fied polyolefin dielectric jacket. To provide a ground path and to enhance the heating cable's ruggedness, the heating cable shall have a braid of tinned copper and an outer jacket of modified polyolefin.

1. For installation on plastic piping, the heating cable shall be applied using aluminum tape.

D. In order to conserve energy and to prevent overheating, the heating cable shall have a self-regulating factor of at least 90 percent. The self-regulating factor is defined as the percentage reduction, without thermostatic control, of the heating cable output going from 40 degrees F pipe temperature operation to 150 degrees F pipe temperature operation.

1. The heating cable shall operate on line voltage of 277 volts without the use of transformers.

2. Electrical Insulating Jacket: Flame-retardant polyolefin.

3. Cable Cover: Tinned-copper braid, and polyolefin outer jacket with UV inhibitor.

4. Maximum Operating Temperature (Power On): 150 degrees F.

5. Maximum Exposure Temperature (Power Off): 185 degrees F.

6. Maximum Operating Temperature: 300 degrees F.

E. Power connection, end seal, splice and tee kit components shall be applied in the field.

F. All heating-cable components shall be UL Listed, CSA Certified, or FM Approved for use as part of the system to provide freeze protection. Component enclosures shall be rated NEMA 4X to prevent water ingress and corrosion. Installation shall not require the installing contractor to cut into the heating-cable core to expose the bus wires. Connection systems that require the installing contractor to strip the bust wires or that use crimps or terminal blocks, shall not be acceptable. All components that make an electrical connection shall be re-enterable for servicing. No components shall use silicone to seal the electrical connections. An exception will be made in areas where a conduit transition is required.

G. Capacities and Characteristics: The heating cable for metal-pipe freeze protection shall be sized according to the table below. The required cable output rating in watts per foot at 50 degrees F assuming 1 inch thick fiberglass insulation.

Heat Output based on Min. Ambient Temp. of 0 degrees F:

Pipe Size (Inches)	**Cable Output Rating**
3 or less	5 watts

Pipe Size (Inches)	Cable Output Rating
4	5 watts
6	8 watts
8	8 watts
10 +	8 watts x 2 runs

H. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

I. Capacities and Characteristics:

1. Maximum Heat Output: 8 W/ft

2. Piping Diameter: 4 inch maximum

3. Number of Parallel Cables: 2

4. Spiral Wrap Pitch: 12 inches

5. Electrical Characteristics for Single-Circuit Connection:

a. Volts: 208

b. Phase: Single

c. Hertz: 60

2.02 CONTROLS:

A. Pipe-Mounted Thermostats for Freeze Protection:

1. Building with Mechanical System Building Automation System Available:

a. Provide controls as required to connect and control heat trace via the building automation system (BAS). All components necessary to enable/disable and monitor the heat trace system shall be provided including any gateways or translators to speak to the BacNET MSTP BAS.

b. Remote, resistance temperature device, or thermistor for directly sensing pipe-wall temperature.

c. Corrosion-resistant, waterproof control enclosure.

d. Heat trace shall be enabled/disabled via BAS system. TC contractor shall coordinate with the ME/EC for install and control of the heat trace and all other snow melt systems.

e. Basis of Design: Raychem ACS-30 with ProtoNode gateway.

2. Building Without Mechanical System Building Automation System Available:

a. Remote bulb unit with adjustable temperature range from 30 to 50 degrees F.

b. Snap action; open-on-rise, single-pole switch with minimum current rating adequate for connected cable.

c. Remote bulb on capillary, resistance temperature device, or thermistor for directly sensing pipe-wall temperature.

d. Corrosion-resistant, waterproof control enclosure.

2.03 ACCESSORIES:

A. Cable Installation Accessories: Fiberglass tape, heat-conductive putty, cable ties, silicone end seals and splice kits, and installation clips all furnished by manufacturer, or as recommended in writing by manufacturer.

B. Warning Labels: Refer to Section 22 05 53.

C. Warning Tape: Continuously printed "Electrical Tracing"; vinyl, at least 3 mils thick, and with pressure-sensitive, permanent, waterproof, self-adhesive back.

1. Width for Markers on Pipes with OD, Including Insulation, Less than 6 Inches: 3/4 inch minimum.

2. Width for Markers on Pipes with OD, Including Insulation, 6 Inches or Larger: 1-1/2 inches minimum.

PART 3 - EXECUTION

3.01 EXAMINATION:

A. Examine surfaces and substrates to receive electric heating cables for compliance with requirements for installation tolerances and other conditions affecting performance.

1. Ensure surfaces and pipes in contact with electric heating cables are free of burrs and sharp protrusions.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 APPLICATIONS:

A. Install the following types of electric heating cable for the applications described:

1. Temperature Maintenance for Domestic Hot Water/Piping Systems: Self-regulating, parallel-resistance heating cable.

3.03 INSTALLATION:

A. Install electric heating cable across expansion, construction, and control joints according to manufacturer's written instructions; use cable-protection conduit and slack cable to allow movement without damage to cable.

B. Electric Heating-Cable Installation for Freeze Protection for Piping:

1. Install electric heating cables after piping has been tested and before insulation is installed.

2. Install electric heating cables according to IEEE 515.1.

3. Install insulation over piping with electric cables according to Section 22 07 19.

4. Install warning tape on piping insulation where piping is equipped with electric heating cables.

C. Electric Heating-Cable Installation for Temperature Maintenance for Domestic Hot Water:

1. Install electric heating cables after piping has been tested and before insulation is installed.

2. Install insulation over piping with electric heating cables according to Section 22 07 19.

3. Install warning tape on piping insulation where piping is equipped with electric heating cables.

D. Set field-adjustable switches and circuit-breaker trip ranges.

3.04 CONNECTIONS:

A. Ground equipment according to Section 26 05 26.

B. Connect wiring according to Section 26 05 20.

3.05 FIELD QUALITY CONTROL:

A. Testing Agency: Engage a qualified testing agency to perform tests and inspections.

B. Manufacturer's Field Service: Engage a factory-authorized service representative to test and inspect components, assemblies, and equipment installations, including connections.

C. Perform the following tests and inspections:

1. Perform tests after cable installation but before application of coverings such as insulation, wall or ceiling construction, or concrete.

2. Test cables for electrical continuity and insulation integrity before energizing.

3. Test cables to verify rating and power input. Energize and measure voltage and current simultaneously.

D. Repeat tests for continuity, insulation resistance, and input power after applying thermal insulation on pipe-mounted cables.

E. Cables will be considered defective if they do not pass tests and inspections.

F. Prepare test and inspection reports.

3.06 PROTECTION:

A. Protect installed heating cables, including non-heating leads, from damage during construction.

B. Remove and replace damaged heat-tracing cables.

3.07 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 22 05 48

VIBRATION AND SEISMIC CONTROLS FOR PLUMBING PIPING AND EQUIPMENT

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide vibration and seismic controls for plumbing piping and equipment as indicated and in compliance with Contract Documents.

1. Isolation pads
2. Isolation mounts
3. Restrained elastomeric isolation mounts
4. Freestanding and restrained spring isolators
5. Housed spring mounts
6. Elastomeric hangers
7. Spring hangers
8. Spring hangers with vertical-limit stops
9. Pipe riser resilient supports
10. Seismic snubbers
11. Restraining braces and cables
12. Steel and inertia, vibration isolation equipment bases

1.02 REFERENCES:

A. ASTM International (ASTM):

1. A492: Standard Specification for Stainless Steel Rope Wire
2. A603: Standard Specification for Zinc-Coated Steel Structural Wire Rope
3. E488: Standard Test Methods for Strength of Anchors in Concrete and Masonry Elements

B. American Welding Society (AWS):

1. D1.1: Structural Welding Code – Steel

C. Manufacturer Metal Framing Systems (MFMA):

1. 4: Standard for Integrated Fire Protection and Life Safety System Testing

D. Manufacturers' Standardization Society (MSS):

1. SP-127: Bracing for Piping Systems: Seismic – Wind – Dynamic Design, Selection, and Application

1.03 DEFINITIONS:

A. AHJ: Authority Having Jurisdiction

B. EPDM: Ethylene-Propylene-Diene Monomer

C. Withstand: Unit will remain in place without separation of any parts from the device when subjected to seismic forces specified.

1.04 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

1. Written certification from Professional Engineer licensed in the State of Utah stating that supports systems and anchorage for equipment have been designed according to requirements of indicated according to Section 1613 of the building codes of Utah, Salt lake City and ASCE/SEI 7 for post-disaster structures at time of shop drawing submittals.

B. Product Data: For each type of product.

1. Include rated load, rated deflection, and overload capacity for each vibration isolation device.

2. Illustrate and indicate style, material, strength, fastening provision, and finish for each type and size of vibration isolation device and seismic-restraint component required.

a. Tabulate types and sizes of seismic restraints, complete with report numbers and rated strength in tension and shear as evaluated by an agency acceptable to authorities having jurisdiction.

b. Annotate to indicate application of each product submitted and compliance with requirements.

3. Interlocking Snubbers: Include ratings for horizontal, vertical, and combined loads.

C. Shop Drawings:

1. Submit manufacturer's assembly-type shop drawings indicating dimensions, weights, required clearances, and method of assembly of components. Detail bases, and show location of equipment anchoring points, coordinated with equipment manufacturer's shop drawings.

a. Shop drawings showing structural design and details of inertia bases, steel beam bases and other custom-fabricated work not covered by manufacturer's submitted data.

(1) Furnish templates, anchor bolts and sleeve for equipment bases, foundations and other support systems for coordination of vibration isolation units with other work.

2. Submit shop drawings indicating scope of vibration isolation work and locations of units and flexible connections. Include support isolation points for piping and ductwork including risers, air housings and inertia bases.

a. Include schedule of units, showing size or manufacturer's part number, and weight supported and resulting deflection of each unit.

D. Delegated-Design Submittal: For each vibration isolation and seismic-restraint device.

1. For each device, equipment or appurtenance provide written certification from Professional Engineer licensed in the State of Utah stating that supports systems and anchorage for equipment have been designed according to the requirements of Section 1613 of the building codes of Utah, Salt Lake City and ASCE/SEI 7, and in accordance with Specification 01 41 20. Submit calculations stamped by a Professional Engineer licensed in the State of Utah for support systems and anchorage for wind, seismic, and all other pertinent loads.

2. Include design calculations and details for selecting vibration isolators and seismic restraints complying with performance requirements, design criteria, and analysis data signed and sealed by the qualified professional engineer responsible for their preparation.

3. Design Calculations: Calculate static and dynamic loading due to equipment weight and operation, due to seismic forces required to select vibration isolators, and due to seismic restraints.

4. Riser Supports: Include riser diagrams and calculations showing anticipated expansion and contraction at each support point, initial and final loads on building structure, spring deflection changes, and seismic loads. Include certification that riser system was examined for excessive stress and that none exists.

5. Seismic-Restraint Details:

   a. Design Analysis: To support selection and arrangement of seismic restraints. Include calculations of combined tensile and shear loads.

   b. Details: Indicate fabrication and arrangement. Detail attachments of restraints to the restrained items and to the structure. Show attachment locations, methods, and spacings. Identify components, list their strengths, and indicate directions and values of forces transmitted to the structure during seismic events. Indicate association with vibration isolation devices.

   c. Coordinate seismic-restraint and vibration isolation details with wind-restraint details required for equipment mounted outdoors. Comply with requirements in other Sections for equipment mounted outdoors.

   d. Preapproval and Evaluation Documentation: By an agency acceptable to authorities having jurisdiction, showing maximum ratings of restraint items and the basis for approval (tests or calculations).

6. Seismic Qualification Certificates:

   a. For pumps, accessories, and components, from manufacturer.

      (1) Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.

      (2) Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.

      (3) Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.

   b. For steel water storage tanks, accessories, and components, from manufacturer.

      (1) Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.

      (2) Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.

      (3) Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.

   c. For waste and vent piping, accessories, and components, from manufacturer.

      (1) Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.

(2) Detailed description of piping anchorage devices on which the certification is based and their installation requirements.

d. For storm drainage piping, accessories, and components, from manufacturer.

(1) Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.

(2) Detailed description of piping anchorage devices on which the certification is based and their installation requirements.

e. Water heaters, accessories, and components, from manufacturer.

(1) Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.

(2) Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.

(3) Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.

E. Qualification Data: For Professional Engineer and Testing Agency.

F. Welding certificates.

G. Field quality-control reports.

1.05 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.06 SPARE PARTS:

A. Comply with the requirements specified in Section 01 61 00.

1.07 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

B. Testing Agency Qualifications: An independent agency, with the experience and capability to conduct the testing indicated, that is an NRTL as defined by OSHA in 29 CFR 1910.7 and that is acceptable to authorities having jurisdiction.

C. Comply with seismic-restraint requirements in the IBC unless requirements in this Section are more stringent.

D. Welding Qualifications: Qualify procedures and personnel according to AWS D1.1, "Structural Welding Code - Steel."

E. Seismic-restraint devices shall have horizontal and vertical load testing and analysis and shall bear anchorage preapproval by an agency acceptable to authorities having jurisdiction, showing maximum seismic-restraint ratings. Ratings based on independent testing are preferred to ratings based on calculations. If preapproved ratings are unavailable, submittals based on independent testing are preferred. Calculations (including combining shear and tensile loads) to support seismic-restraint designs must be signed and sealed by a qualified professional engineer.

1.08 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

PART 2 - PRODUCTS

2.01 PERFORMANCE REQUIREMENTS:

A. Seismic Control:

1. Design equipment, anchorage and support systems for vertical and lateral loading in accordance with Section 1613 of the Building Codes of Utah, Salt Lake City and ASCE/SEI 7.

2. Provide seismic control as required to maintain integrity of mechanical piping, ductwork, and equipment installed in this project, so they will “withstand” earthquake forces.

3. Design shall comply with requirements of this Specification, applicable codes, and requirements of Section 22 05 00.

4. Design, size and install for equipment throughout facility, whether shown or not.

5. Designed by a licensed Professional Engineer in the State of Utah.

2.02 VIBRATION ISOLATION:

A. Elastomeric Pad:

1. Oil-resistant and water-resistant elastomer or natural rubber waffle pads, arranged in single or multiple layers, molded with a nonslip pattern.

2. Waffle pads bonded each side of minimum 0.24 inch thick galvanized steel separator plate.

3. Height of waffle ribs shall not exceed 0.7 times width.

4. Maximum Loading: 60 psi.

5. Minimum Single Layer Thickness: 0.24 inches.

6. Separator plate of sufficient stiffness for uniform loading over pad area.

7. Factory cut to size that matches requirements of supported equipment.

8. Waffle Pad Material: Standard neoprene.

9. Number of Layers: As required to support equipment load; refer to manufacturer's data for load capacities.

B. Elastomeric Mount:

1. Double-deflection type, with molded, oil-resistant rubber or neoprene isolator elements.

2. Factory-drilled, encapsulated top plate for bolting to equipment.

3. Baseplate for bolting to structure.

C. Restrained Elastomeric Isolation Mounts:

1. All-directional isolator with seismic restraints containing two separate and opposing elastomeric elements that prevent central threaded element and attachment hardware from contacting the housing during normal operation.

a. Housing: Cast-ductile iron or welded steel.

b. Elastomeric Material: Molded, oil-resistant rubber, neoprene, or other elastomeric material.

D. Open Spring Isolators:

1. Freestanding, laterally stable, open-spring isolators.

2. Outside Spring Diameter: Not less than 80 percent of the compressed height of the spring at rated load.

3. Minimum Additional Travel: 50 percent of required deflection at rated load.

4. Lateral Stiffness: 80 percent minimum of rated vertical stiffness.

5. Overload Capacity: Support 200 percent of rated load, fully compressed, without deformation or failure.

6. Baseplate:

   a. Factory drilled for bolting to structure and bonded to 0.24 inches thick rubber isolator pad attached to baseplate underside.

   b. Limit floor load to 100 psig.

   c. Top Plate and Adjustment Bolt: Threaded top plate with adjustment bolt and cap screw to fasten and level equipment.

E. Restrained Spring Isolator:

1. Freestanding, steel, open-spring isolators with seismic restraint.

2. Housing: Steel with resilient vertical-limit stops to prevent spring extension due to wind loads or if weight is removed; factory-drilled baseplate bonded to 0.24 inch thick elastomeric isolator pad attached to baseplate underside; and adjustable equipment mounting and levelling bolt that acts as blocking during installation.

3. Outside Spring Diameter: 80 percent minimum of compressed height of spring at rated load.

4. Minimum Additional Travel: 50 percent of required deflection at rated load.

5. Lateral Stiffness: 80 percent minimum of the rated vertical stiffness.

6. Overload Capacity: Support 200 percent of rated load, fully compressed, without deformation or failure.

F. Elastomeric Hanger:

1. Double-deflection type.

2. Molded, oil-resistant rubber or neoprene isolator elements bonded to steel housing.

3. Threaded connections for hanger rods.

G. Spring Hanger:

1. Combination coil-spring and elastomeric-insert hanger with spring and insert in compression.

2. Frame: Steel, fabricated for connection to threaded hanger rods and to allow for a maximum of 30 degrees of angular hanger-rod misalignment without binding or reducing isolation efficiency.

3. Outside Spring Diameter: 80 percent minimum of compressed height of spring at rated load.

4. Minimum Additional Travel: 50 percent of required deflection at rated load.

5. Lateral Stiffness: 80 percent minimum of rated vertical stiffness.

6. Overload Capacity: Support 200 percent of rated load, fully compressed, without deformation or failure.

7. Elastomeric Element:

   a. Molded, oil-resistant rubber or neoprene.

H. Steel washer-reinforced cup to support spring and bushing projecting Thrust Limit:

1. Combination coil spring and elastomeric insert with spring and insert in compression and with a load stop.

2. Rod and angle-iron brackets for attaching to equipment.

3. Frame: Steel, fabricated for connection to threaded rods and to allow for a maximum of 30 degrees of angular rod misalignment without binding or reducing isolation efficiency.

4. Outside Spring Diameter: 80 percent minimum of compressed height of spring at rated load.

5. Minimum Additional Travel: 50 percent of required deflection at rated load.

6. Lateral Stiffness: 80 percent minimum of rated vertical stiffness.

7. Overload Capacity: Support 200 percent of rated load, fully compressed, without deformation or failure.

8. Elastomeric Element: Molded, oil-resistant rubber or neoprene.

9. Coil Spring: Factory set and field adjustable.

2.03 EQUIPMENT BASES:

A. Structural Steel Base:

1. Factory-fabricated, welded, structural steel base and rail.

2. Design Requirements:

   a. Lowest possible mounting height with not less than 1 inch clearance above floor.

   b. Provide equipment anchor bolts and auxiliary motor slide bases or rails.

c. Provide supports for suction and discharge elbows for pumps.

3. Structural Steel:

a. Steel shapes, plates, and bars complying with ASTM A36.

b. Bases shall have shape to accommodate supported equipment.

4. Support Brackets: Factory-welded steel angles on frame for outrigger isolation mountings and to provide for anchor bolts and equipment support.

B. Concrete Inertia Base:

1. Factory-fabricated, welded, structural steel base and rail ready for cast-in-place concrete.

2. Design Requirements:

a. Lowest possible mounting height with not less than 1 inch clearance above floor.

b. Provide equipment anchor bolts and auxiliary motor slide bases or rails.

c. Provide supports for suction and discharge elbows for pumps.

3. Structural Steel:

a. Steel shapes, plates, and bars complying with ASTM A36.

b. Bases shall have shape to accommodate supported equipment.

4. Support Brackets: Factory-welded steel angles on frame for outrigger isolation mountings and to provide for anchor bolts and equipment support.

5. Fabrication:

a. Fabricate steel templates to hold equipment anchor-bolt sleeves and anchors in place during placement of concrete.

b. Obtain anchor-bolt templates from supported equipment manufacturer.

6. Concrete: 4600 psi.

a. Through bottom of frame.

2.04 SNUBBERS:

A. Factory fabricated using welded structural-steel shapes and plates, anchor bolts, and replaceable resilient isolation washers and bushings.

1. Anchor bolts for attaching to concrete shall be seismic-rated, drill-in, and stud-wedge or female-wedge type.

2. Resilient Isolation Washers and Bushings: Oil- and water-resistant neoprene.

3. Maximum 1/4-inch air gap, and minimum 1/4-inch-thick resilient cushion.

2.05 RESTRAINT CHANNEL BRACINGS:

A. MFMA-4, shop- or field-fabricated bracing assembly made of slotted steel channels with accessories for attachment to braced component at one end and to building structure at the other end and other matching components and with corrosion-resistant coating; rated in tension, compression, and torsion forces.

2.06 RESTRAINT CABLES:

A. Restraint Cables: ASTM A492 stainless-steel cables. End connections made of steel assemblies with thimbles, brackets, swivel, and bolts designed for restraining cable service; with a minimum of two clamping bolts for cable engagement.

2.07 SEISMIC-RESTRAINT ACCESSORIES:

A. Hanger-Rod Stiffener: Steel tube or steel slotted-support-system sleeve with internally bolted connections to hanger rod.

B. Hinged and Swivel Brace Attachments: Multifunctional steel connectors for attaching hangers to rigid channel bracings and restraint cables.

C. Bushings for Floor-Mounted Equipment Anchor Bolts: Neoprene bushings designed for rigid equipment mountings, and matched to type and size of anchor bolts and studs.

D. Bushing Assemblies for Wall-Mounted Equipment Anchorage: Assemblies of neoprene elements and steel sleeves designed for rigid equipment mountings, and matched to type and size of attachment devices used.

E. Resilient Isolation Washers and Bushings: One-piece, molded, oil- and water-resistant neoprene, with a flat washer face.

2.08 MECHANICAL ANCHOR BOLTS:

A. Mechanical Anchor Bolts: Drilled-in and stud-wedge or female-wedge type in zinc-coated steel for interior applications and stainless steel for exterior applications. Select anchor bolts with strength required for anchor and as tested according to ASTM E488.

2.09 ADHESIVE ANCHOR BOLTS:

A. Adhesive Anchor Bolts: Drilled-in and capsule anchor system containing PVC or urethane methacrylate-based resin and accelerator, or injected polymer or hybrid mortar adhesive. Provide anchor bolts and hardware with zinc-coated steel for interior applications and stainless steel for exterior applications. Select anchor bolts with strength required for anchor and as tested according to ASTM E488.

PART 3 - EXECUTION

3.01 EXAMINATION:

A. Examine areas and equipment to receive vibration isolation and seismic-control devices for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.

B. Examine roughing-in of reinforcement and cast-in-place anchors to verify actual locations before installation.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 APPLICATIONS:

A. Multiple Pipe Supports: Secure pipes to trapeze member with clamps approved for application by agency acceptable to authorities having jurisdiction.

B. Hanger-Rod Stiffeners: Install hanger-rod stiffeners where indicated or scheduled on Drawings to receive them and where required to prevent buckling of hanger rods due to seismic forces.

C. Strength of Support and Seismic-Restraint Assemblies: Where not indicated, select sizes of components so strength is adequate to carry present and future static and seismic loads within specified loading limits.

D. Hangers and Supports for Plumbing Piping and Equipment: Comply with requirements in Section 22 05 29 and those indicated below:

1. Delegated Design: Design trapeze pipe hangers and equipment supports, including comprehensive engineering analysis by a qualified professional engineer, using performance requirements and design criteria indicated.

a. Structural Performance: Hangers and supports for plumbing piping and equipment shall withstand the effects of gravity loads and stresses within limits and under conditions indicated according to ASCE/SEI 7.

(1) Design supports for multiple pipes, including pipe stands, capable of supporting combined weight of supported systems, system contents, and test water.

(2) Design equipment supports capable of supporting combined operating weight of supported equipment and connected systems and components.

(3) Design seismic-restraint hangers and supports for piping and equipment.

2. Install hangers and supports to allow controlled thermal and seismic movement of piping systems, to permit freedom of movement between pipe anchors, and to facilitate action of expansion joints, expansion loops, expansion bends, and similar units.

E. Plumbing Pumps: Comply with requirements in Section 22 11 23 and those indicated below:

1. Seismic Performance: Plumbing pumps shall withstand the effects of earthquake motions determined according to ASCE/SEI 7.

a. The term "withstand" means "the pump will remain in place without separation of any parts from the pump when subjected to the seismic forces specified."

F. Plumbing Tanks: Comply with requirements in Section 22 12 10 and those indicated below:

1. Elevated Tanks, Ground-Mounted tanks, and Indoor Storage Tanks:

a. Seismic Performance: Elevated water-storage tank, including tank shell, structural reinforcement, supports, and foundations, shall be capable of withstanding the effects of earthquake motions determined according to ASCE/SEI 7.

(1) The term "withstand" means "the unit will remain in place without separation of any parts from the device when subjected to the seismic forces specified."

b. Fabricate supports and attachments to tank with reinforcement strong enough to resist tank movement during seismic event when tank supports are anchored to building structure.

c. Install tank seismic restraints on all tanks.

G. Sanitary Waste and Vent Piping: Comply with requirements in Section 22 13 16 and those indicated below:

1. Seismic Performance: Soil, waste, and vent piping and support and installation shall withstand the effects of earthquake motions determined according to ASCE/SEI 7.

a. The term "withstand" means "the unit will remain in place without separation of any parts from the device when subjected to the seismic forces specified."

2. Install seismic restraints on piping.

H. Storm Drainage Piping: Comply with requirements in Section 22 14 13 and those indicated below:

1. Seismic Performance: Storm drainage piping and support and installation shall withstand the effects of earthquake motions determined according to ASCE/SEI 7.

a. The term "withstand" means "the unit will remain in place without separation of any parts from the device when subjected to the seismic forces specified."

2. Install seismic restraints on piping.

I. Water Heaters (Domestic and Non-potable): Comply with requirements in Section 22 34 00 and those indicated below:

1. Seismic Performance: Storm drainage piping and support and installation shall withstand the effects of earthquake motions determined according to ASCE/SEI 7.

a. The term "withstand" means "the unit will remain in place without separation of any parts from the device when subjected to the seismic forces specified."

2. Install commercial, electric, domestic-water heaters with seismic-restraint devices.

3.03 VIBRATION CONTROL AND SEISMIC-RESTRAINT DEVICE INSTALLATION:

A. Coordinate the location of embedded connection hardware with supported equipment attachment and mounting points and with requirements for concrete reinforcement and formwork specified in Section 03 30 00.

B. Installation of vibration isolators must not cause any change of position of equipment, piping, or ductwork resulting in stresses or misalignment.

C. Comply with requirements in Section 07 72 00 for installation of roof curbs, equipment supports, and roof penetrations.

D. Equipment Restraints:

1. Install seismic snubbers on plumbing equipment mounted on vibration isolators. Locate snubbers as close as possible to vibration isolators and bolt to equipment base and supporting structure.

2. Install resilient bolt isolation washers on equipment anchor bolts where clearance between anchor and adjacent surface exceeds 0.125 inch.

3. Install seismic-restraint devices using methods approved by an agency acceptable to authorities having jurisdiction that provides required submittals for component.

E. Piping Restraints:

1. Comply with requirements in MSS SP-127.

2. Space lateral supports a maximum of 40 feet o.c., and longitudinal supports a maximum of 80 feet o.c.

3. Brace a change of direction longer than 12 feet.

F. Install cables so they do not bend across edges of adjacent equipment or building structure.

G. Install seismic-restraint devices using methods approved by an agency acceptable to authorities having jurisdiction that provides required submittals for component.

H. Install bushing assemblies for anchor bolts for floor-mounted equipment, arranged to provide resilient media between anchor bolt and mounting hole in concrete base.

I. Install bushing assemblies for mounting bolts for wall-mounted equipment, arranged to provide resilient media where equipment or equipment-mounting channels are attached to wall.

J. Attachment to Structure: If specific attachment is not indicated, anchor bracing to structure at flanges of beams, at upper truss chords of bar joists, or at concrete members.

K. Drilled-in Anchors:

1. Identify position of reinforcing steel and other embedded items prior to drilling holes for anchors. Do not damage existing reinforcing or embedded items during coring or drilling. Notify the structural engineer if reinforcing steel or other embedded items are encountered during drilling. Locate and avoid prestressed tendons, electrical and telecommunications conduit, and gas lines.

2. Do not drill holes in concrete or masonry until concrete, mortar, or grout has achieved full design strength.

3. Wedge Anchors: Protect threads from damage during anchor installation. Heavy-duty sleeve anchors shall be installed with sleeve fully engaged in the structural element to which anchor is to be fastened.

4. Adhesive Anchors: Clean holes to remove loose material and drilling dust prior to installation of adhesive. Place adhesive in holes proceeding from the bottom of the hole and progressing toward the surface in such a manner as to avoid introduction of air pockets in the adhesive.

5. Set anchors to manufacturer's recommended torque, using a torque wrench.

6. Install zinc-coated steel anchors for interior and stainless-steel anchors for exterior applications.

3.04 ACCOMMODATION OF DIFFERENTIAL SEISMIC MOTION:

A. Install flexible connections in piping where they cross seismic joints, where adjacent sections or branches are supported by different structural elements, and where the connections terminate with connection to equipment that is anchored to a different structural element from the one supporting the connections as they approach equipment. Comply with requirements in Section 22 11 13 for piping flexible connections.

3.05 FIELD QUALITY CONTROL:

A. Testing Agency: Engage a qualified testing agency to perform tests and inspections.

B. Perform tests and inspections.

C. Tests and Inspections:

1. Provide evidence of recent calibration of test equipment by a testing agency acceptable to authorities having jurisdiction.

2. Schedule test with Owner, through Architect, before connecting anchorage device to restrained component (unless post connection testing has been approved), and with at least seven days' advance notice.

3. Obtain Architect's approval before transmitting test loads to structure. Provide temporary load-spreading members.

4. Test at least four of each type and size of installed anchors and fasteners selected by Architect.

5. Test to 90 percent of rated proof load of device.

6. Measure isolator restraint clearance.

7. Measure isolator deflection.

8. Verify snubber minimum clearances.

D. Remove and replace malfunctioning units and retest as specified above.

E. Prepare test and inspection reports.

3.06 ADJUSTING:

A. Adjust isolators after piping system is at operating weight.

B. Adjust limit stops on restrained-spring isolators to mount equipment at normal operating height. After equipment installation is complete, adjust limit stops so they are out of contact during normal operation.

3.07 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

Page Intentionally Left Blank

SECTION 22 05 53

IDENTIFICATION FOR PLUMBING PIPING AND EQUIPMENT

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide equipment labels, warning signs and labels, pipe labels, stencils, valve tags, and warning tags as indicated and in compliance with Contract Documents.

1.02 REFERENCES:

A. American Society of Mechanical Engineers (ASME):

1. A13.1: Scheme for the identification of Piping Systems

1.03 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Product Data: For each type of product indicated.

C. Samples: For color, letter style, and graphic representation required for each identification material and device.

D. Equipment Label Schedule: Include a listing of all equipment to be labeled with the proposed content for each label.

E. Valve numbering scheme.

F. Valve Schedules: For each piping system to include in maintenance manuals.

1.04 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.05 SPARE PARTS:

A. Comply with the requirements specified in Section 01 61 00.

1.06 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

1.07 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

PART 2 - PRODUCTS

2.01 EQUIPMENT LABELS:

A. Metal Labels for Equipment:

1. Material and Thickness: anodized aluminum, 0.032-inch minimum thickness, and having predrilled or stamped holes for attachment hardware.

2. Letter Color: White

3. Background Color: Black

4. Minimum Label Size: Length and width vary for required label content, but not less than 2-1/2 by 3/4 inch.

5. Minimum Letter Size: 1/4 inch for name of units if viewing distance is less than 24 inches, 1/2 inch for viewing distances up to 72 inches, and proportionately larger lettering for greater viewing distances. Include secondary lettering two-thirds to three-quarters the size of principal lettering.

6. Fasteners: Stainless-steel rivets.

7. Adhesive: Contact-type permanent adhesive, compatible with label and with substrate.

B. Plastic Labels for Equipment:

1. Material and Thickness: Multilayer, multicolor, plastic labels for mechanical engraving, 1/8 inch thick and having predrilled holes for attachment hardware.

2. Letter Color: White

3. Background Color: Black

4. Maximum Temperature: Able to withstand temperatures up to 160 degrees F.

5. Minimum Label Size: Length and width vary for required label content, but not less than 2-1/2 by 3/4 inch.

6. Minimum Letter Size: 1/4 inch for name of units if viewing distance is less than 24 inches, 1/2 inch for viewing distances up to 72 inches, and proportionately larg-

er lettering for greater viewing distances. Include secondary lettering two-thirds to three-quarters the size of principal lettering.

7. Fasteners: Stainless-steel rivets

8. Adhesive: Contact-type permanent adhesive, compatible with label and with substrate.

C. Label Content: Include equipment's Drawing designation or unique equipment number, Drawing numbers where equipment is indicated (plans, details, and schedules), and the Specification Section number and title where equipment is specified.

D. Equipment Label Schedule: For each item of equipment to be labeled, on 8-1/2 by 11-inch bond paper. Tabulate equipment identification number, and identify Drawing numbers where equipment is indicated (plans, details, and schedules) and the Specification Section number and title where equipment is specified. Equipment schedule shall be included in operation and maintenance data.

2.02 WARNING SIGNS AND LABELS:

A. Material and Thickness: Multilayer, multicolor, plastic labels for mechanical engraving, 1/8 inch thick with predrilled holes for attachment hardware.

B. Letter Color: White

C. Background Color: Black

D. Maximum Temperature: Able to withstand temperatures up to 160 degrees F.

E. Minimum Label Size: Length and width vary for required label content, but not less than 2-1/2 by 3/4 inch.

F. Minimum Letter Size: 1/4 inch for name of units if viewing distance is less than 24 inches, 1/2 inch for viewing distances up to 72 inches, and proportionately larger lettering for greater viewing distances. Include secondary lettering two-thirds to three-quarters the size of principal lettering.

G. Fasteners: Stainless-steel rivets.

H. Adhesive: Contact-type permanent adhesive, compatible with label and with substrate.

I. Label Content: Include caution and warning information plus emergency notification instructions.

2.03 PIPE LABELS:

A. General Requirements for Manufactured Pipe Labels: Preprinted, color-coded, with lettering indicating service, and showing flow direction.

B. Pretensioned Pipe Labels: Pre-coiled, semirigid plastic formed to cover full circumference of pipe and to attach to pipe without fasteners or adhesive.

C. Self-Adhesive Pipe Labels: Printed plastic with contact-type, permanent-adhesive backing.

D. Pipe Label Contents: Include identification of piping service using same designations or abbreviations as used on Drawings; also include pipe size and an arrow indicating flow direction.

1. Flow-Direction Arrows: Integral with piping-system service lettering to accommodate both directions or as separate unit on each pipe label to indicate flow direction.

2. Lettering Size: Size letters according to ASME A13.1 for piping.

2.04 STENCILS:

A. Stencils for Piping:

1. Lettering Size: Size letters according to ASME A13.1 for piping.

2. Stencil Material: Aluminum

3. Stencil Paint: Exterior, gloss, alkyd enamel or acrylic enamel in colors complying with recommendations in ASME A13.1 unless otherwise indicated. Paint may be in pressurized spray-can form.

4. Identification Paint: Exterior, alkyd enamel or acrylic enamel in colors according to ASME A13.1 unless otherwise indicated. Paint may be in pressurized spray-can form.

2.05 VALVE TAGS:

A. Valve Tags: Stamped or engraved with 1/4-inch letters for piping system abbreviation and 1/2-inch numbers.

1. Tag Material: Stainless steel, 0.025-inch minimum thickness, and having predrilled or stamped holes for attachment hardware.

2. Fasteners: Brass wire-link chain

B. Valve Schedules: For each piping system, on 8-1/2 by 11-inch bond paper. Tabulate valve number, piping system, system abbreviation (as shown on valve tag), location of valve (room or space), normal-operating position (open, closed, or modulating), and variations for identification. Mark valves for emergency shutoff and similar special uses.

1. Valve-tag schedule shall be included in operation and maintenance data.

2.06 WARNING TAGS:

A. Description: Preprinted or partially preprinted accident-prevention tags of plasticized card stock with matte finish suitable for writing.

1. Size: Approximately 4 by 7 inches

2. Fasteners: Brass grommet and wire

3. Nomenclature: Large-size primary caption such as "DANGER," "CAUTION," or "DO NOT OPERATE."

4. Color: Safety yellow background with black lettering

PART 3 - EXECUTION

3.01 PREPARATION:

A. Clean piping and equipment surfaces of substances that could impair bond of identification devices, including dirt, oil, grease, release agents, and incompatible primers, paints, and encapsulants.

3.02 GENERAL INSTALLATION REQUIREMENTS:

A. Coordinate installation of identifying devices with completion of covering and painting of surfaces where devices are to be applied.

B. Coordinate installation of identifying devices with locations of access panels and doors.

C. Install identifying devices before installing acoustical ceilings and similar concealment.

3.03 EQUIPMENT LABEL INSTALLATION:

A. Install or permanently fasten labels on each major item of mechanical equipment.

B. Locate equipment labels where accessible and visible.

3.04 PIPE LABEL INSTALLATION:

A. Piping Color Coding: Painting of piping is specified in Section 09 90 00.

B. Stenciled Pipe Label Option: Stenciled labels may be provided instead of manufactured pipe labels, at Installer's option. Install stenciled pipe labels, complying with ASME A13.1, on each piping system.

1. Identification Paint: Use for contrasting background.

2. Stencil Paint: Use for pipe marking.

C. Pipe Label Locations: Locate pipe labels where piping is exposed or above accessible ceilings in finished spaces; machine rooms; accessible maintenance spaces such as shafts, tunnels, and plenums; and exterior exposed locations as follows:

1. Near each valve and control device.

2. Near each branch connection, excluding short takeoffs for fixtures and terminal units. Where flow pattern is not obvious, mark each pipe at branch.

3. Near penetrations through walls, floors, ceilings, and inaccessible enclosures.

4. At access doors, maintenance holes, and similar access points that permit view of concealed piping.

5. Near major equipment items and other points of origination and termination.

6. Spaced at maximum intervals of 50 feet along each run. Reduce intervals to 25 feet in areas of congested piping and equipment.

7. On piping above removable acoustical ceilings. Omit intermediately spaced labels.

D. Directional Flow Arrows: Arrows shall be used to indicate direction of flow in pipes, including pipes where flow is allowed in both directions.

E. Pipe Label Color Schedule:

1. Domestic Water Piping:

a. Background: Safety green

b. Letter Colors: White

2. Sanitary Waste and Storm Drainage Piping:

a. Background Color: Safety purple

b. Letter Color: White

3.05 VALVE-TAG INSTALLATION:

A. Install tags on valves and control devices in piping systems, except check valves, valves within factory-fabricated equipment units, shutoff valves, faucets, convenience and lawn-watering hose connections, and similar roughing-in connections of end-use fixtures and units. List tagged valves in a valve schedule.

B. Valve-Tag Application Schedule: Tag valves according to size, shape, and color scheme and with captions similar to those indicated in the following subparagraphs:

1. Valve-Tag Size and Shape:

a. Cold Water: 1-1/2 inches, round

b. Hot Water: 1-1/2 inches, round

c. Low-Pressure Compressed Air: 1-1/2 inches, round

d. High-Pressure Compressed Air: 1-1/2 inches, round.

2. Valve-Tag Colors:

a. Cold Water: Safety green

b. Hot Water: Safety green

c. Low-Pressure Compressed Air: Safety blue

d. High-Pressure Compressed Air: Safety blue

3. Letter Colors:

a. Cold Water: White

b. Hot Water: White

c. Low-Pressure Compressed Air: White

d. High-Pressure Compressed Air: White

3.06 WARNING-TAG INSTALLATION:

A. Write required message on, and attach warning tags to, equipment and other items where required.

3.07 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

Page Intentionally Left Blank

SECTION 22 07 19

PLUMBING PIPING INSULATION

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide the following plumbing piping services as indicated and in compliance with Contract Documents.

1. Potable and non-potable cold-water piping

2. Potable hot-water piping

3. Potable recirculating hot-water piping

4. Sanitary waste piping exposed to freezing conditions

5. Storm-water piping exposed to freezing conditions

6. Roof drains and rainwater leaders

7. Break tanks and pressure vessels

1.02 REFERENCES:

A. ASTM International (ASTM):

1. A240: Standard Specification for Chromium and Chromium-Nickel Stainless Steel Plate, Sheet, and Strip for Pressure Vessels and for General Applications.

2. B209: Standard Specification for Aluminum and Aluminum-Alloy Sheet and Plate

3. C195: Standard Specification for Mineral Fiber Thermal Insulating Cement

4. C449: Standard Specification for Mineral Fiber Hydraulic-Setting Thermal Insulating and Finishing Cement

5. C450: Standard Practice for Fabrication of Thermal Insulating Fitting Covers for NPS Piping, and Vessel Lagging

6. C547: Standard Specification for Mineral Fiber Pipe Insulation

7. C552: Standard Specification for Cellular Glass Thermal Insulation.

8. C585: Standard Practice for Inner and Outer Diameters of Thermal Insulation for Nominal Sizes of Pipe and Tubing

9. C795: Standard Specification for Thermal Insulation for Use in Contact with Austenitic Stainless Steel

10. C1136: Standard Specification for Flexible, Low Permeance Vapor Retarders for Thermal Insulation

11. E84: Standard Test Method for Surface Burning Characteristics of Building Materials

12. E96: Standard Test Methods for Water Vapor Transmission of Materials

13. F1249: Standard Test Method for Water Vapor Transmission Rate Through Plastic Film and Sheeting Using a Modulated Infrared Sensor

B. ICC Evaluation Services (ICC-ES):

1. A117.1: Accessible and Usable Buildings and Facilities

1.03 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Product Data: For each type of product. Include thermal conductivity, water-vapor permeance thickness, and jackets (both factory and field applied if any).

C. Shop Drawings: Include plans, elevations, sections, details, and attachments to other work.

1. Detail application of protective shields, saddles, and inserts at hangers for each type of insulation and hanger.

2. Detail attachment and covering of heat tracing inside insulation.

3. Detail insulation application at pipe expansion joints for each type of insulation.

4. Detail insulation application at elbows, fittings, flanges, valves, and specialties for each type of insulation.

5. Detail removable insulation at piping specialties, equipment connections, and access panels.

6. Detail application of field-applied jackets.

7. Detail application at linkages of control devices.

D. Samples: For each type of insulation and jacket indicated. Identify each Sample, describing product and intended use. Sample sizes are as follows:

1. Preformed Pipe Insulation Materials: 12 inches long by NPS 2.

2. Jacket Materials for Pipe: 12 inches long by NPS 2.

3. Sheet Jacket Materials: 12 inches square.

4. Manufacturer's Color Charts: For products where color is specified, show the full range of colors available for each type of finish material.

E. Qualification Data: For qualified Installer.

F. Material Test Reports: From a qualified testing agency acceptable to authorities having jurisdiction indicating, interpreting, and certifying test results for compliance of insulation materials, sealers, attachments, cements, and jackets, with requirements indicated. Include dates of tests and test methods employed.

G. Field quality-control reports.

1.04 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.05 SPARE PARTS:

A. Comply with the requirements specified in Section 01 61 00.

1.06 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

B. Installer Qualifications: Skilled mechanics who have successfully completed an apprenticeship program or another craft training program certified by the Department of Labor, Bureau of Apprenticeship and Training.

C. Fire-Test Response Characteristics: For insulation and related materials, as determined by testing identical products in accordance with ASTM E84 by a testing agency acceptable to authorities having jurisdiction. Factory label insulation and jacket materials and adhesive, mastic, tapes, and cement material containers, with appropriate markings of applicable testing agency.

1. Insulation Installed Indoors: Flame-spread index of 25 or less and smoke-developed index of 50 or less.

2. Insulation Installed Outdoors: Flame-spread index of 75 or less and smoke-developed index of 150 or less.

D. Manufacturer's Qualifications: Firms regularly engaged in manufacturer of mechanical insulation products, of types and sizes required, whole products have been in satisfactory use in similar service for not less than 3 years.

E. IECC Compliance: Insulation applied to plumbing services shall comply with International Energy Conservation Code (IECC) with regard to insulation performance, thickness, and sealing.

F. Comply with the following applicable standards and other requirements specified for miscellaneous components:

1. Supply and Drain Protective Shielding Guards: ICC A117.1.

1.07 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

B. Packaging: Insulation material containers shall be marked by manufacturer with appropriate ASTM standard designation, type and grade, and maximum use temperature.

C. Deliver insulation, coverings, cements, adhesives, and coatings to site in containers with manufacturer's stamp or label, affixed showing fire hazard indexes of products.

D. Protect insulation against dirt, water, and chemical and mechanical damage. Do not install damaged or wet insulation; remove from project site.

1.08 COORDINATION:

A. Coordinate sizes and locations of supports, hangers, and insulation shields specified in Section 22 05 29.

B. Coordinate clearance requirements with piping Installer for piping insulation application. Before preparing piping Shop Drawings, establish and maintain clearance requirements for installation of insulation and field-applied jackets and finishes and for space required for maintenance.

C. Coordinate installation and testing of heat tracing.

1.09 SCHEDULING:

A. Schedule insulation application after pressure testing systems and, where required, after installing and testing heat tracing. Insulation application may begin on segments that have satisfactory test results.

B. Complete installation and concealment of plastic materials as rapidly as possible in each area of construction.

PART 2 - PRODUCTS

2.01 INSULATION MATERIALS:

A. Comply with requirements in "Piping Insulation Schedule, General," "Indoor Piping Insulation Schedule," "Outdoor, Aboveground Piping Insulation Schedule," and "Outdoor, Underground Piping Insulation Schedule" articles for where insulating materials shall be applied.

B. Products shall not contain asbestos, lead, mercury, or mercury compounds.

C. Products that come into contact with stainless steel shall have a leachable chloride content of less than 50 ppm when tested in accordance with ASTM C871.

D. Insulation materials for use on austenitic stainless steel shall be qualified as acceptable in accordance with ASTM C795.

E. Foam insulation materials shall not use CFC or HCFC blowing agents in the manufacturing process.

F. Cellular Glass: Inorganic, incombustible, foamed or cellulated glass with annealed, rigid, hermetically sealed cells. Comply with ASTM C552.

1. Manufacturers:

a. Cell-U-Foam Corporation; Ultra-CUF

b. Pittsburgh Corning Corporation; Foamglas Super K

2. Block Insulation: ASTM C552, Type I.

3. Special-Shaped Insulation: ASTM C552, Type III.

4. Board Insulation: ASTM C552, Type IV.

5. Preformed Pipe Insulation without jacket: Comply with ASTM C552, Type II, Class 1

6. Preformed Pipe Insulation with Factory-Applied ASJ jacket: Comply with ASTM C552, Type II, Class 2.

7. Factory fabricate shapes in accordance with ASTM C450 and ASTM C585.

8. Factory-applied jacket requirements are specified in "Factory-Applied Jackets" Article.

G. Mineral-Fiber Board Insulation: Mineral or glass fibers bonded with a thermosetting resin. Comply with ASTM C612, Type IA or Type IB. For equipment applications, pro-

vide insulation with factory applied ASJ. Factory-applied jacket requirements are specified in "Factory-Applied Jackets" Article.

1. Manufacturers:

    a. Schuller (formerly Manville Corp.)

    b. Owens-Corning Fiberglas Corp.

    c. Certain Teed Corp.

    d. Knauf Fiber Glass

    e. Manson

    f. Armstrong World Industries, Inc.

    g. Pittsburgh Corning Corp.

    h. Rubatex Corp.

H. Mineral-Fiber, Preformed Pipe: Mineral or glass fibers bonded with a thermosetting resin. Comply with ASTM C547.

1. Manufacturers:

    a. Schuller (formerly Manville Corp.)

    b. Owens-Corning Fiberglas Corp.

    c. Certain Teed Corp.

    d. Knauf Fiber Glass

    e. Manson

    f. Armstrong World Industries, Inc.

    g. Pittsburgh Corning Corp.

    h. Rubatex Corp.

2. Type I, 850 degrees F Materials: Mineral or glass fibers bonded with a thermosetting resin. Comply with ASTM C547, Type I, Grade A, with factory-applied ASJ. Factory-applied jacket requirements are specified in "Factory-Applied Jackets" Article.

I. Mineral-Fiber, Pipe and Tank Insulation: Mineral or glass fibers bonded with a thermosetting resin. Semirigid board material with factory-applied ASJ complying with

ASTM C1393, Type II or Type IIIA Category 2, or with properties similar to ASTM C612, Type IB. Nominal density is 2.5 lb/cu. ft. or more. Thermal conductivity (k-value) at 100 degrees F is 0.29 Btu x in./h x sq. ft. x degrees F or less. Factory-applied jacket requirements are specified in "Factory-Applied Jackets" Article.

1. Manufacturers:

    a. Schuller (formerly Manville Corp.)

    b. Owens-Corning Fiberglas Corp.

    c. Certain Teed Corp

    d. Knauf Fiber Glass

    e. Manson

    f. Armstrong World Industries, Inc.

    g. Pittsburgh Corning Corp.

    h. Rubatex Corp.

2.02 INSULATING CEMENTS:

A. Mineral-Fiber Insulating Cement: Comply with ASTM C195.

B. Expanded or Exfoliated Vermiculite Insulating Cement: Comply with ASTM C196.

C. Mineral-Fiber, Hydraulic-Setting Insulating and Finishing Cement: Comply with ASTM C449.

2.03 ADHESIVES:

A. Materials shall be compatible with insulation materials, jackets, and substrates and for bonding insulation to itself and to surfaces to be insulated unless otherwise indicated.

B. Cellular-Glass, Adhesive: Solvent-based resin adhesive, with a service temperature range of minus 75 to plus 300 degrees F.

1. Manufacturers:

    a. Childers Products, Division of ITW; CP-96

    b. Foster Products Corporation, H. B. Fuller Company; 81-33

C. Mineral-Fiber Adhesive: Comply with MIL-A-3316C, Class 2, Grade A.

1. Manufacturers:

a. Childers Products, Division of ITW; CP-82

b. Foster Products Corporation, H. B. Fuller Company; 85-20

c. ITW TACC, Division of Illinois Tool Works; S-90/80

d. Marathon Industries, Inc.; 225

e. Mon-Eco Industries, Inc.; 22-25

D. ASJ Adhesive, and FSK and PVDC Jacket Adhesive: Comply with MIL-A-3316C, Class 2, Grade A for bonding insulation jacket lap seams and joints.

1. Manufacturers:

a. Childers Products, Division of ITW; CP-82

b. Foster Products Corporation, H. B. Fuller Company; 85-20

c. ITW TACC, Division of Illinois Tool Works; S-90/80

d. Marathon Industries, Inc.; 225

e. Mon-Eco Industries, Inc.; 22-25

E. PVC Jacket Adhesive: Compatible with PVC jacket.

1. Manufacturers:

a. Dow Chemical Company (The); 739, Dow Silicone

b. Johns-Manville; Zeston Perma-Weld, CEEL-TITE Solvent Welding Adhesive

c. P.I.C. Plastics, Inc.; Welding Adhesive

d. Red Devil, Inc.; Celulon Ultra Clear

e. Speedline Corporation; Speedline Vinyl Adhesive

2.04 MASTICS AND COATINGS:

A. Materials shall be compatible with insulation materials, jackets, and substrates; comply with MIL-C-19565C, Type II.

B. Vapor-Barrier Mastic: Solvent based; suitable for indoor use on below ambient services.

1. Manufacturers:

a. Childers Products, Division of ITW; CP-30

b. Foster Products Corporation, H. B. Fuller Company; 30-35

c. ITW TACC, Division of Illinois Tool Works; CB-25

d. Marathon Industries, Inc.; 501

e. Mon-Eco Industries, Inc.; 55-10

2. Water-Vapor Permeance: ASTM F1249, 0.05 perm at 35-mil dry film thickness.

a. Service Temperature Range: 0 to 180 degrees F.

b. Solids Content: ASTM D1644, 44 percent by volume and 62 percent by weight.

c. Color: White.

C. Vapor-Barrier Mastic: Solvent based; suitable for outdoor use on below ambient services.

1. Manufacturers:

a. Childers Products, Division of ITW; Encacel

b. Foster Products Corporation, H. B. Fuller Company; 60-95/60-96

c. Marathon Industries, Inc.; 570

d. Mon-Eco Industries, Inc.; 55-70

2. Water-Vapor Permeance: ASTM F1249, 0.05 perm at 30-mil dry film thickness.

3. Service Temperature Range: Minus 50 to plus 220 degrees F.

4. Solids Content: ASTM D1644, 33 percent by volume and 46 percent by weight.

5. Color: White.

2.05 LAGGING ADHESIVES:

A. Description: Comply with MIL-A-3316C Class I, Grade A and shall be compatible with insulation materials, jackets, and substrates.

1. Manufacturers:

a. Childers Products, Division of ITW; CP-52

b. Foster Products Corporation, H. B. Fuller Company; 81-42

c. Marathon Industries, Inc.; 130

d. Mon-Eco Industries, Inc.; 11-30

e. Vimasco Corporation; 136

2. Fire-resistant, water-based lagging adhesive and coating for use indoors to adhere fire-resistant lagging cloths over equipment and pipe insulation.

3. Service Temperature Range: Minus 50 to plus 180 degrees F.

4. Color: White.

2.06 SEALANTS

A. Joint Sealants:

1. Manufacturers:

a. Childers Products, Division of ITW; CP-76

b. Foster Products Corporation, H. B. Fuller Company; 30-45

c. Marathon Industries, Inc.; 405

d. Mon-Eco Industries, Inc.; 44-05

e. Pittsburgh Corning Corporation; Pittseal 444

f. Vimasco Corporation; 750

2. Materials shall be compatible with insulation materials, jackets, and substrates.

3. Permanently flexible, elastomeric sealant.

4. Service Temperature Range: Minus 100 to plus 300 degrees F.

5. Color: White or gray.

B. FSK and Metal Jacket Flashing Sealants:

1. Manufacturers:

a. Childers Products, Division of ITW; CP-76-8

b. Foster Products Corporation, H. B. Fuller Company; 95-44

c. Marathon Industries, Inc.; 405

d. Mon-Eco Industries, Inc.; 44-05

e. Vimasco Corporation; 750

2. Materials shall be compatible with insulation materials, jackets, and substrates.

3. Fire- and water-resistant, flexible, elastomeric sealant.

4. Service Temperature Range: Minus 40 to plus 250 degrees F.

5. Color: Aluminum.

C. ASJ Flashing Sealants, and Vinyl, PVDC, and PVC Jacket Flashing Sealants:

1. Manufacturers:

a. Childers Products, Division of ITW; CP-76

2. Materials shall be compatible with insulation materials, jackets, and substrates.

3. Fire- and water-resistant, flexible, elastomeric sealant.

4. Service Temperature Range: Minus 40 to plus 250 degrees F.

5. Color: White.

2.07 REMOVABLE INSULATION JACKETS

A. Manufacturers:

1. Childers

2. Ceel-Co

B. Jackets for Piping Insulation: ASTM C921, Type I for piping with temperatures below ambient, Type II for piping with temperatures above ambient. Type I may be used for all piping at Installers option.

C. Encase pipe fittings insulation with one-piece premolded PVC fitting covers, fastened as per manufacturer's recommendations.

D. Where piping is specified to be exposed in finished area all insulated piping shall have PVC jacketing and fitting covers as manufactured by Ceel-Co 550Z with a 25/50 flame/smoke rating not less than 15 mil thick, suitable and ready to accept a final painted finish.

E. Jacketing Material for Equipment Insulation: Provide pre-sized glass cloth jacketing material, not less than 7.8 ounces per square yard, or metal jacket at Installer's option, except as otherwise indicated.

2.08 FACTORY-APPLIED JACKETS:

A. Insulation system schedules indicate factory-applied jackets on various applications. When factory-applied jackets are indicated, comply with the following:

1. ASJ: White, Kraft-paper, fiberglass-reinforced scrim with aluminum-foil backing; complying with ASTM C1136, Type I.

2. ASJ-SSL: ASJ with self-sealing, pressure-sensitive, acrylic-based adhesive covered by a removable protective strip; complying with ASTM C1136, Type I.

3. FSK Jacket: Aluminum-foil, fiberglass-reinforced scrim with Kraft-paper backing; complying with ASTM C1136, Type II.

2.09 FIELD-APPLIED FABRIC-REINFORCING MESH:

A. Woven Glass-Fiber Fabric: Approximately 2 oz./sq. yd. with a thread count of 10 strands by 10 strands/sq. in. for covering pipe and pipe fittings.

B. Woven Polyester Fabric: Approximately 1 oz./sq. yd. with a thread count of 10 strands by 10 strands/sq. in., in a Leno weave, for pipe.

2.10 FIELD-APPLIED CLOTHS:

A. Woven Glass-Fiber Fabric: Comply with MIL-C-20079H, Type I, plain weave, and pre-sized a minimum of 8 oz./sq. yd.

2.11 FIELD-APPLIED JACKETS:

A. Field-applied jackets shall comply with ASTM C921, Type I, unless otherwise indicated.

1. PVC Jacket: High-impact-resistant, UV-resistant PVC complying with ASTM D1784, Class 16354-C; thickness as scheduled; roll stock ready for shop or field cutting and forming. Thickness is indicated in field-applied jacket schedules.

a. Manufacturers:

(1) Johns Manville; Zeston

(2) P.I.C. Plastics, Inc.; FG Series

(3) Proto PVC Corporation; LoSmoke

(4) Speedline Corporation; SmokeSafe

b. Adhesive: As recommended by jacket material manufacturer.

c. Color: White.

d. Factory-fabricated fitting covers to match jacket if available; otherwise, field fabricate.

(1) Shapes: 45- and 90-degree, short- and long-radius elbows, tees, valves, flanges, unions, reducers, end caps, soil-pipe hubs, traps, mechanical joints, and P-trap and supply covers for lavatories.

e. Factory-fabricated tank heads and tank side panels.

2. Metal Jacket:

a. Manufacturers:

(1) Childers Products, Division of ITW; Metal Jacketing Systems

(2) PABCO Metals Corporation; Surefit

(3) RPR Products, Inc.; Insul-Mate

b. Aluminum Jacket: Comply with ASTM B209, Alloy 3003, 3005, 3105 or 5005, Temper H-14.

(1) Factory cut and rolled to size.

(2) Finish and thickness are indicated in field-applied jacket schedules.

(3) Moisture Barrier for Indoor Applications: 3-mil-thick, heat-bonded polyethylene and Kraft paper.

(4) Moisture Barrier for Outdoor Applications: 2.5-mil-thick Polysurlyn.

(5) Factory-Fabricated Fitting Covers:

(a) Same material, finish, and thickness as jacket.

(b) Preformed 2-piece or gore, 45- and 90-degree, short- and long-radius elbows.

(c) Tee covers.

(d) Flange and union covers.

(e) End caps.

(f) Beveled collars.

(g) Valve covers.

(h) Field fabricate fitting covers only if factory-fabricated fitting covers are not available.

c. Stainless-Steel Jacket: ASTM A167 or ASTM A240.

(1) Factory cut and rolled to size.

(2) Material, finish, and thickness are indicated in field-applied jacket schedules.

(3) Moisture Barrier for Indoor Applications: 3-mil-thick, heat-bonded polyethylene and Kraft paper.

(4) Moisture Barrier for Outdoor Applications: 2.5-mil-thick Polysurlyn.

(5) Factory-Fabricated Fitting Covers:

(a) Same material, finish, and thickness as jacket.

(b) Preformed 2-piece or gore, 45- and 90-degree, short- and long-radius elbows.

(c) Tee covers.

(d) Flange and union covers.

(e) End caps.

(f) Beveled collars.

(g) Valve covers.

(h) Field fabricate fitting covers only if factory-fabricated fitting covers are not available.

3. Underground Direct-Buried Jacket: 125-mil-thick vapor barrier and waterproofing membrane consisting of a rubberized bituminous resin reinforced with a woven-glass fiber or polyester scrim and laminated aluminum foil.

a. Manufacturers:

(1) Pittsburgh Corning Corporation; Pittwrap

(2) Polyguard; Insulrap No Torch 125

2.12 TAPES:

A. ASJ Tape: White vapor-retarder tape matching factory-applied jacket with acrylic adhesive, complying with ASTM C1136.

1. Manufacturers:

a. Avery Dennison Corporation, Specialty Tapes Division; Fasson 0835

b. Compac Corp.; 104 and 105

c. Ideal Tape Co., Inc., an American Biltrite Company; 428 AWF ASJ

d. Venture Tape; 1540 CW Plus, 1542 CW Plus, and 1542 CW Plus/SQ

2. Width: 3 inches.

3. Thickness: 11.5 mils.

4. Adhesion: 90 ounces force/inch in width.

5. Elongation: 2 percent.

6. Tensile Strength: 40 lbf/inch in width.

7. ASJ Tape Disks and Squares: Precut disks or squares of ASJ tape.

B. FSK Tape: Foil-face, vapor-retarder tape matching factory-applied jacket with acrylic adhesive; complying with ASTM C1136.

1. Manufacturers:

a. Avery Dennison Corporation, Specialty Tapes Division; Fasson 0827

b. Compac Corp.; 110 and 111

c. Ideal Tape Co., Inc., an American Biltrite Company; 491 AWF FSK

d. Venture Tape; 1525 CW, 1528 CW, and 1528 CW/SQ

2. Width: 3 inches.

3. Thickness: 6.5 mils.

4. Adhesion: 90 ounces force/inch in width.

5. Elongation: 2 percent.

6. Tensile Strength: 40 lbf/inch in width.

7. FSK Tape Disks and Squares: Precut disks or squares of FSK tape.

C. PVC Tape: White vapor-retarder tape matching field-applied PVC jacket with acrylic adhesive; suitable for indoor and outdoor applications.

1. Manufacturers:

a. Avery Dennison Corporation, Specialty Tapes Division; Fasson 0555

b. Compac Corp.; 130

c. Ideal Tape Co., Inc., an American Biltrite Company; 370 White PVC tape

d. Venture Tape; 1506 CW NS

2. Width: 2 inches.

3. Thickness: 6 mils.

4. Adhesion: 64 ounces force/inch in width.

5. Elongation: 500 percent.

6. Tensile Strength: 18 lbf/inch in width.

D. Aluminum-Foil Tape: Vapor-retarder tape with acrylic adhesive.

1. Manufacturers:

a. Avery Dennison Corporation, Specialty Tapes Division; Fasson 0800

b. Compac Corp.; 120

c. Ideal Tape Co., Inc., an American Biltrite Company; 488 AWF

d. Venture Tape; 3520 CW

2. Width: 2 inches.

3. Thickness: 3.7 mils.

4. Adhesion: 100 ounces force/inch in width.

5. Elongation: 5 percent.

6. Tensile Strength: 34 lbf/inch in width.

2.13 SECUREMENTS:

A. Bands:

1. Manufacturers:

a. Childers Products; Bands

b. PABCO Metals Corporation; Bands

c. RPR Products, Inc.; Bands

2. Stainless Steel: ASTM A240, Type 304; 0.015 inch thick, 3/4 inch wide with wing seal.

3. Aluminum: ASTM B209, Alloy 3003, 3005, 3105, or 5005; Temper H-14, 0.020 inch thick, 3/4 inch wide with wing seal.

B. Insulation Pins and Hangers:

1. Capacitor-Discharge-Weld Pins: Copper- or zinc-coated steel pin, fully annealed for capacitor-discharge welding, 0.106-inch- diameter shank, length to suit depth of insulation indicated.

a. Manufacturers:

(1) AGM Industries, Inc.; CWP-1

(2) GEMCO; CD

(3) Midwest Fasteners, Inc.; CD

(4) Nelson Stud Welding; TPA, TPC, and TPS

2. Cupped-Head, Capacitor-Discharge-Weld Pins: Copper- or zinc-coated steel pin, fully annealed for capacitor-discharge welding, 0.106-inch- diameter shank, length to suit depth of insulation indicated with integral 1-1/2-inch galvanized carbon-steel washer.

a. Manufacturers:

(1) AGM Industries, Inc.; CWP-1

(2) GEMCO; Cupped Head Weld Pin

(3) Midwest Fasteners, Inc.; Cupped Head

(4) Nelson Stud Welding; CHP

3. Metal, Adhesively Attached, Perforated-Base Insulation Hangers: Baseplate welded to projecting spindle that is capable of holding insulation, of thickness indicated, securely in position indicated when self-locking washer is in place. Comply with the following requirements:

a. Manufacturers:

(1) AGM Industries, Inc.; Tactoo Insul-Hangers, Series T

(2) GEMCO; Perforated Base

(3) Midwest Fasteners, Inc.; Spindle

b. Baseplate: Perforated, galvanized carbon-steel sheet, 0.030 inch thick by 2 inches square.

c. Spindle: Copper- or zinc-coated, low carbon steel, aluminum, or stainless steel, fully annealed, 0.106-inch-diameter shank, length to suit depth of insulation indicated.

d. Adhesive: Recommended by hanger manufacturer. Product with demonstrated capability to bond insulation hanger securely to substrates indicated without damaging insulation, hangers, and substrates.

4. Nonmetal, Adhesively Attached, Perforated-Base Insulation Hangers: Baseplate fastened to projecting spindle that is capable of holding insulation, of thickness in-

dicated, securely in position indicated when self-locking washer is in place. Comply with the following requirements:

a. Manufacturers:

(1) GEMCO; Nylon Hangers

(2) Midwest Fasteners, Inc.; Nylon Insulation Hangers

b. Baseplate: Perforated, nylon sheet, 0.030 inch thick by 1-1/2 inches in diameter.

c. Spindle: Nylon, 0.106-inch-diameter shank, length to suit depth of insulation indicated, up to 2-1/2 inches.

d. Adhesive: Recommended by hanger manufacturer. Product with demonstrated capability to bond insulation hanger securely to substrates indicated without damaging insulation, hangers, and substrates.

5. Self-Sticking-Base Insulation Hangers: Baseplate welded to projecting spindle that is capable of holding insulation, of thickness indicated, securely in position indicated when self-locking washer is in place. Comply with the following requirements:

a. Manufacturers:

(1) AGM Industries, Inc.; Tactoo Insul-Hangers, Series TSA

(2) GEMCO; Press and Peel

(3) Midwest Fasteners, Inc.; Self Stick

b. Baseplate: Galvanized carbon-steel sheet, 0.030 inch thick by 2 inches square.

c. Spindle: Copper- or zinc-coated, low carbon steel, aluminum, or stainless steel, fully annealed, 0.106-inch-diameter shank, length to suit depth of insulation indicated.

d. Adhesive-backed base with a peel-off protective cover.

6. Insulation-Retaining Washers: Self-locking washers formed from 0.016-inch-thick, aluminum or stainless-steel sheet, with beveled edge sized as required to hold insulation securely in place but not less than 1-1/2 inches in diameter.

a. Manufacturers:

(1) AGM Industries, Inc.; RC-150

(2) GEMCO; R-150

(3) Midwest Fasteners, Inc.; WA-150

(4) Nelson Stud Welding; Speed Clips

b. Protect ends with capped self-locking washers incorporating a spring steel insert to ensure permanent retention of cap in exposed locations.

7. Nonmetal Insulation-Retaining Washers: Self-locking washers formed from 0.016-inch-thick nylon sheet, with beveled edge sized as required to hold insulation securely in place but not less than 1-1/2 inches in diameter.

a. Products: Subject to compliance with requirements, provide one of the following:

(1) GEMCO

(2) Midwest Fasteners, Inc.

C. Staples: Outward-clinching insulation staples, nominal 3/4-inch-wide, stainless steel or Monel.

1. Manufacturers:

a. C & F Wire

b. Childers Products

c. PABCO Metals Corporation

d. RPR Products, Inc.

D. Wire: 0.062-inch soft-annealed, stainless steel.

2.14 PROTECTIVE SHIELDING GUARDS:

A. Protective Shielding Pipe Covers,:

1. Description: Manufactured plastic wraps for covering plumbing fixture hot-water supply and trap and drain piping. Comply with Americans with Disabilities Act (ADA) requirements.

B. Protective Shielding Piping Enclosures,:

1. Description: Manufactured plastic enclosure for covering plumbing fixture hot- and cold-water supplies and trap and drain piping. Comply with ADA requirements.

2.15 CORNER ANGLES:

A. PVC Corner Angles: 30 mils thick, minimum 1 by 1 inch, PVC according to ASTM D1784, Class 16354-C. White or color-coded to match adjacent surface.

B. Aluminum Corner Angles: 0.040 inch thick, minimum 1 by 1 inch, aluminum according to ASTM B209, Alloy 3003, 3005, 3105 or 5005; Temper H-14.

C. Stainless-Steel Corner Angles: 0.024 inch thick, minimum 1 by 1 inch, stainless steel according to ASTM A167 or ASTM A240, Type 304 or 316.

PART 3 - EXECUTION

3.01 EXAMINATION:

A. Examine substrates and conditions for compliance with requirements for installation tolerances and other conditions affecting performance of insulation application.

1. Verify that systems to be insulated have been tested and are free of defects.

2. Verify that surfaces to be insulated are clean and dry.

3. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 PREPARATION:

A. Clean and dry surfaces to receive insulation. Remove materials that will adversely affect insulation application.

B. Clean and prepare surfaces to be insulated. Before insulating, apply a corrosion coating to insulated surfaces as follows:

1. Stainless Steel: Coat 300 series stainless steel with an epoxy primer 5 mils thick and an epoxy finish 5 mils thick if operating in a temperature range of between 140 and 300 degrees F. Consult coating manufacturer for appropriate coating materials and application methods for operating temperature range.

2. Carbon Steel: Coat carbon steel operating at a service temperature of between 32 and 300 degrees F with an epoxy coating. Consult coating manufacturer for appropriate coating materials and application methods for operating temperature range.

C. Coordinate insulation installation with the tradesman installing heat tracing. Comply with requirements for heat tracing that apply to insulation.

D. Mix insulating cements with clean potable water; if insulating cements are to be in contact with stainless steel surfaces, use demineralized water.

3.03 GENERAL INSTALLATION REQUIREMENTS:

A. Install insulation materials, accessories, and finishes with smooth, straight, and even surfaces; free of voids throughout the length of piping, including fittings, valves, and specialties.

B. Install insulation materials, forms, vapor barriers or retarders, jackets, and of thicknesses required for each item of pipe system, as specified in insulation system schedules.

C. Install accessories compatible with insulation materials and suitable for the service. Install accessories that do not corrode, soften, or otherwise attack insulation or jacket in either wet or dry state.

D. Install insulation with longitudinal seams at top and bottom of horizontal runs.

E. Install multiple layers of insulation with longitudinal and end seams staggered.

F. Do not weld brackets, clips, or other attachment devices to piping, fittings, and specialties.

G. Keep insulation materials dry during storage, application, and finishing. Replace insulation materials that get wet.

H. Install insulation with tight longitudinal seams and end joints. Bond seams and joints with adhesive recommended by insulation material manufacturer.

I. Install insulation with least number of joints practical.

J. Where vapor barrier is indicated, seal joints, seams, and penetrations in insulation at hangers, supports, anchors, and other projections with vapor-barrier mastic.

1. Install insulation continuously through hangers and around anchor attachments.

2. For insulation application where vapor barriers are indicated, extend insulation on anchor legs from point of attachment to supported item to point of attachment to structure. Taper and seal ends attached to structure with vapor-barrier mastic.

3. Install insert materials and insulation to tightly join the insert. Seal insulation to insulation inserts with adhesive or sealing compound recommended by insulation material manufacturer.

4. Cover inserts with jacket material matching adjacent pipe insulation. Install shields over jacket, arranged to protect jacket from tear or puncture by hanger, support, and shield.

K. Apply adhesives, mastics, and sealants at manufacturer's recommended coverage rate and wet and dry film thicknesses.

L. Install insulation with factory-applied jackets as follows:

1. Draw jacket tight and smooth.

2. Cover circumferential joints with 3-inch-wide strips, of same material as insulation jacket. Secure strips with adhesive and outward-clinching staples along both edges of strip, spaced 4 inches o.c.

3. Overlap jacket longitudinal seams at least 1-1/2 inches. Install insulation with longitudinal seams at bottom of pipe. Clean and dry surface to receive self-sealing lap. Staple laps with outward-clinching staples along edge at 4 inches o.c.

   a. For below-ambient services, apply vapor-barrier mastic over staples.

4. Cover joints and seams with tape, in accordance with insulation material manufacturer's written instructions, to maintain vapor seal.

5. Where vapor barriers are indicated, apply vapor-barrier mastic on seams and joints and at ends adjacent to pipe flanges and fittings.

M. Cut insulation in a manner to avoid compressing insulation more than 25 percent of its nominal thickness.

N. Finish installation with systems at operating conditions. Repair joint separations and cracking due to thermal movement.

O. Repair damaged insulation facings by applying same facing material over damaged areas. Extend patches at least 4 inches beyond damaged areas. Adhere, staple, and seal patches in similar fashion to butt joints.

P. For above-ambient services, do not install insulation to the following:

1. Vibration-control devices

2. Testing agency labels and stamps

3. Nameplates and data plates

4. Cleanouts

3.04 PENETRATIONS:

A. Insulation Installation at Roof Penetrations: Install insulation continuously through roof penetrations.

1. Seal penetrations with flashing sealant.

2. For applications requiring only indoor insulation, terminate insulation above roof surface and seal with joint sealant. For applications requiring indoor and outdoor insulation, install insulation for outdoor applications tightly joined to indoor insulation ends. Seal joint with joint sealant.

3. Extend jacket of outdoor insulation outside roof flashing at least 2 inches below top of roof flashing.

4. Seal jacket to roof flashing with flashing sealant.

B. Insulation Installation at Underground Exterior Wall Penetrations: Terminate insulation flush with sleeve seal. Seal terminations with flashing sealant.

C. Insulation Installation at Aboveground Exterior Wall Penetrations: Install insulation continuously through wall penetrations.

1. Seal penetrations with flashing sealant.

2. For applications requiring only indoor insulation, terminate insulation inside wall surface and seal with joint sealant. For applications requiring indoor and outdoor insulation, install insulation for outdoor applications tightly joined to indoor insulation ends. Seal joint with joint sealant.

3. Extend jacket of outdoor insulation outside wall flashing and overlap wall flashing at least 2 inches.

4. Seal jacket to wall flashing with flashing sealant.

D. Insulation Installation at Interior Wall and Partition Penetrations (That Are Not Fire Rated): Install insulation continuously through walls and partitions.

E. Insulation Installation at Fire-Rated Wall and Partition Penetrations: Install insulation continuously through penetrations of fire-rated walls and partitions.

1. Comply with requirements in Section 07 84 00 for firestopping and fire-resistive joint sealers.

F. Insulation Installation at Floor Penetrations:

1. Pipe: Install insulation continuously through floor penetrations.

2. Seal penetrations through fire-rated assemblies. Comply with requirements in Section 07 84 00.

3.05 BREAK TANK INSULATION INSTALLATION:

A. Mineral Fiber, Pipe and Tank Insulation Installation for Break Tanks and Vessels: Secure insulation with adhesive and anchor pins and speed washers.

1. Apply adhesives according to manufacturer's recommended coverage rates per unit area of tank and vessel surfaces.

2. Groove and score insulation materials to fit as closely as possible to equipment, including contours. Bevel insulation edges for cylindrical surfaces for tight joints. Stagger end joints.

3. Protect exposed corners with secured corner angles.

4. Install adhesively attached or self-sticking insulation hangers and speed washers on sides of tanks and vessels as follows:

a. Do not weld anchor pins to ASME-labeled pressure vessels.

b. Select insulation hangers and adhesive that are compatible with service temperature and with substrate.

c. On tanks and vessels, maximum anchor-pin spacing is 3 inches from insulation end joints, and 16 inches o.c. in both directions.

d. Do not overcompress insulation during installation.

e. Cut and miter insulation segments to fit curved sides and domed heads of tanks and vessels.

f. Impale insulation over anchor pins and attach speed washers.

g. Cut excess portion of pins extending beyond speed washers or bend parallel with insulation surface. Cover exposed pins and washers with tape matching insulation facing.

h. Secure each layer of insulation with stainless-steel or aluminum bands. Select band material compatible with insulation materials.

i. Where insulation hangers on equipment and vessels are not permitted or practical and where insulation support rings are not provided, install a girdle network for securing insulation. Stretch prestressed aircraft cable around the diameter of vessel and make taut with clamps, turnbuckles, or breather springs. Place one circumferential girdle around equipment approximately 6 inches from each end. Install wire or cable between two circumferential girdles 12 inches o.c. Install a wire ring around each end and around outer periphery of center openings, and stretch prestressed aircraft cable radially from the wire ring to nearest circumferential girdle. Install additional cir-

cumferential girdles along the body of equipment or tank at a minimum spacing of 48 inches o.c. Use this network for securing insulation with tie wire or bands.

j. Stagger joints between insulation layers at least 3 inches.

k. Install insulation in removable segments on equipment access doors, maintenance holes, handholes, and other elements that require frequent removal for service and inspection.

l. Bevel and seal insulation ends around maintenance holes, handholes, ASME stamps, and nameplates.

m. For equipment with surface temperatures below ambient, apply mastic to open ends, joints, seams, breaks, and punctures in insulation.

5. Insulation Installation on Pumps:

a. Fabricate metal boxes lined with insulation. Fit boxes around pumps and coincide box joints with splits in pump casings. Fabricate joints with outward bolted flanges. Bolt flanges on 6-inch centers, starting at corners. Install 3/8-inch-diameter fasteners with wing nuts. Alternatively, secure the box sections together using a latching mechanism.

b. Fabricate boxes from galvanized steel or aluminum, at least 0.040 inch thick.

c. For below ambient services, install a vapor barrier at seams, joints, and penetrations. Seal between flanges with replaceable gasket material to form a vapor barrier.

6. Install insulation materials with smooth and even surfaces and on clean and dry surfaces. Redo poorly fitted joints. Do not use mastic or joint sealer as filler for gapping joints and excessive voids resulting from poor workmanship.

7. Maintain integrity of vapor-barrier on equipment insulation and protect it to prevent puncture and other damage.

8. Do not apply insulation to equipment while hot.

9. Apply insulation using staggered joint method and double layer construction. Apply each layer of insulation separately.

10. Provide removable insulation sections with aluminum jacket and stainless steel bands to cover parts of equipment which must be opened for maintenance; include metal vessel covers, fasteners, flanged, frames and accessories.

3.06 GENERAL PIPE INSULATION INSTALLATION:

A. Requirements in this article generally apply to all insulation materials, except where more specific requirements are specified in various pipe insulation material installation articles.

B. Insulation Installation on Fittings, Valves, Strainers, Flanges, Mechanical Couplings, and Unions:

1. Install insulation over fittings, valves, strainers, flanges, mechanical couplings, unions, and other specialties with continuous thermal and vapor-retarder integrity unless otherwise indicated.

2. Insulate pipe elbows using preformed fitting insulation made from same material and density as that of adjacent pipe insulation. Each piece shall be butted tightly against adjoining piece and bonded with adhesive. Fill joints, seams, voids, and irregular surfaces with insulating cement finished to a smooth, hard, and uniform contour that is uniform with adjoining pipe insulation.

3. Insulate tee fittings with preformed fitting insulation of same material and thickness as that used for adjacent pipe. Cut sectional pipe insulation to fit. Butt each section closely to the next and hold in place with tie wire. Bond pieces with adhesive.

4. Insulate valves using preformed fitting insulation of same material, density, and thickness as that used for adjacent pipe. Overlap adjoining pipe insulation by not less than 2 times the thickness of pipe insulation, or one pipe diameter, whichever is thicker. For valves, insulate up to and including the bonnets, valve stuffing-box studs, bolts, and nuts. Fill joints, seams, and irregular surfaces with insulating cement.

5. Insulate strainers using preformed fitting insulation of same material, density, and thickness as used for adjacent pipe. Overlap adjoining pipe insulation by not less than 2 times the thickness of pipe insulation, or one pipe diameter, whichever is thicker. Fill joints, seams, and irregular surfaces with insulating cement. Insulate strainers, so strainer basket flange or plug can be easily removed and replaced without damaging the insulation and jacket. Provide a removable reusable insulation cover. For below-ambient services, provide a design that maintains vapor barrier.

6. Insulate flanges, mechanical couplings, and unions, using a section of oversized preformed pipe insulation. Overlap adjoining pipe insulation by not less than 2 times the thickness of pipe insulation, or one pipe diameter, whichever is thicker. Stencil or label the outside insulation jacket of each union with the word "union" matching size and color of pipe labels.

7. Cover segmented insulated surfaces with a layer of finishing cement and coat with a mastic. Install vapor-barrier mastic for below-ambient services and a breather mastic for above-ambient services. Reinforce the mastic with fabric-reinforcing mesh. Trowel the mastic to a smooth and well-shaped contour.

8. For services not specified to receive a field-applied jacket, except for flexible elastomeric and polyolefin, install fitted PVC cover over elbows, tees, strainers, valves, flanges, and unions. Terminate ends with PVC end caps. Tape PVC covers to adjoining insulation facing, using PVC tape.

C. Insulate instrument connections for thermometers, pressure gages, pressure temperature taps, test connections, flow meters, sensors, switches, and transmitters on insulated pipes. Shape insulation at these connections by tapering it to and around the connection with insulating cement and finish with finishing cement, mastic, and flashing sealant.

D. Install removable insulation covers at locations indicated. Installation shall conform to the following:

1. Make removable flange and union insulation from sectional pipe insulation of same thickness as that on adjoining pipe. Install same insulation jacket as that of adjoining pipe insulation.

2. When flange and union covers are made from sectional pipe insulation, extend insulation from flanges or union at least 2 times the insulation thickness over adjacent pipe insulation on each side of flange or union. Secure flange cover in place with stainless steel or aluminum bands. Select band material compatible with insulation and jacket.

3. Construct removable valve insulation covers in same manner as for flanges, except divide the two-part section on the vertical center line of valve body.

4. When covers are made from block insulation, make two halves, each consisting of mitered blocks wired to stainless steel fabric. Secure this wire frame, with its attached insulation, to flanges with tie wire. Extend insulation at least 2 inches over adjacent pipe insulation on each side of valve. Fill space between flange or union cover and pipe insulation with insulating cement. Finish cover assembly with insulating cement applied in two coats. After first coat is dry, apply and trowel second coat to a smooth finish.

5. Unless a PVC jacket is indicated in field-applied jacket schedules, finish exposed surfaces with a metal jacket.

3.07 INSTALLATION OF CELLULAR-GLASS INSULATION:

A. Insulation Installation on Straight Pipes and Tubes:

1. Secure each layer of insulation to pipe with wire or bands, and tighten bands without deforming insulation materials.

2. Where vapor barriers are indicated, seal longitudinal seams, end joints, and protrusions with vapor-barrier mastic and joint sealant.

3. For insulation with factory-applied jackets on above-ambient services, secure laps with outward-clinched staples at 6 inches o.c.

4. For insulation with factory-applied jackets on below-ambient services, do not staple longitudinal tabs. Instead, secure tabs with additional adhesive, as recommended by insulation material manufacturer, and seal with vapor-barrier mastic and flashing sealant.

B. Insulation Installation on Pipe Flanges:

1. Install preformed pipe insulation to outer diameter of pipe flange.

2. Make width of insulation section same as overall width of flange and bolts, plus twice the thickness of pipe insulation.

3. Fill voids between inner circumference of flange insulation and outer circumference of adjacent straight pipe segments with cut sections of cellular-glass block insulation of same thickness as that of pipe insulation.

4. Install jacket material with manufacturer's recommended adhesive, overlap seams at least 1 inch, and seal joints with flashing sealant.

C. Insulation Installation on Pipe Fittings and Elbows:

1. Install preformed sections of same material as that of straight segments of pipe insulation when available. Secure according to manufacturer's written instructions.

2. When preformed sections of insulation are not available, install mitered sections of cellular-glass insulation. Secure insulation materials with wire or bands.

D. Insulation Installation on Valves and Pipe Specialties:

1. Install preformed sections of cellular-glass insulation to valve body.

2. Arrange insulation to permit access to packing and to allow valve operation without disturbing insulation.

3. Install insulation to flanges as specified for flange insulation application.

3.08 INSTALLATION OF MINERAL-FIBER INSULATION:

A. Insulation Installation on Straight Pipes and Tubes:

1. Secure each layer of preformed pipe insulation to pipe with wire or bands, and tighten bands without deforming insulation materials.

2. Where vapor barriers are indicated, seal longitudinal seams, end joints, and protrusions with vapor-barrier mastic and joint sealant.

3. For insulation with factory-applied jackets on above-ambient surfaces, secure laps with outward-clinched staples at 6 inches o.c.

4. For insulation with factory-applied jackets on below-ambient surfaces, do not staple longitudinal tabs. Instead, secure tabs with additional adhesive, as recommended by insulation material manufacturer, and seal with vapor-barrier mastic and flashing sealant.

B. Insulation Installation on Pipe Flanges:

1. Install preformed pipe insulation to outer diameter of pipe flange.

2. Make width of insulation section same as overall width of flange and bolts, plus twice the thickness of pipe insulation.

3. Fill voids between inner circumference of flange insulation and outer circumference of adjacent straight pipe segments with mineral-fiber blanket insulation.

4. Install jacket material with manufacturer's recommended adhesive, overlap seams at least 1 inch, and seal joints with flashing sealant.

C. Insulation Installation on Pipe Fittings and Elbows:

1. Install preformed sections of same material as that of straight segments of pipe insulation when available.

2. When preformed insulation elbows and fittings are not available, install mitered sections of pipe insulation, to a thickness equal to adjoining pipe insulation. Secure insulation materials with wire or bands.

D. Insulation Installation on Valves and Pipe Specialties:

1. Install preformed sections of same material as that of straight segments of pipe insulation when available.

2. When preformed sections are not available, install mitered sections of pipe insulation to valve body.

3. Arrange insulation to permit access to packing and to allow valve operation without disturbing insulation.

4. Install insulation to flanges as specified for flange insulation application.

3.09 FIELD QUALITY CONTROL:

A. Owner will engage a qualified testing agency to perform tests and inspections.

B. Engage a qualified testing agency to perform tests and inspections.

C. Manufacturer's Field Service: Engage a factory-authorized service representative to test and inspect components, assemblies, and equipment installations, including connections.

D. Perform tests and inspections.

E. Tests and Inspections: Inspect pipe, fittings, strainers, and valves, randomly selected by Architect, by removing field-applied jacket and insulation in layers in reverse order of their installation. Extent of inspection shall be limited to three locations of straight pipe, three locations of threaded fittings, three locations of welded fittings, two locations of threaded strainers, two locations of welded strainers, three locations of threaded valves, and three locations of flanged valves for each pipe service defined in the "Piping Insulation Schedule, General" Article.

F. All insulation applications will be considered defective if they do not pass tests and inspections.

G. Prepare test and inspection reports.

3.10 EQUIPMENT INSULATION SCHEDULE:

A. Insulation materials and thicknesses are identified below. If more than one material is listed for a type of equipment, selection from materials listed is Contractor's option.

B. Insulate indoor and outdoor equipment in paragraphs below that is not factory insulated.

C. Provide equipment insulation as follows:

Equipment	Material	Thickness (inches)
Potable Water Pump	Rigid Cellular Glass Mineral-Fiber Board	3 2
Filter Housing	Rigid Cellular Glass Mineral-Fiber Board	3 2

3.11 PIPING INSULATION SCHEDULE, GENERAL:

A. Acceptable preformed pipe and tubular insulation materials and thicknesses are identified for each piping system and pipe size range. If more than one material is listed for a piping system, selection from materials listed is Contractor's option.

B. Items Not Insulated: Unless otherwise indicated, do not install insulation on the following:

1. Drainage piping located in crawl spaces.

2. Underground piping.

3. Chrome-plated pipes and fittings unless there is a potential for personnel injury.

3.12 INDOOR PIPING INSULATION SCHEDULE:

A. Provide indoor piping insulation as follows:

Piping Service	Pipe Size	Thickness (inches)	Material
Potable & non-potable Cold Water	All	1	Mineral Fiber
Potable Hot Water & Circulation	1-1/2 inches and Smaller	1	Mineral Fiber
Potable Hot Water & Circulation	2 inches and Larger	1-1/2	Mineral Fiber
Roof Drain & Overflow	All	1	Mineral Fiber
Roof Drain & Overflow Drain Bodies	All	1-1/2	Mineral Fiber
Sanitary Waste Piping Where Heat Tracing is Installed	All	1-1/2	Mineral Fiber

3.13 OUTDOOR, ABOVEGROUND PIPING INSULATION SCHEDULE:

A. Provide outdoor, above ground piping insulation as follows:

Piping Service	Pipe Size	Cellular Glass Thickness
Potable & non-potable Cold Water	All	2 inches
Potable Hot Water & Circulation	All	2 inches
Sanitary Waste & Vent	All	1-1/2 inches

3.14 OUTDOOR, UNDERGROUND PIPING INSULATION SCHEDULE

A. Loose-fill insulation, for belowground piping, is specified in Division 33 piping distribution Sections.

B. Sanitary Waste Piping, All Sizes, Where Heat Tracing Is Installed: Cellular glass, 2 inches thick.

3.15 INDOOR, FIELD-APPLIED JACKET SCHEDULE:

A. Install jacket over insulation material. For insulation with factory-applied jacket, install the field-applied jacket over the factory-applied jacket.

B. If more than one material is listed, selection from materials listed is Contractor's option.

C. Equipment, Concealed:

1. None.

D. Equipment, Exposed, up to 48 Inches in Diameter or with Flat Surfaces up to 72 Inches:

1. PVC: 20 mils thick.

2. Painted Aluminum, Smooth: 0.020 inch thick.

3. Stainless Steel, Type 304 or 316, Smooth 2B Finish or Corrugated: 0.016 inch thick.

E. Equipment, Exposed, Larger Than 48 Inches in Diameter or with Flat Surfaces Larger than 72 Inches:

1. Painted Aluminum, Smooth: 0.032 inch thick.

2. Stainless Steel, Type 304 or 316, Smooth 2B Finish or Corrugated: 0.020 inch thick.

F. Piping, Concealed:

1. None.

G. Piping, Exposed:

1. PVC: 30 mils thick.

3.16 OUTDOOR, FIELD-APPLIED JACKET SCHEDULE:

A. Install jacket over insulation material. For insulation with factory-applied jacket, install the field-applied jacket over the factory-applied jacket.

B. If more than one material is listed, selection from materials listed is Contractor's option.

C. Equipment, Concealed:

1. PVC: 20 mils thick.

2. Painted Aluminum, Smooth: 0.020 inch thick.

3. Stainless Steel, Type 304 or 316, Smooth 2B Finish or Corrugated: 0.016 inch thick.

D. Equipment, Exposed, up to 48 Inches in Diameter or with Flat Surfaces up to 72 Inches:

1. Painted Aluminum, Smooth: 0.020 inch thick.

2. Stainless Steel, Type 304 or 316, Smooth 2B Finish or Corrugated: 0.016 inch thick.

E. Equipment, Exposed, Larger Than 48 Inches in Diameter or with Flat Surfaces Larger than 72 Inches:

1. Painted Aluminum, Smooth: 0.032 inch thick.

2. Stainless Steel, Type 304 or 316, Smooth 2B Finish or Corrugated: 0.020 inch thick.

F. Piping, Concealed:

1. PVC: 20 mils thick.

2. Painted Aluminum, Smooth: 0.020 inch thick.

3. Stainless Steel, Type 304 or 316, Smooth 2B Finish or Corrugated: 0.016 inch thick.

G. Piping, Exposed:

1. Painted Aluminum, Smooth: 0.032 inch thick.

2. Stainless Steel, Type 304 or 316, Smooth 2B Finish or Corrugated: 0.020 inch thick.

3.17 UNDERGROUND, FIELD-APPLIED INSULATION JACKET:

A. For underground direct-buried piping applications, install underground direct-buried jacket over insulation material.

3.18 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

Page Intentionally Left Blank

SECTION 22 11 13

FACILITY WATER DISTRIBUTION PIPING

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide water-distribution piping and related components outside the building for water service as indicated and in compliance with Contract Documents.

3. 372: Drinking Water System Components - Lead Content

G. Underwriters' Laboratories, Inc. (UL):

1.03 DEFINITIONS:

A. PVC: Polyvinyl chloride plastic.

1.04 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

1. Sustainable Design Submittals.

B. Product Data: For each type of product indicated.

C. Coordination Drawings: For piping and specialties including relation to other services in same area, drawn to scale. Show piping and specialty sizes and valves, meter and specialty locations, and elevations.

D. Field quality-control test reports.

E. Operation and Maintenance Data: For water valves and specialties to include in emergency, operation, and maintenance manuals.

1.05 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.06 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

B. Sustainability Standards Certifications.

C. Piping materials shall bear label, stamp, or other markings of specified testing agency.

D. Comply with ASTM F645 for selection, design, and installation of thermoplastic water piping.

1.07 DELIVERY, STORAGE, AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

B. Preparation for Transport: Prepare valves, including hydrants, according to the following:

1. Ensure that valves are dry and internally protected against rust and corrosion.

2. Protect valves against damage to threaded ends and flange faces.

3. Set valves in best position for handling. Set valves closed to prevent rattling.

C. During Storage: Use precautions for valves, including hydrants, according to the following:

1. Do not remove end protectors unless necessary for inspection; then reinstall for storage.

2. Protect from weather. Store indoors and maintain temperature higher than ambient dew-point temperature. Support off the ground or pavement in watertight enclosures when outdoor storage is necessary.

D. Handling: Use sling to handle valves and hydrants if size requires handling by crane or lift. Rig valves to avoid damage to exposed parts. Do not use handwheels or stems as lifting or rigging points.

E. Deliver piping with factory-applied end caps. Maintain end caps through shipping, storage, and handling to prevent pipe-end damage and to prevent entrance of dirt, debris, and moisture.

F. Protect stored piping from moisture and dirt. Elevate above grade. Do not exceed structural capacity of floor when storing inside.

G. Protect flanges, fittings, and specialties from moisture and dirt.

H. Store plastic piping protected from direct sunlight. Support to prevent sagging and bending.

1.08 PROJECT/SITE CONDITIONS:

A. Interruption of Existing Water-Distribution Service: Do not interrupt service to facilities occupied by Owner or others unless permitted under the following conditions and then only after arranging to provide temporary water-distribution service according to requirements indicated:

1. Notify Owner no fewer than two days in advance of proposed interruption of service.

2. Do not proceed with interruption of water-distribution service without Owner's written permission.

PART 2 - PRODUCTS

2.01 PIPING MATERIALS:

A. Comply with requirements in "Piping Application" Article for applications of pipe, tube, fitting materials, and joining methods for specific services, service locations, and pipe sizes.

2.02 PVC PIPE AND FITTINGS:

A. PVC, Schedule 80 Pipe: ASTM D1785.

1. PVC, Schedule 80 Socket Fittings: ASTM D2467.

2. PVC, Schedule 80 Threaded Fittings: ASTM D2464.

B. PVC, AWWA Pipe: AWWA C900, Class 150, with bell end with gasket, and with spigot end.

1. PVC Fabricated Fittings: AWWA C900, Class 150, with bell-and-spigot or double-bell ends. Include elastomeric gasket in each bell.

2. PVC Molded Fittings: AWWA C907, Class 150, with bell-and-spigot or double-bell ends. Include elastomeric gasket in each bell.

3. Push-on-Joint, Ductile-Iron Fittings: AWWA C110, ductile- or gray-iron standard pattern or AWWA C153, ductile-iron compact pattern.

a. Gaskets: AWWA C111, rubber.

4. Mechanical-Joint, Ductile-Iron Fittings: AWWA C110, ductile- or gray-iron standard pattern or AWWA C153, ductile-iron compact pattern.

a. Glands, Gaskets, and Bolts: AWWA C111, ductile- or gray-iron glands, rubber gaskets, and steel bolts.

2.03 JOINING MATERIALS:

A. Plastic Pipe-Flange Gasket, Bolts, and Nuts: Type and material recommended by piping system manufacturer, unless otherwise indicated.

2.04 PROTECTIVE ENCLOSURES:

A. Freeze-Protection Enclosures:

1. Manufacturers:

a. Aquashield.

b. Hubbell.

c. Safe-T-Cover.

2. Description: Insulated enclosure designed to protect aboveground water piping, equipment, or specialties from freezing and damage.

a. Standard: ASSE 1060.

b. Class I-V: For pressure or atmospheric vacuum breaker equipment or devices. Include drain opening in housing.

(1) Housing: Reinforced-aluminum construction.

(a) Size: Of dimensions indicated, but not less than those required for access and service of protected unit.

(b) Drain opening for units with drain connection.

(c) Access doors with locking devices.

(d) Insulation inside housing.

(e) Anchoring devices for attaching housing to concrete base.

3. Aluminum Enclosures Products:

a. Sectionalized enclosures are factory assembled with tongue and grooved sections that slide together and are then secured to the concrete pad with the supplied anchor pads and wedge anchors.

b. Access panels have a four-point locking system with pad lockable handle and are completely removable.

c. Drain ports are sized for full port backflow discharge and are designed for a one-way operation allowing backflow discharge but not allowing wind, debris and small animals to enter the enclosure.

d. Standard enclosures shall be designed to support a minimum vertical load of 100 lb/sf.

e. Standard enclosures up to 36”W x 105”L x 64”H shall be designed to support wind speeds up to 120 mph, all larger sizes shall be designed to support wind speeds up to 80 mph.

f. Standard enclosures are ASSE 1060 certified.

g. Custom enclosures are designed and constructed in the same manner as standard certified enclosures, but have not been lab tested and listed by ASSE.

4. Materials of Fabrication:

a. Aluminum sheeting shall be 3003 aluminum (.050/18 gauge), stucco embossed finish and shall meet ASTEM B209. Stucco embossed finish reduces the glare and helps hide any surface scratches or imperfections received in the field.

b. Bracing shall be 6063 T52 aluminum and shall meet ASTM B221.

c. No wood or particle board used in the construction of any Hot Box product.

d. Anchor pads shall be galvanized steel. 3/8 16 inch x 2 3/4 long zinc plated wedge anchors are supplied.

e. Insulation shall be approximately 1.5" unicellular, non-wicking, polyisocyanate foam sprayed in place that forms a monolithic bond between the aluminum bracing and aluminum sheeting.

f. The Insulation shall have the following properties:

(1) R-Value: 9

(2) Dimensional Stability: Less than 2 percent linear change

(3) Compressive Strength: 51 psi

(4) Flame Point: 325 degrees

(5) Water Absorption: .037 psf

(6) Porosity: 91 percent

B. Enclosure Bases:

1. Description: 4-inch- minimum thickness precast concrete, of dimensions required to extend at least 6 inches beyond edges of enclosure housings. Include openings for piping.

PART 3 - EXECUTION

3.01 EARTHWORK:

A. Refer to Section 31 23 00 for excavating and backfilling.

3.02 PIPING APPLICATIONS:

A. General: Use pipe, fittings, and joining methods for piping systems according to the following applications.

B. Transition couplings and special fittings with pressure ratings at least equal to piping pressure rating may be used, unless otherwise indicated.

C. Do not use flanges or unions for underground piping.

D. Flanges, unions, grooved-end-pipe couplings, and special fittings may be used, instead of joints indicated, on aboveground piping and piping in vaults.

E. Underground water-service piping NPS 3/4 to NPS 10 shall be the following:

1. PVC, Schedule 80 pipe; PVC, Schedule 80 socket fittings; and solvent-cemented joints.

F. Aboveground Water-Service Piping NPS 3/4 to NPS 4 shall be the following:

1. PVC, Schedule 80 pipe; PVC, Schedule 80 threaded fittings; and threaded joints.

3.03 VALVE APPLICATIONS:

A. General Application: Use mechanical-joint-end valves for NPS 3 and larger underground installation. Use threaded- or flanged-end valves for installation in vaults. Use UL/FMG, non-rising-stem gate valves for installation with indicator posts. Use corporation valves and curb valves with ends compatible with piping, for NPS 2 and smaller installation.

B. Drawings indicate valve types to be used.

3.04 PIPING INSTALLATION:

A. Make connections NPS 2 and smaller with drilling machine according to the following:

1. Install service-saddle assemblies and corporation valves in size, quantity, and arrangement required by utility company standards.

2. Install service-saddle assemblies on water-service pipe to be tapped. Position outlets for corporation valves.

3. Use drilling machine compatible with service-saddle assemblies and corporation valves. Drill hole in main. Remove drilling machine and connect water-service piping.

4. Install corporation valves into service-saddle assemblies.

5. Install manifold for multiple taps in water main.

6. Install curb valve in water-service piping with head pointing up and with service box.

B. Install PVC, AWWA pipe according to ASTM F645 and AWWA M23.

C. Bury piping with depth of cover over top at least 30 inches, with top at least 12 inches below level of maximum frost penetration, and according to the following:

1. Under Driveways: With at least 36 inches cover over top.

2. In Loose Gravelly Soil and Rock: With at least 12 inches additional cover.

D. Install piping by tunneling or jacking, or combination of both, under streets and other obstructions that cannot be disturbed.

E. Extend water-service piping and connect to water-supply source and building-water-piping systems at outside face of building wall in locations and pipe sizes indicated.

1. Terminate water-service piping at building wall until building-water-piping systems are installed. Terminate piping with caps, plugs, or flanges as required for piping material. Make connections to building-water-piping systems when those systems are installed.

F. Install underground piping with restrained joints at horizontal and vertical changes in direction. Use restrained-joint piping, thrust blocks, anchors, tie-rods and clamps, and other supports.

3.05 HEATED ENCLOSURE INSTALLATION:

A. The enclosure shall be installed on a concrete slab, on grade. Slab shall extend a minimum of 9-inces larger than the enclosure exterior dimensions.

B. The enclosure shall be assembled per the manufactures instructions provided with the enclosure.

3.06 JOINT CONSTRUCTION:

A. Make pipe joints according to the following:

1. PVC Piping Gasketed Joints: Use joining materials according to AWWA C900. Construct joints with elastomeric seals and lubricant according to ASTM D2774 or ASTM D3139 and pipe manufacturer's written instructions.

3.07 ANCHORAGE INSTALLATION:

A. Anchorage, General: Install water-distribution piping with restrained joints. Anchorages and restrained-joint types that may be used include the following:

1. Concrete thrust blocks.

2. Locking mechanical joints.

3. Heat-fused joints.

4. Pipe clamps and tie rods.

B. Install anchorages for tees, plugs and caps, bends, crosses, valves, and hydrant branches. Include anchorages for the following piping systems:

1. Gasketed-Joint, PVC Water-Service Piping: According to AWWA M23.

C. Apply full coat of asphalt or other acceptable corrosion-resistant material to surfaces of installed ferrous anchorage devices.

D. AWWA Valves Other Than Gate Valves: Comply with AWWA C600 and AWWA M44.

3.08 CONNECTIONS:

A. Connect water-distribution piping to existing water main. Use tapping sleeve and tapping valve.

B. Connect waste piping from concrete vault drains to storm-drainage system. See Section 33 44 00 for connection to storm-sewer piping.

C. Ground equipment according to Section 26 05 26.

3.09 FIELD QUALITY CONTROL:

A. Piping Tests: Conduct piping tests before joints are covered and after concrete thrust blocks have hardened sufficiently. Fill pipeline 24 hours before testing and apply test pressure to stabilize system. Use only potable water.

B. Hydrostatic Tests: Test at not less than one-and-one-half times working pressure for two hours.

1. Increase pressure in 50-psig increments and inspect each joint between increments. Hold at test pressure for 1 hour; decrease to 0 psig. Slowly increase again to test pressure and hold for 1 more hour. Maximum allowable leakage is 2 quarts per hour per 100 joints. Remake leaking joints with new materials and repeat test until leakage is within allowed limits.

C. Prepare reports of testing activities.

3.10 CLEANING:

A. Clean and disinfect water-distribution piping as follows:

1. Purge new water-distribution piping systems and parts of existing systems that have been altered, extended, or repaired before use.

2. Use purging and disinfecting procedure prescribed by authorities having jurisdiction or, if method is not prescribed by authorities having jurisdiction, use procedure described in AWWA C651 or do as follows:

a. Fill system or part of system with water/chlorine solution containing at least 50 ppm of chlorine; isolate and allow to stand for 24 hours.

b. After standing time, flush system with clean, potable water until no chlorine remains in water coming from system.

c. Submit water samples in sterile bottles to authorities having jurisdiction. Repeat procedure if biological examination shows evidence of contamination.

B. Prepare reports of purging and disinfecting activities.

3.11 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

Page Intentionally Left Blank

SECTION 22 11 19

PLUMBING PIPING SPECIALTIES

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide plumbing piping specialties as indicated and in compliance with Contract Documents.

1. Backflow preventers.

2. Post hydrants.

3. Drain valves.

1.02 REFERENCES:

A. American Society of Mechanical Engineers (ASME):

1. A112.18.1: Plumbing Supply Fittings

2. A112.21.3M: Hydrants for Utility and Maintenance Use

3. B1.20.7: Hose Coupling Screw Threads (Inch)

B. American Society of Sanitary Engineering (ASSE):

1. 1011: Performance Requirements for Hose Connection Vacuum Breakers

2. 1015: Performance Requirements for Double Check Backflow Prevention Assemblies and Double Check Fire Protection Backflow Prevention Assemblies

3. 1052: Performance Requirements for Hose Connection Backflow Preventers

C. American Water Works Association (AWWA):

1. C550: Protective Interior Coatings for Valves and Hydrants.

2. SP-110: Ball Valves Threaded, Socket-Welding, Solder Joint, Grooved and Flared Ends

D. NSF International (NSF):

1. 14: Plastics Piping System Components and Related Materials

2. 61: Drinking Water System Components - Health Effects

3. 372: Drinking Water System Components - Lead Content

1.03 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

1. Sustainable Design Submittals.

B. Product Data: For each type of product.

C. Field quality-control reports.

D. Operation and Maintenance Data: For domestic water piping specialties to include in emergency, operation, and maintenance manuals.

1.04 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.05 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

B. Sustainability Standards Certifications.

1.06 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

PART 2 - PRODUCTS

2.01 GENERAL REQUIREMENTS FOR PIPING SPECIALTIES:

A. Potable-water piping and components shall comply with NSF 61 and NSF 14. Mark "NSF-pw" on plastic piping components.

B. Comply with NSF 372 for low lead.

2.02 PERFORMANCE REQUIREMENTS:

A. Minimum Working Pressure for Domestic Water Piping Specialties: 125 psig unless otherwise indicated.

B. Double-Check, Backflow-Prevention Assemblies:

1. Manufacturers:

a. Ames

b. Mifab

c. Watts.

d. Zurn

2. Standard: ASSE 1015.

3. Operation: Continuous-pressure applications unless otherwise indicated.

4. Pressure Loss: 5 psig maximum, through middle third of flow range.

5. Size: 3 inch NPS.

6. Design Flow Rate: 150 gpm.

7. Selected Unit Flow Range Limits: 100-300 gpm.

8. Pressure Loss at Design Flow Rate: 7 psig for sizes NPS 2-1/2 and larger.

9. Body: Ductile or cast iron with interior lining that complies with AWWA C550 or that is FDA approved for NPS 2-1/2 and larger.

10. End Connections: Flanged for NPS 2-1/2 and larger.

11. Configuration: Designed for horizontal, straight-through flow.

12. Accessories:

a. Valves NPS 2-1/2 inch and Larger: Outside-screw and yoke-gate type with flanged ends on inlet and outlet.

2.03 POST HYDRANTS:

A. Non-freeze, Draining-Type Post Hydrants:

1. Manufacturers:

a. Mifab.

b. Murdock Manufacturing.

c. Watts.

d. Woodford.

e. Zurn.

2. Standard: ASME A112.21.3M.

3. Type: Non-freeze, exposed-outlet post hydrant.

4. Operation: Removable lever.

5. Casing and Operating Rod: Of at least length required for burial of valve below frost line.

6. Casing: Bronze with casing guard.

7. Inlet: NPS 1-1/2.

8. Outlet: 1-1/2-inch FPT.

9. Drain: 1/8-inch NPT drain hole. Designed with hole to drain into ground when shut off.

10. Vacuum Breaker:

a. Nonremovable, drainable, hose-connection vacuum breaker complying with ASSE 1011 or backflow preventer complying with ASSE 1052.

2.04 DRAIN VALVES:

A. Ball-Valve-Type, Hose-End Drain Valves:

1. Standard: MSS SP-110 for standard-port, two-piece ball valves.

2. Pressure Rating: 400-psig minimum CWP.

3. Size: NPS 3/4.

4. Body: Copper alloy.

5. Ball: Chrome-plated brass.

6. Seats and Seals: Replaceable.

7. Handle: Vinyl-covered steel.

8. Inlet: Threaded or solder joint.

9. Outlet: Threaded, short nipple with garden-hose thread complying with ASME B1.20.7 and cap with brass chain.

PART 3 - EXECUTION

3.01 INSTALLATION:

A. Backflow Preventers: Install backflow preventers in each water supply to mechanical equipment and systems and to other equipment and water systems that may be sources of contamination. Comply with authorities having jurisdiction.

1. Locate backflow preventers in freeze proof enclosure.

2. Install drain for backflow preventers with atmospheric-vent drain connection with air-gap fitting, fixed air-gap fitting, or equivalent positive pipe separation of at least two pipe diameters in drain piping and pipe-to-floor drain. Locate air-gap device attached to or under backflow preventer. Simple air breaks are unacceptable for this application.

3. Do not install bypass piping around backflow preventers.

B. Non-freeze, Draining-Type Post Hydrants: Install with 1 cubic yard of crushed gravel around drain hole. Set post hydrants in concrete paving or in 1 cubic foot of concrete block at grade.

3.02 CONNECTIONS:

A. Drawings indicate general arrangement of piping, fittings, and specialties.

B. When installing piping specialties adjacent to equipment and machines, allow space for service and maintenance.

3.03 IDENTIFICATION:

A. Plastic Labels for Equipment: Install engraved plastic-laminate equipment nameplate or sign on or near each of the following:

1. Double-check, backflow-prevention assemblies.

B. Distinguish among multiple units, inform operator of operational requirements, indicate safety and emergency precautions, and warn of hazards and improper operations, in addition to identifying unit.

3.04 FIELD QUALITY CONTROL:

A. Perform the following tests and inspections:

1. Test each double-check, backflow-prevention assembly according to authorities having jurisdiction and the device's reference standard.

B. Domestic water piping specialties will be considered defective if they do not pass tests and inspections.

C. Prepare test and inspection reports.

3.05 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 22 11 23

PLUMBING PUMPS

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide plumbing pumps as indicated and in compliance with Contract Documents.

B. Close-coupled, in-line, seal-less centrifugal pumps

C. Separately coupled, in-line centrifugal pumps

D. Sump Pumps:

1. Submersible sump pumps

1.02 REFERENCES:

A. American Society of Heating, Refrigerating and Air-Conditioning Engineers (ASHRAE):

1. 135: A Data Communication Protocol for Building Automation and Control Networks

B. American Society of Mechanical Engineers (ASME):

E. NSF International (NSF):

1. 61: Drinking Water System Components – Health Effects

2. 372: Drinking water System Components – Lead Content

F. Underwriters' Laboratories, Inc. (UL):

1. 778: Motor-Operated Water Pumps

2. 1995: Heating and Cooling Equipment

1.03 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Product Data: For each type of product. Include construction materials, rated capacities, certified performance curves with operating points plotted on curves, operating characteristics, electrical characteristics, and furnished specialties and accessories.

1. Product Data: For each type of product.

a. Include construction details, material descriptions, and dimensions of individual components and profiles.

b. Include rated capacities, operating characteristics, electrical characteristics, and furnished specialties and accessories.

C. Shop Drawings:

1. Include plans, elevations, sections, and mounting details.

2. Include details of equipment assemblies. Indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.

3. Vibration Isolation Base Details: Detail fabrication including anchorages and attachments to structure and to supported equipment. Include adjustable motor bases, rails, and frames for equipment mounting.

D. Delegated-Design Submittal: For domestic-water packaged booster pumps.

1. Include design calculations for selecting vibration isolators and for designing vibration isolation bases.

E. Operation and Maintenance Data: For inline, domestic-water pumps to include in operation and maintenance manuals.

1.04 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.05 SPARE PARTS:

A. Comply with the requirements specified in Section 01 61 00.

1.06 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

1.07 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

B. Retain shipping flange protective covers and protective coatings during storage.

C. Protect bearings and couplings against damage.

D. Comply with pump manufacturer's written instructions for handling.

1.08 COORDINATION:

A. Coordinate sizes and locations of concrete bases with actual equipment provided.

PART 2 - PRODUCTS

2.01 PERFORMANCE REQUIREMENTS:

A. Drinking Water System Components - Health Effects and Drinking Water System Components - Lead Content Compliance: NSF 61 and NSF 372.

B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

C. UL Compliance: UL 778 for motor-operated water pumps.

D. Seismic Performance: Inline, domestic-water pumps shall withstand the effects of earthquake motions determined according to ASCE/SEI 7.

1. The term "withstand" means "the unit will remain in place without separation of any parts when subjected to the seismic forces specified.

2. Component Importance Factor: 1.5.

2.02 SEPARATELY COUPLED, IN-LINE CENTRIFUGAL PUMPS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the manufacturers specified.

1. Armstrong Pumps Inc.

2. Bell & Gossett Domestic Pump; ITT Industries

3. Taco, Inc.

B. Factory-assembled and -tested, centrifugal, overhung-impeller, separately coupled, in-line pump as defined in HI 1.1-1.2 and HI 1.3; and designed for installation with pump and motor shafts mounted horizontally.

C. Pump Construction: All bronze.

D. Casing: Radially split, bronze, with threaded companion-flange connections.

E. Impeller: ASTM B36, rolled brass; or ASTM B584, cast bronze; keyed to shaft.

F. Shaft and Shaft Sleeve: Steel shaft, with copper-alloy shaft sleeve.

G. Seal: Mechanical, with carbon-steel rotating ring, stainless-steel spring, ceramic seat, and rubber bellows and gasket. Include water slinger on shaft between motor and seal.

H. Bearings: Oil-lubricated; bronze-journal or thrust type.

I. Shaft Coupling: Flexible, capable of absorbing torsional vibration and shaft misalignment.

J. Motor: Single speed, with oil-lubricated bearings, unless otherwise indicated; and resiliently mounted to pump casing. Comply with requirements in Section 22 05 13.

2.03 CLOSE-COUPLED, IN-LINE CENTRIFUGAL PUMPS:

A. Manufacturers: Subject to compliance with requirements, provide products by one of the manufacturers specified.

1. Armstrong Pumps Inc.

2. Bell & Gossett Domestic Pump; ITT Industries

3. Paco Pumps, Inc.

4. Taco, Inc.

B. Factory-assembled and -tested, overhung impeller, single-stage, close-coupled, horizontally mounted, in-line centrifugal pumps as defined in HI 1.1-1.2 and HI 1.3; and designed for installation with pump and motor shafts mounted horizontally.

C. Pump Construction: All bronze.

D. Casing: Radially split, cast iron, with threaded companion-flange connections for pumps with NPS 2 pipe connections and flanged connections for pumps with NPS 2-1/2 pipe connections.

E. Impeller: ASTM B 584, cast bronze; statically and dynamically balanced, closed, and keyed to shaft.

F. Shaft and Shaft Sleeve: Steel shaft, with copper-alloy shaft sleeve.

G. Seal: Mechanical, with carbon-steel rotating ring, stainless-steel spring, ceramic seat, and rubber bellows and gasket. Include water slinger on shaft between motor and seal.

H. Bearings: Oil-lubricated; bronze-journal or ball type.

I. Shaft Coupling: Rigid type if pump is provided with coupling.

J. Motor: Single speed, with grease-lubricated ball bearings. Comply with requirements in Section 22 05 13.

2.04 CONTROLS:

A. Pressure Switches: Electric, adjustable for control of water-supply pump.

1. Type: Water-immersion pressure sensor, for installation in piping.

2. Enclosure: NEMA 250, Type 4X.

3. Operation of Pump: On or off.

4. Transformer: Provide if required.

5. Power Requirement: 120 V ac.

2.05 SOURCE QUALITY CONTROL:

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by an NRTL, and marked for intended location and application.

B. ASME Compliance: Comply with ASME B31.9 for piping.

C. UL Compliance for Packaged Pumping Systems:

1. UL 508, "Industrial Control Equipment"

2. UL 508A, "Industrial Control Panels"

3. UL 778, "Motor-Operated Water Pumps"

4. UL 1995, "Heating and Cooling Equipment"

D. Booster pumps shall be listed and labeled as packaged pumping systems by testing agency acceptable to authorities having jurisdiction.

PART 3 - EXECUTION

3.01 EXAMINATION:

A. Examine roughing-in for domestic-water-piping system to verify actual locations of piping connections before pump installation.

3.02 PUMP INSTALLATION:

A. Pump Installation Standards:

1. Comply with HI 1.4 for installation of centrifugal pumps.

B. Mount pumps in orientation complying with manufacturer's written instructions.

C. Pump Mounting:

1. Install dowel rods to connect concrete base to concrete floor. Unless otherwise indicated, install dowel rods on 18-inch centers around the full perimeter of concrete base.

2. For supported equipment, install epoxy-coated anchor bolts that extend through concrete base and anchor into structural concrete floor.

3. Place and secure anchorage devices. Use setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.

4. Install anchor bolts to elevations required for proper attachment to supported equipment.

5. Comply with requirements for vibration isolation and seismic-control devices specified in Section 22 05 48.

6. Comply with requirements for vibration isolation devices specified in Section 22 05 48.13.

D. Install continuous-thread hanger rods and vibration isolation of size required to support pump weight.

1. Comply with requirements for vibration isolation devices specified in Section 22 05 48. Fabricate brackets or supports as required.

2. Comply with requirements for hangers and supports specified in Section 22 05 29.

E. Install pressure switches in water-supply piping.

F. Install thermostats in hot-water return piping.

G. Install timers on wall**.**

H. Install time-delay relays in piping between water heaters and hot-water storage tanks.

I. Wiring Method: Comply with requirements in Section 26 05 19.

J. Wiring within Enclosures: Bundle, lace, and train conductors to terminal points with no excess and without exceeding manufacturer's limitations on bending radii. Provide and use lacing bars and distribution spools.

3.03 BOOSTER PUMP INSTALLATION:

A. Booster-Pump Mounting:

1. Install booster pumps on cast-in-place concrete equipment base(s). Comply with requirements for equipment bases and foundations specified in Section 03 30 00.

B. Support connected domestic-water piping so weight of piping is not supported by booster pumps.

3.04 PIPING CONNECTIONS:

A. Comply with requirements for piping specified in Section 22 11 16. Drawings indicate general arrangement of piping, fittings, and specialties.

B. Where installing piping adjacent to inline, domestic-water pumps, allow space for service and maintenance.

C. Connect domestic-water piping to pumps. Install suction and discharge piping equal to or greater than size of pump nozzles.

1. Install flexible connectors adjacent to pumps in suction and discharge piping of the following pumps:

   a. Horizontally mounted, in-line, separately coupled centrifugal pumps.

   b. Horizontally mounted, in-line, close-coupled centrifugal pumps.

   c. Comply with requirements for flexible connectors specified in Section 22 11 16.

D. Install shutoff valve and strainer on suction side of each pump, and check, shutoff, and throttling valves on discharge side of each pump. Install valves same size as connected piping. Comply with requirements for strainers specified in Section 22 11 19. Comply with requirements for valves specified in the following:

1. Section 22 05 23

2. Install pressure gauge at suction of each pump and pressure gauge at discharge of each pump. Install at integral pressure-gauge tappings where provided or install pressure-gauge connectors in suction and discharge piping around pumps. Comply with requirements for pressure gauges and snubbers specified in Section 22 05 19.

E. Booster-Pump Piping Connections: Connect domestic-water piping to booster pumps. Install suction and discharge pipe equal to or greater than size of system suction and discharge piping.

1. Install shutoff valves on piping connections to booster-pump suction and discharge piping. Install ball, butterfly, or gate valves same size as suction and discharge piping. Comply with requirements for general-duty valves specified in Section 22 05 23.

2. Install union, flanged, or grooved-joint connections on suction and discharge piping at connection to domestic-water piping. Comply with requirements for unions and flanges specified in Section 22 05 00.

3. Install valved bypass, same size as and between piping, at connections to booster-pump suction and discharge piping. Comply with requirements for domestic-water piping specified in Section 22 11 13.

4. Install flexible connectors, same size as piping, on piping connections to booster-pump suction and discharge piping. Comply with requirements for flexible connectors specified in Section 22 11 13.

5. Where installing piping adjacent to booster pumps, allow space for service and maintenance.

F. Connect water piping to pumps. Install suction and discharge piping equal to or greater than size of pump nozzles.

1. Install flexible connectors adjacent to pumps in suction and discharge piping of the following pumps:

a. Horizontally mounted, in-line, separately coupled centrifugal pumps.

b. Horizontally mounted, in-line, close-coupled centrifugal pumps.

c. Comply with requirements for flexible connectors specified in Section 22 11 19.

G. Install shutoff valve and strainer on suction side of each pump, and check, shutoff, and throttling valves on discharge side of each pump. Install valves same size as connected piping. Comply with requirements for strainers specified in Section 22 11 19.

1. Install pressure gauge at suction of each pump and pressure gauge at discharge of each pump. Install at integral pressure-gauge tappings where provided or install pressure-gauge connectors in suction and discharge piping around pumps. Comply with requirements for pressure gauges as specified in Section 22 05 19.

3.05 ELECTRICAL CONNECTIONS:

A. Connect wiring according to Section 26 05 19.

B. Ground equipment according to Section 26 05 26.

C. Install electrical devices furnished by manufacturer, but not factory mounted, according to NFPA 70 and NECA 1.

3.06 CONTROL CONNECTIONS:

A. Install control and electrical power wiring to field-mounted control devices.

B. Connect control wiring between temperature controllers and devices.

C. Interlock pump between water heater and hot-water storage tank with water heater burner and time-delay relay.

3.07 IDENTIFICATION:

A. Identify system components. Comply with requirements for identification specified in Section 22 05 53.

B. Install nameplate for each electrical connection, indicating electrical equipment designation and circuit number feeding connection.

1. Nameplate shall be laminated acrylic or melamine plastic signs with a black background and engraved white letters at least 1/2 inch high.

3.08 FIELD QUALITY CONTROL:

A. Manufacturer's Field Service: Engage a factory-authorized service representative to test and inspect components, assemblies, and equipment installations, including connections.

B. Tests and Inspections:

1. Leak Test: After installation, charge system and test for leaks. Repair leaks and retest until no leaks exist.

2. Operational Test: After electrical circuitry has been energized, start units to confirm proper motor rotation and unit operation.

3. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.

C. Pumps and controls will be considered defective if they do not pass tests and inspections.

D. Prepare test and inspection reports.

3.09 STARTUP SERVICE:

A. Perform startup service.

1. Complete installation and startup checks according to manufacturer's written instructions.

2. Check piping connections for tightness.

3. Clean strainers on suction piping.

4. Set pressure switches, thermostats, timers, and time-delay relays for automatic starting and stopping operation of pumps.

5. Perform the following startup checks for each pump before starting:

a. Verify bearing lubrication.

b. Verify that pump is free to rotate by hand and that pump for handling hot liquid is free to rotate with pump hot and cold. If pump is bound or drags, do not operate until cause of trouble is determined and corrected.

c. Verify that pump is rotating in the correct direction.

6. Prime pump by opening suction valves and closing drains, and prepare pump for operation.

7. Start motor.

8. Open discharge valve slowly.

9. Adjust temperature settings on thermostats.

10. Adjust timer settings.

3.10 ADJUSTING:

A. Adjust inline, domestic-water pumps to function smoothly, and lubricate as recommended by manufacturer.

B. Adjust initial temperature set points.

C. Set field-adjustable switches and circuit-breaker trip ranges as indicated.

END OF SECTION

Page Intentionally Left Blank

SECTION 22 12 10

PLUMBING TANKS

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide welded-steel reservoirs and break tanks for storage and backflow prevention of domestic water as indicated and in compliance with Contract Documents.

1.02 REFERENCES:

A. American Society of Civil Engineers (ASCE):

1. 7: Minimum Design Loads for Buildings and Other Structures

B. ASTM International (ASTM):

1. A53: Standard Specification for Pipe, Steel, Black and Hot-Dipped, Zinc-Coated, Welded and Seamless

2. A234: Standard Specification for Piping Fittings of Wrought Carbon Steel and Alloy Steel for Moderate and High Temperature Service

3. A767: Standard Specification for Zinc-Coated (Galvanized) Steel Bars for Concrete Reinforcement

4. D2240: Standard Test Method for Rubber Property-Durometer Hardness

C. American Welding Society (AWS):

1. D1.1: Structural Welding Code – Steel

2. D1.3: Structural Welding Code – Sheet Steel

3. D1.4: Structural Welding Code – Reinforcing Steel

D. American Water Works Association (AWWA):

1. C652: Disinfection of Water-Storage Facilities

2. D100: Welded Steel Tanks for Water Storage

3. D102: Coating Steel Water-Storage Tanks

4. D103: Factory-Coated Bolted Carbon Steel Tanks for Water Storage

5. M42: Steel Water – Storage Tanks

E. NSF International (NSF):

1. 61: Drinking Water System Components - Health Effects

2. 372: Drinking Water System Components - Lead Content

1.03 DEFINITIONS:

A. Bottom Capacity Level (BCL): Water level above which the specified capacity is provided. In a supported tank (reservoir or standpipe), the BCL is the water level in the tank shell when the tank is emptied through the specified discharge fittings, unless otherwise specified.

B. Capacity: Net volume, in gallons, that may be removed from a tank filled to TCL and emptied to BCL.

C. CR: Chlorosulfonated polyethylene synthetic rubber

D. Minimum Capacity within Operating Range: Capacity when water level is at BCL

E. NR: Natural rubber

F. Range of Head: Vertical distance between TCL and BCL

G. Reservoir: Flat-bottomed, cylindrical, steel water-storage tank with shell height equal to or less than its diameter

H. SDWA: Safe Drinking Water Act

I. Top Capacity Level (TCL): Water level defined by the lip of the overflow elevation

1.04 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Product Data: For each type of potable-water storage tank, include rated capacities, accessories, appurtenances, and furnished specialties.

C. Shop Drawings: Signed and sealed by a qualified professional engineer. Show fabrication and installation details for each potable-water storage tank, including the following:

1. Tank, roof, and shell openings

2. Safety railings and ladders

3. Plans, elevations, sections, and attachment details

4. Structural analysis data signed and sealed by the qualified Professional Engineer responsible for their preparation

5. Diagram power, signal, and control wiring

D. Qualification Data: For fabricator.

E. Seismic Qualification Data: Certificates, for potable-water storage tanks and components, from manufacturer.

1. Basis for Certification: Include calculation upon which withstand certification is based.

2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.

3. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.

F. Welding certificates.

G. Field quality-control reports.

H. Operation and Maintenance Data: For each product type.

1.05 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.06 SPARE PARTS:

A. Comply with the requirements specified in Section 01 61 00.

1.07 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

B. Fabricator Qualifications: Employ a qualified structural engineer to prepare calculations, Shop Drawings, and other structural data for fabrication and erection of potable-water storage tanks.

1. Engineering Responsibility: Preparation of data for potable-water tanks, accessories, specified appurtenances, and concrete supports and foundations, including Shop Drawings, based on testing and engineering analysis of manufacturer's standard units in assemblies similar to those indicated for this Project.

C. Welding Qualifications: Qualify procedures and personnel according to the following:

1. AWS D1.1, "Structural Welding Code - Steel"

2. AWS D1.3, "Structural Welding Code - Sheet Steel"

3. AWS D1.4, "Structural Welding Code - Reinforcing Steel"

D. Pipe Welding: Qualify procedures and personnel according to ASME Boiler and Pressure Vessel Code: Section IX, "Welding, Brazing, and Fusing Qualifications."

1.08 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

PART 2 - PRODUCTS

2.01 PERFORMANCE REQUIREMENTS:

A. Structural Performance: Potable-water tank, including structural reinforcement, supports and foundation, shall withstand the effects of dead and live gravity loads.

B. AIS Compliance of these materials is required. Refer to Section 22 05 00, 1.01 E for description.

C. Seismic Performance: Potable-water storage tank, including structural reinforcement, supports and foundation, shall withstand the effects of earthquake motions determined according to ASCE/SEI 7.

1. The term "withstand" means "the unit will remain in place without separation of any parts from the device when subjected to the seismic forces specified.

D. Comply with NSF 61 and NSF 372.

E. Comply with 29 CFR 1910.

2.02 WELDED-STEEL, POTABLE-WATER RESERVOIRS:

A. Description: Manufactured, welded-steel tank with welded-steel plates, bolts, rods, and reinforcing steel.

B. Compliance: AIS Compliance required. Contractor to submit compliant manufacturer if Basis of Design cannot certify AIS compliance.

C. Standard: Designed and fabricated according to AWWA D100 and AWWA M42.

D. Pipe Connections: Comply with AWWA D100. Match size of water-distribution pipe.

E. Overflow Piping: ASTM A53, Grade B, Schedule 40, welded-steel pipe with ASTM A234, Grade WPB, Schedule 40, carbon-steel butt-weld fittings.

F. Tank Vent: Steel pipe with stainless-steel screen, constructed to prevent entrance of air-borne contaminants.

G. Foundation: Reinforced concrete. See Section 03 30 00.

2.03 PAINT MATERIALS:

A. Paint: Comply with AWWA D102.

B. Primer: Tank fabricator's epoxy-polyamide paint.

C. Tank Shell Interior Finish Paint: Tank fabricator's epoxy-polyamide paint complying with NSF 61 and NSF 372, and compatible with prime coat.

D. Tank Shell Exterior Intermediate Paint: Tank fabricator's epoxy-polyamide paint compatible with prime and finish paint. Intermediate coat shall have a slight color contrast with finish coat.

E. Tank Shell Exterior Finish Paint: Tank fabricator's urethane paint.

2.04 SHOP PAINTING:

A. Factory coating according to AWWA D103.

B. Tank Shell Interior Finish Coat: Comply with NSF 61 and NSF 372.

C. Tank Shell Exterior Finish Coat: Factory coating according to AWWA D103.

2.05 POTABLE-WATER STORAGE TANK APPURTENANCES:

A. Water-Level Controls: Automatic controls for maintaining water level in tank, with valves, piping, and audible and visual alarms to indicate the following:

1. High- and low-water levels

2. Tank overflowing or tank not filling

PART 3 - EXECUTION

3.01 STEEL, POTABLE-WATER STORAGE TANK INSTALLATION:

A. Welded-Steel Tanks:

1. Erect tank shell, accessories, and appurtenances according to AWWA D100 and AWWA M42.

2. Fabricate steel plate sections in the shop. Erect tank shell by welding plate sections in the field.

B. Install tank vent at center of roof.

C. Install two maintenance holes in tank wall near grade.

3.02 PIPING CONNECTIONS:

A. Connect tanks to water-distribution piping.

B. Connect drains to storm-drainage piping.

C. Surface preparation is specified in Section 09 90 00.

D. Apply paint according to AWWA D102.

E. Prime-Coat Touchup: Apply primer to cleaned areas and where shop finish has been damaged during shipping, handling, and erection. Apply prime coat to a dry film thickness of 3.0 to 5.0 mils for tank interior and to a dry film thickness of 2.0 to 3.0 mils for exterior tank and support surfaces.

F. Tank Shell and Steel Support Exterior Coats: Apply intermediate paint to a dry film thickness of 2.0 to 3.0 mils. Apply finish paint to a dry film thickness of 2.0 to 3.0 mils.

G. Tank Exterior Lettering and Logo: Apply two coats of urethane paint to a dry film thickness of 2.0 to 3.0 mils for each application.

H. Overflow Pipe: Paint pipe exterior that is outside tank and structure as indicated for tank exterior.

I. Do not paint if ambient temperature is less than 50 degrees F or is expected to drop below 40 degrees F in the next 18 hours. Do not paint if temperature of steel surface is higher than 125 degrees F. Do not apply paint if surfaces are wet or damp, if precipitation is expected, or if relative humidity will exceed 85 percent. Do not spray paint when wind velocity exceeds 15 mph. Maintain at least a 24-hour waiting period between coats. Provide adequate ventilation in tank during painting to maintain clear atmosphere and provide explosion-proof flood lighting and spot lighting.

J. Complete daily painting to allow time for paint to dry before condensation is expected.

3.03 SURFACE WATER-STORAGE TANK APPURTENANCE INSTALLATION:

A. Install and adjust water-level control valves, piping, and alarms.

3.04 FIELD QUALITY CONTROL:

A. Perform the following tests and inspections.

1. Leak Test: Comply with AWWA D100. Fill tanks with potable water and test for leaks after installation. Repair leaks and retest until no leaks exist.

a. Water will be furnished by Owner.

2. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.

B. Unit will be considered defective if it does not pass tests and inspections.

C. Prepare test and inspection reports.

3.05 CLEANING:

A. Clean interior and exterior of potable-water storage tanks.

3.06 DEMONSTRATION:

A. Train Owner's maintenance personnel to adjust, operate, and maintain the following:

1. Water-level controls

3.07 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

Page Intentionally Left Blank

SECTION 22 13 16

SANITARY WASTE AND VENT PIPING

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide sanitary waste and vent piping as indicated and in compliance with Contract Documents.

1. Hubless, cast-iron soil pipe and fittings

2. PVC pipe and fittings

1.02 REFERENCES:

A. American Society of Civil Engineers (ASCE):

15. D3311: Standard Specification for Drain, Waste, and Vent (DWV) Plastic Fittings Patterns

16. D5926: Standard Specification for Poly (Vinyl Chloride) (PVC) Gaskets for Drain, Waste, and Vent (DWV), Sewer, Sanitary, and Storm Plumbing Systems

17. F402: Standard Practice for Safe Handling of Solvent Cements, Primers, and Cleaners Used for Joining Thermoplastic Pipe and Fittings

18. F477: Standard Specification for Elastomeric Seals (Gaskets) for Joining Plastic Pipe

19. F656: Standard Specification for Primers for Use in Solvent Cement Joints of Poly(Vinyl Chloride) (PVC) Plastic Pipe and Fittings

20. F891: Standard Specification for Coextruded Poly(Vinyl Chloride) (PVC) Plastic Pipe With a Cellular Core

21. F1476: Standard Specification for Performance of Gasketed Mechanical Couplings for Use in Piping Applications

D. American Water Works Association (AWWA):

1. C110/A21.10: Ductile-Iron and Gray-Iron Fittings

2. C151/A21.51: Ductile-Iron Pipe, Centrifugally Cast

3. C153/A21.53: Ductile-Iron Compact Fittings

4. C219: Bolted Sleeve-Type Couplings for Plain-End Pipe

5. C606: Grooved and Shouldered Joints

E. Cast Iron Soil Pipe Institute (CISPI):

1. Cast Iron Soil Pipe and Fittings Handbook

2. 301: Standard Specification for Hubless Cast Iron Soil Pipe and Fittings for Sanitary and Storm Drain, Waste, and Vent Piping Applications

3. 310: Specification for Coupling for Use in Connection with Hubless Cast Iron Soil Pipe and Fittings for Sanitary and Storm Drain, Waste, and Vent Piping Applications

1.03 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Product Data: For each type of product.

C. Shop Drawings: For hubless, single-stack drainage system. Include plans, elevations, sections, and details.

D. Seismic Qualification Certificates: For waste and vent piping, accessories, and components, from manufacturer.

1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.

2. Detailed description of piping anchorage devices on which the certification is based and their installation requirements.

E. Field quality-control reports.

1.04 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.05 SPARE PARTS:

A. Comply with the requirements specified in Section 01 61 00.

1.06 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

1.07 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

1.08 PROJECT/SITE CONDITIONS:

A. Interruption of Existing Sanitary Waste Service: Do not interrupt service to facilities occupied by Owner or others unless permitted under the following conditions and then only after arranging to provide temporary service according to requirements indicated:

1. Notify Owner no fewer than two days in advance of proposed interruption of sanitary waste service.

2. Do not proceed with interruption of sanitary waste service without Owner's written permission.

1.09 WARRANTY:

A. Listed manufacturers to provide labeling and warranty of their respective products.

PART 2 - PRODUCTS

2.01 PERFORMANCE REQUIREMENTS:

A. Components and installation shall be capable of withstanding the following minimum working pressure unless otherwise indicated:

1. Soil, Waste, and Vent Piping: 10-foot head of water

B. AIS Compliance of these materials is required. Refer to Section 22 05 00, 1.01 E for description.

C. Seismic Performance: Soil, waste, and vent piping and support and installation shall withstand the effects of earthquake motions determined according to ASCE/SEI 7.

2.02 PIPING MATERIALS:

A. Piping materials shall bear label, stamp, or other markings of specified testing agency.

B. Comply with requirements in Table 22 13 16-1 "Plumbing Waste and Vent Piping Schedule" for applications of pipe, tube, fitting materials, and joining methods for specific services, service locations, and pipe sizes.

2.03 HUBLESS, CAST-IRON SOIL PIPE AND FITTINGS:

A. See Section 40 23 19.05 for Pipe and fitting specifications.

B. Compliance: AIS Compliance required. Manufacturer listed is the Basis of Design for performance product requirements. Contractor to submit compliant manufac-turer if Basis of Design cannot certify AIS compliance.

C. Pipe and Fittings: ASTM A888 or CISPI 301

D. Heavy-Duty, Hubless-Piping Couplings:

1. Standards: ASTM C1277 and ASTM C1540

2. Description: Stainless-steel shield with stainless-steel bands and tightening devices; and ASTM C564, rubber sleeve with integral, center pipe stop.

3. Manufacturers:

a. Tyler Pipe and Coupling

b. ANACO-Husky

c. Dallas Specialty

d. Fernco Inc.

e. MIFAB, Inc.

2.04 PVC PIPE AND FITTINGS:

A. See Section 40 23 19.05 for Pipe and fitting specifications.

2.05 SPECIALTY PIPE FITTINGS:

A. Transition Couplings:

1. Fitting-Type Transition Couplings: Manufactured piping coupling or specified piping system fitting.

2. Compliance: AIS Compliance required. Manufacturer listed is the Basis of Design for performance product requirements. Contractor to submit compliant manufacturer if Basis of Design cannot certify AIS compliance.

3. Shielded, Non-pressure Transition Couplings:

    a. Manufacturers:

        (1) Tyler Pipe and Coupling

        (2) ANACO-Husky

        (3) Dallas Specialty

        (4) Fernco Inc.

        (5) MIFAB, Inc.

    b. Standard: ASTM C1460

    c. Description: Elastomeric or rubber sleeve with full-length, corrosion-resistant outer shield and corrosion-resistant-metal tension band and tightening mechanism on each end.

    d. End Connections: Same size as and compatible with pipes to be joined.

4. Pressure Transition Couplings:

    a. Compliance: AIS Compliance required. Manufacturer listed is the Basis of Design for performance product requirements. Contractor to submit compliant manufacturer if Basis of Design cannot certify AIS compliance.

    b. Manufacturers:

        (1) Tyler Pipe and Coupling

        (2) ANACO-Husky

        (3) Dallas Specialty

        (4) Fernco Inc.

        (5) MIFAB, Inc.

    c. Standard: AWWA C219

    d. Description: Metal, sleeve-type same size as, with pressure rating at least equal to, and ends compatible with, pipes to be joined.

    e. Center-Sleeve Material: Manufacturer's standard

    f. Gasket Material: Natural or synthetic rubber

g. Metal Component Finish: Corrosion-resistant coating or material

PART 3 - EXECUTION

3.01 EARTH MOVING:

A. Comply with requirements for excavating, trenching, and backfilling specified in Section 31 23 33.

3.02 PIPING INSTALLATION:

A. Drawing plans, schematics, and diagrams indicate general location and arrangement of piping systems.

1. Indicated locations and arrangements were used to size pipe and calculate friction loss, expansion, pump sizing, and other design considerations.

2. Install piping as indicated unless deviations to layout are approved on coordination drawings.

B. Install piping in concealed locations unless otherwise indicated and except in equipment rooms and service areas.

C. Install piping indicated to be exposed and piping in equipment rooms and service areas at right angles or parallel to building walls. Diagonal runs are prohibited unless specifically indicated otherwise.

D. Install piping above accessible ceilings to allow sufficient space for ceiling panel removal.

E. Install piping to permit valve servicing.

F. Install piping at indicated slopes.

G. Install piping free of sags and bends.

H. Install fittings for changes in direction and branch connections.

I. Install piping to allow application of insulation.

J. Install seismic restraints on piping. Comply with requirements for seismic-restraint devices specified in Section 22 05 48.

K. Make changes in direction for soil and waste drainage and vent piping using appropriate branches, bends, and long-sweep bends.

1. Sanitary tees and short-sweep 1/4 bends may be used on vertical stacks if change in direction of flow is from horizontal to vertical.

2. Use long-turn, double Y-branch and 1/8-bend fittings if two fixtures are installed back to back or side by side with common drain pipe.

    a. Straight tees, elbows, and crosses may be used on vent lines.

3. Do not change direction of flow more than 90 degrees.

4. Use proper size of standard increasers and reducers if pipes of different sizes are connected.

    a. Reducing size of waste piping in direction of flow is prohibited.

L. Lay buried building waste piping beginning at low point of each system.

1. Install true to grades and alignment indicated, with unbroken continuity of invert. Place hub ends of piping upstream.

2. Install required gaskets according to manufacturer's written instructions for use of lubricants, cements, and other installation requirements.

3. Maintain swab in piping and pull past each joint as completed.

M. Install soil and waste and vent piping at the following minimum slopes unless otherwise indicated:

1. Building Sanitary Waste: 2 percent downward in direction of flow for piping NPS 3 and smaller; 1 percent downward in direction of flow for piping NPS 4 and larger.

2. Horizontal Sanitary Waste Piping: 2 percent downward in direction of flow.

3. Vent Piping: 1 percent down toward vertical fixture vent or toward vent stack.

N. Install cast-iron soil piping according to CISPI's "Cast Iron Soil Pipe and Fittings Handbook," Chapter IV, "Installation of Cast Iron Soil Pipe and Fittings."

1. Install encasement on underground piping according to ASTM A674 or AWWA C105/A 21.5.

O. Install underground PVC piping according to ASTM D2321.

P. Install engineered soil and waste and vent piping systems as follows:

1. Combination Waste and Vent: Comply with standards of authorities having jurisdiction.

2. Hubless, Single-Stack Drainage System: Comply with ASME B16.45 and hubless, single-stack aerator fitting manufacturer's written installation instructions.

3. Reduced-Size Venting: Comply with standards of authorities having jurisdiction.

3.03 JOINT CONSTRUCTION:

A. Join hub-and-spigot, cast-iron soil piping with gasket joints according to CISPI's "Cast Iron Soil Pipe and Fittings Handbook" for compression joints.

B. Join hub-and-spigot, cast-iron soil piping with calked joints according to CISPI's "Cast Iron Soil Pipe and Fittings Handbook" for lead-and-oakum calked joints.

C. Join hubless, cast-iron soil piping according to CISPI 310 and CISPI's "Cast Iron Soil Pipe and Fittings Handbook" for hubless-piping coupling joints.

D. Join stainless-steel pipe and fittings with gaskets according to ASME A112.3.1.

E. Grooved Joints: Cut groove ends of pipe according to AWWA C606. Lubricate and install gasket over ends of pipes or pipe and fitting. Install coupling housing sections, over gasket, with keys seated in piping grooves. Install and tighten housing bolts.

F. Flanged Joints: Align bolt holes. Select appropriate gasket material, size, type, and thickness. Install gasket concentrically positioned. Use suitable lubricants on bolt threads. Torque bolts in cross pattern.

G. Plastic, Non-pressure-Piping, Solvent-Cement Joints: Clean and dry joining surfaces. Join pipe and fittings according to the following:

1. Comply with ASTM F402 for safe-handling practice of cleaners, primers, and solvent cements.

2. ABS Piping: Join according to ASTM D2235 and ASTM D2661 appendixes.

3. PVC Piping: Join according to ASTM D2855 and ASTM D2665 appendixes.

3.04 SPECIALTY PIPE FITTING INSTALLATION:

A. Transition Couplings:

1. Install transition couplings at joints of piping with small differences in ODs.

2. In Waste Drainage Piping: Unshielded, non-pressure transition couplings.

3. In Aboveground Forcemain Piping: Fitting-type transition couplings.

4. In Underground Forcemain Piping:

a. NPS 1-1/2 and Smaller: Fitting-type transition couplings

b. NPS 2 and Larger: Pressure transition couplings

3.05 INSTALLATION OF HANGERS AND SUPPORTS:

A. Comply with requirements for seismic-restraint devices specified in Section 22 05 48.

B. Comply with requirements for pipe hanger and support devices and installation specified in Section 22 05 29.

1. Vertical Piping: MSS Type 8 or Type 42, clamps

2. Install individual, straight, horizontal piping runs:

a. 100 Feet and Less: MSS Type 1, adjustable, steel clevis hangers

b. Longer Than 100 Feet: MSS Type 43, adjustable roller hangers

c. Longer Than 100 Feet if Indicated: MSS Type 49, spring cushion rolls

3. Multiple, Straight, Horizontal Piping Runs 100 Feet or Longer: MSS Type 44, pipe rolls. Support pipe rolls on trapeze

4. Base of Vertical Piping: MSS Type 52, spring hangers

C. Install hangers for cast-iron soil piping, with maximum horizontal spacing and minimum rod diameters, to comply with MSS-58, locally enforced codes, and authorities having jurisdiction requirements, whichever are most stringent.

D. Install hangers for PVC piping, with maximum horizontal spacing and minimum rod diameters, to comply with manufacturer's written instructions, locally enforced codes, and authorities having jurisdiction requirements, whichever are most stringent.

E. Support horizontal piping and tubing within 12 inches of each fitting, valve, and coupling.

F. Support vertical runs of cast iron soil piping to comply with MSS-58, locally enforced codes, and authorities having jurisdiction requirements, whichever are most stringent.

G. Support vertical runs of PVC piping to comply with manufacturer's written instructions, locally enforced codes, and authorities having jurisdiction requirements, whichever are most stringent.

3.06 CONNECTIONS:

A. Drawings indicate general arrangement of piping, fittings, and specialties.

B. Connect soil and waste piping to exterior sanitary sewerage piping. Use transition fitting to join dissimilar piping materials.

C. Connect waste and vent piping to the following:

1. Plumbing Fixtures: Connect waste piping in sizes indicated, but not smaller than required by plumbing code.

2. Plumbing Fixtures and Equipment: Connect atmospheric vent piping in sizes indicated, but not smaller than required by authorities having jurisdiction.

3. Plumbing Specialties: Connect waste and vent piping in sizes indicated, but not smaller than required by plumbing code.

4. Install test tees (wall cleanouts) in conductors near floor and floor cleanouts with cover flush with floor.

5. Install horizontal backwater valves in pit with pit cover flush with floor.

6. Comply with requirements for backwater valves cleanouts and drains specified in Section 22 13 19.

7. Equipment: Connect waste piping as indicated.

a. Provide shutoff valve if indicated and union for each connection.

b. Use flanges instead of unions for connections NPS 2-1/2 and larger.

D. Where installing piping adjacent to equipment, allow space for service and maintenance of equipment.

E. Make connections according to the following unless otherwise indicated:

1. Install unions, in piping NPS 2 and smaller, adjacent to each valve and at final connection to each piece of equipment.

2. Install flanges, in piping NPS 2-1/2 and larger, adjacent to flanged valves and at final connection to each piece of equipment.

3.07 IDENTIFICATION:

A. Identify exposed sanitary waste and vent piping.

B. Comply with requirements for identification specified in Section 22 05 53.

3.08 FIELD QUALITY CONTROL:

A. During installation, notify authorities having jurisdiction at least 24 hours before inspection must be made. Perform tests specified below in presence of authorities having jurisdiction.

1. Roughing-in Inspection: Arrange for inspection of piping before concealing or closing-in after roughing-in and before setting fixtures.

2. Final Inspection: Arrange for final inspection by authorities having jurisdiction to observe tests specified below and to ensure compliance with requirements.

B. Reinspection: If authorities having jurisdiction find that piping will not pass test or inspection, make required corrections and arrange for reinspection.

C. Reports: Prepare inspection reports and have them signed by authorities having jurisdiction.

D. Test sanitary waste and vent piping according to procedures of authorities having jurisdiction or, in absence of published procedures, as follows:

1. Test for leaks and defects in new piping and parts of existing piping that have been altered, extended, or repaired.

a. If testing is performed in segments, submit separate report for each test, complete with diagram of portion of piping tested.

2. Leave uncovered and unconcealed new, altered, extended, or replaced waste and vent piping until it has been tested and approved.

a. Expose work that was covered or concealed before it was tested.

3. Roughing-in Plumbing Test Procedure: Test waste and vent piping except outside leaders on completion of roughing-in.

a. Close openings in piping system and fill with water to point of overflow, but not less than 10-foot head of water.

b. From 15 minutes before inspection starts to completion of inspection, water level must not drop.

c. Inspect joints for leaks.

4. Finished Plumbing Test Procedure: After plumbing fixtures have been set and traps filled with water, test connections and prove they are gastight and watertight.

a. Plug vent-stack openings on roof and building drains where they leave building. Introduce air into piping system equal to pressure of 1-inch wg.

b. Use U-tube or manometer inserted in trap of water closet to measure this pressure.

c. Air pressure must remain constant without introducing additional air throughout period of inspection.

d. Inspect plumbing fixture connections for gas and water leaks.

5. Repair leaks and defects with new materials and retest piping, or portion thereof, until satisfactory results are obtained.

6. Prepare reports for tests and required corrective action.

3.09 CLEANING AND PROTECTION:

A. Clean interior of piping. Remove dirt and debris as work progresses.

B. Protect sanitary waste and vent piping during remainder of construction period to avoid clogging with dirt and debris and to prevent damage from traffic and construction work.

C. Place plugs in ends of uncompleted piping at end of day and when work stops.

3.10 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

Table 22 13 16-1 – Plumbing Waste and Vent Piping Schedule							
Service	**Size (in)**	**Pipe Matl**	**Fittings**	**Gasket**	**Joint Type**	**Location**	**Remarks**
Sanitary Vent	All	CAST IRON, CISPI 301	Cast-Iron	Neoprene rubber with stainless clamp/shield	No-Hub CISPI 310	All	For process areas typically use 3" and greater Class 53 DIP ceramic epoxy lined or less than 3" 316 SS sched 40
Sanitary Sewer	All	CAST IRON, CISPI 301	Cast-Iron	Neoprene rubber with stainless clamp/shield	No-Hub CISPI 310	Inside Exposed, Encased, Buried within building footprint	For process areas typically use 3" and greater Class 53 DIP cement lined
Sanitary Sewer	All	PVC	PVC	N/A	Solvent Weld	Buried within building foot print (NON-Encased)	

END OF SECTION

SECTION 22 13 19

SANITARY WASTE PIPING SPECIALTIES

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide sanitary waste and vent piping specialties as indicated and in compliance with Contract Documents.

1. Backwater valves

2. Cleanouts

3. Floor drains.

4. Floor sinks.

5. Roof flashing assemblies

6. Through-penetration firestop assemblies

7. Miscellaneous sanitary drainage piping specialties

1.02 REFERENCES:

A. American Society of Mechanical Engineers (ASME):

B. American Society of Sanitary Engineering (ASSE):

1. 1050: Performance Requirements for Stack Air Admittance Valves for Sanitary Drainage Systems

2. 1051: Performance Requirements for Individual and Branch Type Air Admittance Valves for Sanitary Drainage Systems

C. ASTM International (ASTM):

1. A48: Specification for Gray Iron Castings.

2. A74: Standard Specification for Cast Iron Soil Pipe and Fittings

3. C564: Standard Specification for Rubber Gaskets for Cast Iron Soil Pipe and Fittings

D. NSF International (NSF):

1. 14: Plastics Piping System Components and Related Materials

E. Underwriters' Laboratories, Inc. (UL):

1. 1479: Standard for Safety Fire Tests of Through-Penetration Firestops

1.03 DEFINITIONS:

A. PVC: Polyvinyl chloride

1.04 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Product Data: For each type of product. Include rated capacities, operating characteristics, and accessories.

C. Shop Drawings:

1. Show fabrication and installation details for frost-resistant vent terminals.

D. Field quality-control reports.

E. Operation and Maintenance Data: For sanitary waste piping specialties to include in emergency, operation, and maintenance manuals.

1.05 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.06 SPARE PARTS:

A. Comply with the requirements specified in Section 01 61 00.

1.07 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

1.08 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

PART 2 - PRODUCTS

2.01 ASSEMBLY DESCRIPTIONS:

A. Sanitary waste piping specialties shall bear label, stamp, or other markings of specified testing agency.

B. Comply with NSF 14 for plastic sanitary waste piping specialty components.

C. AIS Compliance of the steel and iron components in this Section materials is required. Refer to Section 22 05 00, 1.01 E for description.

2.02 BACKWATER VALVES:

A. Horizontal, Cast-Iron Backwater Valves:

1. Compliance: AIS Compliance required. Manufacturer listed is the Basis of Design for performance product requirements. Contractor to submit compliant manufacturer if Basis of Design cannot certify AIS compliance.

2. Manufacturers:

a. MIFAB, Inc.

b. Zurn

3. Standard: ASME A112.14.1.

4. Size: Same as connected piping.

5. Body: Cast iron.

6. Cover: Cast iron with bolted access check valve.

7. End Connections: Hub and spigot or hubless.

8. Type Check Valve: Removable, bronze, swing check, factory assembled or field modified to hang closed.

9. Extension: ASTM A74, Service class; full-size, cast-iron, soil-pipe extension to field-installed cleanout at floor; replaces backwater valve cover.

B. Horizontal, Plastic Backwater Valves:

1. Manufacturers:

a. Ferguson

2. Size: Same as connected piping.

3. Body: PVC.

4. Cover: Same material as body with threaded access to check valve.

5. Check Valve: Removable swing check.

6. End Connections: Socket type.

2.03 CLEANOUTS:

A. Cast-Iron Exposed Cleanouts:

1. Compliance: AIS Compliance required. Manufacturer listed is the Basis of Design for performance product requirements. Contractor to submit compliant manufacturer if Basis of Design cannot certify AIS compliance.

2. Standard: ASME A112.36.2M.

3. Size: Same as connected drainage piping

4. Body Material: Hubless, cast-iron soil pipe test tee as required to match connected piping.

5. Closure: cast-iron plug.

6. Closure Plug Size: Same as or not more than one size smaller than cleanout size.

B. Cast-Iron Exposed Floor Cleanouts:

1. Compliance: AIS Compliance required. Manufacturer listed is the Basis of Design for performance product requirements. Contractor to submit compliant manufacturer if Basis of Design cannot certify AIS compliance.

2. Standard: ASME A112.36.2M for heavy-duty, adjustable housing cleanout.

3. Size: Same as connected branch.

4. Type: Heavy-duty, adjustable housing.

5. Body or Ferrule: Cast iron.

6. Clamping Device: Required.

7. Outlet Connection: Threaded.

8. Closure: Cast-iron plug.

9. Adjustable Housing Material: Cast iron with threads.

10. Frame and Cover Material and Finish: Nickel-bronze, copper alloy.

11. Frame and Cover Shape: Round.

12. Top Loading Classification: Extra Heavy Duty.

13. Riser: ASTM A74, Extra-Heavy class, cast-iron drainage pipe fitting and riser to cleanout.

C. Cast-Iron Wall Cleanouts:

1. Compliance: AIS Compliance required. Manufacturer listed is the Basis of Design for performance product requirements. Contractor to submit compliant manufacturer if Basis of Design cannot certify AIS compliance.

2. Standard: ASME A112.36.2M. Include wall access.

3. Size: Same as connected drainage piping.

4. Body: Hubless, cast-iron soil pipe test tee as required to match connected piping.

5. Closure Plug:

a. Cast iron

b. Countersunk head

c. Drilled and threaded for cover attachment screw

d. Size: Same as or not more than one size smaller than cleanout size

6. Wall Access: Round, deep, chrome-plated bronze cover plate with screw.

D. Plastic Floor Cleanouts:

1. Size: Same as connected branch

2. Body: PVC

3. Closure Plug: PVC

4. Riser: Drainage pipe fitting and riser to cleanout of same material as drainage piping

2.04 FLOOR DRAINS:

A. Cast-Iron Floor Drains:

1. Compliance: AIS Compliance required. Manufacturer listed is the Basis of Design for performance product requirements. Contractor to submit compliant manufacturer if Basis of Design cannot certify AIS compliance.

2. Manufacturers:

a. Josam Company.

b. MIFAB, Inc.

c. WATTS.

d. Zurn Industries, LLC.

3. Standard: ASME A112.6.3.

4. Pattern: Floor drain.

5. Body Material: Gray iron.

6. Outlet: Bottom.

7. Top or Strainer Material: Bronze.

8. Top of Body and Strainer Finish: Nickel bronze.

9. Top Shape: Square.

10. Top Loading Classification: Heavy Duty.

B. Stainless-Steel Floor Drains, ASME A112.3.1

1. Compliance: AIS Compliance required. Manufacturer listed is the Basis of Design for performance product requirements. Contractor to submit compliant manufacturer if Basis of Design cannot certify AIS compliance.

2. Manufacturers:

a. Josam Company.

b. MIFAB, Inc.

c. WATTS.

d. Zurn Industries, LLC.

3. Outlet: Bottom.

4. Top or Strainer Material: Stainless steel.

5. Top Shape: Round.

C. Plastic Floor Drains:

1. Manufacturers:

a. Jay R. Smith Mfg Co; a division of Morris Group International.

b. Josam Company.

c. Zurn Industries, LLC.

2. Standard: ASME A112.6.3.

3. Material: ABS or PVC.

4. Outlet: Bottom.

5. Top or Strainer Material: Plastic.

6. Top Shape: Round.

2.05 FLOOR SINKS

A. Cast-Iron Floor Sinks:

1. Compliance: AIS Compliance required. Manufacturer listed is the Basis of Design for performance product requirements. Contractor to submit compliant manufacturer if Basis of Design cannot certify AIS compliance.

2. Manufacturers:

a. Jay R. Smith Mfg Co; a division of Morris Group International.

b. Josam Company.

c. WATTS.

d. Zurn Industries, LLC.

3. Standard: ASME A112.6.7.

4. Pattern: Floor drain.

5. Body Material: Cast iron.

6. Outlet: Bottom, no-hub connection.

7. Top Grate Material: Cast iron, loose.

8. Top of Body and Grate Finish: Nickel bronze.

9. Top Shape: Square.

10. Top Loading Classification: No traffic.

B. Stainless-Steel Floor Sinks, ASME A112.6.7:

1. Compliance: AIS Compliance required. Manufacturer listed is the Basis of Design for performance product requirements. Contractor to submit compliant manufacturer if Basis of Design cannot certify AIS compliance.

2. Manufacturers:

a. Jay R. Smith Mfg Co; a division of Morris Group International.

b. Josam Company.

c. WATTS.

d. Zurn Industries, LLC.

3. Standard: ASME A112.6.7.

4. Pattern: Floor drain.

5. Body Material: Stainless steel.

6. Outlet: Bottom, no-hub connection.

7. Top Grate Material: Stainless steel, loose.

8. Top of Body and Grate Finish: Stainless steel.

9. Top Shape: Square.

10. Top Loading Classification: No traffic.

C. Plastic Floor Sinks:

1. Manufacturers:

a. Jay R. Smith Mfg Co; a division of Morris Group International.

b. Josam Company.

c. Zurn Industries, LLC.

2. Standard: ASME A112.6.7.

3. Pattern: Floor drain.

4. Body Material: PVC.

5. Outlet: Bottom, PVC primer and solvent cement connection.

6. Top Grate Material: PVC.

7. Top Shape: Square.

8. Top Loading Classification: No traffic.

2.06 ROOF FLASHING ASSEMBLIES:

A. Roof Flashing Assemblies.

1. assembly made of 6.0-lb/sq. ft., 0.0938-inch- thick, lead flashing collar and skirt extending at least 10 inches from pipe, with galvanized-steel boot reinforcement and counterflashing fitting.

a. Open-Top Vent Cap: Without cap.

2.07 THROUGH-PENETRATION FIRESTOP ASSEMBLIES:

A. Through-Penetration Firestop Assemblies:

1. Standard: UL 1479 assembly of sleeve-and-stack fitting with firestopping plug.

2. Size: Same as connected soil, waste, or vent stack.

3. Sleeve: Molded-PVC plastic, of length to match slab thickness and with integral nailing flange on one end for installation in cast-in-place concrete slabs.

4. Special Coating: Corrosion resistant on interior of fittings.

2.08 MISCELLANEOUS SANITARY DRAINAGE PIPING SPECIALTIES:

A. Open Drains:

1. Description: Shop or field fabricate from ASTM A74, Service class, hub-and-spigot, cast-iron soil-pipe fittings. Include P-trap, hub-and-spigot riser section; and where required, increaser fitting joined with ASTM C564 rubber gaskets.

2. Compliance: AIS Compliance required. Manufacturer listed is the Basis of Design for performance product requirements. Contractor to submit compliant manufacturer if Basis of Design cannot certify AIS compliance.

3. Size: Same as connected waste piping with increaser fitting of size indicated.

B. Deep-Seal Traps:

1. Description: Cast-iron or bronze casting, with inlet and outlet matching connected piping and cleanout trap-seal primer valve connection.

2. Compliance: AIS Compliance required. Manufacturer listed is the Basis of Design for performance product requirements. Contractor to submit compliant manufacturer if Basis of Design cannot certify AIS compliance.

3. Size: Same as connected waste piping.

a. NPS 2: 4-inch-minimum water seal

b. NPS 2-1/2 and Larger: 5-inch-minimum water seal

C. Floor-Drain, Trap-Seal Primer Fittings:

1. Description: Cast iron, with threaded inlet and threaded or spigot outlet, and trap-seal primer valve connection.

2. Compliance: AIS Compliance required. Manufacturer listed is the Basis of Design for performance product requirements. Contractor to submit compliant manufacturer if Basis of Design cannot certify AIS compliance.

3. Size: Same as floor drain outlet with NPS 1/2 side inlet

D. Air-Gap Fittings:

1. Standard: ASME A112.1.2, for fitting designed to ensure fixed, positive air gap between installed inlet and outlet piping.

2. Body: Bronze or cast iron.

3. Inlet: Opening in top of body.

4. Outlet: Larger than inlet.

5. Size: Same as connected waste piping and with inlet large enough for associated indirect waste piping.

E. Sleeve Flashing Device:

1. Description: Manufactured, cast-iron fitting, with clamping device that forms sleeve for pipe floor penetrations of floor membrane. Include galvanized-steel pipe extension in top of fitting that will extend 2 inches above finished floor and galvanized-steel pipe extension in bottom of fitting that will extend through floor slab.

2. Size: As required for close fit to riser or stack piping.

F. Stack Flashing Fittings:

1. Description: Counterflashing-type, cast-iron fitting, with bottom recess for terminating roof membrane, and with threaded or hub top for extending vent pipe.

2. Size: Same as connected stack vent or vent stack.

G. Vent Caps:

1. Description: Cast-iron body with threaded or hub inlet and vandal-proof design. Include vented hood and setscrews to secure to vent pipe.

2. Size: Same as connected stack vent or vent stack.

H. Frost-Resistant Vent Terminals:

1. Description: Manufactured or shop-fabricated assembly constructed of copper, lead-coated copper, or galvanized steel.

2. Design: To provide 1-inch enclosed air space between outside of pipe and inside of flashing collar extension, with counterflashing.

I. Expansion Joints:

1. Standard: ASME A112.6.4

2. Compliance: AIS Compliance required. Manufacturer listed is the Basis of Design for performance product requirements. Contractor to submit compliant manufacturer if Basis of Design cannot certify AIS compliance.

3. Body: Cast iron with bronze sleeve, packing, and gland

4. End Connections: Matching connected piping

5. Size: Same as connected soil, waste, or vent piping

PART 3 - EXECUTION

3.01 INSTALLATION:

A. Equipment Mounting:

1. Comply with requirements for vibration-isolation and seismic-control devices specified in Section 22 05 48.

2. Comply with requirements for vibration-isolation devices specified in Section 22 05 48.

B. Install backwater valves in building drain piping.

1. For interior installation, provide cleanout deck plate flush with floor and centered over backwater valve cover, and of adequate size to remove valve cover for servicing.

C. Install cleanouts in aboveground piping and building drain piping according to the following, unless otherwise indicated:

1. Size same as drainage piping up to NPS 4. Use NPS 4 for larger drainage piping unless larger cleanout is indicated.

2. Locate at each change in direction of piping greater than 45 degrees.

3. Locate at minimum intervals of 50 feet for piping NPS 4 and smaller and 100 feet for larger piping.

4. Locate at base of each vertical soil and waste stack.

D. For floor cleanouts for piping below floors, install cleanout deck plates with top flush with finished floor.

E. For cleanouts located in concealed piping, install cleanout wall access covers, of types indicated, with frame and cover flush with finished wall.

F. Install fixture air-admittance valves on fixture drain piping.

G. Install stack air-admittance valves at top of stack vent and vent stack piping.

H. Install air-admittance-valve wall boxes recessed in wall.

I. Install roof flashing assemblies on sanitary stack vents and vent stacks that extend through roof. Comply with requirements in Section 07 60 00.

J. Install flashing fittings on sanitary stack vents and vent stacks that extend through roof. Comply with requirements in Section 07 60 00.

K. Install through-penetration firestop assemblies in plastic conductors and stacks at floor penetrations. Comply with requirements in Section 07 84 00.

L. Assemble open drain fittings and install with top of hub 2 inches above floor.

M. Install deep-seal traps on floor drains and other waste outlets, if indicated.

N. Install floor-drain, trap-seal primer fittings on inlet to floor drains that require trap-seal primer connection.

1. Exception: Fitting may be omitted if trap has trap-seal primer connection.

2. Size: Same as floor drain inlet.

O. Install air-gap fittings on draining-type backflow preventers and on indirect-waste piping discharge into sanitary drainage system.

P. Install sleeve and sleeve seals with each riser and stack passing through floors with water-proof membrane.

Q. Install vent caps on each vent pipe passing through roof.

R. Install frost-resistant vent terminals on each vent pipe passing through roof. Maintain 1-inch clearance between vent pipe and roof substrate.

S. Install expansion joints on vertical stacks and conductors. Position expansion joints for easy access and maintenance.

T. Install frost-proof vent caps on each vent pipe passing through roof. Maintain 1-inch clearance between vent pipe and roof substrate.

U. Assemble components of FOG disposal systems and install on floor.

1. Install trap, vent, fresh-air inlet, and flow-control fitting according to authorities having jurisdiction.

2. Install shelf fastened to reinforcement in wall construction and adjacent to unit, unless otherwise indicated.

3. Install culture bottle, culture metering pump, timer, and control on shelf. Install tubing between culture bottle, metering pump, and chamber.

V. Install wood-blocking reinforcement for wall-mounting-type specialties.

W. Install traps on plumbing specialty drain outlets. Omit traps on indirect wastes unless trap is indicated.

3.02 CONNECTIONS:

A. Comply with requirements in Section 22 13 16 for piping installation requirements. Drawings indicate general arrangement of piping, fittings, and specialties.

B. Install piping adjacent to equipment to allow service and maintenance.

C. Ground equipment according to Section 26 05 26.

D. Connect wiring according to Section 26 05 20.

3.03 FLASHING INSTALLATION:

A. Comply with requirements in Section 07 60 00.

B. Fabricate flashing from single piece unless large pans, sumps, or other drainage shapes are required.

C. Install sheet flashing on pipes, sleeves, and specialties passing through or embedded in floors and roofs with waterproof membrane.

1. Pipe Flashing: Sleeve type, matching pipe size, with minimum length of 10 inches, and skirt or flange extending at least 8 inches around pipe.

2. Sleeve Flashing: Flat sheet, with skirt or flange extending at least 8 inches around sleeve.

3. Embedded Specialty Flashing: Flat sheet, with skirt or flange extending at least 8 inches around specialty.

D. Set flashing on floors and roofs in solid coating of bituminous cement.

E. Secure flashing into sleeve and specialty clamping ring or device.

F. Install flashing for piping passing through roofs with counterflashing or commercially made flashing fittings, according to Section 07 60 00.

G. Extend flashing up vent pipe passing through roofs and turn down into pipe, or secure flashing into cast-iron sleeve having calking recess.

3.04 LABELING AND IDENTIFYING:

A. Equipment Nameplates and Signs: Install engraved plastic-laminate equipment nameplate or sign on or near each of the following:

1. FOG disposal systems.

B. Distinguish among multiple units, inform operator of operational requirements, indicate safety and emergency precautions, and warn of hazards and improper operations, in addition to identifying unit.

1. Nameplates and signs are specified in Section 22 05 53.

3.05 FIELD QUALITY CONTROL:

A. Perform tests and inspections, and prepare test reports.

B. Tests and Inspections:

1. Leak Test: After installation, charge system and test for leaks. Repair leaks and retest until no leaks exist.

2. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.

3.06 PROTECTION:

A. Protect drains during remainder of construction period to avoid clogging with dirt or debris and to prevent damage from traffic or construction work.

B. Place plugs in ends of uncompleted piping at end of each day or when work stops.

3.07 DEMONSTRATION:

A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain FOG disposal systems.

3.08 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

Page Intentionally Left Blank

SECTION 22 34 00

DOMESTIC WATER HEATERS

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide electric, instantaneous potable water heaters as indicated and in compliance with Contract Documents.

1. Section Includes:

a. Flow-control, instantaneous electric water heaters.

b. Water heater accessories.

1.02 REFERENCES:

A. American National Standards Institute (ANSI):

1. Z21.22: Relief Valves for Hot Water Supply Systems

B. American Society of Mechanical Engineers (ASME):

1. B1.20.1: Pipe Threads, General Purpose (Inch)

C. National Fire Protection Association (NFPA):

1. 70: National Electrical Code

D. NSF International (NSF):

1. 5: Water Heaters, Hot Water Supply Boilers, and Heat Recovery Equipment

2. 61: Drinking Water System Components - Health Effects

3. 372: Drinking Water System Components - Lead Content

E. Underwriters' Laboratories, Inc. (UL):

1. 1453: Standard for Electric Booster and Commercial Storage Tank Water Heaters

1.03 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Product Data: For each type of product. Include rated capacities, operating characteristics, electrical characteristics, and furnished specialties and accessories.

C. Shop Drawings:

1. Submit manufacturer's assembly type shop drawings indicating dimensions, required clearances, and methods of assembly of components.

2. Wiring Diagrams: Submit manufacturer's electrical requirements for electrical power supply wiring to water heaters. Submit manufacturer's ladder-type wiring diagrams for interlock and control wiring required for final installation of water heaters and controls. Differentiate between portions of wiring that are factory-installed and portions that are to be field-installed.

D. Seismic Qualification Data:

1. Certificates: For water heat exchangers, accessories, and components, from manufacturer.

E. Product Certificates: For each type of water heater.

F. Domestic-Water Heater Labeling: Certified and labeled by testing agency acceptable to authorities having jurisdiction.

G. Source quality-control reports.

H. Field quality-control reports.

I. Warranty: Sample of special warranty.

J. Operation and Maintenance Data: For each type of water heater to include in emergency, operation, and maintenance manuals.

1.04 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.05 SPARE PARTS:

A. Comply with the requirements specified in Section 01 61 00.

1.06 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

1.07 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

1.08 COORDINATION:

A. Coordinate sizes and locations of concrete bases with actual equipment provided.

1.09 WARRANTY:

A. Warranty on Coil, Heat Exchanger, and Burner: Provide written warranty, signed by manufacturer, agreeing to replace/repair, within warranty period, coils, heat exchangers, and burners with inadequate or defective materials and workmanship, including leakage, breakage, improper assembly, or failure to perform as required; provided manufacturer's instructions for handling, installing, protecting, and maintaining units have been adhered to during warranty period. Replacement is limited to component replacement only and does not include labor for removal and reinstallation.

B. Warranty Period: 5 years from Date of Substantial Completion.

PART 2 - PRODUCTS

2.01 PERFORMANCE REQUIREMENTS:

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by an NRTL, and marked for intended location and use.

B. Seismic Performance: Commercial domestic-water heaters and domestic-water heat exchangers shall withstand the effects of earthquake motions determined in accordance with ASCE/SEI 7.

1. The term "withstand" means "the unit will remain in place without separation of any parts from the device when subjected to the seismic forces specified."

C. NSF Compliance: Fabricate and label equipment components that will be in contact with potable water to comply with NSF 61 and NSF 372.

2.02 FLOW-CONTROL, INSTANTANEOUS ELECTRIC WATER HEATERS:

A. Comply with UL 499 for tankless electric (water heater) heating appliance.

B. Manufacturers:

1. Chronomite Laboratories, Inc.

2. Controlled Energy Corporation.

3. Eemax, Inc.

4. Hot Aqua, Inc.

5. IMI Waterheating, Ltd.

6. Stiebel Eltron, Inc.

C. Construction: Copper piping or tubing complying with NSF 61 barrier materials for potable water, without storage capacity.

1. Connections: ASME B1.20.1 pipe thread.

2. Pressure Rating: 150 PSIG.

3. Heating Element: Resistance heating system.

4. Temperature Control: Flow-control fitting.

5. Safety Control: High-temperature-limit cutoff device or system.

6. Jacket: Aluminum or steel with enameled finish or plastic.

D. Support: Bracket for wall mounting.

E. Capacity and Characteristics: See plans

2.03 DOMESTIC-WATER HEATER ACCESSORIES:

A. Combination Temperature and Pressure Relief Valves: ASME rated and stamped and complying with ASME PTC 25.3. Include relieving capacity at least as great as heat input and include pressure setting less than water heater working-pressure rating. Select relief valves with sensing element that extends into storage tank.

B. Pressure Relief Valves: ASME rated and stamped and complying with ASME PTC 25.3. Include pressure setting less than water heater working-pressure rating.

C. Water Heater Mounting Brackets: Water heater manufacturer's factory-fabricated steel bracket for wall mounting and capable of supporting water heater and water.

D. Piping-Type Heat Traps: Field-fabricated piping arrangement according to ASHRAE/IESNA 90.1 or ASHRAE 90.2.

E. Water Regulators: ASSE 1003, water-pressure reducing valve. Set at 25-PSIG- (172.5-kPa-) maximum outlet pressure, unless otherwise indicated.

F. Shock Absorbers: ASSE 1010 or PDI WH 201, Size A water hammer arrester.

2.04 SOURCE QUALITY CONTROL:

A. Factory Tests: Test and inspect assembled water heaters and storage tanks specified to be ASME-code construction, in accordance with ASME Boiler and Pressure Vessel Code.

B. Water heaters will be considered defective if they do not pass tests and inspections.

C. Prepare test and inspection reports.

PART 3 - EXECUTION

3.01 WATER HEATER INSTALLATION

A. General: Install water heaters in accordance with manufacturer's installation instructions. Install units plumb and level, firmly anchored in locations indicated, and maintain manufacturer's recommended clearances

B. Install combination temperature and pressure relief valves in water piping for water heaters without storage. Extend commercial-water-heater relief-valve outlet, with drain piping same as domestic water piping in continuous downward pitch, and discharge by positive air gap onto closest floor drain.

C. Piping: Connect hot and cold water piping to units with shutoff valves and unions. Connect recirculating water line to unit with shutoff valve, check valve, and union. Extend relief valve discharge to closet floor drain, or as indicated.

D. Install water regulator, with integral bypass relief valve, in booster-heater inlet piping and water hammer arrester in booster-heater outlet piping.

E. Fill water heaters with water.

3.02 PIPING CONNECTIONS:

A. Comply with requirements for water piping specified in Section 22 11 13

B. Drawings indicate general arrangement of piping, fittings, and specialties.

C. Ground equipment according to Division 26.

D. Connect wiring according to Division 26.

3.03 IDENTIFICATION:

A. Identify system components. Comply with requirements for identification specified in Section 22 05 53.

3.04 FIELD QUALITY CONTROL:

A. Perform Tests and Inspections.

1. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect components, assemblies, and equipment installations, including connections, and to assist in testing.

a. Leak Test: After installation, charge system and test for leaks. Repair leaks and retest until no leaks exist.

b. Operational Test: After electrical circuitry has been energized, start units to confirm proper operation.

c. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.

2. Water heaters will be considered defective if they do not pass tests and inspections. Comply with requirements in Section 01 45 00 for retesting and re-inspecting requirements and Section 22 05 00 for requirements for correcting the Work.

3. Prepare test and inspection reports.

3.05 DEMONSTRATION:

A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain water heat exchangers.

3.06 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 22 42 00

PLUMBING FIXTURES

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide plumbing fixtures as indicated and in compliance with Contract Documents.

1. Commercial Water Closets:

a. Water closets

b. Flushometer valves and tanks

c. Toilet seats

d. Supports

2. Commercial Lavatories:

a. Lavatories

b. Faucets

c. Supply fittings

d. Waste fittings

e. Supports

3. Commercial Sinks:

a. Service sinks

b. Utility sinks

c. Sample sinks

d. Sink faucets

e. Supports

f. Supply fittings

g. Waste fittings

1.03 DEFINITIONS:

A. Effective Flush Volume: Average of two reduced flushes and one full flush per fixture.

B. Remote Water Closet: Located more than from other drain line connections or fixture and where less than 1.5 drainage fixture units are upstream of the drain line connection.

C. Accessible Fixture: Plumbing fixture that can be approached, entered, and used by people with disabilities.

D. Tepid: Moderately warm.

1.04 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Product Data: For each type of product.

1. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes for fixtures.

2. Include rated capacities, operating characteristics, electrical characteristics, and furnished specialties and accessories.

C. Shop Drawings:

1. Include plans, elevations, sections, and mounting details.

2. Include details of equipment assemblies. Indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.

3. Vibration Isolation Base Details: Detail fabrication including anchorages and attachments to structure and to supported equipment. Include adjustable motor bases, rails, and frames for equipment mounting.

4. Include diagrams for power, signal, and control wiring.

D. Product Certificates: Submit certificates of performance testing specified in "Source Quality Control" Article.

E. Field quality-control test reports.

F. Operation and Maintenance Data to include in operation and maintenance manuals.

G. Furnish extra materials that are packaged with protective covering for storage and identified with labels describing contents.

1. Faucet Washers and O-Rings: Equal to 10 percent of amount of each type and size installed.

2. Faucet Cartridges and O-Rings: Equal to 5 percent of amount of each type and size installed.

3. Flushing-Fluid Solution: Separate lot and equal to at least 200 percent of amount of solution installed for each self-contained unit.

1.05 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.06 SPARE PARTS:

A. Comply with the requirements specified in Section 01 61 00.

1.07 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

1.08 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

PART 2 - PRODUCTS

2.01 WALL-MOUNTED WATER CLOSETS:

A. Water Closets (WC-1): Wall mounted, top spud.

1. Manufacturers:

a. American Standard

b. Briggs Plumbing Products, Inc.

c. Capizzi

d. Crane Plumbing, LLC.

e. FNW; Ferguson Enterprises, Inc.

f. Gerber Plumbing Fixtures LLC.

g. Kohler Company

h. Mansfield Plumbing Products LLC.

i. Peerless Pottery Sales, Inc.

j. Sloan Valve Company

k. TOTO USA, Inc.

l. Zurn Industries, LLC

2. Bowl:

a. Standards: ASME A112.19.2/CSA B45.1 and ASME A112.19.5.

b. Material: Vitreous china.

c. Type: Siphon jet.

d. Style: Flushometer valve.

e. Height: Standard.

f. Rim Contour: Elongated.

g. Water Consumption: 1.6 gallons per flush.

h. Spud Size and Location: NPS 1-1/2; top.

3. Water-Closet Mounting Height: See Architectural Drawings.

2.02 FLUSHOMETER VALVES:

A. Lever-Handle, Piston Flushometer Valves:

1. Manufacturers:

a. American Standard

b. Delany Products

c. Kohler Company

d. Sloan Valve Company

e. TOTO USA, Inc.

f. Zurn Industries, LLC.

2. Standard: ASSE 1037.

3. Minimum Pressure Rating: 125 psig.

4. Features: Include integral check stop and backflow-prevention device.

5. Material: Brass body with corrosion-resistant components.

6. Exposed Flushometer-Valve Finish: Chrome plated.

7. Panel Finish: Chrome plated or stainless steel.

8. Style: Exposed.

9. Consumption: 1.28 gallons per flush.

10. Minimum Inlet: NPS 1.

11. Minimum Outlet: NPS 1-1/4.

2.03 TOILET SEATS:

A. Toilet Seats:

1. Manufacturers:

a. American Standard

b. Bemis Manufacturing Company

c. Kohler Company

d. TOTO USA, Inc.

e. Zurn Industries, LLC.

2. Standard: IAPMO/ANSI Z124.5.

3. Material: Plastic.

4. Type: Commercial (Heavy duty).

5. Shape: Elongated rim, open front.

6. Hinge: Self-sustaining.

7. Hinge Material: Non-corroding metal.

8. Seat Cover: Not required.

9. Color: White.

2.04 SUPPORTS:

A. Water Closet Carrier:

1. Manufacturers:

a. Josam Company

b. Zurn Industries, LLC.

2. Standard: ASME A112.6.1M.

3. Description: Waste-fitting assembly, as required to match drainage piping material and arrangement with faceplates, couplings gaskets, and feet; bolts and hardware matching fixture. Include additional extension coupling, faceplate, and feet for installation in wide pipe space.

2.05 VITREOUS-CHINA, WALL-MOUNTED LAVATORIES:

A. Lavatory: Ledge back, vitreous china, wall mounted.

1. Manufacturers:

a. American Standard

b. Briggs Plumbing Products, Inc.

c. Gerber Plumbing Fixtures LLC.

d. Kohler Company

e. Mansfield Plumbing Products LLC.

f. Peerless Pottery Sales, Inc.

g. Sloan Valve Company

2. Fixture:

a. Standard: ASME A112.19.2/CSA B45.1.

b. Type: For wall hanging.

c. Nominal Size: Rectangular, 20 by 18.

d. Faucet-Hole Punching: One hole.

e. Faucet-Hole Location: Top.

f. Color: White.

g. Mounting Material: Chair carrier.

3. Faucet: See Plumbing Drawings.

4. Support: Type I, exposed-arm lavatory carrier.

5. Lavatory Mounting Height: See Architectural Drawings.

2.06 SOLID-BRASS, MANUALLY OPERATED FAUCETS:

A. NSF Standard: Comply with NSF 372 for faucet materials that will be in contact with potable water.

B. Lavatory Faucets: Manual-type, two-handle mixing, commercial, solid-brass valve.

1. Manufacturers:

a. American Standard

b. Delta Faucet Company

c. Elkay Manufacturing Company

d. Gerber Plumbing Fixtures LLC.

e. Kohler Company

f. Moen Incorporated

g. Zurn Industries, LLC.

2. Standard: ASME A112.18.1/CSA B125.1.

3. General: Include hot- and cold-water indicators; coordinate faucet inlets with supplies and fixture hole punchings; coordinate outlet with spout and fixture receptor.

4. Body Type: Widespread.

5. Body Material: Commercial, solid brass.

6. Finish: Polished chrome plate.

7. Maximum Flow Rate: 0.5 gpm.

8. Maximum Flow: 0.25 gallon per metering cycle.

9. Mounting Type: Back/wall, exposed.

10. Valve Handle(s):Wrist blade, 4 inches.

11. Spout: Rigid type.

12. Spout Outlet: Laminar flow.

13. Operation: Compression, manual.

14. Drain: Not part of faucet.

2.07 WASTE FITTINGS:

A. Standard: ASME A112.18.2/CSA B125.2.

B. Drain: Grid type with NPS 1-1/4 offset and straight tailpiece.

C. Trap:

1. Size: NPS 1-1/4.

2. Material: Chrome-plated, two-piece, cast-brass trap and ground-joint swivel elbow with 0.032-inch-thick brass tube to wall; and chrome-plated, brass or steel wall flange.

2.08 SUPPLY FITTINGS:

A. NSF Standard: Comply with NSF 372 for supply-fitting materials that will be in contact with potable water.

B. Standard: ASME A112.18.1/CSA B125.1.

C. Supply Piping: Chrome-plated-brass pipe or chrome-plated copper tube matching water-supply piping size. Include chrome-plated-brass or stainless-steel wall flange.

D. Supply Stops: Chrome-plated-brass, one-quarter-turn, ball-type or compression valve with inlet connection matching supply piping.

E. Operation: Wheel handle.

F. Risers:

1. NPS 3/8.

2. ASME A112.18.6, braided- or corrugated-stainless-steel, flexible hose riser.

2.09 SERVICE SINKS:

A. Service Sinks: Enameled, cast iron, floor mounted, corner sink.

1. Manufacturers:

a. Zurn Industries, LLC.

2. Fixture:

a. Standard: ASME A112.19.1/CSA B45.2.

b. Style: With front apron and raised back.

c. Nominal Size: 28 by 28 inches.

d. Color: White.

e. Drain: Grid with NPS 3 outlet.

f. Rim Guard: Coated wire.

3. Faucet: See Plumbing Drawings.

2.10 UTILITY SINKS:

1. Supply Fittings:

a. Standard: ASME A112.18.1/CSA B125.1.

b. Supplies: Chrome-plated brass compression stop with inlet connection matching water-supply piping type and size.

(1) Operation: Wheel handle.

(2) Risers: NPS 1/2, ASME A112.18.6, braided or corrugated stainless-steel flexible hose.

2. Waste Fittings:

a. Standard: ASME A112.18.2/CSA B125.2.

b. Trap(s):

(1) Size: NPS 2.

B. Sample Sinks: Stainless steel, freestanding with drainboard.

1. Manufacturers:

a. Advance Tabco

b. Eagle Group

c. Elkay Manufacturing Company

d. Griffin Products, Inc.

e. Just Manufacturing

2. Fixture:

a. Standard: ASME A112.19.3/CSA B45.4.

b. Type: With backsplash.

c. Number of Compartments: One.

d. Overall Dimensions: 55-1/2 inches x 27-1/2 inches x 14 inches.

e. Metal Thickness: 14-gauge.

f. Compartment:

(1) Dimensions: 30 inches x 24 inches x 14 inches.

(2) Drain: Grid with NPS 2 tailpiece and twist drain.

(3) Drain Location: Centered in compartment.

g. Drainboard(s): Right side.

(1) Dimensions Each: 24 inches x 24 inches

3. Supports: Adjustable-length steel legs.

4. Faucet(s): See Plumbing Drawings.

a. Number Required: One.

b. Mounting: On backsplash.

5. Supply Fittings:

a. Standard: ASME A112.18.1/CSA B125.1.

b. Supplies: Chrome-plated brass compression stop with inlet connection matching water-supply piping type and size.

(1) Operation: Wheel handle.

(2) Risers: NPS 1/2, ASME A112.18.6, braided or corrugated stainless-steel flexible hose.

6. Waste Fittings:

a. Standard: ASME A112.18.2/CSA B125.2.

b. Trap(s):

(1) Size: NPS 2.

(2) Material: Stainless-steel, two-piece trap and swivel elbow with 0.012-inch-thick stainless-steel tube to wall; and stainless-steel wall flange.

2.11 SINK FAUCETS:

A. NSF Standard: Comply with NSF 372 for faucet-spout materials that will be in contact with potable water.

B. Sink Faucets: Manual type, two lever handle mixing valve.

1. Commercial, Solid-Brass Faucets.

a. Manufacturers:

(1) American Standard

(2) Bradley Corporation

(3) Elkay Manufacturing Company

(4) Kohler Company

(5) Moen Incorporated

(6) Sloan Valve Company

(7) Zurn Industries, LLC.

2. General-Duty, Solid-Brass Faucets:

a. Manufacturers:

(1) American Standard

(2) Bradley Corporation

(3) Elkay Manufacturing Company

(4) Kohler Company

(5) Moen Incorporated

(6) Zurn Industries, LLC.

3. Standard: ASME A112.18.1/CSA B125.1.

4. General: Include hot- and cold-water indicators; coordinate faucet inlets with supplies and fixture hole punchings; coordinate outlet with spout and sink receptor.

5. Body Type: Centerset.

6. Body Material: Commercial, solid brass.

7. Finish: Polished chrome plate.

8. Maximum Flow Rate: 2.2 gpm.

9. Handle(s): Wrist blade, 4 inches.

10. Mounting Type: Deck, exposed.

11. Spout Type: Rigid, solid brass.

12. Spout Outlet: Aerator.

C. Sink Faucets: Manual type, mop sink two lever handle mixing valve.

1. Commercial, Solid-Brass Faucets.

a. Manufacturers:

(1) American Standard

(2) Bradley Corporation

(3) Elkay Manufacturing Company

(4) Kohler Company

(5) Moen Incorporated

(6) Sloan Valve Company

(7) Zurn Industries, LLC.

2. General-Duty, Solid-Brass Faucets:

a. Manufacturers:

(1) American Standard

(2) Bradley Corporation

(3) Elkay Manufacturing Company

(4) Kohler Company

(5) Moen Incorporated.

(6) Zurn Industries, LLC.

3. Standard: ASME A112.18.1/CSA B125.1.

4. General: Include hot- and cold-water indicators; coordinate faucet inlets with supplies and fixture hole punchings; coordinate outlet with spout and sink receptor.

5. Body Type: Centerset.

6. Body Material: Commercial, solid brass.

7. Finish: Polished chrome plate.

8. Maximum Flow Rate: 2.2 gpm.

9. Handle(s): Wrist blade, 4 inches.

10. Mounting Type: Deck, exposed.

11. Spout Type: Rigid, solid brass.

12. Vacuum Breaker: Required for hose outlet.

13. Spout Outlet: Hose thread according to ASME B1.20.7.

2.12 WATER-TEMPERING EQUIPMENT:

A. Hot- and Cold-Water, Water-Tempering Equipment (TMV):

1. Manufacturers:

a. Acorn Engineering Company

b. Bradley Corporation

c. Guardian Equipment Company

d. Haws Corporation

2. Description: Factory-fabricated equipment with thermostatic mixing valve.

a. Thermostatic Mixing Valve: Designed to provide 65 to 95 degrees F tepid, potable water at emergency plumbing fixtures, to maintain temperature at plus or minus 5 degrees F throughout required 15-minute test period, and in

case of unit failure to continue cold-water flow, with union connections, controls, metal piping, and corrosion-resistant enclosure.

b. Supply Connections: For hot and cold water.

2.13 SUPPLEMENTAL EQUIPMENT:

A. Freeze-Proof Yard Hydrant:

1. Provide freeze-proof yard hydrant with inlet and nozzle size as indicated on drawings. Hydrant shall have galvanized steel pipe casing and be provided with 1/8-inch drain hole. Hydrant valve shall have a bury depth of 3 feet. Provide hydrant that can be maintained and serviced without excavation. Woodford MFG Model IOWA Y1.

2.14 SOURCE QUALITY CONTROL:

A. Certify performance of emergency plumbing fixtures by independent testing organization acceptable to authorities having jurisdiction.

2.15 GROUT:

A. Standard: ASTM C1107, Grade B, post-hardening and volume-adjusting, dry, hydraulic-cement grout.

B. Characteristics: Non-shrink; recommended for interior and exterior applications.

C. Design Mix: 5000-psi, 28-day compressive strength.

D. Packaging: Premixed and factory packaged.

PART 3 - EXECUTION

3.01 EXAMINATION:

A. Examine roughing-in of water supply and sanitary drainage and vent piping systems to verify actual locations of piping connections before water-closet installation.

B. Examine walls and floors for suitable conditions where water closets will be installed.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 COMMERCIAL WATER CLOSET INSTALLATION:

A. Water-Closet Installation:

1. Install level and plumb according to roughing-in drawings.

2. Install floor-mounted water closets on bowl-to-drain connecting fitting attachments to piping or building substrate.

3. Install accessible, wall-mounted water closets at mounting height for handicapped/elderly, according to ICC/ANSI A117.1.

B. Support Installation:

1. Install supports, affixed to building substrate, for floor-mounted, back-outlet water closets.

2. Use carrier supports with waste-fitting assembly and seal.

3. Install floor-mounted, back-outlet water closets attached to building floor substrate, onto waste-fitting seals; and attach to support.

4. Install wall-mounted, back-outlet water-closet supports with waste-fitting assembly and waste-fitting seals; and affix to building substrate.

C. Flushometer-Valve Installation:

1. Install flushometer-valve, water-supply fitting on each supply to each water closet.

2. Attach supply piping to supports or substrate within pipe spaces behind fixtures.

3. Install lever-handle flushometer valves for accessible water closets with handle mounted on open side of water closet.

D. Install toilet seats on water closets.

E. Wall Flange and Escutcheon Installation:

1. Install wall flanges or escutcheons at piping wall penetrations in exposed, finished locations and within cabinets and millwork.

2. Install deep-pattern escutcheons if required to conceal protruding fittings.

3. Comply with escutcheon requirements specified in Section 22 05 00.

F. Joint Sealing:

1. Seal joints between water closets and walls and floors using sanitary-type, one-part, mildew-resistant silicone sealant.

2. Match sealant color to water-closet color.

3. Comply with sealant requirements specified in Section 07 92 00.

3.03 COMMERCIAL LAVATORIES INSTALLATION:

A. Install lavatories level and plumb according to roughing-in drawings.

B. Install supports, affixed to building substrate, for wall-mounted lavatories.

C. Install accessible wall-mounted lavatories at handicapped/elderly mounting height for people with disabilities or the elderly, according to ICC/ANSI A117.1.

D. Install wall flanges or escutcheons at piping wall penetrations in exposed, finished locations. Use deep-pattern escutcheons if required to conceal protruding fittings. Comply with escutcheon requirements specified in Section 22 05 00.

E. Seal joints between lavatories, counters, and walls using sanitary-type, one-part, mildew-resistant silicone sealant. Match sealant color to fixture color. Comply with sealant requirements specified in Section 07 92 00.

F. Install protective shielding pipe covers and enclosures on exposed supplies and waste piping of accessible lavatories. Comply with requirements in Section 22 07 19.

3.04 COMMERCIAL SINK INSTALLATION:

A. Install sinks level and plumb according to roughing-in drawings.

B. Install supports, affixed to building substrate, for wall-hung sinks.

C. Install accessible wall-mounted sinks at handicapped/elderly mounting height according to ICC/ANSI A117.1.

D. Set floor-mounted sinks in leveling bed of cement grout.

E. Install water-supply piping with stop on each supply to each sink faucet.

1. Exception: Use ball or gate valves if supply stops are not specified with sink. Comply with valve requirements specified in Section 22 05 23.

2. Install stops in locations where they can be easily reached for operation.

F. Install wall flanges or escutcheons at piping wall penetrations in exposed, finished locations. Use deep-pattern escutcheons if required to conceal protruding fittings. Comply with escutcheon requirements specified in Section 22 05 00.

G. Seal joints between sinks and counters, floors, and walls using sanitary-type, one-part, mildew-resistant silicone sealant. Match sealant color to fixture color. Comply with sealant requirements specified in Section 07 92 00.

H. Install protective shielding pipe covers and enclosures on exposed supplies and waste piping of accessible sinks. Comply with requirements in Section 22 07 19.

3.05 CONNECTIONS:

A. Connect fixtures with water supplies, stops, and risers, and with traps, soil, waste, and vent piping. Use size fittings required to match fixtures.

B. Comply with water piping requirements specified in Section 22 05 00.

C. Comply with traps and soil and waste piping requirements specified in Section 22 13 16.

D. Where installing piping adjacent to water closets, allow space for service and maintenance.

E. Where installing piping adjacent to urinals, allow space for service and maintenance.

F. Install protective-shielding pipe covers and enclosures on exposed supplies and waste piping of accessible wash fountains. Comply with requirements in Section 22 07 19.

G. Connect cold-water-supply piping to plumbed emergency plumbing fixtures not having water-tempering equipment. Comply with requirements for cold-water piping specified in Section 22 05 00.

H. Connect hot- and cold-water-supply piping to hot- and cold-water, water-tempering equipment. Connect output from water-tempering equipment to emergency plumbing fixtures. Comply with requirements for hot- and cold-water piping specified in Section 22 05 00.

I. Connect cold water and electrical power to electric heating water-tempering equipment. Comply with requirements for cold-water piping specified in Section 22 05 00.

J. Directly connect emergency plumbing fixture receptors with trapped drain outlet to sanitary waste and vent piping. Comply with requirements for waste piping specified in Section 22 13 16.

K. Indirectly connect emergency plumbing fixture receptors without trapped drain outlet to sanitary waste or storm drainage piping.

L. Where installing piping adjacent to emergency plumbing fixtures, allow space for service and maintenance of fixtures.

3.06 ADJUSTING:

A. Operate and adjust fixtures and controls. Replace damaged and malfunctioning water closets, fittings, and controls.

B. Adjust water pressure at flushometer valves to produce proper flow.

C. Install fresh batteries in battery-powered, electronic-sensor mechanisms.

3.07 CLEANING AND PROTECTION:

A. Clean fixtures and fittings with manufacturers' recommended cleaning methods and materials.

B. Install protective covering for installed fixtures and fittings.

C. Do not allow use plumbing fixtures for temporary facilities unless approved in writing by Owner.

3.08 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

DIVISION 23

HEATING, VENTILATING, AND AIR CONDITIONING

Page Intentionally Left Blank

SECTION 23 05 13

COMMON MOTOR REQUIREMENTS FOR HVAC EQUIPMENT

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide general requirements for single-phase and polyphase, general-purpose, horizontal, small and medium, squirrel-cage induction motors for use on alternating-current power systems up to 600 V and installed at equipment manufacturer's factory or shipped separately by equipment manufacturer for field installation as indicated and in compliance with Contract Documents.

1.02 REFERENCES:

A. The Institute of Electrical and Electronics Engineers, Inc. (IEEE):

1. 841: Motors

B. National Electrical Manufacturers Association (NEMA):

1. MG-1: Motors and Generators.

1.03 COORDINATION:

A. Coordinate features of motors, installed units, and accessory devices to be compatible with the following:

1. Motor controllers.

2. Torque, speed, and horsepower requirements of the load.

3. Ratings and characteristics of supply circuit and required control sequence.

4. Ambient and environmental conditions of installation location.

1.04 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.05 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

B. Sustainability Standards Certifications.

1.06 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

PART 2 - PRODUCTS

2.01 GENERAL MOTOR REQUIREMENTS:

A. Comply with NEMA MG 1 unless otherwise indicated.

B. Comply with IEEE 841 for severe-duty motors.

2.02 MOTOR CHARACTERISTICS:

A. Duty: Continuous duty at ambient temperature of 40 degrees C and at altitude of 4,300 feet above sea level.

B. Capacity and Torque Characteristics: Sufficient to start, accelerate, and operate connected loads at designated speeds, at installed altitude and environment, with indicated operating sequence, and without exceeding nameplate ratings or considering service factor.

2.03 POLYPHASE MOTORS:

A. Description: NEMA MG 1, Design B, medium induction motor.

B. Efficiency: Premium efficient, as defined in NEMA MG 1.

C. Service Factor: 1.15.

D. Multispeed Motors: Variable torque.

1. For motors with 2:1 speed ratio, consequent pole, single winding.

2. For motors with other than 2:1 speed ratio, separate winding for each speed.

E. Multispeed Motors: Separate winding for each speed.

F. Rotor: Random-wound, squirrel cage.

G. Bearings: Regreasable, shielded, antifriction ball bearings suitable for radial and thrust loading.

H. Temperature Rise: Match insulation rating.

I. Insulation: Class F.

J. Code Letter Designation:

1. Motors 15 HP and Larger: NEMA starting Code F or Code G.

2. Motors Smaller Than 15 HP: Manufacturer's standard starting characteristic.

K. Enclosure Material: Cast iron for motor frame sizes 324T and larger; rolled steel for motor frame sizes smaller than 324T.

2.04 ADDITIONAL REQUIREMENTS FOR POLYPHASE MOTORS:

A. Motors Used with Reduced-Voltage and Multispeed Controllers: Match wiring connection requirements for controller with required motor leads. Provide terminals in motor terminal box, suited to control method.

B. Motors Used with Variable-Frequency Controllers: Ratings, characteristics, and features coordinated with and approved by controller manufacturer.

1. Windings: Copper magnet wire with moisture-resistant insulation varnish, designed and tested to resist transient spikes, high frequencies, and short time rise pulses produced by pulse-width-modulated inverters.

2. Premium-Efficient Motors: Class B temperature rise; Class F insulation.

3. Inverter-Duty Motors: Class F temperature rise; Class H insulation.

4. Thermal Protection: Comply with NEMA MG 1 requirements for thermally protected motors.

C. Severe-Duty Motors: Comply with IEEE 841, with 1.15 minimum service factor.

2.05 SINGLE-PHASE MOTORS:

A. Motors larger than 1/20 hp shall be one of the following, to suit starting torque and requirements of specific motor application:

1. Permanent-split capacitor.

2. Split phase.

3. Capacitor start, inductor run.

4. Capacitor start, capacitor run.

B. Multispeed Motors: Variable-torque, permanent-split-capacitor type.

C. Bearings: Prelubricated, antifriction ball bearings or sleeve bearings suitable for radial and thrust loading.

D. Motors 1/20 HP and Smaller: Shaded-pole type.

E. Thermal Protection: Internal protection to automatically open power supply circuit to motor when winding temperature exceeds a safe value calibrated to temperature rating of motor insulation. Thermal-protection device shall automatically reset when motor temperature returns to normal range.

PART 3 - EXECUTION

3.01 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 23 05 19

METERS AND GAGES FOR HVAC PIPING

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide meters and gages for HVAC piping as indicated and in compliance with Contract Documents.

1. Bimetallic-actuated thermometers

2. Liquid-in-glass thermometers

3. Duct-thermometer mounting brackets

4. Thermowells

5. Dial-type pressure gages

6. Gage attachments

1.02 REFERENCES:

A. American Society of Mechanical Engineers (ASME):

1. B1.1: Unified Inch Screw Threads

2. B1.20.1: Pipe Threads, General Purpose (Inch)

3. B40.100: Pressure Gauges and Gauge Attachments

4. B40.200: Thermometers, Direct Reading and Remote Reading

1.03 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Product Data: For each type of product.

C. Shop Drawings:

1. Include diagrams for power, signal, and control wiring.

D. Product Certificates: For each type of meter and gage.

E. Operation and Maintenance Data: For meters and gages to include in operation and maintenance manuals.

1.04 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.05 SPARE PARTS:

A. Comply with the requirements specified in Section 01 61 00.

1.06 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

1.07 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

PART 2 - PRODUCTS

2.01 BIMETALLIC-ACTUATED THERMOMETERS:

A. Manufacturers:

1. Trerice
2. Ashcroft
3. Winters
4. Marsh

B. Standard: ASME B40.200.

C. Case: Liquid-filled and sealed type(s); stainless steel with 3-inch nominal diameter.

D. Dial: Nonreflective aluminum with permanently etched scale markings and scales in degrees F.

E. Connector Type(s): Union joint, adjustable angle, with unified-inch screw threads.

F. Connector Size: 1/2 inch, with ASME B1.1 screw threads.

G. Stem: 0.25 or 0.375 inch in diameter; stainless steel.

H. Window: Plain glass or plastic.

I. Ring: Stainless steel.

J. Element: Bimetal coil.

K. Pointer: Dark-colored metal.

L. Accuracy: Plus or minus 1 percent of scale range.

2.02 LIQUID-IN-GLASS THERMOMETERS:

A. Metal-Case, Compact-Style, Liquid-in-Glass Thermometers:

1. Trerice

2. Ashcroft

3. Winters

4. Marsh

B. Standard: ASME B40.200.

C. Case: Cast aluminum; 6-inch nominal size.

D. Case Form: Straight unless otherwise indicated.

E. Tube: Glass with magnifying lens and blue or red organic liquid.

F. Tube Background: Nonreflective aluminum with permanently etched scale markings graduated in degrees F.

G. Window: Glass or plastic.

H. Stem: Aluminum or brass and of length to suit installation.

1. Design for Air-Duct Installation: With ventilated shroud.

2. Design for Thermowell Installation: Bare stem.

I. Connector: 3/4 inch, with ASME B1.1 screw threads.

J. Accuracy: Plus or minus 1 percent of scale range or one scale division, to a maximum of 1.5 percent of scale range.

2.03 DUCT-THERMOMETER MOUNTING BRACKETS:

A. Description: Flanged bracket with screw holes, for attachment to air duct and made to hold thermometer stem.

2.04 THERMOWELLS:

A. Thermowells:

1. Standard: ASME B40.200.

2. Description: Pressure-tight, socket-type fitting made for insertion in piping tee fitting.

3. Material for Use with Copper Tubing: CNR or CUNI.

4. Material for Use with Steel Piping: CRES.

5. Type: Stepped shank unless straight or tapered shank is indicated.

6. External Threads: NPS 1/2, NPS 3/4, or NPS 1, ASME B1.20.1 pipe threads.

7. Internal Threads: 1/2, 3/4, and 1 inch, with ASME B1.1 screw threads.

8. Bore: Diameter required to match thermometer bulb or stem.

9. Insertion Length: Length required to match thermometer bulb or stem.

10. Lagging Extension: Include on thermowells for insulated piping and tubing.

11. Bushings: For converting size of thermowell's internal screw thread to size of thermometer connection.

B. Heat-Transfer Medium: Mixture of graphite and glycerin.

2.05 DIAL-TYPE PRESSURE GAGES:

A. Direct-Mounted, Metal-Case, Dial-Type Pressure Gages:

1. Manufacturers:

a. Trerice

b. Ashcroft

c. Weiss

d. Marsh

2. Standard: ASME B40.100.

3. Case: Sealed type(s); cast aluminum or drawn steel; 4-1/2-inch nominal diameter.

4. Gasketed pressure relief back with solid front.

5. Pressure-Element Assembly: Bourdon tube unless otherwise indicated.

6. Diaphragm assembly for corrosive service.

7. Snubber for pulsating operation.

8. Oil filled for high vibration applications.

9. Pressure Connection: Brass, with ASME B1.20.1 pipe threads and bottom-outlet type unless back-outlet type is indicated.

10. Movement: Mechanical, with link to pressure element and connection to pointer.

11. Dial: Nonreflective aluminum with permanently etched scale markings graduated in psi.

12. Pointer: Dark-colored metal.

13. Window: Glass.

14. Ring: Brass or Stainless steel.

15. Accuracy: Grade A, plus or minus 1 percent of middle half of scale range.

2.06 GAGE ATTACHMENTS:

A. Snubbers: ASME B40.100, brass; ASME B1.20.1 pipe threads and piston surge-dampening device. Include extension for use on insulated piping.

B. Siphons: Loop-shaped section of stainless-steel pipe.

C. Valves: Brass ball, with ASME B1.20.1 pipe threads.

PART 3 - EXECUTION

3.01 INSTALLATION:

A. Install thermowells with socket extending a minimum of one-third of pipe diameter and in vertical position in piping tees.

B. Install thermowells of sizes required to match thermometer connectors. Include bushings if required to match sizes.

C. Install thermowells with extension on insulated piping.

D. Fill thermowells with heat-transfer medium.

E. Install direct-mounted thermometers in thermowells and adjust vertical and tilted positions.

F. Install remote-mounted thermometer bulbs in thermowells and install cases on panels; connect cases with tubing and support tubing to prevent kinks. Use minimum tubing length.

G. Install duct-thermometer mounting brackets in walls of ducts. Attach to duct with screws.

H. Install direct-mounted pressure gages in piping tees with pressure gage located on pipe at the most readable position.

I. Install remote-mounted pressure gages on panel.

J. Install valve and snubber in piping for each pressure gage for fluids.

K. Assemble and install connections, tubing, and accessories between flow-measuring elements and flowmeters according to manufacturer's written instructions.

L. Install permanent indicators on walls or brackets in accessible and readable positions.

M. Install connection fittings in accessible locations for attachment to portable indicators.

N. Install thermometers in the following locations:

1. Other locations as indicated.

O. Install pressure gages in the following locations:

1. Discharge of each pressure-reducing valve.

2. Suction and discharge of each pump.

3.02 CONNECTIONS:

A. Install meters and gages adjacent to machines and equipment to allow space for service and maintenance of meters, gages, machines, and equipment.

3.03 ADJUSTING:

A. Adjust faces of meters and gages to proper angle for best visibility.

3.04 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 23 05 29

HANGERS AND SUPPORTS FOR HVAC PIPING AND EQUIPMENT

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide hangers and supports for HVAC piping and equipment as indicated and in compliance with Contract Documents.

B. Section Includes:

1. Metal pipe hangers and supports

2. Trapeze pipe hangers

3. Metal framing systems

4. Thermal-hanger shield inserts

5. Fastener systems

6. Pipe stands

7. Equipment supports

1.03 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Product Data: For each type of product.

C. Shop Drawings: Signed and sealed by a qualified Professional Engineer. Show fabrication and installation details and include calculations for the following; include Product Data for components:

1. Trapeze pipe hangers

2. Metal framing systems

3. Pipe stands

4. Equipment supports

D. Delegated-Design Submittal: For trapeze hangers indicated to comply with performance requirements and design criteria, including analysis data signed and sealed by the qualified professional engineer responsible for their preparation.

1. Detail fabrication and assembly of trapeze hangers.

2. Include design calculations for designing trapeze hangers.

E. Welding certificates.

1.04 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.05 SPARE PARTS:

A. Comply with the requirements specified in Section 01 61 00.

1.06 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

B. Structural-Steel Welding Qualifications: Qualify procedures and personnel according to AWS D1.1, "Structural Welding Code - Steel."

C. Pipe Welding Qualifications: Qualify procedures and operators according to ASME Boiler and Pressure Vessel Code, Section IX.

1.07 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

PART 2 - PRODUCTS

2.01 PERFORMANCE REQUIREMENTS:

A. Delegated Design: Engage a qualified professional engineer, as defined in Section 01 45 00, to design trapeze pipe hangers and equipment supports.

B. Structural Performance: Hangers and supports for HVAC piping and equipment shall withstand the effects of gravity loads and stresses within limits and under conditions indicated according to ASCE/SEI 7.

1. Design supports for multiple pipes, including pipe stands, capable of supporting combined weight of supported systems, system contents, and test water.

2. Design equipment supports capable of supporting combined operating weight of supported equipment and connected systems and components.

3. Design seismic-restraint hangers and supports for piping and equipment and obtain approval from authorities having jurisdiction.

2.02 METAL PIPE HANGERS AND SUPPORTS:

A. Carbon-Steel Pipe Hangers and Supports:

1. Description: MSS SP-58, Types 1 through 58, factory-fabricated components.

2. Galvanized Metallic Coatings: Pre-galvanized, hot-dip galvanized, or electro-galvanized.

3. Nonmetallic Coatings: Plastic coated, or epoxy powder-coated.

4. Padded Hangers: Hanger with fiberglass or other pipe insulation pad or cushion to support bearing surface of piping.

5. Hanger Rods: Continuous-thread rod, nuts, and washer made of carbon steel.

B. Stainless-Steel Pipe Hangers and Supports:

1. Description: MSS SP-58, Types 1 through 58, factory-fabricated components.

2. Padded Hangers: Hanger with fiberglass or other pipe insulation pad or cushion to support bearing surface of piping.

3. Hanger Rods: Continuous-thread rod, nuts, and washer made of stainless steel.

C. Copper Pipe and Tube Hangers:

1. Description: MSS SP-58, Types 1 through 58, copper-plated steel, factory-fabricated components.

2. Hanger Rods: Continuous-thread rod, nuts, and washer made of stainless steel.

2.03 TRAPEZE PIPE HANGERS:

A. Description: MSS SP-58, Type 59, shop- or field-fabricated pipe-support assembly made from structural carbon-steel shapes with MSS SP-58 carbon-steel hanger rods, nuts, saddles, and U-bolts.

2.04 METAL FRAMING SYSTEMS:

A. MFMA Manufacturer Metal Framing Systems:

1. Description: Shop- or field-fabricated, pipe-support assembly made of steel channels, accessories, fittings, and other components for supporting multiple parallel pipes.

2. Standard: Comply with MFMA-4 factory-fabricated components for field assembly.

3. Channels: Continuous slotted carbon-steel channel with inturned lips.

4. Channel Width: Selected for applicable load criteria.

5. Channel Nuts: Formed or stamped nuts or other devices designed to fit into channel slot and, when tightened, prevent slipping along channel.

6. Hanger Rods: Continuous-thread rod, nuts, and washer made of carbon steel.

7. Metallic Coating: Hot-dip galvanized.

2.05 THERMAL-HANGER SHIELD INSERTS:

A. Insulation-Insert Material for Cold Piping: ASTM C552, Type II cellular glass with 100-psi or ASTM C591, Type VI, Grade 1 polyisocyanurate with 125-psi minimum compressive strength and vapor barrier.

B. Insulation-Insert Material for Hot Piping: ASTM C552, Type II cellular glass with 100-psi or ASTM C591, Type VI, Grade 1 polyisocyanurate with 125-psi minimum compressive strength.

C. For Trapeze or Clamped Systems: Insert and shield shall cover entire circumference of pipe.

D. For Clevis or Band Hangers: Insert and shield shall cover lower 180 degrees of pipe.

E. Insert Length: Extend 2 inches beyond sheet metal shield for piping operating below ambient air temperature.

2.06 FASTENER SYSTEMS:

A. Powder-Actuated Fasteners: Threaded-steel stud, for use in hardened Portland cement concrete with pull-out, tension, and shear capacities appropriate for supported loads and building materials where used.

B. Mechanical-Expansion Anchors: Insert-wedge-type anchors for use in hardened Portland cement concrete; with pull-out, tension, and shear capacities appropriate for supported loads and building materials where used.

1. Indoor Applications: Stainless steel

2. Outdoor Applications: Stainless steel

2.07 PIPE STANDS:

A. General Requirements for Pipe Stands: Shop- or field-fabricated assemblies made of manufactured corrosion-resistant components to support roof-mounted piping.

B. Compact Pipe Stand:

1. Description: Single base unit with integral-rod roller, pipe clamps, or V-shaped cradle to support pipe, for roof installation without membrane penetration.

2. Base: Single, vulcanized rubber, molded polypropylene, or polycarbonate

3. Hardware: Galvanized steel or polycarbonate

4. Accessories: Protection pads

C. Low-Profile, Single Base, Single-Pipe Stand:

1. Description: Single base with vertical and horizontal members, and pipe support, for roof installation without membrane protection.

2. Base: Single, vulcanized rubber, molded polypropylene, or polycarbonate

3. Vertical Members: Two, galvanized steel, continuous-thread 1/2-inch rods

4. Horizontal Member: Adjustable horizontal, galvanized steel pipe support channels

5. Pipe Supports: Strut clamps

6. Hardware: Galvanized steel

7. Accessories: Protection pads

8. Height: 12 inches above roof

D. High-Profile, Multiple-Pipe Stand:

1. Description: Assembly of bases, vertical and horizontal members, and pipe supports, for roof installation without membrane penetration.

2. Bases: Two or more; vulcanized rubber

3. Vertical Members: Two or more, galvanized steel channels

4. Horizontal Members: One or more, adjustable height, galvanized steel pipe support

5. Pipe Supports: Strut clamps

6. Hardware: Galvanized steel

7. Height: 36 inches above roof

E. Curb-Mounted-Type Pipe Stands: Shop- or field-fabricated pipe supports made from structural-steel shapes, continuous-thread rods, and rollers, for mounting on permanent stationary roof curb.

2.08 EQUIPMENT SUPPORTS:

A. Description: Welded, shop- or field-fabricated equipment support made from structural carbon-steel shapes.

2.09 MATERIALS:

A. Aluminum: ASTM B221

B. Carbon Steel: ASTM A1011

C. Structural Steel: ASTM A36, carbon-steel plates, shapes, and bars; galvanized

D. Stainless Steel: ASTM A240

E. Threaded Rods: Continuously threaded. Zinc-plated or galvanized steel for indoor applications and stainless steel for outdoor applications. Mating nuts and washers of similar materials as rods.

F. Grout: ASTM C1107, factory-mixed and -packaged, dry, hydraulic-cement, non-shrink and non-metallic grout; suitable for interior and exterior applications.

1. Properties: Non-staining, non-corrosive, and non-gaseous

2. Design Mix: 5000-psi, 28-day compressive strength

PART 3 - EXECUTION

3.01 APPLICATION:

A. Comply with requirements in Section 07 84 00 for firestopping materials and installation for penetrations through fire-rated walls, ceilings, and assemblies.

B. Strength of Support Assemblies: Where not indicated, select sizes of components so strength will be adequate to carry present and future static loads within specified loading limits. Minimum static design load used for strength determination shall be weight of supported components plus 200 pounds.

3.02 HANGER AND SUPPORT INSTALLATION:

A. Metal Pipe-Hanger Installation: Comply with MSS SP-58. Install hangers, supports, clamps, and attachments as required to properly support piping from the building structure.

B. Metal Trapeze Pipe-Hanger Installation: Comply with MSS SP-58. Arrange for grouping of parallel runs of horizontal piping, and support together on field-fabricated trapeze pipe hangers.

1. Pipes of Various Sizes: Support together and space trapezes for smallest pipe size or install intermediate supports for smaller diameter pipes as specified for individual pipe hangers.

2. Field fabricate from ASTM A36, carbon-steel shapes selected for loads being supported. Weld steel according to AWS D1.1.

C. Metal Framing System Installation: Arrange for grouping of parallel runs of piping, and support together on field-assembled strut systems.

D. Thermal-Hanger Shield Installation: Install in pipe hanger or shield for insulated piping.

E. Fastener System Installation:

1. Install powder-actuated fasteners for use in lightweight concrete or concrete slabs less than 4 inches thick in concrete after concrete is placed and completely cured. Use operators that are licensed by powder-actuated tool manufacturer. Install fasteners according to powder-actuated tool manufacturer's operating manual.

2. Install mechanical-expansion anchors in concrete after concrete is placed and completely cured. Install fasteners according to manufacturer's written instructions.

F. Pipe Stand Installation:

1. Pipe Stand Types except Curb-Mounted Type: Assemble components and mount on smooth roof surface. Do not penetrate roof membrane.

2. Curb-Mounted-Type Pipe Stands: Assemble components or fabricate pipe stand and mount on permanent, stationary roof curb. See Section 07 72 00 for curbs.

G. Install hangers and supports complete with necessary attachments, inserts, bolts, rods, nuts, washers, and other accessories.

H. Equipment Support Installation: Fabricate from welded-structural-steel shapes.

I. Install hangers and supports to allow controlled thermal and seismic movement of piping systems, to permit freedom of movement between pipe anchors, and to facilitate action of expansion joints, expansion loops, expansion bends, and similar units.

J. Install lateral bracing with pipe hangers and supports to prevent swaying.

K. Install building attachments within concrete slabs or attach to structural steel. Install additional attachments at concentrated loads, including valves, flanges, and strainers, NPS 2-1/2 and larger and at changes in direction of piping. Install concrete inserts before concrete is placed; fasten inserts to forms and install reinforcing bars through openings at top of inserts.

L. Load Distribution: Install hangers and supports so that piping live and dead loads and stresses from movement will not be transmitted to connected equipment.

M. Pipe Slopes: Install hangers and supports to provide indicated pipe slopes and to not exceed maximum pipe deflections allowed by ASME B31.9 for building services piping.

N. Insulated Piping:

1. Attach clamps and spacers to piping.

a. Piping Operating above Ambient Air Temperature: Clamp may project through insulation.

b. Piping Operating below Ambient Air Temperature: Use thermal-hanger shield insert with clamp sized to match OD of insert.

c. Do not exceed pipe stress limits allowed by ASME B31.9 for building services piping.

2. Install MSS SP-58, Type 39, protection saddles if insulation without vapor barrier is indicated. Fill interior voids with insulation that matches adjoining insulation.

    a. Option: Thermal-hanger shield inserts may be used. Include steel weight-distribution plate for pipe NPS 4 and larger if pipe is installed on rollers.

3. Install MSS SP-58, Type 40, protective shields on cold piping with vapor barrier. Shields shall span an arc of 180 degrees.

    a. Option: Thermal-hanger shield inserts may be used. Include steel weight-distribution plate for pipe NPS 4 and larger if pipe is installed on rollers.

4. Shield Dimensions for Pipe: Not less than the following:

    a. NPS 1/4 to NPS 3-1/2: 12 inches long and 0.048 inch thick

    b. NPS 4: 12 inches long and 0.06 inch thick

    c. NPS 5 and NPS 6: 18 inches long and 0.06 inch thick

    d. NPS 8 to NPS 14: 24 inches long and 0.075 inch thick

    e. NPS 16 to NPS 24: 24 inches long and 0.105 inch thick

5. Pipes NPS 8 and Larger: Include wood or reinforced calcium-silicate-insulation inserts of length at least as long as protective shield.

6. Thermal-Hanger Shields: Install with insulation same thickness as piping insulation.

3.03 EQUIPMENT SUPPORTS:

A. Fabricate structural-steel stands to suspend equipment from structure overhead or to support equipment above floor.

B. Grouting: Place grout under supports for equipment and make bearing surface smooth.

C. Provide lateral bracing, to prevent swaying, for equipment supports.

3.04 METAL FABRICATIONS:

A. Cut, drill, and fit miscellaneous metal fabrications for trapeze pipe hangers and equipment supports.

B. Fit exposed connections together to form hairline joints. Field weld connections that cannot be shop welded because of shipping size limitations.

C. Field Welding: Comply with AWS D1.1 procedures for shielded, metal arc welding; appearance and quality of welds; and methods used in correcting welding work; and with the following:

1. Use materials and methods that minimize distortion and develop strength and corrosion resistance of base metals.

2. Obtain fusion without undercut or overlap.

3. Remove welding flux immediately.

4. Finish welds at exposed connections so no roughness shows after finishing and so contours of welded surfaces match adjacent contours.

3.05 ADJUSTING:

A. Hanger Adjustments: Adjust hangers to distribute loads equally on attachments and to achieve indicated slope of pipe.

B. Trim excess length of continuous-thread hanger and support rods to 1-1/2 inches.

3.06 PAINTING:

A. Touchup: Clean field welds and abraded areas of shop paint. Paint exposed areas immediately after erecting hangers and supports. Use same materials as used for shop painting. Comply with SSPC-PA 1 requirements for touching up field-painted surfaces.

1. Apply paint by brush or spray to provide a minimum dry film thickness of 2.0 mils.

B. Galvanized Surfaces: Clean welds, bolted connections, and abraded areas and apply galvanizing-repair paint to comply with ASTM A780.

3.07 HANGER AND SUPPORT SCHEDULE:

A. Specific hanger and support requirements are in Sections specifying piping systems and equipment.

B. Comply with MSS SP-58 for pipe-hanger selections and applications that are not specified in piping system Sections.

C. Use hangers and supports with galvanized metallic coatings for piping and equipment that will not have field-applied finish.

D. Use nonmetallic coatings on attachments for electrolytic protection where attachments are in direct contact with copper tubing.

E. Use carbon-steel pipe hangers and supports metal trapeze pipe hangers and metal framing systems and attachments for general service applications.

F. Use stainless-steel pipe hangers and stainless-steel attachments for hostile environment applications:

1. Wet Well

G. Use copper-plated pipe hangers and stainless-steel attachments for copper piping and tubing.

H. Use padded hangers for piping that is subject to scratching.

I. Use thermal-hanger shield inserts for insulated piping and tubing.

J. Horizontal-Piping Hangers and Supports: Unless otherwise indicated and except as specified in piping system Sections, install the following types:

1. Adjustable, Steel Clevis Hangers (MSS Type 1): For suspension of non-insulated or insulated, stationary pipes NPS 1/2 to NPS 30.

2. Carbon- or Alloy-Steel, Double-Bolt Pipe Clamps (MSS Type 3): For suspension of pipes NPS 3/4 to NPS 36, requiring clamp flexibility and up to 4 inches of insulation.

3. Steel Pipe Clamps (MSS Type 4): For suspension of cold and hot pipes NPS 1/2 to NPS 24 if little or no insulation is required.

4. Pipe Hangers (MSS Type 5): For suspension of pipes NPS 1/2 to NPS 4, to allow off-center closure for hanger installation before pipe erection.

5. Adjustable, Swivel Split- or Solid-Ring Hangers (MSS Type 6): For suspension of non-insulated, stationary pipes NPS 3/4 to NPS 8.

6. Adjustable, Steel Band Hangers (MSS Type 7): For suspension of non-insulated, stationary pipes NPS 1/2 to NPS 8.

7. Adjustable Band Hangers (MSS Type 9): For suspension of non-insulated, stationary pipes NPS 1/2 to NPS 8.

8. Adjustable, Swivel-Ring Band Hangers (MSS Type 10): For suspension of non-insulated, stationary pipes NPS 1/2 to NPS 8.

9. Split Pipe Ring with or without Turnbuckle Hangers (MSS Type 11): For suspension of non-insulated, stationary pipes NPS 3/8 to NPS 8.

10. Extension Hinged or Two-Bolt Split Pipe Clamps (MSS Type 12): For suspension of non-insulated, stationary pipes NPS 3/8 to NPS 3.

11. U-Bolts (MSS Type 24): For support of heavy pipes NPS 1/2 to NPS 30.

12. Clips (MSS Type 26): For support of insulated pipes not subject to expansion or contraction.

13. Pipe Saddle Supports (MSS Type 36): For support of pipes NPS 4 to NPS 36, with steel-pipe base stanchion support and cast-iron floor flange or carbon-steel plate.

14. Pipe Stanchion Saddles (MSS Type 37): For support of pipes NPS 4 to NPS 36, with steel-pipe base stanchion support and cast-iron floor flange or carbon-steel plate, and with U-bolt to retain pipe.

15. Adjustable Pipe Saddle Supports (MSS Type 38): For stanchion-type support for pipes NPS 2-1/2 to NPS 36 if vertical adjustment is required, with steel-pipe base stanchion support and cast-iron floor flange.

16. Single-Pipe Rolls (MSS Type 41): For suspension of pipes NPS 1 to NPS 30, from two rods if longitudinal movement caused by expansion and contraction might occur.

17. Adjustable Roller Hangers (MSS Type 43): For suspension of pipes NPS 2-1/2 to NPS 24, from single rod if horizontal movement caused by expansion and contraction might occur.

18. Complete Pipe Rolls (MSS Type 44): For support of pipes NPS 2 to NPS 42 if longitudinal movement caused by expansion and contraction might occur but vertical adjustment is unnecessary.

19. Pipe Roll and Plate Units (MSS Type 45): For support of pipes NPS 2 to NPS 24 if small horizontal movement caused by expansion and contraction might occur and vertical adjustment is unnecessary.

20. Adjustable Pipe Roll and Base Units (MSS Type 46): For support of pipes NPS 2 to NPS 30 if vertical and lateral adjustment during installation might be required in addition to expansion and contraction.

K. Vertical-Piping Clamps: Unless otherwise indicated and except as specified in piping system Sections, install the following types:

1. Extension Pipe or Riser Clamps (MSS Type 8): For support of pipe risers NPS 3/4 to NPS 24.

2. Carbon- or Alloy-Steel Riser Clamps (MSS Type 42): For support of pipe risers NPS 3/4 to NPS 24 if longer ends are required for riser clamps.

L. Hanger-Rod Attachments: Unless otherwise indicated and except as specified in piping system Sections, install the following types:

1. Steel Turnbuckles (MSS Type 13): For adjustment up to 6 inches for heavy loads.

2. Steel Clevises (MSS Type 14): For 120 to 450 degrees F piping installations.

3. Swivel Turnbuckles (MSS Type 15): For use with MSS Type 11, split pipe rings.

4. Malleable-Iron Sockets (MSS Type 16): For attaching hanger rods to various types of building attachments.

5. Steel Weldless Eye Nuts (MSS Type 17): For 120 to 450 degrees F piping installations.

M. Building Attachments: Unless otherwise indicated and except as specified in piping system Sections, install the following types:

1. Steel or Malleable Concrete Inserts (MSS Type 18): For upper attachment to suspend pipe hangers from concrete ceiling.

2. Top-Beam C-Clamps (MSS Type 19): For use under roof installations with bar-joist construction, to attach to top flange of structural shape.

3. Side-Beam or Channel Clamps (MSS Type 20): For attaching to bottom flange of beams, channels, or angles.

4. Center-Beam Clamps (MSS Type 21): For attaching to center of bottom flange of beams.

5. Welded Beam Attachments (MSS Type 22): For attaching to bottom of beams if loads are considerable and rod sizes are large.

6. C-Clamps (MSS Type 23): For structural shapes.

7. Top-Beam Clamps (MSS Type 25): For top of beams if hanger rod is required tangent to flange edge.

8. Side-Beam Clamps (MSS Type 27): For bottom of steel I-beams.

9. Steel-Beam Clamps with Eye Nuts (MSS Type 28): For attaching to bottom of steel I-beams for heavy loads.

10. Linked-Steel Clamps with Eye Nuts (MSS Type 29): For attaching to bottom of steel I-beams for heavy loads, with link extensions.

11. Malleable-Beam Clamps with Extension Pieces (MSS Type 30): For attaching to structural steel.

12. Welded-Steel Brackets: For support of pipes from below or for suspending from above by using clip and rod. Use one of the following for indicated loads:

a. Light (MSS Type 31): 750 pounds

b. Medium (MSS Type 32): 1500 pounds

c. Heavy (MSS Type 33): 3000 pounds

13. Side-Beam Brackets (MSS Type 34): For sides of steel or wooden beams.

14. Plate Lugs (MSS Type 57): For attaching to steel beams if flexibility at beam is required.

15. Horizontal Travelers (MSS Type 58): For supporting piping systems subject to linear horizontal movement where headroom is limited.

N. Saddles and Shields: Unless otherwise indicated and except as specified in piping system Sections, install the following types:

1. Steel-Pipe-Covering Protection Saddles (MSS Type 39): To fill interior voids with insulation that matches adjoining insulation.

2. Protection Shields (MSS Type 40): Of length recommended in writing by manufacturer to prevent crushing insulation.

3. Thermal-Hanger Shield Inserts: For supporting insulated pipe.

O. Spring Hangers and Supports: Unless otherwise indicated and except as specified in piping system Sections, install the following types:

1. Restraint-Control Devices (MSS Type 47): Where indicated to control piping movement.

2. Spring Cushions (MSS Type 48): For light loads if vertical movement does not exceed 1-1/4 inches.

3. Spring-Cushion Roll Hangers (MSS Type 49): For equipping Type 41, roll hanger with springs.

4. Spring Sway Braces (MSS Type 50): To retard sway, shock, vibration, or thermal expansion in piping systems.

5. Variable-Spring Hangers (MSS Type 51): Preset to indicated load and limit variability factor to 25 percent to allow expansion and contraction of piping system from hanger.

6. Variable-Spring Base Supports (MSS Type 52): Preset to indicated load and limit variability factor to 25 percent to allow expansion and contraction of piping system from base support.

7. Variable-Spring Trapeze Hangers (MSS Type 53): Preset to indicated load and limit variability factor to 25 percent to allow expansion and contraction of piping system from trapeze support.

8. Constant Supports: For critical piping stress and if necessary to avoid transfer of stress from one support to another support, critical terminal, or connected equipment. Include auxiliary stops for erection, hydrostatic test, and load-adjustment capability. These supports include the following types:

   a. Horizontal (MSS Type 54): Mounted horizontally

   b. Vertical (MSS Type 55): Mounted vertically

   c. Trapeze (MSS Type 56): Two vertical-type supports and one trapeze member

P. Comply with MSS SP-58 for trapeze pipe-hanger selections and applications that are not specified in piping system sections.

Q. Comply with MFMA-103 for metal framing system selections and applications that are not specified in piping system sections.

R. Use powder-actuated fasteners or mechanical-expansion anchors instead of building attachments where required in concrete construction.

3.08 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 23 05 48

VIBRATION ISOLATION AND SEISMIC CONTROL

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide vibration isolation and seismic control as indicated and in compliance with Contract Documents.

1.02 REFERENCES:

A. ASTM International (ASTM):

1. A36: Standard Specification for Carbon Structural Steel

2. E488: Standard Test Methods for Strength of Anchors in Concrete and Masonry Elements

B. Conform to latest edition of CSA W59 for welding.

C. Sheet Metal and Air Conditioning Contractors' National Association (SMACNA):

1. Seismic Restraint Manual; Guidelines for Mechanical Systems

2. HVAC Duct Construction Standards Metal and Flexible

D. Vibration Isolation and Seismic Control Manufacturers Association (VISCMA).

1.03 DEFINITIONS:

A. AHJ: Authority Having Jurisdiction

B. EPDM: Ethylene-Propylene-Diene Monomer

C. Withstand: Unit will remain in place without separation of any parts from the device when subjected to seismic forces specified.

1.04 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Delegated Design Submittals: For each device, equipment or appurtenance provide written certification from Professional Engineer licensed in the State of Utah stating that supports systems and anchorage for equipment have been designed according to the requirements of Section 1613 of the building codes of Utah, Salt Lake City and

ASCE/SEI 7, and in accordance with Specification 01 41 20. Submit calculations stamped by a Professional Engineer licensed in the State of Utah for support systems and anchorage for wind, seismic, and all other pertinent loads.

1. Seismic-Restraint Details:

    a. Design Analysis: To support selection and arrangement of seismic restraints. Include calculations of combined tensile and shear loads.

    b. Details: Indicate fabrication and arrangement. Detail attachments of restraints to the restrained items and to the structure. Show attachment locations, methods, and spacings. Identify components, list their strengths, and indicate directions and values of forces transmitted to the structure during seismic events. Indicate association with vibration isolation devices.

    c. Coordinate seismic-restraint and vibration isolation details with wind-restraint details required for equipment mounted outdoors. Comply with requirements in other Sections for equipment mounted outdoors.

    d. Preapproval and Evaluation Documentation: By an agency acceptable to authorities having jurisdiction, showing maximum ratings of restraint items and the basis for approval (tests or calculations).

2. Seismic Qualification Certificates:

    a. For pumps, accessories, and components, from manufacturer.

        (1) Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.

        (2) Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.

        (3) Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.

    b. For steel water storage tanks, accessories, and components, from manufacturer.

        (1) Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.

        (2) Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.

        (3) Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.

c. For air handling units and energy recovery units, accessories, and components, from manufacturer.

(1) Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.

(2) Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.

(3) Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.

d. Hot water heaters, accessories, and components, from manufacturer.

(1) Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.

(2) Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.

(3) Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.

C. Shop Drawings, Vibration Isolators:

1. Complete set of approved shop drawings of mechanical equipment, piping, and ductwork equipment which is to be isolated.

2. Include, as a minimum, basic equipment layout, length and width, installed operating weights of equipment to be isolated and distribution of weight at isolation points.

3. Product Data:

a. Manufacturer's product data including details of materials, construction, dimensions of individual components, installation details, and finishes.

b. Schedule of vibration isolator type with location and static and dynamic load on each.

c. Vibration Isolation Base Details:

(1) Detail fabrication, including anchorages and attachments to structure and to supported equipment.

(2) Include auxiliary motor slides and rails, base weights, equipment static loads, power transmission, component misalignment, and cantilever loads.

D. Shop Drawings, Seismic Control Components:

1. Complete set of approved shop drawings of mechanical equipment, piping, and ductwork equipment that is to be seismically restrained.

2. Include, as a minimum, basic equipment layout, length and width, installed operating weights of equipment to be isolated and distribution of weight at isolation points.

3. Signed and sealed by a licensed Professional Engineer licensed registered in the State of Utah.

4. Calculations (including combining shear and tensile loads) to support seismic restraint designs shall be signed and sealed by a qualified registered Professional Engineer.

5. Include, as a minimum, a tabulation of design data for each snubber, including specific anchorage details.

6. Detail fabrication and attachment of seismic restraints and snubbers. Show anchorage details and indicate quantity, diameter, and depth of penetration of anchors.

7. Product Data:

   a. Manufacturer's product data including details of materials, construction, dimensions of individual components, installation details, and finishes.

   b. Schedule of seismic control component type with location and static and dynamic load on each.

   c. Interlocking Snubbers: Include load deflection curves up to 1/2-inch deflection in x, y, and z planes.

E. Manufacturer's Installation Instructions: Indicate special procedures and setting dimensions.

F. Certifications:

1. Manufacturer's Certificate of Compliance, in accordance with Section 01 33 00.

2. Manufacturer's Certificate of Proper Installation, in accordance with Section 01 33 00.

3. Welding Certificates: Copies of certificates for welding procedures and personnel.

4. Manufacturer's Seismic Certification: Certification that specified equipment will withstand earthquake forces. Include the following:

   a. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculations.

   b. Dimensioned Outline Drawing of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.

   c. Detailed description of equipment anchorage devices on which certification is based and their installation requirements.

1.05 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.06 EXTRA MATERIALS:

A. Furnish extra materials described below which match products installed and that are packaged with protective covering for storage and identified with labels describing content.

   1. Seismic Snubber Units: Furnish replacement neoprene inserts for snubbers.

1.07 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

B. Qualify procedures and personnel according to AWS D1.1, "Structural Welding Code - Steel.".

C. Isolation materials, flexible connectors, and seismic restraints shall be same manufacturer. Select and certify using published or factory certified data.

D. Vibration isolation and seismic restraint manufacturer shall be a member of the Vibration Isolation and Seismic Control Manufacturer's Association (VISCMA).

E. Seismic Control:

   1. Designer Qualifications:

      a. Professional Engineer registered in the State of Utah.

      b. Minimum of 5 years' work experience certifying seismic snubber and anchorage details.

c. Components shall bear anchorage pre-approval “R” number, from OSHPD or other agency acceptable to AHJ, showing maximum seismic restraint ratings.

1.08 DESIGN REQUIREMENTS:

A. Seismic Control:

1. Design equipment, anchorage and support systems for vertical and lateral loading in accordance with Section 1613 of the building codes of Utah, Salt lake City and ASCE/SEI 7.

2. Provide seismic control as required to maintain integrity of mechanical piping, ductwork, and equipment installed in this project, so they will “withstand” earthquake forces.

3. Design shall comply with requirements of this Specification, applicable codes, and requirements of Section 01 41 20.

4. Design, size and install for equipment throughout facility, whether shown or not.

5. Designed by a licensed Professional Engineer in the State of Utah.

6. Seismic restraints shall conform to requirements of latest edition of SMACNA Seismic Restraint Manual.

1.09 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

PART 2 - PRODUCTS

2.01 MANUFACTURERS:

A. Mason Industries, Inc.

B. Vibro-Acoustics

C. Kinetics Noise Control Inc.

2.02 EQUIPMENT SCHEDULES:

A. Refer to Drawings and/or Shop Drawings for product type and capacities.

2.03 VIBRATION ISOLATION:

A. General:

1. Provide for mechanical piping, ductwork, and equipment as identified by this Specification.

2. Select in accordance with equipment, pipe, or duct weight distribution to produce reasonably uniform deflections.

3. Springs: Minimum horizontal stiffness equal to 75 percent vertical stiffness, with working deflection between 30 percent and 60 percent of maximum deflection.

B. Elastomeric Pad:

1. Oil-resistant and water-resistant elastomer or natural rubber waffle pads, arranged in single or multiple layers, molded with a nonslip pattern.

2. Waffle pads bonded each side of minimum 0.24 inch thick galvanized steel separator plate.

3. Height of waffle ribs shall not exceed 0.7 times width.

4. Maximum Loading: 60 psi.

5. Minimum Single Layer Thickness: 0.24 inches.

6. Separator plate of sufficient stiffness for uniform loading over pad area.

7. Factory cut to size that matches requirements of supported equipment.

8. Waffle Pad Material: Standard neoprene.

9. Number of Layers: As required to support equipment load; refer to manufacturer's data for load capacities.

C. Elastomeric Mount:

1. Double-deflection type, with molded, oil-resistant rubber or neoprene isolator elements.

2. Factory-drilled, encapsulated top plate for bolting to equipment.

3. Baseplate for bolting to structure.

D. Open Spring Isolator:

1. Freestanding, laterally stable, open-spring isolators.

2. Outside Spring Diameter: Not less than 80 percent of the compressed height of the spring at rated load.

3. Minimum Additional Travel: 50 percent of required deflection at rated load.

4. Lateral Stiffness: 80 percent minimum of rated vertical stiffness.

5. Overload Capacity: Support 200 percent of rated load, fully compressed, without deformation or failure.

6. Baseplate:

   a. Factory drilled for bolting to structure and bonded to 0.24 inches thick rubber isolator pad attached to baseplate underside.

   b. Limit floor load to 100 psig.

   c. Top Plate and Adjustment Bolt: Threaded top plate with adjustment bolt and cap screw to fasten and level equipment.

E. Restrained Spring Isolator:

1. Freestanding, steel, open-spring isolators with seismic restraint.

2. Housing: Steel with resilient vertical-limit stops to prevent spring extension due to wind loads or if weight is removed; factory-drilled baseplate bonded to 0.24 inch thick elastomeric isolator pad attached to baseplate underside; and adjustable equipment mounting and levelling bolt that acts as blocking during installation.

3. Outside Spring Diameter: 80 percent minimum of compressed height of spring at rated load.

4. Minimum Additional Travel: 50 percent of required deflection at rated load.

5. Lateral Stiffness: 80 percent minimum of the rated vertical stiffness.

6. Overload Capacity: Support 200 percent of rated load, fully compressed, without deformation or failure.

F. Elastomeric Hanger:

1. Double-deflection type.

2. Molded, oil-resistant rubber or neoprene isolator elements bonded to steel housing.

3. Threaded connections for hanger rods.

G. Spring Hanger:

1. Combination coil-spring and elastomeric-insert hanger with spring and insert in compression.

2. Frame: Steel, fabricated for connection to threaded hanger rods and to allow for a maximum of 30 degrees of angular hanger-rod misalignment without binding or reducing isolation efficiency.

3. Outside Spring Diameter: 80 percent minimum of compressed height of spring at rated load.

4. Minimum Additional Travel: 50 percent of required deflection at rated load.

5. Lateral Stiffness: 80 percent minimum of rated vertical stiffness.

6. Overload Capacity: Support 200 percent of rated load, fully compressed, without deformation or failure.

7. Elastomeric Element:

   a. Molded, oil-resistant rubber or neoprene.

   b. Steel washer-reinforced cup to support spring and bushing projecting through bottom of frame.

H. Thrust Limit:

1. Combination coil spring and elastomeric insert with spring and insert in compression and with a load stop.

2. Rod and angle-iron brackets for attaching to equipment.

3. Frame: Steel, fabricated for connection to threaded rods and to allow for a maximum of 30 degrees of angular rod misalignment without binding or reducing isolation efficiency.

4. Outside Spring Diameter: 80 percent minimum of compressed height of spring at rated load.

5. Minimum Additional Travel: 50 percent of required deflection at rated load.

6. Lateral Stiffness: 80 percent minimum of rated vertical stiffness.

7. Overload Capacity: Support 200 percent of rated load, fully compressed, without deformation or failure.

8. Elastomeric Element: Molded, oil-resistant rubber or neoprene.

9. Coil Spring: Factory set and field adjustable.

2.04 EQUIPMENT BASES:

A. Structural Steel Base:

1. Factory-fabricated, welded, structural steel base and rail.

2. Design Requirements:

a. Lowest possible mounting height with not less than 1 inch clearance above floor.

b. Provide equipment anchor bolts and auxiliary motor slide bases or rails.

c. Provide supports for suction and discharge elbows for pumps.

3. Structural Steel:

a. Steel shapes, plates, and bars complying with ASTM A36.

b. Bases shall have shape to accommodate supported equipment.

4. Support Brackets: Factory-welded steel angles on frame for outrigger isolation mountings and to provide for anchor bolts and equipment support.

B. Concrete Inertia Base:

1. Factory-fabricated, welded, structural steel base and rail ready for cast-in-place concrete.

2. Design Requirements:

a. Lowest possible mounting height with not less than 1 inch clearance above floor.

b. Provide equipment anchor bolts and auxiliary motor slide bases or rails.

c. Provide supports for suction and discharge elbows for pumps.

3. Structural Steel:

a. Steel shapes, plates, and bars complying with ASTM A36.

b. Bases shall have shape to accommodate supported equipment.

4. Support Brackets: Factory-welded steel angles on frame for outrigger isolation mountings and to provide for anchor bolts and equipment support.

5. Fabrication:

   a. Fabricate steel templates to hold equipment anchor-bolt sleeves and anchors in place during placement of concrete.

   b. Obtain anchor-bolt templates from supported equipment manufacturer.

6. Concrete: 4600 psi

C. Rooftop Isolation Rails:

1. Factory-assembled, fully enclosed, insulated, airtight, and watertight curb rail designed to resiliently support equipment.

2. Lower Support Assembly:

   a. Sheet metal "Z" section containing adjustable and removable steel springs that support upper floating frame.

   b. Upper frame shall provide continuous support for equipment and shall be captive to resiliently resist wind and seismic forces.

   c. Provide means for attaching to building structure and a wood nailer for attaching roof materials.

   d. Insulated with a minimum of 2 inches of rigid, glass-fiber insulation on inside of assembly.

3. Isolators:

   a. Adjustable, restrained spring type, mounted on elastomeric vibration isolation pads.

   b. Provide access ports, for level adjustment, with removable waterproof covers at isolator locations.

   c. Locate so they are accessible for adjustment during the life of the installation without interfering with the integrity of the roof.

   d. Restrained Spring Isolators:

      (1) Freestanding, steel, open-spring isolators with seismic restraint.

      (2) Housing: Steel with resilient vertical-limit stops and adjustable equipment mounting and levelling bolt.

      (3) Outside Spring Diameter: 80 percent minimum of compressed height of spring at rated load.

(4) Minimum Additional Travel: 50 percent of required deflection at rated load.

(5) Lateral Stiffness: 80 percent minimum of rated vertical stiffness.

(6) Overload Capacity: Support 200 percent of rated load, fully compressed, without deformation or failure.

e. Elastomeric Isolator Pads:

(1) Oil-resistant and water-resistant elastomer or natural rubber, arranged in single of multiple layers, molded with a nonslip pattern.

(2) Single Layer Thickness: Minimum 0.24 inches

(3) Galvanized steel baseplates of sufficient stiffness for uniform loading over pad area, and factory cut to size that match requirements of supported equipment.

(4) Material: Standard neoprene

(5) Number of Layers: As required to support equipment load; refer to manufacturer's data for load capacities.

f. Snubber Bushings: All-directional, elastomeric snubber bushings at least 0.24 inches thick.

g. Water Seal: Galvanized sheet metal with EPDM seals at corners, attached to upper support frame, extending down past wood nailer of lower support assembly, and counter-flashed over roof materials.

2.05 FLEXIBLE CONNECTORS:

A. Flexible Pipe Connectors:

1. Braided Nonferrous: For nonferrous piping systems, provide bronze hose covered with bronze wire braid with copper tube ends or bronze flanged ends, braze-welded to hose.

2. Braided Stainless Steel: For ferrous piping, provide stainless steel hose covered with Type 304 stainless steel wire braid with NPT steel nipples or 150 psi ANSI flanges, welded to hose.

3. Rubber:

a. Neoprene or EDPM construction consisting of multiple piles of nylon tire cord fabric and elastomer, molded and cured in hydraulic rubber presses.

b. Straight or elbow connector as indicated on the Drawings, rated at 120 psi at 219.2 degrees F.

B. Flexible Duct Connectors: Refer to Section 23 33 00.

2.06 SEISMIC RESTRAINTS:

A. Resilient Isolation Washers and Bushings: One-piece, molded neoprene, having a durometer 50, plus or minus 5, with a flat washer face.

B. Seismic Snubbers: Factory fabricated using welded structural steel shapes and plates, anchor bolts, and replaceable resilient isolation washers and bushings.

C. Restraining Cables: Galvanized steel aircraft cables with end connections made of steel assemblies that swivel to final installation angle and utilize two clamping bolts for cable engagement.

D. Anchor Bolts:

1. Seismic-rated, drill-in, and stud-wedge or female-wedge type.

2. Select anchor bolts with strength required for anchor and as tested according to ASTM E488.

2.07 SHOP/FACTORY FINISHING:

A. Manufacturer's standard paint applied to factory-assembled and factory-tested equipment, before shipping.

B. Powder coating on springs and housings.

C. Electro-galvanize hardware.

D. Hot-dip galvanize metal components for exterior use.

E. Baked enamel coat metal components for interior use.

F. Color-code or otherwise mark vibration isolation and seismic control devices to indicate capacity range.

PART 3 - EXECUTION

3.01 EXAMINATION:

A. Examine areas and equipment to receive vibration isolation and seismic control devices for compliance with requirements, installation tolerances, and other conditions affecting performance.

B. Examine roughing-in of reinforcement and cast-in-place anchors to verify actual locations before installation.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 INSTALLATION:

A. General:

1. Install products in accordance with manufacturers' written instructions.

2. Connect wiring to isolated equipment with flexible hanging loop.

3. Install roof curbs, equipment supports, and roof penetrations as specified in Section 07 60 00.

4. Install thrust limits at centerline of thrust, symmetrical on either side of equipment.

5. Locate isolation hangers as near overhead support structure as possible.

B. Multiple Pipe Supports: Secure pipes to trapeze member with clamps approved for application by agency acceptable to authorities having jurisdiction.

C. Hanger-Rod Stiffeners: Install hanger-rod stiffeners where indicated or scheduled on Drawings to receive them and where required to prevent buckling of hanger rods due to seismic forces.

D. Strength of Support and Seismic-Restraint Assemblies: Where not indicated, select sizes of components so strength is adequate to carry present and future static and seismic loads within specified loading limits.

E. Hangers and Supports for HVAC Piping and Equipment: Comply with requirements in Section 23 05 29 and those indicated below:

1. Delegated Design: Design trapeze pipe hangers and equipment supports, including comprehensive engineering analysis by a qualified professional engineer, using performance requirements and design criteria indicated.

a. Structural Performance: Hangers and supports for plumbing piping and equipment shall withstand the effects of gravity loads and stresses within limits and under conditions indicated according to ASCE/SEI 7.

(1) Design supports for multiple pipes, including pipe stands, capable of supporting combined weight of supported systems, system contents, and test water.

(2) Design equipment supports capable of supporting combined operating weight of supported equipment and connected systems and components.

(3) Design seismic-restraint hangers and supports for piping and equipment.

2. Install hangers and supports to allow controlled thermal and seismic movement of piping systems, to permit freedom of movement between pipe anchors, and to facilitate action of expansion joints, expansion loops, expansion bends, and similar units.

F. Metals Ducts: Comply with requirements in Section 23 31 13 and those indicated below:

1. Seismic Performance: Metal ductwork and support and installation shall withstand the effects of earthquake motions determined according to ASCE/SEI 7.

a. The term "withstand" means "the unit will remain in place without separation of any parts from the device when subjected to the seismic forces specified."

2. Install seismic restraints on ductwork.

G. Mechanical Equipment

1. In the sections below, seismic performance seismic for the mechanical equipment indicated shall withstand the effects of earthquake motions determined according to ASCE/SEI 7.

a. In each case, the term "withstand" means "the unit will remain in place without separation of any parts from the device when subjected to the seismic forces specified."

2. Fans and Accessories: Comply with requirements in Section 23 34 00 and those indicated below:

a. Isolation Curb Support: Install centrifugal fans on isolation curbs, and install flexible duct connectors and vibration isolation and seismic-control devices.

b. Comply with requirements in Section 23 33 00 for flexible duct connectors.

3. Air Conditioning Equipment: Comply with requirements indicated below:

a. Equipment Installation: Install air conditioning equipment with seismic-restraint devices.

b. Comply with requirements for hangers and supports specified in Section 23 05 29.

4. Indoor, Semi-Custom Air-Handling Units: Comply with requirements indicated below:

a. Design Calculations: Calculate requirements for selecting vibration isolators and seismic restraints and for designing vibration isolation bases.

b. Equipment Installation: Install air-handling units with seismic-restraint devices.

c. Install floor-mounted units on 4-inch (unless noted otherwise on drawings) high concrete base designed to withstand, without damage to equipment, seismic force required by code.

5. Dedicated, Outdoor Air-Handling Units: Comply with requirements indicated below:

a. Design Calculations: Calculate requirements for selecting vibration isolators and seismic restraints and for designing vibration isolation bases.

b. Equipment Installation: Install air-handling units with seismic-restraint devices.

c. Install floor-mounted units on 4-inch (unless noted otherwise on drawings) high concrete base designed to withstand, without damage to equipment, seismic force required by code.

H. Vibration Isolations:

1. Install spring hangers without binding.

2. On closed spring isolators, adjust so side stabilizers are clear under normal operating conditions.

I. Equipment Bases:

1. Adjust equipment level.

2. Bases with seismic snubbers shall have snubbers located close to isolators.

3. Structural Steel Bases: Set steel bases for 1 inch clearance between housekeeping pad and base.

4. Concrete Inertial Bases:

    a. Set concrete inertia bases for 2 inch clearance between housekeeping pad and base.

    b. Fill concrete inertia bases, after installing base frame, with concrete; trowel to a smooth finish.

J. Flexible Connectors: Prior to making piping connections to equipment with operating weights substantially different from installed weights, block up equipment with temporary shims to final height. When full load is applied, adjust isolators to load to allow shim removal.

K. Seismic Restraint Devices:

1. Notify local representative of seismic restraint materials manufacturer prior to installing seismic restraint devices.

2. Representative of seismic restraint materials manufacturer shall provide a written report of compliance with installed equipment.

3. No rigid connections between equipment and building structure shall be made which degrades seismic restraint system herein specified.

4. Electrical conduit to restrained equipment shall be looped to allow free motion of equipment without damage to electrical wiring.

5. Install seismic snubbers on isolated equipment.

6. Locate snubbers as close as possible to vibration isolators and bolt to equipment base and supporting structure.

7. Install restraining cables at each trapeze and individual pipe hanger. At trapeze anchor locations, shackle piping to trapeze. Install cables so they do not bend across sharp edges of adjacent equipment or building structure.

8. Install steel angles or channel, sized to prevent buckling, clamped with ductile-iron clamps to hanger rods for trapeze and individual pipe hangers.

9. At trapeze anchor locations, shackle piping and equipment to trapeze.

10. Install resilient bolt isolation washers on equipment anchor bolts.

11. Upon completion of seismic restraint material installation and before startup of restrained equipment, all debris shall be cleaned from beneath all protected equipment, leaving equipment free to contact snubbers.

3.03 FIELD QUALITY CONTROL:

A. Testing: Conduct the following field quality-control testing:

1. Isolator deflection

2. Isolator seismic-restraint clearance

3. Snubber minimum clearances

B. Seismic Control Component Inspection:

1. Conduct periodic inspections of material installation with assistance of manufacturer's representative. Report in writing deviations from good installation practice.

2. Upon completion of seismic restraint device installation inspect completed system with assistance of manufacturer's representative. Report in writing installation errors, improperly selected snubber devices, or other fault in the system that could affect performance of the system.

C. Manufacturer's Services:

1. Provide manufacturer's representative at Site in accordance with Section 01 33 00 for installation assistance, inspection and certification of proper installation, equipment testing, and startup assistance.

2. Manufacturer's representative present at Site for minimum person-days listed below, travel time excluded:

a. 3 person-days for installation assistance and inspection

b. 1 person-day for completion of Manufacturer's Certification of Proper Installation

3. Inspection and Report:

a. Inspect isolated equipment after installation

b. Include static deflections

c. Submit report

3.04 ADJUSTING:

A. Vibration Isolation Devices:

1. Adjust isolators after piping systems have been filled and equipment is at operating weight.

2. Adjust limit stops on restrained spring isolators to mount equipment at normal operating height.

3. After equipment installation is complete, adjust limit stops so they are out of contact during normal operation.

4. Attach thrust limits at centerline of thrust and adjust to a maximum of 6 mm movement during start and stop.

5. Adjust isolators to ensure units do not exceed rated operating deflections or bottom out under loading, and are not short circuited by other contacts or bearing points.

6. Adjust levelling devices as required to distribute loading uniformly on isolators. Shim units as required where levelling devices cannot be used to distribute loading properly.

B. Seismic Control Components:

1. Adjust snubbers according to manufacturer's written recommendations and additional corrections as required by the manufacturers' representative site visit per Paragraph 3.03.B.

2. Adjust seismic restraints to permit free movement of equipment within normal mode of operation.

3. Torque anchor bolts according to equipment manufacture's written recommendations to resist earthquake forces.

C. Cleaning:

1. After completing equipment installation, inspect vibration isolation and seismic-control devices. Remove paint splatters and other spots, dirt, and debris.

3.05 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

Page Intentionally Left Blank

SECTION 23 05 53

IDENTIFICATION FOR HVAC PIPING AND EQUIPMENT

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide equipment labels, warning signs and labels, pipe labels, duct labels, stencils, valve tags, warning tags as indicated and in compliance with Contract Documents.

1.02 REFERENCES:

A. American Society of Mechanical Engineers (ASME):

1. A13.1: Scheme for the Identification of Piping Systems

1.03 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Product Data: For each type of product.

C. Samples: For color, letter style, and graphic representation required for each identification material and device.

D. Equipment Label Schedule: Include a listing of all equipment to be labeled with the proposed content for each label.

E. Valve numbering scheme.

F. Valve Schedules: For each piping system to include in maintenance manuals.

1.04 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.05 SPARE PARTS:

A. Comply with the requirements specified in Section 01 61 00.

1.06 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

1.07 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

PART 2 - PRODUCTS

2.01 EQUIPMENT LABELS:

A. Metal Labels for Equipment:

1. Material and Thickness: Brass, 0.032-inch or aluminum, 0.032-inch minimum thickness, and having predrilled or stamped holes for attachment hardware.

2. Letter Color: Black

3. Background Color: White

4. Minimum Label Size: Length and width vary for required label content, but not less than 2-1/2 by 3/4 inch.

5. Minimum Letter Size: 1/4 inch for name of units if viewing distance is less than 24 inches, 1/2 inch for viewing distances up to 72 inches, and proportionately larger lettering for greater viewing distances. Include secondary lettering two-thirds to three-quarters the size of principal lettering.

6. Fasteners: Stainless-steel rivets or self-tapping screws.

7. Adhesive: Contact-type permanent adhesive, compatible with label and with substrate.

B. Plastic Labels for Equipment:

1. Material and Thickness: Multilayer, multicolor, plastic labels for mechanical engraving, 1/8 inch thick, and having predrilled holes for attachment hardware.

2. Letter Color: Black

3. Background Color: White

4. Maximum Temperature: Able to withstand temperatures up to 160 degrees F.

5. Minimum Label Size: Length and width vary for required label content, but not less than 2-1/2 by 3/4 inch.

6. Minimum Letter Size: 1/4 inch for name of units if viewing distance is less than 24 inches, 1/2 inch for viewing distances up to 72 inches, and proportionately larg-

er lettering for greater viewing distances. Include secondary lettering two-thirds to three-quarters the size of principal lettering.

7. Fasteners: Stainless-steel rivets or self-tapping screws.

8. Adhesive: Contact-type permanent adhesive, compatible with label and with substrate.

C. Label Content: Include equipment's Drawing designation or unique equipment number, Drawing numbers where equipment is indicated (plans, details, and schedules), and the Specification Section number and title where equipment is specified.

D. Equipment Label Schedule: For each item of equipment to be labeled, on 8-1/2 by 11-inch bond paper. Tabulate equipment identification number, and identify Drawing numbers where equipment is indicated (plans, details, and schedules) and the Specification Section number and title where equipment is specified. Equipment schedule shall be included in operation and maintenance data.

2.02 WARNING SIGNS AND LABELS:

A. Material and Thickness: Multilayer, multicolor, plastic labels for mechanical engraving, 1/8 inch thick, and having predrilled holes for attachment hardware.

B. Letter Color: Black

C. Background Color: Yellow

D. Maximum Temperature: Able to withstand temperatures up to 160 degrees F.

E. Minimum Label Size: Length and width vary for required label content, but not less than 3-1/2 by 1 inch.

F. Minimum Letter Size: 1/2 inch for viewing distances up to 48 inches, and proportionately larger lettering for greater viewing distances. Include secondary lettering two-thirds to three-quarters the size of principal lettering.

G. Fasteners: Stainless-steel rivets

H. Adhesive: Contact-type permanent adhesive, compatible with label and with substrate.

I. Label Content: Include caution and warning information plus emergency notification instructions.

2.03 PIPE LABELS:

A. General Requirements for Manufactured Pipe Labels: Preprinted, color-coded, with lettering indicating service, and showing flow direction according to ASME A13.1.

B. Pretensioned Pipe Labels: Precoiled, semirigid plastic formed to partially cover or cover full circumference of pipe and to attach to pipe without fasteners or adhesive.

C. Self-Adhesive Pipe Labels: Printed plastic with contact-type, permanent-adhesive backing.

D. Pipe Label Contents: Include identification of piping service using same designations or abbreviations as used on Drawings; also include pipe size and an arrow indicating flow direction.

1. Flow-Direction Arrows: Integral with piping system service lettering to accommodate both directions or as separate unit on each pipe label to indicate flow direction.

2. Lettering Size: Size letters according to ASME A13.1 for piping.

2.04 STENCILS:

A. Stencils for Piping:

1. Lettering Size: Size letters according to ASME A13.1 for piping

2. Stencil Material: Aluminum

3. Stencil Paint: Exterior, gloss, in colors complying with recommendations in ASME A13.1 unless otherwise indicated. Paint may be in pressurized spray-can form.

4. Identification Paint: Exterior, in colors according to ASME A13.1 unless otherwise indicated. Paint may be in pressurized spray-can form.

B. Stencils for Ducts:

1. Lettering Size: Minimum letter height of 1-1/4 inches for viewing distances up to 15 feet and proportionately larger lettering for greater viewing distances

2. Stencil Material: Aluminum

3. Stencil Paint: Exterior, gloss, acrylic enamel. Paint may be in pressurized spray-can form

4. Identification Paint: Exterior, acrylic enamel. Paint may be in pressurized spray-can form

C. Stencils for Access Panels and Door Labels, Equipment Labels, and Similar Operational Instructions:

1. Lettering Size: Minimum letter height of 1 inch for viewing distances up to 72 inches and proportionately larger lettering for greater viewing distances

2. Stencil Material: Aluminum

3. Stencil Paint: Exterior, gloss, acrylic enamel. Paint may be in pressurized spray-can form

4. Identification Paint: Exterior, acrylic enamel. Paint may be in pressurized spray-can form

2.05 VALVE TAGS:

A. Description: Stamped or engraved with 1/4-inch letters for piping system abbreviation and 1/2-inch numbers.

1. Tag Material: Brass, 0.032-inch minimum thickness, and having predrilled or stamped holes for attachment hardware

2. Fasteners: Brass beaded chain

B. Valve Schedules: For each piping system, on 8-1/2 by 11-inch bond paper. Tabulate valve number, piping system, system abbreviation (as shown on valve tag), location of valve (room or space), normal-operating position (open, closed, or modulating), and variations for identification. Mark valves for emergency shutoff and similar special uses.

1. Valve-tag schedule shall be included in operation and maintenance data.

2.06 WARNING TAGS:

A. Description: Preprinted or partially preprinted accident-prevention tags of plasticized card stock with matte finish suitable for writing.

1. Size: 3 by 5-1/4 inches minimum

2. Fasteners: Brass grommet and wire

3. Nomenclature: Large-size primary caption such as "DANGER," "CAUTION," or "DO NOT OPERATE"

4. Color: Safety-yellow background with black lettering

PART 3 - EXECUTION

3.01 PREPARATION:

A. Clean piping and equipment surfaces of substances that could impair bond of identification devices, including dirt, oil, grease, release agents, and incompatible primers, paints, and encapsulants.

3.02 GENERAL INSTALLATION REQUIREMENTS:

A. Coordinate installation of identifying devices with completion of covering and painting of surfaces where devices are to be applied.

B. Coordinate installation of identifying devices with locations of access panels and doors.

C. Install identifying devices before installing acoustical ceilings and similar concealment.

3.03 EQUIPMENT LABEL INSTALLATION:

A. Install or permanently fasten labels on each major item of mechanical equipment.

B. Locate equipment labels where accessible and visible.

3.04 PIPE LABEL INSTALLATION:

A. Piping Color Coding: Painting of piping is specified in Section 09 90 00.

B. Stenciled Pipe Label Option: Stenciled labels may be provided instead of manufactured pipe labels, at Installer's option. Install stenciled pipe labels, complying with ASME A13.1, with painted, color-coded bands or rectangles on each piping system.

1. Identification Paint: Use for contrasting background

2. Stencil Paint: Use for pipe marking

C. Pipe Label Locations: Locate pipe labels where piping is exposed or above accessible ceilings in finished spaces; machine rooms; accessible maintenance spaces such as shafts, tunnels, and plenums; and exterior exposed locations as follows:

1. Near each valve and control device.

2. Near each branch connection, excluding short takeoffs for fixtures and terminal units. Where flow pattern is not obvious, mark each pipe at branch.

3. Near penetrations and on both sides of through walls, floors, ceilings, and inaccessible enclosures.

4. At access doors, maintenance holes, and similar access points that permit view of concealed piping.

5. Near major equipment items and other points of origination and termination.

6. Spaced at maximum intervals of 50 feet along each run. Reduce intervals to 25 feet in areas of congested piping and equipment.

7. On piping above removable acoustical ceilings. Omit intermediately spaced labels.

D. Directional Flow Arrows: Arrows shall be used to indicate direction of flow in pipes, including pipes where flow is allowed in both directions.

E. Pipe Label Color Schedule:

1. Refrigerant Piping: White letters on a safety-purple background

3.05 DUCT LABEL INSTALLATION:

A. Install self-adhesive duct labels with permanent adhesive on air ducts in the following color codes:

1. Blue: For cold-air supply ducts

2. Yellow: For hot-air supply ducts

3. Green: For exhaust-, outside-, relief-, return-, and mixed-air ducts

B. Stenciled Duct Label Option: Stenciled labels showing service and flow direction may be provided instead of plastic-laminated duct labels, at Installer's option.

C. Locate labels near points where ducts enter into and exit from concealed spaces and at maximum intervals of 50 feet in each space where ducts are exposed or concealed by removable ceiling system.

3.06 VALVE-TAG INSTALLATION:

A. Install tags on valves and control devices in piping systems, except check valves, valves within factory-fabricated equipment units, shutoff valves and HVAC terminal devices and similar roughing-in connections of end-use fixtures and units. List tagged valves in a valve schedule.

B. Valve-Tag Application Schedule: Tag valves according to size, shape, and color scheme and with captions similar to those indicated in the following subparagraphs:

1. Valve-Tag Size and Shape:

a. Refrigerant: 2 inches round

b. Gas: 2 inches round

2. Valve-Tag Colors:

a. Toxic and Corrosive Fluids: Black letters on a safety-orange background

b. Flammable Fluids: Black letters on a safety-yellow background

c. Combustible Fluids: White letters on a safety-brown background

d. Potable and Other Water: White letters on a safety-green background

e. Compressed Air: White letters on a safety-blue background

3.07 WARNING-TAG INSTALLATION:

A. Write required message on, and attach warning tags to, equipment and other items where required.

3.08 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 23 05 93

TESTING, ADJUSTING, AND BALANCING FOR HVAC

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide testing, adjusting and balancing for HVAC as indicated and in compliance with Contract Documents.

1. Balancing Air Systems:

a. Constant-volume air systems

b. Variable-volume air systems

2. Testing, Adjusting, and Balancing Equipment:

a. Motors

3. Testing, adjusting, and balancing existing systems and equipment

4. Vibration tests

5. Control system verification

1.02 REFERENCES:

A. Associated Air Balance Council (AABC):

1. National Standards for Total System Balance

B. Air Movement and Control Association International, Inc. (AMCA):

1. 201: Fans and Systems

C. American Society of Heating, Refrigerating and Air-Conditioning Engineers (ASHRAE):

1. 90.1: Energy Efficient Design of New Buildings Except Low-Rise Residential Buildings

2. 111: Measurement, Testing, Adjusting and Balancing of Building HVAC Systems

D. National Environmental Balancing Bureau (NEBB):

1. Procedural Standards for Testing, Adjusting, and Balancing of Environmental Systems

E. Sheet Metal and Air Conditioning Contractors National Association (SMANCA):

1. HVAC Systems – Duct Design

2. HVAC Systems – Testing, Adjusting, and Balancing

1.03 DEFINITIONS:

A. AABC: Associated Air Balance Council

B. BAS: Building automation Systems

C. NEBB: National Environmental Balancing Bureau

D. TAB: Testing, adjusting, and balancing

E. TAB Specialist: An independent entity meeting qualifications to perform TAB work

F. TDH: Total dynamic head

1.04 PREINSTALLATION MEETINGS:

A. TAB Conference: If requested by the Owner, conduct a TAB conference at Project site after approval of the TAB strategies and procedures plan to develop a mutual understanding of the details. Provide a minimum of 14 days' advance notice of scheduled meeting time and location.

1. Minimum Agenda Items:

a. The Contract Documents examination report

b. The TAB plan

c. Needs for coordination and cooperation of trades and subcontractors

d. Proposed procedures for documentation and communication flow

1.05 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

1. TAB Report: Documentation indicating that Work complies with ASHRAE/IES 90.1, Section 6.7.2.3 - "System Balancing."

B. Qualification Data: Within 90 days of Contractor's Notice to Proceed, submit documentation that the TAB specialist and this Project's TAB team members meet the qualifications specified in "Quality Assurance" Article.

C. Contract Documents Examination Report: Within 90 days of Contractor's Notice to Proceed, submit the Contract Documents review report as specified in Part 3.

D. Strategies and Procedures Plan: Within 90 days of Contractor's Notice to Proceed, submit TAB strategies and step-by-step procedures as specified in "Preparation" Article.

E. System Readiness Checklists: Within 90 days of Contractor's Notice to Proceed, submit system readiness checklists as specified in "Preparation" Article.

F. Examination Report: Submit a summary report of the examination review required in "Examination" Article.

G. Certified TAB reports

H. Sample report forms

I. Instrument calibration reports, to include the following:

1. Instrument type and make

2. Serial number

3. Application

4. Dates of use

5. Dates of calibration

1.06 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.07 SPARE PARTS:

A. Comply with the requirements specified in Section 01 61 00.

1.08 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

B. TAB Specialists Qualifications: Certified by AABC.

1. TAB Field Supervisor: Employee of the TAB specialist and certified by AABC.

2. TAB Technician: Employee of the TAB specialist and certified by AABC as a TAB technician.

C. TAB Specialists Qualifications: Certified by NEBB.

1. TAB Field Supervisor: Employee of the TAB specialist and certified by NEBB.

2. TAB Technician: Employee of the TAB specialist and certified by NEBB as a TAB technician.

D. Instrumentation Type, Quantity, Accuracy, and Calibration: Comply with requirements in ASHRAE 111, Section 4, "Instrumentation."

E. ASHRAE/IES 90.1 Compliance: Applicable requirements in ASHRAE/IES 90.1, Section 6.7.2.3 - "System Balancing."

1.09 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

PART 2 - PRODUCTS

(Not Used)

PART 3 - EXECUTION

3.01 EXAMINATION:

A. Examine the Contract Documents to become familiar with Project requirements and to discover conditions in systems designs that may preclude proper TAB of systems and equipment.

B. Examine installed systems for balancing devices, such as test ports, gage cocks, thermometer wells, flow-control devices, balancing valves and fittings, and manual volume dampers. Verify that locations of these balancing devices are applicable for intended purpose and are accessible.

C. Examine the approved submittals for HVAC systems and equipment.

D. Examine design data including HVAC system descriptions, statements of design assumptions for environmental conditions and systems output, and statements of philosophies and assumptions about HVAC system and equipment controls.

E. Examine ceiling plenums and underfloor air plenums used for supply, return, or relief air to verify that they are properly separated from adjacent areas. Verify that penetrations in plenum walls are sealed and fire-stopped if required.

F. Examine equipment performance data including fan and pump curves.

1. Relate performance data to Project conditions and requirements, including system effects that can create undesired or unpredicted conditions that cause reduced capacities in all or part of a system.

2. Calculate system-effect factors to reduce performance ratings of HVAC equipment when installed under conditions different from the conditions used to rate equipment performance. To calculate system effects for air systems, use tables and charts found in AMCA 201, "Fans and Systems," or in SMACNA's "HVAC Systems - Duct Design." Compare results with the design data and installed conditions.

G. Examine system and equipment installations and verify that field quality-control testing, cleaning, and adjusting specified in individual Sections have been performed.

H. Examine test reports specified in individual system and equipment Sections.

I. Examine HVAC equipment and verify that bearings are greased, belts are aligned and tight, filters are clean, and equipment with functioning controls is ready for operation.

J. Examine operating safety interlocks and controls on HVAC equipment.

K. Report deficiencies discovered before and during performance of TAB procedures. Observe and record system reactions to changes in conditions. Record default set points if different from indicated values.

3.02 PREPARATION:

A. Prepare a TAB plan that includes the following:

1. Equipment and systems to be tested.

2. Strategies and step-by-step procedures for balancing the systems.

3. Instrumentation to be used.

4. Sample forms with specific identification for all equipment.

B. Perform system-readiness checks of HVAC systems and equipment to verify system readiness for TAB work. Include, at a minimum, the following:

1. Airside:

a. Verify that leakage and pressure tests on air distribution systems have been satisfactorily completed.

b. Duct systems are complete with terminals installed.

c. Volume, smoke, and fire dampers are open and functional.

d. Clean filters are installed.

e. Fans are operating, free of vibration, and rotating in correct direction.

f. Variable-frequency controllers' startup is complete and safeties are verified.

g. Automatic temperature-control systems are operational.

h. Ceilings are installed.

i. Windows and doors are installed.

j. Suitable access to balancing devices and equipment is provided.

3.03 GENERAL PROCEDURES FOR TESTING AND BALANCING:

A. Perform testing and balancing procedures on each system according to the procedures contained in AABC's "National Standards for Total System Balance" NEBB's "Procedural Standards for Testing, Adjusting, and Balancing of Environmental Systems" SMACNA's "HVAC Systems - Testing, Adjusting, and Balancing" and in this Section.

B. Cut insulation, ducts, pipes, and equipment cabinets for installation of test probes to the minimum extent necessary for TAB procedures.

1. After testing and balancing, install test ports and duct access doors that comply with requirements in Section 23 33 00.

2. Install and join new insulation that matches removed materials. Restore insulation, coverings, vapor barrier, and finish according to Section 23 07 13, Section 23 07 16, and Section 23 07 19.

C. Mark equipment and balancing devices, including damper-control positions, valve position indicators, fan-speed-control levers, and similar controls and devices, with paint or other suitable, permanent identification material to show final settings.

D. Take and report testing and balancing measurements in inch-pound (IP) units.

3.04 GENERAL PROCEDURES FOR BALANCING AIR SYSTEMS:

A. Prepare test reports for both fans and outlets. Obtain manufacturer's outlet factors and recommended testing procedures. Cross-check the summation of required outlet volumes with required fan volumes.

B. Prepare schematic diagrams of systems' "record drawing" duct layouts.

C. Determine the best locations in main and branch ducts for accurate duct-airflow measurements.

D. Check airflow patterns from the outdoor-air louvers and dampers and the return- and exhaust-air dampers through the supply-fan discharge and mixing dampers.

E. Locate start-stop and disconnect switches, electrical interlocks, and motor starters.

F. Verify that motor starters are equipped with properly sized thermal protection.

G. Check dampers for proper position to achieve desired airflow path.

H. Check for airflow blockages.

I. Check condensate drains for proper connections and functioning.

J. Check for proper sealing of air-handling-unit components.

K. Verify that air duct system is sealed as specified in Section 23 31 13.

3.05 PROCEDURES FOR CONSTANT-VOLUME AIR SYSTEMS:

A. Adjust fans to deliver total indicated airflows within the maximum allowable fan speed listed by fan manufacturer.

1. Measure total airflow.

a. Set outside-air, return-air, and relief-air dampers for proper position that simulates minimum outdoor-air conditions.

b. Where duct conditions allow, measure airflow by main Pitot-tube traverse. If necessary, perform multiple Pitot-tube traverses, close to the fan and prior to any outlets, to obtain total airflow.

c. Where duct conditions are not suitable for Pitot-tube traverse measurements, a coil traverse may be acceptable.

2. Measure fan static pressures as follows:

a. Measure static pressure directly at the fan outlet or through the flexible connection.

b. Measure static pressure directly at the fan inlet or through the flexible connection.

c. Measure static pressure across each component that makes up the air-handling system.

d. Report artificial loading of filters at the time static pressures are measured.

3. Review Record Documents to determine variations in design static pressures versus actual static pressures. Calculate actual system-effect factors. Recommend adjustments to accommodate actual conditions.

4. Comply with requirements in HVAC Sections for air-handling units for adjustment of fans, belts, and pulley sizes to achieve indicated air-handling-unit performance.

5. Do not make fan-speed adjustments that result in motor overload. Consult equipment manufacturers about fan-speed safety factors. Modulate dampers and measure fan-motor amperage to ensure that no overload occurs. Measure amperage in full-cooling, full-heating, economizer, and any other operating mode to determine the maximum required brake horsepower.

B. Adjust volume dampers for main duct, submain ducts, and major branch ducts to indicated airflows.

1. Measure airflow of submain and branch ducts

2. Adjust submain and branch duct volume dampers for specified airflow

3. Re-measure each submain and branch duct after all have been adjusted

C. Adjust air inlets and outlets for each space to indicated airflows.

1. Set airflow patterns of adjustable outlets for proper distribution without drafts

2. Measure inlets and outlets airflow

3. Adjust each inlet and outlet for specified airflow

4. Re-measure each inlet and outlet after they have been adjusted

D. Verify Final System Conditions:

1. Re-measure and confirm that minimum outdoor, return, and relief airflows are within design. Readjust to design if necessary.

2. Re-measure and confirm that total airflow is within design

3. Re-measure all final fan operating data, rpms, volts, amps, and static profile

4. Mark all final settings

5. Test system in economizer mode. Verify proper operation and adjust if necessary.

6. Measure and record all operating data

7. Record final fan-performance data

3.06 PROCEDURES FOR MOTORS:

A. Motors 1/2 HP and Larger: Test at final balanced conditions and record the following data:

1. Manufacturer's name, model number, and serial number

2. Motor horsepower rating

3. Motor rpm

4. Phase and Hertz

5. Nameplate and measured voltage, each phase

6. Nameplate and measured amperage, each phase

7. Starter size and thermal-protection-element rating

8. Service factor and frame size

B. Motors Driven by Variable-Frequency Controllers: Test manual bypass of controller to prove proper operation.

3.07 DUCT LEAKAGE TESTS:

A. Witness the duct pressure testing performed by Installer.

B. Verify that proper test methods are used and that leakage rates are within specified tolerances.

C. Report deficiencies observed.

3.08 CONTROLS VERIFICATION:

A. In conjunction with system balancing, perform the following:

1. Verify temperature control system is operating within the design limitations.

2. Confirm that the sequences of operation are in compliance with Contract Documents.

3. Verify that controllers are calibrated and function as intended.

4. Verify that controller set points are as indicated.

5. Verify the operation of lockout or interlock systems.

6. Verify the operation of valve and damper actuators.

7. Verify that controlled devices are properly installed and connected to correct controller.

8. Verify that controlled devices travel freely and are in position indicated by controller: open, closed, or modulating.

9. Verify location and installation of sensors to ensure that they sense only intended temperature, humidity, or pressure.

B. Reporting: Include a summary of verifications performed, remaining deficiencies, and variations from indicated conditions.

3.09 TOLERANCES:

A. Set HVAC system's airflow rates and water flow rates within the following tolerances:

1. Supply, Return, and Exhaust Fans and Equipment with Fans: Plus or minus 10 percent

2. Air Outlets and Inlets: Plus or minus 10 percent

B. Maintaining pressure relationships as designed shall have priority over the tolerances specified above.

3.10 PROGRESS REPORTING:

A. Initial Construction-Phase Report: Based on examination of the Contract Documents as specified in "Examination" Article, prepare a report on the adequacy of design for systems balancing devices. Recommend changes and additions to systems balancing devices to facilitate proper performance measuring and balancing. Recommend changes and additions to HVAC systems and general construction to allow access for performance measuring and balancing devices.

B. Status Reports: Prepare biweekly progress reports to describe completed procedures, procedures in progress, and scheduled procedures. Include a list of deficiencies and problems found in systems being tested and balanced. Prepare a separate report for each system and each building floor for systems serving multiple floors.

3.11 FINAL REPORT:

A. General: Prepare a certified written report; tabulate and divide the report into separate sections for tested systems and balanced systems.

1. Include a certification sheet at the front of the report's binder, signed and sealed by the certified testing and balancing engineer.

2. Include a list of instruments used for procedures, along with proof of calibration.

3. Certify validity and accuracy of field data.

B. Final Report Contents: In addition to certified field-report data, include the following:

1. Fan curves

2. Manufacturers' test data

3. Field test reports prepared by system and equipment installers

4. Other information relative to equipment performance; do not include Shop Drawings and Product Data

C. General Report Data: In addition to form titles and entries, include the following data:

1. Title page

2. Name and address of the TAB specialist

3. Project name

4. Project location

5. Architect's name and address

6. Engineer's name and address

7. Contractor's name and address

8. Report date

9. Signature of TAB supervisor who certifies the report

10. Table of Contents with the total number of pages defined for each section of the report. Number each page in the report.

11. Summary of contents including the following:

a. Indicated versus final performance

b. Notable characteristics of systems

c. Description of system operation sequence if it varies from the Contract Documents

12. Nomenclature sheets for each item of equipment.

13. Data for terminal units, including manufacturer's name, type, size, and fittings.

14. Notes to explain why certain final data in the body of reports vary from indicated values.

15. Test conditions for fans and pump performance forms including the following:

    a. Settings for outdoor-, return-, and exhaust-air dampers

    b. Conditions of filters

    c. Cooling coil, wet- and dry-bulb conditions

    d. Face and bypass damper settings at coils

    e. Fan drive settings including settings and percentage of maximum pitch diameter

    f. Settings for supply-air, static-pressure controller

    g. Other system operating conditions that affect performance

D. System Diagrams: Include schematic layouts of air distribution systems. Present each system with single-line diagram and include the following:

1. Quantities of outdoor, supply, return, and exhaust airflows

2. Duct, outlet, and inlet sizes

3. Terminal units

4. Balancing stations

5. Position of balancing devices

E. Air-Handling-Unit Test Reports: For air-handling units with coils, include the following:

1. Unit Data:

    a. Unit identification

    b. Location

    c. Make and type

    d. Model number and unit size

    e. Manufacturer's serial number

f. Unit arrangement and class

g. Discharge arrangement

h. Sheave make, size in inches , and bore

i. Center-to-center dimensions of sheave and amount of adjustments in inches

j. Number, make, and size of belts

k. Number, type, and size of filters

2. Motor Data:

a. Motor make, and frame type and size

b. Horsepower and rpm

c. Volts, phase, and Hertz

d. Full-load amperage and service factor

e. Sheave make, size in inches, and bore

f. Center-to-center dimensions of sheave and amount of adjustments in inches

3. Test Data (Indicated and Actual Values):

a. Total airflow rate in cfm

b. Total system static pressure in inches wg

c. Fan rpm

d. Discharge static pressure in inches wg

e. Filter static-pressure differential in inches wg

f. Preheat-coil static-pressure differential in inches wg

g. Cooling-coil static-pressure differential in inches wg

h. Heating-coil static-pressure differential in inches wg

i. Outdoor airflow in cfm

j. Return airflow in cfm

k. Outdoor-air damper position

l. Return-air damper position

F. Apparatus-Coil Test Reports:

1. Coil Data:

a. System identification

b. Location

c. Coil type

d. Number of rows

e. Fin spacing in fins per inch

f. Make and model number

g. Face area in sq. ft.

h. Tube and fin materials

i. Circuiting arrangement

2. Test Data (Indicated and Actual Values):

a. Airflow rate in cfm

b. Average face velocity in fpm

c. Air pressure drop in inches wg

d. Outdoor-air, wet- and dry-bulb temperatures in degrees F

e. Return-air, wet- and dry-bulb temperatures in degrees F

f. Entering-air, wet- and dry-bulb temperatures in degrees F

g. Leaving-air, wet- and dry-bulb temperatures in degrees F

G. Fan Test Reports: For supply, return, and exhaust fans, include the following:

1. Fan Data:

a. System identification

b. Location

c. Make and type

d. Model number and size

e. Manufacturer's serial number

f. Arrangement and class

g. Sheave make, size in inches, and bore

h. Center-to-center dimensions of sheave and amount of adjustments in inches

2. Motor Data:

a. Motor make, and frame type and size

b. Horsepower and rpm

c. Volts, phase, and Hertz

d. Full-load amperage and service factor

e. Sheave make, size in inches, and bore

f. Center-to-center dimensions of sheave, and amount of adjustments in inches

g. Number, make, and size of belts

3. Test Data (Indicated and Actual Values):

a. Total airflow rate in cfm

b. Total system static pressure in inches wg

c. Fan rpm

d. Discharge static pressure in inches wg

e. Suction static pressure in inches wg

H. Round, Flat-Oval, and Rectangular Duct Traverse Reports: Include a diagram with a grid representing the duct cross-section and record the following:

1. Report Data:

a. System and air-handling-unit number

b. Location and zone

c. Traverse air temperature in degrees F

d. Duct static pressure in inches wg

e. Duct size in inches

f. Duct area in square feet

g. Indicated airflow rate in cfm

h. Indicated velocity in fpm

i. Actual airflow rate in cfm

j. Actual average velocity in fpm

k. Barometric pressure in psig

I. Instrument Calibration Reports:

1. Report Data:

a. Instrument type and make

b. Serial number

c. Application

d. Dates of use

e. Dates of calibration

3.12 VERIFICATION OF TAB REPORT:

A. The TAB specialist's test and balance engineer shall conduct the inspection in the presence of commissioning authority.

B. Commissioning authority shall randomly select measurements, documented in the final report, to be rechecked. Rechecking shall be limited to either 10 percent of the total measurements recorded or the extent of measurements that can be accomplished in a normal 8-hour business day.

C. If rechecks yield measurements that differ from the measurements documented in the final report by more than the tolerances allowed, the measurements shall be noted as "FAILED."

D. If the number of "FAILED" measurements is greater than 10 percent of the total measurements checked during the final inspection, the testing and balancing shall be considered incomplete and shall be rejected.

E. If TAB work fails, proceed as follows:

1. TAB specialists shall recheck all measurements and make adjustments. Revise the final report and balancing device settings to include all changes; resubmit the final report and request a second final inspection.

2. If the second final inspection also fails, Owner may contract the services of another TAB specialist to complete TAB work according to the Contract Documents and deduct the cost of the services from the original TAB specialist's final payment.

3. If the second verification also fails, Owner may contact AABC Headquarters regarding the AABC National Performance Guaranty.

F. Prepare test and inspection reports.

3.13 ADDITIONAL TESTS:

A. Within 90 days of completing TAB, perform additional TAB to verify that balanced conditions are being maintained throughout and to correct unusual conditions.

B. Seasonal Periods: If initial TAB procedures were not performed during near-peak summer and winter conditions, perform additional TAB during near-peak summer and winter conditions.

3.14 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

Page Intentionally Left Blank

SECTION 23 05 94

PRESSURE TESTING OF DUCTED AIR SYSTEMS

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide pressure testing of ducted air systems as indicated and in compliance with Contract Documents.

1.02 REFERENCES:

A. Sheet Metal and Air Conditioning Contractors' National Association (SMACNA):

1. ANSI/SMACNA HVAC Air Duct Leakage Test Manual – second edition 2012.

1.03 GENERAL:

A. Ducts over 5 m in length, forming part of a supply forming part of a supply, return or exhaust ductwork system directly or indirectly connected to air handling equipment to be pressure tested for leaks

1.04 TIMING:

A. Ducts to be tested before installation of insulation or any other form of concealments.

B. Test after seals have cured.

C. Test when ambient temperature will not affect effectiveness of seals, gaskets, etc.

1.05 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

1.06 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

1.07 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

1.08 TEST PROCEDURES:

A. Maximum lengths of ducts to be tested to be consistent with capacity of test equipment.

B. Section of duct to be tested to include:

1. Main ducts, fittings, branch ducts, tap-ins.

C. No less than 25 percent of all ductwork shall be tested at a test pressure of 3 inch wg. If a single test result is “pass” then no additional testing shall be required. If a single test result is “fail” then additional leak testing shall be performed on 50 percent of all ductwork. If the test result is “pass” then no additional testing shall be required. If the second test result is “fail” then all 100 percent of ductwork shall be tested.

D. Consultant shall randomly select duct work sections to be tested.

E. System leakage tolerances shall adhere to Paragraph F below.

F. Acceptable Leakage shall be calculated based on the following criteria:

1. Rectangular Metal Ductwork: Leakage Class 8

2. Round Metal Ductwork: Leakage Class 4

3. All ductwork to be Seal Class B

G. The equipment used shall be of sufficient capacity to perform the test. Extrapolation shall not permitted.

1. All ductwork shall be tested prior to the installation of dampers, grilles, registers, coils, openings, etc. that could cause a failure in the pressure test. Sections of ductwork shall be completely replaced where this occurs prior to the passing of the leakage testing.

H. Base partial system leakage calculations on Reference Standard.

I. Seal leaks that can be heard or felt, regardless of their contribution to total leakage.

1.09 VERIFICATION:

A. Consultant to witness tests and to verify reported results.

B. To be certified by the same TAB agency approved by Consultant to undertake TAB on this project.

1.10 TEST INSTRUMENTS:

A. Agency to provide instruments for tests.

B. Test apparatus to include:

1. Fan capable of producing required static pressure.

2. Duct section with calibrated orifice plate mounted and accurately located pressure taps.

3. Flow measuring instrument compatible with the orifice plate.

4. Calibration curves for orifice plates used.

5. Flexible duct for connecting to ductwork under test.

6. Smoke bombs for visual inspections.

C. Test apparatus to be accurate to within +/- 3 percent of flow rate and pressure.

D. Submit details of test instruments to be used to Consultant at least three months before anticipated start date.

E. Test instruments to be calibrated and certificate of calibration deposited with Consultant no more than 28 days before start of tests.

F. Instruments to be re-calibrated every six months thereafter.

1.11 SYSTEM LEAKAGE TOLERANCES:

A. System leakage tolerances specified herein are stated as a percentage of total flow rate handled by the system. Therefore, when testing sections of ductwork this acceptable leakage shall be pro-rated to entire system. Leakage for sections of duct systems shall not exceed the total allowable leakage.

B. Leakage tests on following systems not to exceed specified leakage rates.

1. Rectangular ductwork leakage Class 8

2. Round ductwork leakage Class 4

3. All ductwork to be test to duct class 3 inch wg, Class “B”

C. Evaluation of test results to use surface area of duct and pressure in duct as basic parameters.

1.12 EQUIPMENT LEAKAGE TOLERANCES:

A. Equipment and System Components, Leakage: 2 percent

1.13 REPORT FORMS:

A. Submit proposed report form and test report format to Consultant for approval at least three months before proposed date of first series of tests. Do not start tests until approval received in writing from Consultant.

1.14 PRESSURE TEST REPORTS:

A. Prepare report of results and submit to Consultant within 24 hours of completion of tests. Include:

1. Schematic of entire system

2. Schematic of section under test showing test site

3. Required and achieved static pressures

4. Orifice differential pressure at test sites

5. Permissible and actual leakage flow rate CFM for test sites

6. Witnessed certification of results

B. Include test reports in final TAB report.

PART 2 - PRODUCTS

(Not Used)

PART 3 - EXECUTION

3.01 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 23 07 13

DUCT INSULATION

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide duct insulation as indicated and in compliance with Contract Documents.

1. Indoor, concealed supply and outdoor air

2. Indoor, exposed supply and outdoor air

3. Indoor, concealed return located in unconditioned space

4. Indoor, exposed return located in unconditioned space

5. Indoor, concealed exhaust between isolation damper and penetration of building exterior

6. Indoor, exposed exhaust between isolation damper and penetration of building exterior.

7. Outdoor, concealed supply and return

8. Outdoor, exposed supply and return

E. National Fire Protection Association (NFPA):

1. 90A: Standards for the Installation of Air-Conditioning and Ventilating Systems

2. 90B: Standard for the Installation of Warm Air Heating and Air-Conditioning Systems

1.03 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Product Data: For each type of product indicated. Include thermal conductivity, water-vapor permeance thickness, and jackets (both factory- and field-applied if any).

C. Field quality-control reports.

1.04 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.05 SPARE PARTS:

A. Comply with the requirements specified in Section 01 61 00.

1.06 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

1.07 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

B. Packaging: Insulation material containers shall be marked by manufacturer with appropriate ASTM standard designation, type and grade, and maximum use temperature.

1.08 COORDINATION:

A. Coordinate sizes and locations of supports, hangers, and insulation shields specified in Section 23 05 29.

B. Coordinate clearance requirements with duct Installer for duct insulation application. Before preparing ductwork Shop Drawings, establish and maintain clearance requirements for installation of insulation and field-applied jackets and finishes and for space required for maintenance.

C. Coordinate installation and testing of heat tracing.

1.09 SCHEDULING:

A. Schedule insulation application after pressure testing systems and, where required, after installing and testing heat tracing. Insulation application may begin on segments that have satisfactory test results.

B. Complete installation and concealment of plastic materials as rapidly as possible in each area of construction.

PART 2 - PRODUCTS

2.01 GENERAL:

A. Comply with requirements in "Duct Insulation Schedule, General," "Indoor Duct and Plenum Insulation Schedule," and "Aboveground, Outdoor Duct and Plenum Insulation Schedule" articles for where insulating materials shall be applied.

B. Products shall not contain asbestos, lead, mercury, or mercury compounds.

C. Products that come in contact with stainless steel shall have a leachable chloride content of less than 50 ppm when tested according to ASTM C871.

D. Insulation materials for use on austenitic stainless steel shall be qualified as acceptable according to ASTM C795.

2.02 DUCT WRAP:

A. Resin bonded fibrous glass blanket with a damage-resistant, flame retardant, reinforced aluminum foil (FRK) facing.

B. Duct wrap insulation is not known to contain penta-, octa, or deca-brominated diphenyl flame retardant substances, such as deca-Bromine (deca-BDE).

C. Certifications:

1. GREENGUARD Indoor Air Quality Certified® and GREENGUARD Gold Certified

2. Certified by SCS Global Services to contain a minimum of 53 percent recycled glass content, 31 percent pre-consumer and 22 percent post-consumer

3. UL labeled

D. Duct Wrap Insulation:

1. ASTM C1290, Type III, to maximum service temperature of 250 degrees°F, and ASTM C1136, Type II, facing material.

E. Acceptable Product: Owens Corning® SoftR® Duct Wrap FRK.

1. Type 75: 0.75 lb./cu.ft. density: 1-1/2 in, 2 in, 2.2 in or 3 in thick

2. Type 100: 1.0 lb./cu.ft. density: 1-1/2 in or 2 in thick

3. Type 150: 1.5 lb./cu.ft. density: 1-1/2 in or 2 in thick

F. The duct wrap insulation shall consist of a blanket of glass fibers factory-laminated to a foil reinforced kraft (FRK) vapor retarder facing with a 2 in. stapling and taping flange on one edge.

G. Manufacturers:

1. Owens Corning

2. Johns Manville

3. Knauf Insulation

2.03 ADHESIVES:

A. Materials shall be compatible with insulation materials, jackets, and substrates and for bonding insulation to itself and to surfaces to be insulated unless otherwise indicated.

B. Mineral-Fiber Adhesive: Comply with MIL-A-3316C, Class 2, Grade A.

1. Manufacturers:

a. Foster

b. Johns Manville

C. ASJ Adhesive, and FSK Jacket Adhesive: Comply with MIL-A-3316C, Class 2, Grade A for bonding insulation jacket lap seams and joints.

1. Manufacturers:

a. Foster

b. Johns Manville

2.04 LAGGING ADHESIVES:

A. Description: Comply with MIL-A-3316C, Class I, Grade A and shall be compatible with insulation materials, jackets, and substrates.

1. Manufacturers:

a. Foster

b. Childers

2. Fire-resistant, water-based lagging adhesive and coating for use indoors to adhere fire-resistant lagging cloths over duct insulation.

3. Service Temperature Range: 0 to plus 180 degrees F

2.05 SEALANTS:

A. FSK and Metal Jacket Flashing Sealants:

1. Manufacturers:

a. Childers

2. Materials shall be compatible with insulation materials, jackets, and substrates

3. Fire- and water-resistant, flexible, elastomeric sealant

4. Service Temperature Range: Minus 40 to plus 250 degrees F

5. Color: Aluminum

2.06 FIELD-APPLIED CLOTHS:

A. Woven Glass-Fiber Fabric: Comply with MIL-C-20079H, Type I, plain weave, and pre-sized a minimum of 8 oz./sq. yd.

1. Manufacturers:

a. GLT Products

b. Childers

B. Metal Jacket:

1. Aluminum Jacket: Comply with ASTM B209, Alloy 3003, 3005, 3105, or 5005, Temper H-14.

a. Sheet and roll stock ready for shop or field sizing.

b. Finish: Stucco embossed.

c. Moisture Barrier: Heat laminated 3-mil-thick, polyethylene–Surlyn, polyfilm moisture barrier.

2. Stainless-Steel Jacket: ASTM A167 or ASTM A240.

a. Sheet and roll stock ready for shop or field sizing.

b. Moisture Barrier: Heat laminated 3-mil-thick, polyethylene–Surlyn, polyfilm moisture barrier.

3. Manufacturers:

a. Johns Manville

b. K-flex USA

2.07 TAPES:

A. FSK Tape: Foil-face, vapor-retarder tape matching factory-applied jacket with acrylic adhesive; complying with ASTM C1136.

1. Manufacturers:

a. 3M

b. Nashua

2. Width: 3 inches

3. Thickness: 6.5 mils

4. Adhesion: 90 ounces force/inch in width

5. Elongation: 2 percent

6. Tensile Strength: 40 lbf/inch in width

7. FSK Tape Disks and Squares: Precut disks or squares of FSK tape

2.08 SECUREMENTS:

A. Bands:

1. Manufacturers:

a. Johns Manville

b. Band-it

2. Stainless Steel: ASTM A167 or ASTM A240, Type 304 or Type 316; 0.020 inch thick, 3/4 inch wide with wing seal.

B. Insulation Pins and Hangers:

1. Capacitor-Discharge-Weld Pins: Copper- or zinc-coated steel pin, fully annealed for capacitor-discharge welding, 0.135-inch diameter shank, length to suit depth of insulation indicated.

a. Manufacturers:

(1) GLT Products

2. Cupped-Head, Capacitor-Discharge-Weld Pins: Copper- or zinc-coated steel pin, fully annealed for capacitor-discharge welding, 0.106-inch diameter shank, length to suit depth of insulation indicated with integral 1-1/2-inch galvanized carbon-steel washer.

a. Manufacturers:

(1) GLT Products

3. Metal, Adhesively Attached, Perforated-Base Insulation Hangers: Baseplate welded to projecting spindle that is capable of holding insulation, of thickness indicated, securely in position indicated when self-locking washer is in place. Comply with the following requirements:

a. Manufacturers:

(1) GLT Products

b. Baseplate: Perforated, galvanized carbon-steel sheet, 0.030 inch thick by 2 inches square.

c. Spindle: Zinc-coated, low-carbon steel or Stainless steel, fully annealed, 0.106-inch-diameter shank, length to suit depth of insulation indicated.

d. Adhesive: Recommended by hanger manufacturer. Product with demonstrated capability to bond insulation hanger securely to substrates indicated without damaging insulation, hangers, and substrates.

4. Self-Sticking-Base Insulation Hangers: Baseplate welded to projecting spindle that is capable of holding insulation, of thickness indicated, securely in position indicated when self-locking washer is in place. Comply with the following requirements:

C. Staples: Outward-clinching insulation staples, nominal 3/4-inch-wide, stainless steel or Monel

D. Wire: 16 gauge soft-annealed, stainless steel

1. Manufacturers:

a. GLT Products

2.09 CORNER ANGLES:

A. Aluminum Corner Angles: 0.040 inch thick, minimum 1 by 1 inch, aluminum according to ASTM B209, Alloy 3003, 3005, 3105, or 5005; Temper H-14.

B. Stainless-Steel Corner Angles: 0.024 inch thick, minimum 1 by 1 inch, stainless steel according to ASTM A167 or ASTM A240, Type 304 or Type 316.

PART 3 - EXECUTION

3.01 EXAMINATION:

A. Examine substrates and conditions for compliance with requirements for installation tolerances and other conditions affecting performance of insulation application.

1. Verify that systems to be insulated have been tested and are free of defects.

2. Verify that surfaces to be insulated are clean and dry.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 PREPARATION:

A. Surface Preparation: Clean and dry surfaces to receive insulation. Remove materials that will adversely affect insulation application.

3.03 GENERAL INSTALLATION REQUIREMENTS:

A. Install insulation materials, accessories, and finishes with smooth, straight, and even surfaces; free of voids throughout the length of ducts and fittings.

B. Install insulation materials, vapor barriers or retarders, jackets, and thicknesses required for each item of duct system as specified in insulation system schedules.

C. Install accessories compatible with insulation materials and suitable for the service. Install accessories that do not corrode, soften, or otherwise attack insulation or jacket in either wet or dry state.

D. Install insulation with longitudinal seams at top and bottom of horizontal runs.

E. Install multiple layers of insulation with longitudinal and end seams staggered.

F. Keep insulation materials dry during application and finishing.

G. Install insulation with tight longitudinal seams and end joints. Bond seams and joints with adhesive recommended by insulation material manufacturer.

H. Install insulation with least number of joints practical.

I. Where vapor barrier is indicated, seal joints, seams, and penetrations in insulation at hangers, supports, anchors, and other projections with vapor-barrier mastic.

    1. Install insulation continuously through hangers and around anchor attachments.

    2. For insulation application where vapor barriers are indicated, extend insulation on anchor legs from point of attachment to supported item to point of attachment to structure. Taper and seal ends at attachment to structure with vapor-barrier mastic.

    3. Install insert materials and install insulation to tightly join the insert. Seal insulation to insulation inserts with adhesive or sealing compound recommended by insulation material manufacturer.

J. Apply adhesives, mastics, and sealants at manufacturer's recommended coverage rate and wet and dry film thicknesses.

K. Install insulation with factory-applied jackets as follows:

    1. Draw jacket tight and smooth.

    2. Cover circumferential joints with 3-inch-wide strips, of same material as insulation jacket. Secure strips with adhesive and outward clinching staples along both edges of strip, spaced 4 inches o.c.

3. Overlap jacket longitudinal seams at least 1-1/2 inches. Clean and dry surface to receive self-sealing lap. Staple laps with outward clinching staples along edge at 2 inches o.c.

   a. For below ambient services, apply vapor-barrier mastic over staples.

4. Cover joints and seams with tape, according to insulation material manufacturer's written instructions, to maintain vapor seal.

5. Where vapor barriers are indicated, apply vapor-barrier mastic on seams and joints and at ends adjacent to duct flanges and fittings.

L. Cut insulation in a manner to avoid compressing insulation more than 75 percent of its nominal thickness.

M. Finish installation with systems at operating conditions. Repair joint separations and cracking due to thermal movement.

N. Repair damaged insulation facings by applying same facing material over damaged areas. Extend patches at least 4 inches beyond damaged areas. Adhere, staple, and seal patches similar to butt joints.

3.04 PENETRATIONS:

A. Insulation Installation at Roof Penetrations: Install insulation continuously through roof penetrations.

1. Seal penetrations with flashing sealant.

2. For applications requiring only indoor insulation, terminate insulation above roof surface and seal with joint sealant. For applications requiring indoor and outdoor insulation, install insulation for outdoor applications tightly joined to indoor insulation ends. Seal joint with joint sealant.

3. Extend jacket of outdoor insulation outside roof flashing at least 2 inches below top of roof flashing.

4. Seal jacket to roof flashing with flashing sealant.

B. Insulation Installation at Aboveground Exterior Wall Penetrations: Install insulation continuously through wall penetrations.

1. Seal penetrations with flashing sealant.

2. For applications requiring only indoor insulation, terminate insulation inside wall surface and seal with joint sealant. For applications requiring indoor and outdoor insulation, install insulation for outdoor applications tightly joined to indoor insulation ends. Seal joint with joint sealant.

3. Extend jacket of outdoor insulation outside wall flashing and overlap wall flashing at least 2 inches.

4. Seal jacket to wall flashing with flashing sealant.

C. Insulation Installation at Interior Wall and Partition Penetrations (That Are Not Fire Rated): Install insulation continuously through walls and partitions.

D. Insulation Installation at Fire-Rated Wall and Partition Penetrations: Terminate insulation at fire damper sleeves for fire-rated wall and partition penetrations. Externally insulate damper sleeves to match adjacent insulation and overlap duct insulation at least 2 inches.

1. Comply with requirements in Section 07 84 00.

E. Insulation Installation at Floor Penetrations:

1. Duct: For penetrations through fire-rated assemblies, terminate insulation at fire damper sleeves and externally insulate damper sleeve beyond floor to match adjacent duct insulation. Overlap damper sleeve and duct insulation at least 2 inches.

2. Seal penetrations through fire-rated assemblies. Comply with requirements in Section 07 84 00.

3.05 INSTALLATION OF FLEXIBLE ELASTOMERIC INSULATION:

A. Seal longitudinal seams and end joints with manufacturer's recommended adhesive to eliminate openings in insulation that allow passage of air to surface being insulated.

3.06 INSTALLATION OF MINERAL-FIBER INSULATION:

A. Blanket Insulation Installation on Ducts and Plenums: Secure with adhesive and insulation pins.

1. Apply adhesives according to manufacturer's recommended coverage rates per unit area, for 100 percent coverage of duct and plenum surfaces.

2. Apply adhesive to entire circumference of ducts and to all surfaces of fittings and transitions.

3. Install either capacitor-discharge-weld pins and speed washers or cupped-head, capacitor-discharge-weld pins on sides and bottom of horizontal ducts and sides of vertical ducts as follows:

a. On duct sides with dimensions 18 inches and smaller, place pins along longitudinal centerline of duct. Space 3 inches maximum from insulation end joints, and 16 inches o.c.

b. On duct sides with dimensions larger than 18 inches, place pins 16 inches o.c. each way, and 3 inches maximum from insulation joints. Install additional pins to hold insulation tightly against surface at cross bracing.

c. Pins may be omitted from top surface of horizontal, rectangular ducts and plenums.

d. Do not over-compress insulation during installation.

e. Impale insulation over pins and attach speed washers.

f. Cut excess portion of pins extending beyond speed washers or bend parallel with insulation surface. Cover exposed pins and washers with tape matching insulation facing.

4. For ducts and plenums with surface temperatures below ambient, install a continuous unbroken vapor barrier. Create a facing lap for longitudinal seams and end joints with insulation by removing 2 inches from one edge and one end of insulation segment. Secure laps to adjacent insulation section with 1/2-inch outward-clinching staples, 1 inch o.c. Install vapor barrier consisting of factory- or field-applied jacket, adhesive, vapor-barrier mastic, and sealant at joints, seams, and protrusions.

   a. Repair punctures, tears, and penetrations with tape or mastic to maintain vapor-barrier seal.

   b. Install vapor stops for ductwork and plenums operating below 50 degrees F at 18-foot intervals. Vapor stops shall consist of vapor-barrier mastic applied in a Z-shaped pattern over insulation face, along butt end of insulation, and over the surface. Cover insulation face and surface to be insulated a width equal to two times the insulation thickness, but not less than 3 inches.

5. Overlap unfaced blankets a minimum of 2 inches on longitudinal seams and end joints. At end joints, secure with steel bands spaced a maximum of 18 inches o.c.

6. Install insulation on rectangular duct elbows and transitions with a full insulation section for each surface. Install insulation on round and flat-oval duct elbows with individually mitered gores cut to fit the elbow.

7. Insulate duct stiffeners, hangers, and flanges that protrude beyond insulation surface with 6-inch-wide strips of same material used to insulate duct. Secure on alternating sides of stiffener, hanger, and flange with pins spaced 6 inches o.c.

B. Board Insulation Installation on Ducts and Plenums: Secure with adhesive and insulation pins.

1. Apply adhesives according to manufacturer's recommended coverage rates per unit area, for 100 percent coverage of duct and plenum surfaces.

2. Apply adhesive to entire circumference of ducts and to all surfaces of fittings and transitions.

3. Install either capacitor-discharge-weld pins and speed washers or cupped-head, capacitor-discharge-weld pins on sides and bottom of horizontal ducts and sides of vertical ducts as follows:

    a. On duct sides with dimensions 18 inches and smaller, place pins along longitudinal centerline of duct. Space 3 inches maximum from insulation end joints, and 16 inches o.c.

    b. On duct sides with dimensions larger than 18 inches, space pins 16 inches o.c. each way, and 3 inches maximum from insulation joints. Install additional pins to hold insulation tightly against surface at cross bracing.

    c. Pins may be omitted from top surface of horizontal, rectangular ducts and plenums.

    d. Do not over-compress insulation during installation.

    e. Cut excess portion of pins extending beyond speed washers or bend parallel with insulation surface. Cover exposed pins and washers with tape matching insulation facing.

4. For ducts and plenums with surface temperatures below ambient, install a continuous unbroken vapor barrier. Create a facing lap for longitudinal seams and end joints with insulation by removing 2 inches from one edge and one end of insulation segment. Secure laps to adjacent insulation section with 1/2-inch outward-clinching staples, 1 inch o.c. Install vapor barrier consisting of factory- or field-applied jacket, adhesive, vapor-barrier mastic, and sealant at joints, seams, and protrusions.

    a. Repair punctures, tears, and penetrations with tape or mastic to maintain vapor-barrier seal.

    b. Install vapor stops for ductwork and plenums operating below 50 degrees F at 18-foot intervals. Vapor stops shall consist of vapor-barrier mastic applied in a Z-shaped pattern over insulation face, along butt end of insulation, and over the surface. Cover insulation face and surface to be insulated a width equal to two times the insulation thickness, but not less than 3 inches.

5. Install insulation on rectangular duct elbows and transitions with a full insulation section for each surface. Groove and score insulation to fit as closely as possible to outside and inside radius of elbows. Install insulation on round and flat-oval duct elbows with individually mitered gores cut to fit the elbow.

6. Insulate duct stiffeners, hangers, and flanges that protrude beyond insulation surface with 6-inch-wide strips of same material used to insulate duct. Secure on alternating sides of stiffener, hanger, and flange with pins spaced 6 inches o.c.

3.07 FIELD-APPLIED JACKET INSTALLATION:

A. Where glass-cloth jackets are indicated, install directly over bare insulation or insulation with factory-applied jackets.

1. Draw jacket smooth and tight to surface with 2-inch overlap at seams and joints.

2. Embed glass cloth between two 0.062-inch-thick coats of lagging adhesive.

3. Completely encapsulate insulation with coating, leaving no exposed insulation.

B. Where FSK jackets are indicated, install as follows:

1. Draw jacket material smooth and tight.

2. Install lap or joint strips with same material as jacket.

3. Secure jacket to insulation with manufacturer's recommended adhesive.

4. Install jacket with 1-1/2-inch laps at longitudinal seams and 3-inch-wide joint strips at end joints.

5. Seal openings, punctures, and breaks in vapor-retarder jackets and exposed insulation with vapor-barrier mastic.

C. Where metal jackets are indicated, install with 2-inch overlap at longitudinal seams and end joints. Overlap longitudinal seams arranged to shed water. Seal end joints with weatherproof sealant recommended by insulation manufacturer. Secure jacket with stainless-steel bands 12 inches o.c. and at end joints.

3.08 FIRE-RATED INSULATION SYSTEM INSTALLATION:

A. Where fire-rated insulation system is indicated, secure system to ducts and duct hangers and supports to maintain a continuous fire rating.

B. Insulate duct access panels and doors to achieve same fire rating as duct.

C. Install firestopping at penetrations through fire-rated assemblies. Fire-stop systems are specified in Section 07 84 00.

3.09 FINISHES:

A. Insulation with ASJ, Glass-Cloth, or Other Paintable Jacket Material: Paint jacket with paint system identified below and as specified in Section 09 90 00 and Section 09 91 00.

1. Flat Acrylic Finish: Two finish coats over a primer that is compatible with jacket material and finish coat paint. Add fungicidal agent to render fabric mildew proof.

a. Finish Coat Material: Interior, flat, latex-emulsion size

B. Flexible Elastomeric Thermal Insulation: After adhesive has fully cured, apply two coats of insulation manufacturer's recommended protective coating.

C. Color: Final color as selected by Architect. Vary first and second coats to allow visual inspection of the completed Work.

D. Do not field paint aluminum or stainless-steel jackets.

3.10 DUCT INSULATION SCHEDULE, GENERAL:

A. Plenums and Ducts Requiring Insulation:

1. Indoor, concealed supply and outdoor air

2. Indoor, exposed supply and outdoor air

3. Indoor, concealed return located in unconditioned space

4. Indoor, exposed return located in unconditioned space

5. Indoor, concealed exhaust between isolation damper and penetration of building exterior

6. Indoor, exposed exhaust between isolation damper and penetration of building exterior

7. Outdoor, concealed supply and return

8. Outdoor, exposed supply and return

B. Items Not Insulated:

1. Fibrous-glass ducts

2. Metal ducts with duct liner of sufficient thickness to comply with energy code and ASHRAE/IESNA 90.1

3. Factory-insulated flexible ducts

4. Factory-insulated plenums and casings

5. Flexible connectors

6. Vibration-control devices

7. Factory-insulated access panels and doors

3.11 INDOOR DUCT AND PLENUM INSULATION SCHEDULE:

A. Concealed supply-air duct insulation shall be one of the following:

1. Mineral-Fiber Blanket: 1-1/2 inches thick and 1.5-lb/cu. ft. nominal density

2. Mineral-Fiber Board: 1-1/2 inches thick and 2-lb/cu. ft. nominal density

B. Concealed return-air duct insulation shall be one of the following:

1. Mineral-Fiber Blanket: 1-1/2 inches thick and 1.5-lb/cu. ft. nominal density

2. Mineral-Fiber Board: 1-1/2 inches thick and 1.5-lb/cu. ft. nominal density

C. Concealed outdoor-air duct insulation shall be one of the following:

1. Mineral-Fiber Blanket: 2 inches thick and 1.5-lb/cu. ft. nominal density

2. Mineral-Fiber Board: 2 inches thick and 1.5-lb/cu. ft. nominal density

D. Concealed exhaust-air duct insulation shall be one of the following:

1. Mineral-Fiber Blanket: 1-1/2 inches thick and 1.5-lb/cu. ft. nominal density

2. Mineral-Fiber Board: 1-1/2 inches thick and 1.5-lb/cu. ft. nominal density

E. Concealed, rectangular, exhaust-air duct insulation between isolation damper and penetration of building exterior shall be one of the following:

1. Mineral-Fiber Blanket: 2 inches thick and 1.5-lb/cu. ft. nominal density

2. Mineral-Fiber Board: 2 inches thick and 1.5-lb/cu. ft. nominal density

F. Concealed, outdoor-air plenum insulation shall be one of the following:

1. Mineral-Fiber Blanket: 3 inches thick and 1.5-lb/cu. ft. nominal density

2. Mineral-Fiber Board: 3 inches thick and 1.5-lb/cu. ft. nominal density.

G. Concealed, exhaust-air plenum insulation shall be one of the following:

1. Mineral-Fiber Blanket: 2 inches 1.5-lb/cu. ft. nominal density

2. Mineral-Fiber Board: 2 inches thick and 2-lb/cu. ft. nominal density

H. Exposed supply-air duct insulation shall be one of the following:

1. Mineral-Fiber Blanket: 1-1/2 inches thick and 1.5-lb/cu. ft. nominal density

2. Mineral-Fiber Board: 1-1/2 inches thick and 2-lb/cu. ft. nominal density

I. Exposed return-air duct insulation shall be one of the following:

1. Mineral-Fiber Blanket: 1-1/2 inches thick and 1.5-lb/cu. ft. nominal density

2. Mineral-Fiber Board: 1-1/2 inches thick and 1.5-lb/cu. ft. nominal density

J. Exposed outdoor-air duct insulation shall be one of the following:

1. Mineral-Fiber Blanket: 2 inches thick and 1.5-lb/cu. ft. nominal density

2. Mineral-Fiber Board: 2 inches thick and 1.5-lb/cu. ft. nominal density

K. Exposed exhaust-air duct insulation shall be one of the following:

1. Mineral-Fiber Blanket: 2 inches 1.5-lb/cu. ft. nominal density

2. Mineral-Fiber Board: 2 inches thick and 2-lb/cu. ft. nominal density

L. Exposed, supply-air plenum insulation shall be one of the following:

1. Mineral-Fiber Blanket: 1-1/2 inches thick and 1.5-lb/cu. ft. nominal density

2. Mineral-Fiber Board: 1-1/2 inches thick and 2-lb/cu. ft. nominal density

M. Exposed, return-air plenum insulation shall be one of the following:

1. Mineral-Fiber Blanket: 1-1/2 inches thick and 1.5-lb/cu. ft. nominal density

2. Mineral-Fiber Board: 1-1/2 inches thick and 2-lb/cu. ft. nominal density

N. Exposed, outdoor-air plenum insulation shall be one of the following:

1. Mineral-Fiber Blanket: 3 inches thick and 1.5-lb/cu. ft. nominal density

2. Mineral-Fiber Board: 3 inches thick and 1.5-lb/cu. ft. nominal density

O. Exposed, exhaust-air plenum insulation shall be one of the following:

1. (Mineral-Fiber Blanket: 2 inches 1.5-lb/cu. ft. nominal density

2. Mineral-Fiber Board: 2 inches thick and 2-lb/cu. ft. nominal density

3.12 ABOVEGROUND, OUTDOOR DUCT AND PLENUM INSULATION SCHEDULE:

A. Insulation materials and thicknesses are identified below. If more than one material is listed for a duct system, selection from materials listed is Contractor's option.

B. Exposed or Concealed supply-air duct insulation shall be one of the following:

1. Mineral-Fiber Blanket: 3 inches and 1.5-lb/cu. ft. nominal density

2. Mineral-Fiber Board: 3 inches thick and 2-lb/cu. ft. nominal density

C. Exposed or Concealed return-air duct insulation shall be one of the following:

1. Mineral-Fiber Blanket: 3 inches and 1.5-lb/cu. ft. nominal density

2. Mineral-Fiber Board: 3 inches thick and 2-lb/cu. ft. nominal density

D. Exposed or Concealed outdoor-air duct insulation shall be one of the following:

1. Mineral-Fiber Blanket: 3 inches and 1.5-lb/cu. ft. nominal density

2. Mineral-Fiber Board: 3 inches thick and 2-lb/cu. ft. nominal density

E. Exposed or Concealed, supply-air plenum insulation shall be one of the following:

1. Mineral-Fiber Blanket: 4 inches and 1.5-lb/cu. ft. nominal density

2. Mineral-Fiber Board: 4 inches thick and 2-lb/cu. ft. nominal density

F. Exposed or Concealed, return-air plenum insulation shall be one of the following:

1. Mineral-Fiber Blanket: 4 inches and 1.5-lb/cu. ft. nominal density

2. Mineral-Fiber Board: 4 inches thick and 2-lb/cu. ft. nominal density

3.13 INDOOR, FIELD-APPLIED JACKET SCHEDULE:

A. Install jacket over insulation material. For insulation with factory-applied jacket, install the field-applied jacket over the factory-applied jacket.

B. If more than one material is listed, selection from materials listed is Contractor's option.

C. Ducts and Plenums, Concealed: None

D. Ducts and Plenums, Exposed:

1. Aluminum, Stucco Embossed: 0.024 inch thick

2. Stainless Steel, Type 304 or Type 316, Smooth 2B Finish: 0.016 inch thick

3.14 OUTDOOR, FIELD-APPLIED JACKET SCHEDULE:

A. Install jacket over insulation material. For insulation with factory-applied jacket, install the field-applied jacket over the factory-applied jacket.

B. If more than one material is listed, selection from materials listed is Contractor's option.

C. Ducts and Plenums, Concealed: None

D. Ducts and Plenums, Exposed, up to 48 Inches in Diameter or with Flat Surfaces up to 72 Inches:

1. Aluminum, Stucco Embossed: 0.032 inch thick

2. Stainless Steel, Type 316, Stucco Embossed: 0.020 inch thick

E. Ducts and Plenums, Exposed, Larger Than 48 Inches in Diameter or with Flat Surfaces Larger Than 72 Inches:

1. Stainless Steel, Type 316, Stucco Embossed: 0.024 inch thick

3.15 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

Page Intentionally Left Blank

SECTION 23 08 20

COMMISSIONING OF HVAC

PART 1 - GENERAL

1.01 DESCRIPTION:

A. This Section describes the commissioning of the mechanical system and outlines the duties and responsibilities of the team.

B. The commissioning of the mechanical system shall be in accordance with the Code of Practice for Commissioning Mechanical Systems in Buildings and as described in this Section.

C. The commissioning process shall be applied to all products, equipment and systems provided under this Division.

D. The Contractor shall appoint a Commissioning Coordinator upon award of Contract.

1.02 SCOPE:

A. Demonstration of equipment and systems operations.

B. Instruction seminars for Owner's personnel.

1.03 QUALITY ASSURANCE:

A. Work specified shall be performed by the Contractor.

PART 2 - PRODUCTS

(Not Used)

PART 3 – EXECUTION

3.01 THE COMMISSIONING PROCESS:

A. The Commissioning Team:

1. The Commissioning Team shall be formed and consist of:

a. The Commissioning Coordinator

b. The Contractor

c. The Balancing Agent

d. The Contract Administrator’s representative

e. The Owner's staff representative

B. Duties of the Team:

1. The duties of the team are summarized below:

2. The Contractor shall within one month of the award of the Contract appoint a Commissioning Coordinator and submit the name and contact details of the Commissioning Coordinator to the Contract Administrator.

3. The Commissioning Coordinator shall plan, organize and implement the commissioning process.

4. The Commissioning Coordinator shall provide a complete description of the systems operation, performance and flow data to the Contract Administrator for review.

5. The Commissioning Coordinator shall prepare the commissioning plan and provide demonstration and instructions to the Owner's staff over a period of time to enable the staff to become familiar with the systems.

6. The Commissioning Coordinator will arrange and chair regularly scheduled meetings with the commissioning team to discuss the design intent, schedule, the commissioning plan, and anything else relevant to the commissioning of mechanical equipment installed under Division 23.

3.02 COMMISSIONING SCHEDULE:

A. Within six (6) weeks of commencing with the project work the commissioning coordinator shall review design intent and intended commissioning procedures with the Engineer. Six (6) weeks prior to the date of scheduled substantial performance, submit a detailed plan identifying the orderly progression of the prestart commissioning check and subsequent commissioning performance check of each sub-system, leading up to the ultimate commissioning of entire systems.

B. Submit a schedule for the commissioning phase of the work. This schedule shall show:

1. Completion dates for each trade in each major section of the building.

2. Timing of the various phases of the commissioning, testing, balancing and demonstration process.

3. Submission dates for the various documents required prior to verification of commissioning by the Contract Administrator.

4. Prepare a commissioning statement in which each of the four (4) phases that the process is perceived to be worked through. In sequence, the phases are expected to be:

    a. Phase 1 - System Readiness

    b. Phase 2 - System Start-up, Testing, Balancing, etc.

    c. Phase 3 - Verification of System Commissioning

    D. Phase 4 - Demonstration and Instruction

C. Within the commissioning schedule noted above, submit a copy of all commissioning worksheets to be used during the commissioning process.

D. Each phase is applicable to each major and separate system making up the work in Division 23 including controls and Division 26 interface as applicable.

1. Commissioning Phases

E. **Phase 1** - Before starting any of the separate systems, provide written verification stating that the specific system is ready for start-up and the following conditions have been met:

1. Copies of all test and certificates have been submitted to the Contract Administrator

2. All safety controls installed and fully operational (dry run test)

3. Flushing, chemical cleaning (as required), charging, fluid operating (as required), are complete

4. Equipment lubrication and pre-start checks are complete

5. Air system cleaning complete

6. Filter systems installed and sealed in place (except for air system charcoal filters)

7. Adjusting vibration isolation completed

8. Alignment of drives (direct and belt) completed

9. Control functional checks, including all alarms performed

10. Start-up verification checks by manufacturers representatives completed.

11. All deficiencies to be recorded, reviewed by the commissioning team and, subsequently corrected before proceeding to the next phase, Phase 2

F. **Phase 2** - System Commissioning shall include but not necessarily be limited to:

1. Activation of all systems

2. Testing and adjustment of all systems

3. As in the case of the System Readiness Phase, all deficiencies are to be recorded, reviewed by the Commissioning team and, subsequently, corrected. The process at the point of the deficiency shall be repeated before proceeding forward.

4. Phase 2 is concluded when the installation is in full working order and acceptable for use. The work will include the following:

    a. Position all balance dampers in ductwork

    b. Position all balance valves in piping systems (where appropriate)

    c. Make provisions for testing air pressures and flow rates

    d. Set up air diffusers, registers and grilles

    e. Set up all automatic temperature control devices

    f. Set up constant volume and variable volume fans

    g. Adjust variable volume boxes and air valves as necessary

    h. Plug all air pressure and flow measuring holes

    i. Adjust vibration isolators as necessary

    j. Verification by the air balance contractor that all fire dampers have been checked

    k. Air balance complete

5. Fine Tuning

6. Setting up automatic controls for accurate response and precise sequencing.

7. Correction of problems revealed by Balancing Agency and change of fan speed and pitch as necessary.

8. Testing

9. The commissioning coordinator shall perform a detailed check of the following:

    a. Control sequences functionality of all HVAC systems

b. Alarm functions

c. Temperature setpoints and maintenance for spaces and systems

d. Room Pressure settings and control

e. Gas detection setpoints and alarms

f. Motor loads under all operating conditions

10. All items and functions to be later demonstrated to the Owners representatives.

11. Systems operation in the fire mode (pressurisation and smoke removal) in the presence of the authorities having jurisdiction. Obtain a written statement/ certificate of approval from the authorized manual jurisdiction.

G. **Phase 3** - Verification of Commissioning.

1. Verification of commissioning by the Contract Administrator shall not commence until the commissioning process, Phase 2, has been totally completed. Submit test procedure completion test certificates at the time of requesting the commencement of the verification procedure. The verification process will include the demonstration of the following:

a. Location of and opening and closing of all access panels.

b. Operation of all automatic control dampers and automatic temperature/ volume adjustment controls.

c. Proper response of all variable air volume valves to thermostats and volume adjustment controls.

d. Operability of randomly selected fire dampers.

e. Noise level from typical variable air volume valves under extreme operating conditions.

f. Operation of all equipment and systems, under each mode of operation, including:

(1) DDC control features

(2) Automatic controls

(3) Special exhaust/make-up air systems

(4) Make-up air systems

2. At the completion of Phase 3, the Contractor shall submit the following to the Contract Administrator:

   a. A letter certifying that all work specified under this contract is complete, clean and operational in accordance with the specification and drawings.

   b. A copy of Phase 2 Verification Certificates provided by the specialist trades for submission to the Contract Administrator.

   c. Record drawings as specified

   d. A letter from the testing and balancing agency certifying that all necessary data for inclusion in operating and maintenance manuals has been received.

   e. A statement confirming completion of EMCS acceptance test, Section 15900.

3. Upon receipt of all documents and a satisfactory outcome of the verification procedure, the Contract Administrator will provide a Certificate of Verification for Phase 3.

4. Substantial Performance may, thereupon, be declared.

H. **Phase 4** - Demonstration and Acceptance shall not commence until the commissioning process Phase 3 has been successfully completed - verification certificate issued and Substantial Performance declared. The demonstration process is a statement of satisfaction from the Contract Administrator and Owner upon completion. Total Performance will not be accomplished without this achievement.

3.03 HVAC SYSTEMS:

A. Duct System: Pressure tests, insulation, identification, air balance identification.

B. Air Handling and Make-up Air Units: Installation vibration isolation, duct connections, motor rotation, air balance, filters, capacity identification, controls.

C. Control Dampers: Installation, operation, identification, capacity modulation, connection to EMCS.

D. Controls: See Section 23 09 13, Section 23 09 93.11 and SCADA specifications. Commissioning of controls by the SCADA Contractor under the supervision of the commissioning coordinator.

E. Terminal Devices: Installation, capacity modulation, reheat, response to controls, air balance.

3.04 GENERAL:

A. Independent Agency shall chair the demonstration and instruction sessions.

B. Contractor shall arrange for presentation and demonstration of mechanical equipment and systems by appropriate specialists and shall ensure that required manufacturer's representatives are in attendance.

3.05 DEMONSTRATIONS:

A. Provide three (3) working days for demonstration of equipment to the Owner.

B. Demonstrate specific starting and general maintenance requirements for each major piece of equipment. Ensure all labelling and identification is completed.

C. Demonstrate the following systems, in the form of instruction seminars and contractor-guided tour of the facility.

1. Air Systems

2. Control Systems

D. Demonstrate the following pieces of equipment:

1. Air Handling and Make-up Air Units

2. As requested by Owner

E. Prepare a schedule identifying the proposed sequence of demonstration. Sequence of demonstration shall correspond to full system starting. Submit for review by Contract Administrator one month prior to demonstration.

F. Answer all questions raised by Owner at demonstrations; if unable to satisfactorily answer questions immediately, provide written response within three (3) days.

G. Provide a professionally produced video of all instructions and demonstrations. Engage the services of a professional video production company to provide four (4) copies of the edited DVD(s).

3.01 CONTRACT CLOSEOUT:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

Page Intentionally Left Blank

SECTION 23 09 13

HVAC CONTROLS, FIELD COMPONENTS AND INSTRUMENTS

PART 1 - GENERAL

1.01 DESCRIPTION:

A. This Section specifies the general requirements for monitoring and controlling HVAC equipment.

B. All HVAC systems and sub-systems as indicated, except for Odor Control Removal are to be controlled by the Building Management System (BMS).

C. The Odor Control Removal system will be controlled by the SCADA system.

D. Building control will be provided directly by the BMS with designated alarming and warnings reported to the SCADA. All programming of the BMS will be by the BMS provider.

E. Automation system programming, configuration, testing and commissioning to be the responsibility of the automation system integrator under supervision of the controls lead see Section 40 61 96

F. The SCADA system is Schneider M580 PLC based. The BMS communication protocol must be capable of interfacing directly with M580 communication protocols (Ethernet, Modbus, TCP/IP, etc.)

G. The BMS provider and the automation systems integrator will work together to ensure all controls, alarms, setpoints etc. associated with the BMS are integrated into the SCADA.

H. The HVAC system is to be complete with all necessary control components and connections to achieve the specified functions. Reference all control narratives for general outline of expected functionality.

I. While the intent is to have the HVAC, systems controlled (Temperature) by the SCADA via BMS. Should the SCADA/BMS connection fail, the HVAC systems will be capable of being controlled directly through the BMS system.

J. Furnish all materials, including all Human Machine Interface (HMI) hardware and software, operator input/output peripherals, standalone local control panels, automation sensors and controls, wiring, and interface systems.

K. The control system is to be set up and adjusted to achieve energy efficient operation of the HVAC system. This includes sequencing, timing and re-adjustment, as required.

L. This section is a performance specification clarified in certain sections to establish minimum standard of equipment, installation and level of control.

M. This Section is a supplement to instruments and controls in Division 40.

N. The requirements of this Section shall be provided in addition to those listed in Division 40.

1.02 REFERENCES:

A. National Fire Protection Association (NFPA):

1. 70: National Electrical Code

2. NFPA 820 for Water Treatment Plants

3. ASHRAE 62.1

1.03 SUBMITTALS:

A. Provide submittals in accordance with Section 01 33 00 and the following:

1. Manufacturer's descriptive literature for materials.

2. Control center layouts.

3. Interconnection schematics.

4. Wiring and piping diagrams.

5. One-line diagram from sensor and control points to Field Interface device and/or standalone DDC panel including all components and cables.

6. Terminal cabinets, including termination listing.

7. Written description indicating sequence of operation.

8. Shop Drawings will be rejected if the written description is not included with the submission. Sequences should reference English descriptors and labels for each point described. Follow any established client cable and equipment tagging system.

9. All input/output points which are to include the following information associated with each point.

a. Sensing element type and location.

b. Details of associated field wiring schematics and schedules.

c. Software and programming details.

10. Detailed block diagrams of transmission trunk routing and configuration.

11. Valve and damper schedules indicating size, configuration, capacity and locations.

12. Detailed description/list of HVAC controls, alarms and setpoints available on the SCADA

13. Provide transfer table/data reference points to be used by SCADA system to control the HVAC systems

B. Submit the following shop drawings in accordance with Section 01 33 00.

1.04 SPARE PARTS:

A. Comply with the requirements specified in Section 01 61 00.

1.05 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

1.06 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

1.07 FREEZE PROTECTION:

A. BMS to shut down all supply air handling units containing coils, upon sensing air off the coils at 4 degrees C/40 degrees ^{o}F.

B. Allow up to three (3) restarts, over short period before generating an alarm.

1.08 ALARMS – GENERAL:

A. No alarm is to be triggered for a device until the device has been started and is in stable operation. Use software time delays to achieve this requirement.

B. Generate an alarm on the SCADA if any equipment is not in the intended operating condition or if any analog input is not within the intended operating range.

PART 2 - PRODUCTS

2.01 GENERAL:

A. Provide a BACNet BMS system as a distributed control system. The system shall have Stand-Alone Digital Controllers (SDC's), a communications network, and a separate workstation computer with workstation software. The workstations and network

controllers shall communicate to any outside network including the SCADA network, using TCP/IP protocol and addressing.

B. Provide an operator programmable system to perform closed-loop, modulating control of building equipment. Connect all digital controllers through the communication network to share common data and report to workstation computer. Provide workstation BMS software capable of programming and monitoring the digital controllers. The control system shall be capable of downloading programs between the workstation and digital controllers.

C. Apply digital controllers in a distributed control manner.

D. Total number of I/O hardware points, including those communicated over a LAN, used by a single SDC, including I/O expansion units shall not exceed 48.

E. Design, provide and install all conduit and wiring linking all elements of system, including future capability.

F. All control units in the BMS are to be BACnet compliant with open protocol to allow future replacement of obsolete components or integration of another manufacturer's BACnet compliant components and any existing BMS system

G. All control units in the BMS are to be BACnet compliant with open protocol to allow for integration with the SCADA system.

H. Location of controllers to be approved by the Engineer prior to installation.

I. Provide analog output and input devices utilizing a 0-10 VDC or 4-20 mA control signal. Verify input and output requirements from BMS to other vendor supplied equipment controls and configure accordingly.

J. Provide field instrumentation and sensing devices analog or digital as applicable which measure temperature, humidity, pressure, flow, current, voltage, equipment states, etc., and which input signals to the SCU terminal strip that conform to the input requirements. All field devices will be of industrial grade.

K. Provide output devices and actuators which convert the digital or analog output signal from the SCU to activate relays or open and close valves, dampers, etc.

L. The end to end accuracy called for in Subsection 2.9 includes the combined effect of sensitivity, hysteresis, linearity and repeatability between the measured variable and the input to the analog-to-digital converter in the SCU or between the SCU input to the digital-to-analog converter and the controlled variable for the full sensing range.

M. Acceptable system suppliers:

1. Honeywell

2. Johnson Controls

3. Siemens

4. Schneider

2.02 BMS SYSTEM WORLD WIDE WEB BASED ACCESSIBILITY

A. The control system must be capable of Web accessible with four (4) simultaneous users. Web accessibility will be provided with same level of password protection (four levels) for internal accessibility. Web Based accessibility will provide full access to the BMS system including monitoring, diagnostic functions, setpoint adjustment, access to real time and archived trending data and reports. The Facility Operations will control when the system accesses the Web is permitted.

2.03 STAND-ALONE DIGITAL CONTROLLERS (SDC'S):

A. Inputs:

1. Provide input function integral to the SDC. Provide input type(s) as required by the systems design. For each type of input used on high-level controllers, provide at least one similar spare input point per controller.

2. Analog Inputs: Allowable input types are 100-ohm (or higher) platinum RTDs, 4-20 mA, and 2-10 VDC. Direct RTD inputs must have appropriate conversion curves stored in controller software or firmware. Analog to digital (A/D) conversion shall have 16-bit minimum resolution.

3. Digital Inputs: Digital inputs shall sense open/close, on/off, or other two state indications.

B. Outputs:

1. Provide output function integral to the direct digital controller. Provide output type(s) as required by the systems design. For each type of output used on high-level controllers, provide at least one (1) similar spare output point per controller.

2. Analog Outputs: Provide controllers with 16-bit minimum output resolution. Output shall be 4-20 mA or 2-10 VDC.

3. Digital Outputs: Provide contacts rated at a minimum of 1 ampere at 24 V.

C. PID Control:

1. Provide controllers with proportional integral and derivative control capability.

2. The upper level digital controllers shall be capable of networking with other similar upper level controllers. Upper level controllers shall also be capable of communicating over a network between buildings.

D. Communications Ports:

1. Controller-to-Controller LAN Communications Ports: Controllers in the building BMS system shall be connected on a communications network. Controllers shall have controller to controller communication ports to both peer controllers (upper level controllers) and terminal controllers (lower level controllers). Network may consist of more than one level of local area network and one level may have multiple drops. Communications network shall permit sharing information between controllers, allowing execution of dynamic control strategies, and coordinated response to alarm conditions. Minimum speed for all LAN's is 100 Mbps.

2. Interface Ports: Provide a RS-232 or RS-485 communications ports for each digital controller that allows direct connection of a computer or handheld terminal and through which the controller may be fully accessed. Controller access shall not be limited to access through another controller. Interface communication ports shall be in addition to the communications port(s) supporting controller to controller communications. Communication rate is 9600 Baud minimum. Every controller on the highest-level LAN shall have a communications port supporting direct connection of a computer; a hand held terminal port is not sufficient. By connecting a computer to this port, every controller in the direct digital control system shall be accessible and programmable. The following operations shall be available: downloading and uploading control programs, modifying programs and program database, and retrieving or accepting trend reports, status reports, messages, and alarms.

3. Remote Workstation Interface Port: Provide one (1) additional direct connect computer port in each BMS system for permanent connection of a remote operator's work station, unless the workstation is a node on the LAN. All operations possible by directly connecting a computer to a controller at the highest-level LAN shall be available through this port.

2.04 ETHERNET NIC:

A. Provide one (1) Ethernet NIC per BMS system to communicate between the digital control system and the computer workstation. Minimum Ethernet transmission rate is 100 Gigahertz.

B. The BACnet communication network system will be redundant design such that a failure of a single communication link or node will not impact the ability of the system/sub-system to communicate with other nodes or from the SCADA system

2.05 DIGITAL CONTROLLER CABINET:

A. Each indoor digital controller cabinet shall protect the controller from dust and rated NEMA 1, unless specified otherwise. Refer to Electrical drawings for area classifications and categories. Each outdoor digital controller cabinet shall protect the controller from all outside conditions and rated NEMA 4. Cabinets for high level controllers shall be hinged door, lockable, and have offset removable metal back plate.

B. Make all wiring connections in the shop from the equipment mounted on the panel to numbered terminal blocks conveniently located in the panel, including the power supply for all instruments.

C. Identify all wiring by means of stamped markings on heat shrinkable tubing. Install all wiring neatly and laced or bunched into cable form using plastic wire clips, where practical, contained in plastic wiring channels with covers. Maximum twenty-five (25) conductors to each wire bundle.

D. Install "Hand-Off-Auto" selector switches such that safety controls and electrical over current protection are not overridden when selector switch is in the "Hand" position.

2.06 MAIN POWER SWITCH:

A. Each controller on the highest-level LAN or each control cabinet shall have a main external power switch for isolation of the controller from AC power. The switch shall be in the BMS cabinet.

2.07 TERMINAL CONTROL UNITS (TCUS):

A. The same company as the digital controllers shall manufacture TCUs.

B. TCUs shall automatically start-up on return of power after a failure, and previous operating parameters shall exist or shall be automatically downloaded from a digital controller on a higher level LAN.

C. TCUs do not require an internal clock if they get time information from a higher level digital controller.

2.08 WIRE

A. Control wiring for digital functions shall be 18 AWG minimum with 300 V insulation control wiring for analog functions shall be 18 AWG minimum with 300 V insulation, twisted and shielded, 2 or 3 wire to match analog function hardware.

B. Sensor wiring shall be 18 AWG minimum twisted and shielded, 2 or 3 wire to match analogue function hardware or 16 AWG as required by code.

C. Transformer current wiring shall be 16 AWG minimum.

2.09 CONDUITS AND CABLES

A. All wiring shall be in conduit or trays. Conform to Division 23 requirements for conduit and tray Specifications.

B. Seal conduit where such conduit leaves heated areas and enters unheated area.

C. Run low level signal lines in separate conduit from high level signal and power transmission lines.

D. Identify each cable and wire at every termination point.

E. Where applicable, mount field interface equipment (i.e. relays, transducers, etc.) in local device cabinets adjacent to field interface panels.

F. Separate conduits shall be provided for pneumatic tubing and electrical wiring runs.

G. Color code all conductors and conduits by permanently applied color bands on maximum 30-foot intervals. Color code shall follow base building schedule.

2.10 RELATED ACCESSORIES

A. Provide and install all necessary transformers, transducers, interposing relays, interface devices, contractors, and EP's to perform control functions required.

B. It is the responsibility of the Contractor to identify, at the time of tender submission, all additional items not specified that are required to meet the operational intent specified.

C. Items required but not identified at the time of tender acceptance shall be the Contractor's responsibility.

2.11 CONTROL DAMPERS:

A. General:

1. See Section 23 09 23.12.

2. Furnish opposed-blade type for proportional action and parallel-blade type for two-position action, except where indicated otherwise in the Contract Documents.

B. Instrumentation and Controls:

1. The dampers shall have the option of being controlled locally or remotely via the main BMS system.

C. Shop Assembly:

1. The dampers shall be fully assembled to the maximum extent possible.

2.12 CONTROL DAMPER OPERATORS:

A. General:

1. See Section 23 09 23.12.

2. Drawings and Control Diagrams indicate only one damper motor for each motorized damper (M).

3. Select actual quantity of motors required to operate each damper in accordance with the size of damper provided.

4. Coordinate exact quantity of damper motors with electrical Work to ensure that necessary wiring and conduit is provided for installation.

5. Provide operators for motorized dampers and motorized louvers for all cases where an operator is not supplied as part of a unit.

2.13 AUTOMATIC CONTROL VALVES:

A. General:

1. See Section 23 09 93.11.

2.14 VALVE ACTUATORS:

A. General:

1. See Section 23 09 93.11.

2.15 ELECTRIC THERMOSTATS:

A. Office Area Room Thermostat:

1. Modulating electric type, except where two-position action is required.

2. Temperature Scale: Furnish 35 to 95 degrees F dial.

3. Concealed adjustments.

4. Adjustable sensitivity.

5. Removable, tamper-proof cover.

6. Insulating back, where exterior wall mounting is indicated in the Contract Documents.

B. Process Area Room Thermostat:

1. Modulating electric type, except where two-position action is required.

2. Temperature Scale: Furnish 35 to 95 degrees F dial.

3. External adjustments, temperature display.

4. Adjustable sensitivity.

5. Insulating back where exterior wall mounting is indicated in the Contract Documents.

6. Locking wire protective guard.

7. Enclosure and sensing element to match area classification and moisture/corrosion category.

C. Outdoor Thermostat:

1. Modulating electric type, except where two-position action is required.

2. Temperature Scale: Furnish -40 degrees F to 140 degrees F dial.

3. External adjustments, temperature display.

4. Adjustable sensitivity.

5. Insulating back where exterior wall mounting is indicated in the Contract Documents.

6. Locking wire protective guard.

7. Sunshield

8. Enclosure and sensing element to match area classification and moisture/corrosion category.

2.16 ELECTRONIC SENSORS:

A. Temperature:

1. General Requirements:

a. Sensors and transmitters shall be provided, as outlined in the control schematics, input/output summary and sequence of operations.

b. Temperature sensor shall be resistance type, and shall be two-wire 1,000-ohm platinum RTD.

c. The following point types (and accuracy of each) are required, and their associated accuracy values include errors associated with sensor, lead wire, and A to D conversion:

Point Type	Accuracy
Hot / Chilled Water	+ 0.5 degrees F
Room Temperature	+ 0.5 degrees F
Duct Temperature	+ 0.5 degrees F
All Others	+ 0.7 degrees F

2. Room Temperature:

   a. Constructed for either surface or wall box mounting.

   b. Non-locking wire protective guards for room temperature sensors installed in process areas.

3. Room Temperature Sensors with Integral Display

   a. Constructed for either surface or wall box mounting.

   b. Non-locking wire protective guards for room temperature sensors installed in process areas.

   c. Integral LCD display and four button keypad with the following capabilities:

      (1) Display room and outside air temperatures

      (2) Display and adjust room comfort set point

      (3) Display and adjust fan operation status

      (4) Timed override request pushbutton with LED status for activation of after-hours operation

      (5) Display controller mode

      (6) Password selectable adjustment of set point and override modes

4. Duct Temperature:

   a. Accuracy: +/-1 degree F

   b. Range:

      (1) Heating: 40 to 140 degrees F

(2) Cooling: 30 to 100 degrees F

c. Element:

(1) Rigid insertion, 12-inch length, through sealed opening in center of duct.

(2) Averaging, for ducts or plenums with any dimension greater than 36 inches. Sealed opening in duct. Sensing element incorporated in copper capillary a minimum of 20 feet long, serpentined across full area of airflow.

B. Pressure (PS):

1. Air Pressure:

a. Accuracy: 5 percent of range

b. Range: 150 percent of measured variable

c. Mount non-vibrating

d. Cover: NEMA 250 Type, suitable for area classification; in accordance with NFPA 70

2. Water Pressure:

a. Dwyer Instruments Inc.; No. 630 Series, 0 to 20 psi

b. Transicoil Inc. (Robinson Halpern); No. 151 Series

C. Differential Pressure:

1. General:

a. Temperature compensated.

b. Vary output voltage with change in differential pressure. Voltage shall vary linearly from 0 to 10V DC according to differential pressure between high and low pressure ports.

c. Sensing range shall be suitable for application with linearity of 1.5 percent of full scale and offset of less than 1 percent of full scale.

d. Capable of withstanding up to 150 percent of rated pressure without damage.

e. Compatible with 14V to 30V DC supply voltage range.

2. Duct Air Static Differential Pressure (Flow Measurement):

    a. Ultra-low differential pressure and flow transmitter

    b. 0.5 percent of natural span accuracy

    c. 4-20 mA output.

    d. Pressure range to sit application

    e. Integral 3-way zeroing valve

    f. Built-in square root function

    g. NEMA 12 enclosure

    h. Veltron DPT 2500 transmitter with NEMA 12 enclosure

    i. Sensocon A3 controller/display with NEMA 12 enclosure

3. Space Air Static Differential Pressure: MAMAC Systems Inc. or Setra transmitter

4. Water Differential Pressure:

    a. Dwyer Instruments Inc.; No. 630 Series, 0 to 20 PSI range

    b. Rosemount Controls Inc.; No. 1151-DP Series

    c. Include three-valve manifold connection

D. Position Indicator:

1. 0 to 100 percent open, for damper, inlet vane, or similar

2. Potentiometer, 0 to 2,000 ohm equals 0 to 100 percent

E. Relative Humidity (RH):

1. Room Relative Humidity

2. Accuracy: +/-2 percent

3. Range: 10 to 95 percent

4. Solid state

F. Current Sensors (CS):

1. Fixed Setpoint, Digital Output Current Switch:

a. Manufacturer:

(1) Veris Industries Inc.; Hawkeye 600/800

b. Application: Monitoring status of direct drive equipment

c. Current-operated solid state relay

d. Split core design

e. Trip Setpoint: Fixed

f. Output: Digital switch

g. Sensor Power: Induced from line

2. Adjustable Setpoint, Analog Output Current Sensor:

a. Manufacturer:

(1) Veris Industries Inc.; Hawkeye H721LC/721HC

b. Application: Monitoring status of belt drive equipment

c. Current-operated solid state transducer

d. Split core design

e. Output: Analog

f. Sensor Power: Induced from line

3. Adjustable Setpoint, Digital Output, VFD Current Switch:

a. Manufacturer:

(1) Veris Industries Inc.; Hawkeye 904

b. Application: Monitoring status of belt-drive or direct-drive equipment controlled by a VFD

c. Microprocessor-based current-operated solid state relay

d. Automatic compensation for VFD frequency and current changes

e. Split core design

f. Trip Setpoint: Self-calibrating

g. Output: Digital switch, with normal and alarm status LED

h. Sensor Power: Induced from line

2.17 AIRFLOW MONITORING STATION

A. The airflow monitoring station shall consist of multiple aluminum airflow measuring elements containing multiple total and static pressure sensing ports placed along the leading edge of the cylinder. The static pressure chamber shall incorporate dual offset static taps on opposing sides of the averaging chamber capable of accommodating flow angle variations of plus or minus 20 degrees in the approaching airstream. The probes shall be manifolded together in a 0.06 inch type 316 stainless steel duct section with 90 degree undrilled flanges, fabricated to the duct size, and shall contain multiple interconnected airflow traverse elements.

B. Where primary flow elements are located outside of the Manufacturer's published installation guidelines the manufacturer shall be consulted, and approve of any special configurations, such as air equalizers and/or additional and strategically placed measuring points, as may be required.

C. The airflow traverse elements shall be capable of producing steady, non-pulsating signals of true total and static pressure. Signal amplifying sensors requiring flow correction (K factors) for field calibration are not acceptable.

D. Accuracy: plus or minus 2 percent

E. Operating Velocity Range: 100 to 1000 feet per minute

F. Operating Temperature Range: minus 40 to 104 degrees F

G. Air Pressure Drop: < 0.18 inches WG Pa at 4000 feet per second

H. Generated Noise Level: < NC40

I. Acceptable Manufacturers:

1. PCI

2. Ebtron

2.18 HIGH TEMPERATURE DETECTORS:

A. The high temperature switch shall be of the automatic reset type with Double Pole/Single Throw snap acting contacts rated for 16 amps at 120VAC. An auxiliary contact shall be provided for remote alarm (EMS) monitoring of a high temperature condition.

B. The sensing element shall be bi-metal type.

C. Sensing element shall react to the warmest section of the multi section element.

D. Thermostat element shall be a probe type.

E. For large duct areas where the sensing element does not provide full coverage of the air stream, additional thermostats shall be provided as required to provide full protection of the air stream.

F. Provide means of providing a time delay on the high temperature cut out where required and indicated on the Drawings.

2.19 LOW TEMPERATURE DETECTORS:

A. The low temperature switch shall be of the automatic reset type with Double Pole/Single Throw snap acting contacts rated for 16 amps at 120VAC. An auxiliary contact shall be provided for remote alarm (EMS) monitoring of a low temperature condition.

B. The sensing element shall be a minimum of 20 feet in length and shall react to the coldest 18 inch section.

C. Element shall be of sufficient length to allow a serpentine distribution across the duct cross section and provide an accurate indication of the air flow temperature, especially in the case where a mixed air temperature is being measured.

D. For large duct areas where the sensing element does not provide full coverage of the air stream, additional switches shall be provided as required to provide full protection of the air stream.

E. Provide means of providing a time delay on the low temperature cut out where required and indicated on the Drawings.

2.20 TIMER PUSHBUTTON STATIONS:

A. Provide NEMA 12 panel complete with surface-mounted on and off momentary pushbuttons/contacts, LED feedback lamp and flush-mounted LCD display on outer surface of panel.

B. LED shall go ON when ‘ON’ pushbutton is pressed to indicate that ventilation system has been activated.

C. LCD display shall indicate the ventilation system run time remaining following each press of the 'ON' pushbutton. For each time the 'ON' pushbutton is pressed, an operator-adjustable run time interval will be banked up to a maximum of one hour and the display will count down from the total accumulated value selected.

D. The 'OFF' pushbutton, when pressed, shall override the time remaining and stop the ventilation, except where the space temperature exceeds the maximum space temperature setpoint.

E. Provide non-wear, securely fastened signage next to each pushbutton station with the following wording: "Press ON Pushbutton until Desired Room Ventilation System Run Time is Displayed. To Override Selected Runtime, Press OFF Pushbutton.

2.21 BMS SOFTWARE:

A. Provide, in the digital controllers, software to execute the sequence of control. Provide one (1) registered copy of all software used to program control sequences in all direct digital controllers and LAN controllers on the computer workstation. Provide any access keys which restrict programming language software functions or the ability to compile or prepare programming for download to controllers. Provide final copy of each program used in the system in both compiled and editable formats. Where specially programmed factory configured smart controllers are used in the system, provide minimum factory programming tools and specialized controller programs ready for download to replacement controllers. At minimum, controllers must be capable of performing programming functions outlined in the following "Parameter Modification" section.

B. Provide software to modify control parameters. Parameter modification for all controllers (high level and low-level application specific) is through the main workstation computer and with laptop computer or keypad terminal directly at each controller. Modifications are to be accomplished without having to make changes directly in line-by-line programming. When the control program is of the line-by-line type, database parameters in the following list that take real number values require assignment of variable names so parameters can be changed without modifying programming. Alternatively, block programming languages shall provide for modification of these database parameters in fill-in-the-blank screens. Parameters of like type, including those in different high level and low-level controllers, may be grouped together for a single, global change. For example, an operator may group all second floor space temperature setpoints into a group and raise the setpoint by two degrees with a single command. The following parameters shall be modifiable in this way:

1. Setpoints.

2. Dead band limits and spans.

3. Reset schedules.

4. Switch over points.

5. PID gains and time between control output changes.

6. Time.

7. Timed local override time.

8. Occupancy schedules.

9. Holidays.

10. Alarm points, alarm limits, and alarm messages.

11. Point definition database.

12. Point enable, disable, and override.

13. Trend points, trend intervals, trend reports.

14. Analog input default values.

15. Passwords.

16. Communications parameters including network and telephone communications setups.

C. Differential:

1. Where setpoint is in response to some analog input such as temperature, pressure, or humidity, include a setpoint differential to prevent short cycling of control devices.

D. Motor and Flow Status Delay:

E. Provide an adjustable delay between when a motor is commanded on or off and when the control program looks to the motor or flow status input for confirmation of successful command execution.

F. Run Time Accumulation:

1. Provide resettable run time accumulation for each controlled digital output.

G. Time Programs:

1. Provide programs to automatically adjust for leap years, daylight savings time, and operator time adjustments.

H. Scheduling:

1. Individual controlled equipment shall be schedulable with schedule based on time of day, day of week, and day of year. Equipment may be associated into groups. Each group may be associated with a different schedule. Changing the schedule of a group shall change the schedule of all equipment in the group. Groups may be modified, created, and deleted by the operator.

2. Provide capability to view and modify schedules in a seven-day week format. When control program does not automatically compute holidays, provide capability to enter holiday schedules one (1) full year at a time.

I. Point Override:

1. I/O and virtual points shall accept software overrides to any possible value.

J. Alarming:

1. I/O points and software points shall be alarmable. Alarms may be enabled and disabled for every point. Alarm limits shall be adjustable on analog points. Controllers connected to an external communications device such as a printer, terminal, or computer, shall download alarm and alarm message when alarm occurs. Otherwise alarms will be stored and automatically downloaded when a communications link occurs. In addition to those described in Schedule 18 C11.4, the following conditions shall generate alarms:

   a. An analog input takes a value indicating sensor failure.

   b. A module is not communicating on the LAN.

   c. A power outage occurs.

   d. Activation of any emergency eyewash or emergency shower.

K. Messages:

1. Messages shall consist of the device tag number, the device/associated equipment description and fault, and be assigned to alarm or status conditions. An example of a message for the activation of a pressure switch would be, “80-PDS-XXXXX, - Air Handling Unit 80-AHU-XXXXX - Summer Filter Dirty”. Messages shall be displayed on the workstation and be capable of being printed when these conditions occur.

L. Trending:

1. BMS system shall have the capability to trend all I/O and virtual points. Points may be associated into groups. A trend report may be set up for each group. The period between logging consecutive trend values shall range from fifteen seconds to sixty

(60) minutes at a minimum. The minimum number of consecutive trend values stored at one time shall be 6000 per variable. Trend data shall be uploaded to workstation computer automatically for archiving and processing prior to controller storage being exceeded, maximum once per day. Trend data shall be available on a real time or archived basis; trend data shall appear numerically and graphically on a connected computer's screen as the data is processed from the BMS. Workstation software will process the data into user defined reports. The system must be able to show single or multiple values in multiple ranges on a single graph, including the ability to mix analog and digital signals. The time scale must be user definable. The line types must be able to be displayed in a variety of formats including column, line, symbol, scatter or area. The user must be able to zoom and scroll on the trend. The trend should be capable of displaying a user selected point value. Database for storing of archived data and reports shall be in ASCII format compatible for export to common database manipulation programs (e.g. Microsoft Access, Microsoft Excel). Archived data and reports shall be kept and be retrievable for a minimum of two (2) years.

2. All Trended and archived data will be accessible by the SCADA system

M. Status Display:

1. Current status of I/O and virtual points shall be displayed on command. Points shall be associated into functional groups, such as all the I/O and virtual points associated with control of a make-up air unit, and displayed as a group, so the status of a single mechanical system can be readily checked. A group shall be selectable from a menu of groups having meaningful names; such as 80- MAU-XXXXX, Screen Room, Electrical room Heat Cooling System, and other such names.

N. Diagnostics:

1. Each controller shall perform self-diagnostic routines and provide messages to an operator when errors are detected. The BMS shall be capable of recognizing a non-responsive module on a LAN. The remaining, responsive modules on a LAN shall not operate in a degraded mode.

O. Power Loss:

1. During a power outage, each controller shall assume a disabled status and outputs shall go to a user definable state. Upon restoration of power, the BMS shall perform an orderly restart, with sequencing of outputs.

P. Program Transfer:

1. Provide software for download of control programs and database from a computer to controllers and upload of same to a computer from controllers. Every digital controller in the BMS shall be capable of being downloaded and uploaded to through a single controller on the highest-level LAN.

Q. System Back-up and Restoration:

1. The entire control system shall be capable of being backed-up or restored to or from a single back-up storage media.

R. Password Protection:

1. Provide at least four (4) levels of password protection to the BMS permitting different levels of access to the system. The lowest level allows monitoring only. The highest level allows full control of all functions, including setting new passwords.

S. Operator Workstation:

1. BMS System provider will confirm the Operator Work Station (OWS) being supplied conforms to the requirements with the Facility Information Management System Standards. OWS will be at a minimum

2. Desktop Computer:

a. Processor: 7th Generation Intel® Core™ processor (8M Cache, up to 4.00 GHz).

b. OS: Windows 10 Professional.

c. Memory: 8 GB Dual Channel DDR3 1600 MHz.

d. Hard Drive: 1TB 7200 RPM SATA Hard Drive 6.0 Gb/s.

e. Video Card: NVIDIA GeForce GT 720 1GB DDR3.

f. Sound Card: Integrated 7.1 with WAVE MAXXAudio 4.

g. Optical Drive: Tray load DVD drive (reads and writes to DVD/CD).

h. Internal battery-backed real time clock.

i. Provide at a minimum 4 USB, 3 serial and 2 parallel port to connect I/O devices.

3. Monitor:

a. BMS System provider will confirm monitor being supplied conforms to the requirements with the Facility Information Management System Standards. Monitor will be at a minimum:

b. Diagonally Viewable Size: 23.8 inches.

c. Aspect Ratio: Widescreen (16:9).

d. Panel Type, Surface: In-plane switching, anti-glare with hard coat 3H.

e. Optimal resolution: 1920 x 1080 at 60Hz.

f. Contrast Ratio: 1000: 1 (typical), 2 Million: 1 (Max) (Dynamic Contrast Ratio).

g. Brightness: 250 cd/m^2 (typical).

h. Response Time: 8 ms (gray to gray).

i. Viewing Angle: (178° vertical / 178° horizontal).

j. Color Support: Color Gamut[7] (typical): 85% (CIE1976), sRGB 96% (average Delta E of>4) 16.77 Million colors.

k. Pixel Pitch: 0.274 mm.

l. Backlight Technology: LED.

m. Display Type: Widescreen Flat Panel Display.

n. Display Screen Coating: Antiglare with hard-coating 3H.

o. Stand: Height adjustable stand, tilt, pivot, swivel and built in cable management.

p. Connectivity: 2 HDMI(MHL) connectors, 1 Mini DisplayPort, 1 DisplayPort (version 1.2a), 1 DisplayPort out (MST), 1 Audio Line out, 4 USB 3.0 ports - Downstream (4 at the back, 1 with battery charging), 1 USB 3.0 port – Upstream.

4. Printer:

a. BMS System provider will confirm printers being supplied conforms to the requirements with the Facility Information Management System Standards. Printers will be at a minimum:

b. Inkjet type printer.

c. Normal print resolution 600 x 600 dpi.

PART 3 - EXECUTION

3.01 GENERAL – INSTALLATION OF FIELD COMPONENTS AND INSTRUMENTS:

A. The control drawings and/or control sequences indicate only the principal items of equipment controlling the systems. Supplement each control system with all devices (e.g. relays) gauges and auxiliaries required to enable each system to perform as specified and to permit proper operation and supervision of same.

B. Upon completion of the Work, all control devices shall be calibrated, tested and verified, as required, to place the system in complete and satisfactory operating condition.

C. Notify the Consultant in writing of any conflict between these Specifications and the manufacturer's instructions.

D. All equipment installed shall be mechanically stable and, as necessary, fixed to floor or wall. Anti-vibration mounts to be provided, where required, for the proper isolation of equipment.

E. Install equipment so as to allow for ease of maintenance access such that it does not interfere in any way with access to adjacent equipment and personnel traffic in the surrounding space.

F. Install equipment in locations having suitable ambient conditions for its specified functioning, allowing for adequate ventilation and the prevention of condensation traps.

G. Outdoor installation is to be weatherproof construction in NEMA 4X enclosures.

H. Ensure that all holes drilled in ductwork and HVAC equipment housings are properly sealed to eliminate leakage and to maintain the pressure rating of the equipment in question.

I. Confirm Operator Workstation location with Engineer prior to installation.

J. Install damper motors on outside of ducts. Do not locate in air stream.

K. Wire "hand/off/auto" selector switches such that automatic operating controls and not safety controls and electrical over current protection shall be overridden when switch is in the "hand" position.

L. Coordinate and confirm all controller set points with the balancing Contractor to verify all minimum and maximum air volumes on VSD controlled fans, air handlers and make-up air units.

M. The BMS provider and the SCADA System Integrator shall work together to ensure all controls, alarms, setpoints are integrated into the SCADA system.

N. Provide copies of proposed control screens to Engineer for review prior to implementation.

3.02 TEMPERATURE SENSORS AND THERMOWELLS:

A. Provide mixed air temperature sensors of a sufficient length to give an accurate temperature indication for the cross section of mixing plenum or duct involved. Install sensors in a serpentine arrangement about the plane of stratification (horizontal or vertical) so that an equal length of the sensing element covers an equal area of the mixing plenum and an accurate measurement of the mixed air temperature is achieved.

B. Unless otherwise indicated in the Contract Documents, mount space sensors 60 inches above the finished floor level. Confirm exact location of all thermostats prior to roughing-in.

C. In process/service areas, utility rooms and other areas where the thermostat might be subject to damage, provide a metal cage or cast aluminum thermostat guard.

D. Drill holes, weld thread-o-lets and mount thermowells in piping after isolating and draining the section to be worked on. Notify the Consultant/Regions before doing so. Install sensors in thermowells with dust-tight connection heads. Ensure sensor element is immersed in heat transfer compound and firmly seated against tip of well. Element shall extend at least two thirds of the pipe diameter into the pipe. Install sensor in region of piping where well-mixed conditions exist (e.g. at a pipe bend) wherever possible. Where pipe diameter is less than the length of the sensing element, mount sensor at piping elbow. Use stainless steel thermowells with extensions, where required, to accommodate thickness of insulation. Replace and repair insulation and pipe jacketing to return to original condition.

3.03 INSTALLATION OF DIRECT DIGITAL CONTROL SYSTEM COMPONENTS:

A. Provide all control (including 120V where indicated on the Drawings) and power wiring, including installation required to interconnect control components located on air handling units and power wiring between lighting panel circuits provided under Division 26 and field-mounted controllers . Refer to electrical wiring diagrams for details regarding interconnection wiring requirements with control components.

B. Sensor and control device wiring are to be as recommended by the control system manufacturer.

C. Provide all contacts and interfaces required for pickup of alarm and status points for systems and equipment other than the SCADA controlled devices as indicated on the Drawings.

3.04 INSTALLATION OF DAMPERS AND OPERATORS:

A. Provide the required number of electric operators to properly drive all system dampers. Check and test operation, and adjust as required.

B. Securely mount operators on damper frames to withstand counter torque created by dampers.

C. Install at locations indicated on the Drawings and in accordance with the manufacturer's instructions.

D. Install square and free from racking with blades running horizontally.

E. Operate opposed blade dampers from a power blade or drive axle.

F. Bracing:

1. Install for multiple section assemblies to support assembly weight and to hold against system pressure.

2. Install at every horizontal and vertical mullion.

3.05 INSTALLATION OF THERMOSTATS:

A. Unless otherwise specified in the Contract Documents, provide all required line voltage thermostats, including those for unit heaters and fan coils.

B. In process areas, utility rooms and other areas where the thermostat might be subject to damage provide a metal cage or cast aluminum thermostat guard. Note; No guard is required where Farm-o-Stats are used.

C. Unless otherwise indicated in the Contract Documents, mount room thermostats 60 inches above the finished floor level. Confirm exact location of all thermostats prior to roughing-in.

D. Provide stand-off mounting and an insulated sub-base for thermostats on outside walls.

3.06 INSTALLATION OF HIGH AND LOW TEMPERATURE DETECTORS, AND ACCESSORIES:

A. Place where indicated on the control Drawings.

B. Element shall be mounted across duct to in a serpentine arrangement about the plane of stratification (horizontal or vertical) so that an equal length of the sensing element covers an equal area of the mixing plenum and an accurate measurement of temperature is achieved.

3.07 INSTALLATION OF CONTROL COMPONENT PANELS:

A. Provide at locations indicated on the Drawings or implied by the Drawings and Control Specifications. Locate panels to provide a convenient operator interface with control system.

B. Surface wall mount or secure in place between free-standing galvanized structural steel members.

C. Confirm exact cabinet locations prior to roughing-in.

3.08 ACCEPTANCE TESTING:

A. A final operational acceptance test of seven (7) consecutive days shall be conducted on the complete and total installed and operational control system to demonstrate that it is functioning properly in accordance with the Specifications.

1. Acceptance testing will require the SCADA/BMS integrated systems to be functional

B. The correct operation of all monitored and controlled points shall be demonstrated as well as the operation and capabilities of all sequences, reports, specialized control programs and algorithms, diagnostics and all other software.

C. In the event of the failure of function, during the test, of any of the hardware components or software application or routines, the test will recommence and run until seven (7) failure-free test days have occurred.

D. After successful completion of the acceptance test, the Engineer will issue written acceptance of the control system.

E. Prior to acceptance of the Work, submit hard copy and electronic copy on disk of final database listings.

3.09 TRAINING:

A. Construction Contractor to provide three (3) weeks written notice to the Engineer prior to commencing formal training sessions.

B. Formal training sessions shall commence only after "As-Constructed" Drawings have been completed, reviewed and approved by the Engineer.

3.10 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 23 09 23.12

CONTROL DAMPERS

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide control dampers and actuators for DDC systems as indicated and in compliance with Contract Documents.

1. Rectangular control dampers

2. General control-damper actuator requirements

3. Electric and electronic actuators

B. Drawings and Control Diagrams indicate only one damper motor for each motorized damper (M).

C. Select actual quantity of motors required to operate each damper in accordance with the size of damper provided.

D. Coordinate exact quantity of damper motors with electrical Work to ensure that necessary wiring and conduit is provided for installation.

1.03 DEFINITIONS:

A. DDC: Direct-digital control

B. RMS: Root-mean-square value of alternating voltage, which is the square root of the mean value of the square of the voltage values during a complete cycle

1.04 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Product Data: For each type of product, including the following:

1. Construction details, material descriptions, dimensions of individual components and profiles, and finishes.

2. Operating characteristics, electrical characteristics, and furnished accessories indicating process operating range, accuracy over range, control signal over range, default control signal with loss of power, calibration data specific to each unique application, electrical power requirements, and limitations of ambient operating environment, including temperature and humidity.

3. Product description with complete technical data, performance curves, and product specification sheets.

4. Installation instructions, including factors affecting performance.

C. Shop Drawings:

1. Include plans, elevations, sections, and mounting details.

2. Include details of product assemblies. Indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.

3. Include diagrams for power, signal, and control wiring.

4. Include diagrams for air and process signal tubing.

5. Include diagrams for pneumatic signal and main air tubing.

D. Delegated-Design Submittal:

1. Schedule and design calculations for control dampers and actuators, including the following.

a. Flow at project design and minimum flow conditions.

b. Pressure drop across damper at project design and minimum airflow conditions.

c. Maximum close-off pressure.

d. Torque required at worst case condition for sizing actuator.

e. Actuator selection indicating torque provided.

E. Coordination Drawings: Plan drawings and corresponding product installation details, drawn to scale, on which the following items are shown and coordinated with each other, using input from installers of the items involved:

1. Product installation location shown in relationship to room, duct, and equipment.

2. Size and location of wall access panels for control dampers and actuators installed behind walls.

3. Size and location of ceiling access panels for control dampers and actuators installed above inaccessible ceilings.

F. Operation and Maintenance Data: For control dampers to include in operation and maintenance manuals.

1.05 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.06 SPARE PARTS:

A. Comply with the requirements specified in Section 01 61 00.

1.07 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

1.08 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

PART 2 - PRODUCTS

2.01 MOTORIZED THERMALLY INSULATED CONTROL DAMPERS:

A. Extruded aluminum (6063-T5) damper frame shall not be less than 0.08 inches in thickness. Damper frame shall be 4 inches deep x 1 inch, with duct mounting flanges on both sides of frame. Damper frame shall have a 2-inch mounting flange on the rear of the damper, when installed as Extended Rear Flange install type. Frame to be assembled using zinc-plated steel mounting fasteners.

B. Blades shall be a maximum of 6 inches deep extruded aluminum (6063-T5) air-foil profiles with a minimum wall thickness of 0.06 inches. Blades shall be internally insulated with expanded polyurethane foam and shall be thermally broken. Complete blade shall have an insulating factor of R-2.29 and a temperature index of 55 (tested to AAMA 1502.7 Test Method).

C. Blade seals shall be extruded EPDM, secured in an integral slot within the aluminum blade extrusions and shall be mechanically fastened to prevent shrinkage and movement over the life of the damper. Adhesive or clip-on type blade seals will not be approved.

D. Frame seals shall be extruded silicone, secured in an integral slot within the aluminum frame extrusions and shall be mechanically fastened to prevent shrinkage and movement over the life of the damper. Metallic compression type jamb seals will not be approved.

E. Bearings shall be a dual bearing system composed of a Celcon inner bearing (fixed around a 0.437-inch aluminum hexagon blade pivot pin), rotating within a polycarbonate outer bearing inserted in the frame. Single axle bearing, rotating in an extruded or punched hole shall not be acceptable.

F. Hexagonal control shaft shall be 0.437-inches. It shall have an adjustable length and shall be an integral part of the blade axle. A field-applied control shaft shall not be acceptable. All parts shall be zinc-plated steel.

G. Linkage hardware shall be aluminum and corrosion-resistant zinc-plated steel, installed in the frame side, out of the airstream, and accessible after installation. Linkage hardware shall be complete with cup-point trunnion screws to prevent linkage slippage. Linkage that consists of metal rubbing metal will not be approved.

H. Dampers shall be designed for operation in temperatures ranging from -40 degrees F to 212 degrees F.

I. Dampers shall be AMCA rated for Leakage Class 1A at 1-inch water gage static pressure differential. Standard air leakage data to be certified under the AMCA Certified Ratings Program.

J. Dampers shall be custom made to required size, with blade stops not exceeding 1.25 inches in height.

K. Dampers shall be opposed blade action for modulating airflow control and parallel blade for two position open – close action.

L. Standard of Acceptance: TAMCO Series 9000 thermally insulated damper

M. Manufacturers:

1. Tamco

2. Nailor

3. Ruskin

2.02 MOTORIZED CONTROL DAMPERS:

A. Extruded aluminum (6063-T5) damper frame shall not be less than 0.08 inches in thickness. Damper frame shall be 4 inches deep x 1 inch, with duct mounting flanges on both sides of frame. Damper frame shall have a 2-inch mounting flange on the rear of the damper, when installed as Extended Rear Flange install type. Frame to be assembled using zinc-plated steel mounting fasteners.

B. Blades shall be maximum 6 inches deep extruded aluminum (6063-T5) air-foil profiles with a minimum wall thickness of 0.06 inches.

C. Blade seals shall be extruded EPDM, secured in an integral slot within the aluminum blade extrusions and shall be mechanically fastened to prevent shrinkage and movement over the life of the damper. Adhesive or clip-on type blade seals will not be approved.

D. Frame seals shall be extruded silicone, secured in an integral slot within the aluminum frame extrusions and shall be mechanically fastened to prevent shrinkage and movement over the life of the damper. Metallic compression type jamb seals will not be approved.

E. Bearings shall be a dual bearing system composed of a Celcon inner bearing (fixed around 0.437 inch aluminum hexagon blade pivot pin, rotating within a polycarbonate outer bearing inserted in the frame. Single axle bearing, rotating in an extruded or punched hole shall not be acceptable.

F. Hexagonal control shaft shall be 0.437 inch. It shall have an adjustable length and shall be an integral part of the blade axle. A field-applied control shaft shall not be acceptable. All parts shall be zinc-plated steel.

G. Linkage hardware shall be aluminum and corrosion-resistant zinc-plated steel, installed in the frame side, out of the airstream, and accessible after installation. Linkage hardware shall be complete with cup-point trunnion screws to prevent linkage slippage. Linkage that consists of metal rubbing metal will not be approved.

H. Dampers shall be designed for operation in temperatures ranging from -40 degrees F to 212 degrees F.

I. Dampers shall be AMCA rated for Leakage Class 1A at 1 inch water gage static pressure differential. Standard air leakage data to be certified under the AMCA Certified Ratings Program.

J. Dampers shall be custom made to required size, with blade stops not exceeding 1.25 inches in height.

K. Dampers shall be opposed blade action for modulating airflow control and parallel blade for two position open – close action.

L. Standard of acceptance: TAMCO Series 1000 Air-Foil Control Damper

M. Manufacturers:

1. Tamco

2. Nailor

3. Ruskin

2.03 DAMPER OPERATORS:

A. Electronic Operators for Modulating Damper:

1. Fail-safe spring return, 24 VAC operating voltage, 0 to 10 VDC input signal, 0 to 10 VDC position output signal, seventy (70) seconds maximum running time for 90 degrees opening and thirty (30) seconds maximum closing time.

2. Provide sufficient damper motors to achieve unrestricted movement, with a minimum of one damper operator per damper section.

3. Provide manual override gear release or crank.

4. For modulating actuators provide actuator with 0-10V feedback proportional to damper position.

5. Provide position indicator.

6. Provide two (2) auxiliary switches for position proofing, one (1) at 10 degrees rotation and one (1) adjustable up to 90 degrees rotation.

7. Unless otherwise shown on the Drawings, operators to be provided and set up such that all return air dampers are normally open (fail open) and exhaust and outdoor air dampers fail normally closed (fail closed).

8. Provide “fail safe”, spring return, direct coupled type, 24 volt or 120 volt A.C. operators with accessories as required, each suitable in all respects for the application.

9. Provide Class 1 Division 2 or Class 1 Division 1 rated actuators or explosion-resistant enclosures where required.

10. All actuators provided shall be from a single manufacturer.

11. Acceptable manufacturers:

    a. Belimo Aircontrols Inc.

    b. Johnson Controls Inc.

    c. Siemens Building Technologies Inc.

B. Electronic Operators for Two Position Damper:

1. Spring return, 24 VAC operating voltage, seventy (70) seconds maximum running time for 90 degrees opening and thirty (30) seconds maximum closing time.

2. Provide sufficient damper motors to achieve unrestricted movement, with a minimum of one damper operator per damper section.

3. Provide manual override gear release or crank.

4. Provide position indicator.

5. Provide two (2) auxiliary switches for position proofing, one (1) at 10 degrees rotation and one (1) adjustable up to 90 degrees rotation.

6. Provide Class 1 Division 1 or 2 rated actuators or explosion-resistant enclosures where required

2.04 PERFORMANCE REQUIREMENTS:

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

B. Ground Fault: Products shall not fail due to ground fault condition when suitably grounded.

C. Backup Power Source: Systems and equipment served by a backup power source shall have associated control damper actuators served from a backup power source.

D. Environmental Conditions:

1. Provide electric control-damper actuators, with protective enclosures satisfying the following minimum requirements unless more stringent requirements are indicated. Electric control-damper actuators not available with integral enclosures, com-

plying with requirements indicated, shall be housed in protective secondary enclosures.

a. Hazardous Locations: Explosion-proof rating for condition

PART 3 - EXECUTION

3.01 EXAMINATION:

A. Examine substrates and conditions for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.

B. Examine roughing-in for dampers and instruments installed in duct systems to verify actual locations of connections before installation.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 CONTROL-DAMPER APPLICATIONS:

A. Select from damper types indicated in "Control Dampers" Article to achieve performance requirements and characteristics indicated while subjected to full range of system operation encountered.

1. Rectangular Exhaust Air Duct Applications: Rectangular dampers with aluminum airfoil blades. Insulated rectangular dampers.

2. Rectangular Outdoor Air Duct Applications: Rectangular dampers with aluminum airfoil blades. Insulated rectangular dampers.

3. Rectangular Return Air Duct Applications: Rectangular dampers with aluminum airfoil blades.

4. Rectangular Supply Air Duct Applications: Rectangular dampers with aluminum airfoil blades.

3.03 INSTALLATION, GENERAL:

A. Furnish and install products required to satisfy most stringent requirements indicated.

B. Properly support dampers and actuators, tubing, wiring, and conduit to comply with requirements indicated. Brace all products to prevent lateral movement and sway or a break in attachment..

C. Provide ceiling, floor, roof, and wall openings and sleeves required by installation. Before proceeding with drilling, punching, or cutting, check location first for concealed products that could potentially be damaged. Patch, flash, grout, seal, and refinish openings to match adjacent condition.

D. Seal penetrations made in fire-rated and acoustically rated assemblies.

E. Install products in locations that are accessible and that will permit calibration and maintenance from floor, equipment platforms, or catwalks. Where ladders are required for Owner's access, confirm unrestricted ladder placement is possible under occupied condition.

F. Corrosive Environments:

1. Use products that are suitable for environment to which they will be subjected.

2. If possible, avoid or limit use of materials in corrosive environments, including, but not limited to, the following:

a. Laboratory exhaust airstreams

b. Process exhaust airstreams

c. Odor Control Systems

3. Use Type 316 stainless-steel tubing and fittings when in contact with a corrosive environment.

4. When conduit is in contact with a corrosive environment, use Type 316 stainless-steel conduit and fittings or conduit and fittings that are coated with a corrosive-resistant coating that is suitable for environment.

5. Where actuators are located in a corrosive environment and are not corrosive resistant from manufacturer, field install products in a NEMA 250, Type 4X enclosure constructed of Type 316L stainless steel.

3.04 ELECTRIC POWER:

A. Furnish and install electrical power to products requiring electrical connections.

B. Furnish and install raceways. Comply with requirements in Section 26 05 33.

3.05 CONTROL DAMPERS:

A. Install smooth transitions, not exceeding 30 degrees, to dampers smaller than adjacent duct. Install transitions as close to damper as possible but at distance to avoid interference and impact to performance. Consult manufacturer for recommended clearance.

B. Clearance:

1. Locate dampers for easy access and provide separate support of dampers that cannot be handled by service personnel without hoisting mechanism.

2. Install dampers with at least 24 inches of clear space on sides of dampers requiring service access.

C. Service Access:

1. Dampers and actuators shall be accessible for visual inspection and service.

2. Install access door(s) in duct or equipment located upstream of damper to allow service personnel to hand clean any portion of damper, linkage, and actuator. Comply with requirements in Section 23 33 00.

D. Install dampers straight and true, level in all planes, and square in all dimensions. Install supplementary structural steel reinforcement for large multiple-section dampers if factory support alone cannot handle loading.

E. Attach actuator(s) to damper drive shaft.

F. For duct-mounted and equipment-mounted dampers installed outside of equipment, install a visible and accessible indication of damper position from outside.

3.06 CONNECTIONS:

A. Connect electrical devices and components to electrical grounding system. Comply with requirements in Section 26 05 26.

3.07 IDENTIFICATION:

A. Identify system components, wiring, cabling, and terminals. Each piece of wire, cable, and tubing shall have the same designation at each end for operators to determine continuity at points of connection. Comply with requirements for identification specified in Section 26 05 53.

B. Install engraved phenolic nameplate with damper identification on damper.

3.08 CHECKOUT PROCEDURES:

A. Control-Damper Checkout:

1. Check installed products before continuity tests, leak tests, and calibration.

2. Check dampers for proper location and accessibility.

3. Verify that control dampers are installed correctly for flow direction.

4. Verify that proper blade alignment, either parallel or opposed, has been provided.

5. Verify that damper frame attachment is properly secured and sealed.

6. Verify that damper actuator and linkage attachment are secure.

7. Verify that actuator wiring is complete, enclosed, and connected to correct power source.

8. Verify that damper blade travel is unobstructed.

3.09 ADJUSTMENT, CALIBRATION, AND TESTING:

A. Stroke and adjust control dampers following manufacturer's recommended procedure, from 100 percent open to 100 percent closed back to 100 percent open.

B. Stroke control dampers with pilot positioners. Adjust damper and positioner following manufacturer's recommended procedure, so damper is 100 percent closed, 50 percent closed, and 100 percent open at proper air pressure.

C. Check and document open and close cycle times for applications with a cycle time of less than 30 seconds.

D. For control dampers equipped with positive position indication, check feedback signal at multiple positions to confirm proper position indication.

3.10 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

Page Intentionally Left Blank

SECTION 23 09 93.11

SEQUENCE OF OPERATIONS FOR HVAC DDC

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide control sequences for DDC for HVAC systems, subsystems, and equipment as indicated and in compliance with Contract Documents.

1.02 DEFINITIONS:

A. Analog Output: Proportional output signal (zero- to 10-V dc, 4 to 20 mA)

B. Binary Output: On/off output signal or contact closure

C. DDC: Direct digital control

D. Digital Output: Data output that must be interpreted digitally

1.03 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Product Data:

1. An instrumentation list for each controlled system. Label each element of the controlled system in table format. Show, in the table element name, type of device, manufacturer, model number, and control device product data sheet number.

2. A complete description of the operation of the control system, including sequences of operation. Include and reference a schematic diagram of the controlled system.

C. Shop Drawings:

1. Riser diagrams showing control network layout, communication protocol, and wire types.

2. Schematic diagram of each controlled system. Include all control points labeled with point names shown or listed. Show the location of control elements in the system.

3. Wiring diagram for each controlled system. Show all control elements labels. Where a control element is the same as that shown on the control system schematic, label with the same name. Label all terminals.

1.04 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.05 SPARE PARTS:

A. Comply with the requirements specified in Section 01 61 00.

1.06 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

1.07 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

1.08 MAKE UP AIR-UNIT CONTROL SEQUENCES:

A. Make Up Unit 01-MAU-81210 – Pump Room 101:

1. Makeup air unit 01-MAU-81210 will be started via the BMS based on scheduling to be determined by the owner (initially set to run continuously).

2. Motorized dampers 01-MD-81570 and 01-MD-81580 shall be energized to open and proven to be open.

3. The 01-MAU-81210 shall be started.

4. The BMS will monitor the space temperature in the Pump Room 101. The BMS will allow a signal from the SCADA to adjust the space temperature set point.

5. The lower space temperature setpoint will be set to 65 degrees F.

6. In the event the space temperature drops below 65 degrees F the makeup air units' discharge air temperatures will be adjusted upward proportionally to the error from the set point by a signal to the gas burner controls.

7. If the space temperature goes above 67 degrees F for the space the discharge temperature setpoint of 01-MAU-81210 will be decreased proportionally until the gas burner shuts off. The minimum discharge air temperature will be 45 degrees F.

8. If the space temperature in the room exceeds 100 degrees F (adjustable) a high temperature alarm will be generated via the BMS to the SCADA.

9. If the space temperature in the room drops below 45 degrees F (adjustable) a low temperature alarm will be generated via the BMS to the SCADA.

10. Pressure drop across the air filters will be continuously monitored with an alarm being initiated to the BMS if the pressure drop exceeds a predetermined set point. The pressure drop of the filter at the alarm point is not to affect the airflow by more than 10 percent of design. The set point of the alarm is to be provided by the air handler manufacturer based on the unit's fan performance and the performance of the specified filter.

B.

1.09 COOLING FANS CONTROL SEQUENCES:

A. Cooling Fans 01-F-81410 and 01-F-81420 - Pump Room 101:

1. The high horsepower effluent pumps result in a large, rejected heat load to the space. To control the space temperature supply fans will induce outside air in amounts proportional to the current heat load and exhaust fans will expel room air at a rate to avoid over pressurizing the space.

2. Upon exceeding a space temperature setpoint of 85 degrees F motorized damper 01-MD-81550 will open and supply fan 01-F-81410 will be started with the VFDs set to 20%.

3. At the same time 01-F-81410 is started motorized damper 01-MD-81560 will open and exhaust fan 01-F-81420 will be started to keep the space positively pressurized at 0.10" water gage (adjustable) relevant to outside.

4. Exhaust fan 01-F-81420, controlled by a VFD, will be adjusted to maintain the room pressure set point.

5. If the space temperature drops below 85 degrees F supply fan 01-F-81410 will slow proportionally to room temperature deviation to a low speed of 20%.

6. If the space temperature drops below 65 degrees F both 01-F-81410 and 01-F-81420 will stop and motorized dampers 01-MD-81550 and 01-MD-81560 will close.

7. Pressure drop across the air filters will be continuously monitored with an alarm being initiated in the BMS if the pressure drop exceeds a predetermined set point. The pressure drop of the filter at the alarm point is not to affect the airflow by more than 10 percent of design.

1.10 AIR HANDLING UNIT CONTROL SEQUENCES:

A. Air Handling Unit 10-AHU-81310 and 10-AHU-81320 – Electrical Room:

1. The air handling units will be started via the BMS system based on load requirements per the following.

2. With the air handler off mixing dampers are to be set to full return air and the supply air isolation dampers are to be closed.

3. On start of the air handler's 10-AHU-81310's or 10-AHU-81320 supply fan return air damper will be fully open, outside air damper fully closed and relief air damper closed. Damper positions will be confirmed prior to starting the fans.

4. After startup the default position of the return and outside air damper will allow the scheduled minimum outside air to enter the unit.

5. Only one air handler will be started at a time and will be designated the primary unit.

6. The second air handler shall be designated the primary unit and the first air handler shutdown on a schedule to maintain equal service time. Set initial switchover schedule at 30 days (adjustable).

7. In the event of the primary unit failing the BMS will automatically switch primary duty to the other unit.

8. The BMS will monitor the space temperature in Electrical Room and adjust the discharge air temperature proportionally to the error from setpoint. The BMS will allow a signal from the SCADA to adjust the space temperature set point.

9. Minimum space temperature set point for the Electrical Room will be 68 degrees F and the maximum will be 80 degrees F.

10. If the space temperature falls below the minimum space temperature setpoint the electric heating coil in the unit will be activated. The coil output shall modulate proportionally to the deviation from setpoint with maximum output at 5 degrees F below setpoint.

11. If the Electrical Room space temperature is above 75 degrees F and the outside air is below 65 degrees F the unit's outside air damper will be modulated open from its minimum position with the return air damper modulating closed to achieve a discharge air temperature proportional to the temperature error from setpoint with a minimum limit of 55 degrees F discharge temperature. This provides free cooling.

12. As the Outside air damper opens the relief air dampers 10-MD-81520 and 10-MD-81540 will open to maintain a positive space pressure of 0.1 inches water gage relative to adjacent spaces.

13. If the unit is at maximum free cooling and the maximum space temperature cannot be held the unit will revert to minimum outside air with the dampers and the mechanical cooling will be engaged..

14. The BMS will monitor the space temperature in Electrical Room and adjust the discharge air temperature proportionally to the error from setpoint with a minimum limit of 55 degrees F discharge temp. The BMS will allow a signal from the SCADA to adjust the space temperature set point.

15. Upon dropping 2 degrees Fahrenheit below the maximum space temperature the mechanical cooling will shut down.

16. If the space temperature in the Electrical Room exceeds 90 degrees F a high temperature alarm will be generated via the BMS to the SCADA.

17. If the space temperature in the Electrical Room drops below 55 degrees F a low temperature alarm will be generated via the BMS to the SCADA.

18. Pressure drop across the air filters will be continuously monitored with an alarm being initiated in the BMS if the pressure drop exceeds a predetermined set point. The pressure drop of the filter at the alarm point is not to affect the airflow by more than 10 percent of design. The set point of the alarm is to be provided by the air handler manufacturer based on the unit's fan performance and the performance of the specified filter.

B. Force Flow Heater, Electric (Typical): Space thermostat cycles fan and sequences stages of heating.

1. Space Temperature:

a. Input:

(1) Device: Electric thermostat

(2) Location: Space

b. Output:

(1) Device: Hard wired

(2) Location: Unit control panel

(3) Transference: Electric contactors

c. Action: Sequence electric coil stages and fan to maintain 65 degrees F space temperature.

C. Baseboard Heater, Electric (Typical): Space thermostat cycles heating.

1. Space Temperature:

a. Input:

(1) Device: Electric thermostat

(2) Location: Integral

b. Output:

(1) Device: Hard wired

(2) Location: Unit control panel

(3) Transference: Electric contactors

c. Action: Baseboard heater cycles to maintain 65 degrees F space temperature.

D. Split-type Air Conditioner (Typical): Space thermostat cycles fan and cooling capacity.

1. Space Temperature:

a. Input:

(1) Device: Electronic thermostat

(2) Location: Space

b. Output:

(1) Device: Hard wired

(2) Location: Unit control panel

c. Action: Modulate cooling capacity and fan to maintain 75 degrees F space temperature.

1.11 BOOSTER PUMP:

A. General:

1. The purpose of this system is to boost the site distribution water pressure, which is discharged into a break tank to prevent cross-contamination. The ASHRAE

90.1 controls and the hydro-pneumatic tank allow the system to shut down during periods of low demand.

2. This system consists of the following, all furnished as a part of the booster pump package:

   a. Two (2) centrifugal booster pumps; each selected for (50 percent duty)

   b. Two (2) variable frequency drives (VFD)s

   c. Inlet manifold

   d. Discharge manifold

   e. Diaphragm tank to smooth out flow and pressure changes

   f. Suction line pressure transmitter

   g. Remote discharge line pressure transmitter (on Screw Press Level)

   h. Turbine flow meter on discharge line. (turbine meter may be eliminated where the power consumed by the pump based on rpm can determine the approximate flow.)

   i. Electronic microprocessor control system

   j. Gateway for interconnecting booster pump control system with the SCADA system.

   k. Two (2) current switch inputs to the SCADA indicating which pumps are running.

   l. A digital output to indicate the system is in low water pressure alarm.

3. All adjustments to the system operating parameters will be required to be performed at the HMI located on the local pump controller provided by the booster pump manufacturer; not on the SCADA system.

B. Integral Microprocessor Control System:

1. The control system provided is required to meet the minimum requirements of section 10.4.2 of ASHRAE standard 90.1. In addition, the pump includes a pump suction pressure transmitter. The purpose of the transmitter is to ensure the booster pump does not pull excessive suction on the incoming water line, thus reducing the pressure to other system users.

   a. Section 10.4.2 of ASHRAE standard 90.1-2013 (or later) states as follows:

(1) One or more pressure sensors shall be used to vary the pump speed and/or start and stop of pumps. The sensor(s) shall either be located near the critical fixture(s) that determine the pressure required, or logic shall be employed that adjusts the setpoint to simulate operation of remote sensor(s).

(2) No device(s) shall be installed for the purpose of reducing the pressure of all of the water supplied by any booster system, except for safety devices.

(3) No booster system pumps shall operate when there is no service water flow.

b. The control shall therefore employ the following sequence of operation:

C. Sequence of Operation:

1. The control system shall include logic for each pump so that the control system knows where the pump is operating on the pump curve including flow, pressure, speed, efficiency, and brake horsepower.

2. At greater than 25 percent flow capacity, the control system will determine the number of pumps in operation based on efficiency or brake horsepower. Some delay in the logic may be incorporated such that the number of pumps in operation does not fluctuate at a rate greater than the booster pump manufacturer recommends.

3. For one or more remote pressure transmitters:

a. At greater than 25 percent flow capacity, if the booster pump system is provided with one or more remote pressure transmitters, the pump speed will be modulated in direct response to the remote pressure transmitter readings; particularly the one that is most different from its low pressure setpoint.

b. The minimum suction pressure setpoint will be used to limit the amount of water that is drawn from the pump water supply. The initial setting will be 5 psig less than the expected minimum inlet pressure. When a suction pressure lower than this value is attained, the discharge pressure setpoint variable will be overridden and the pump speed will be reduced to meet this minimum inlet pressure variable requirement.

c. When the number of pumps is required to change, the system shall employ a rotational sequence to maintain an even distribution of pump starts and pump run time.

d. When more than one pump is in operation, the operating pumps will operate at the same speed.

4. Manual Operation:

    a. A “test-off-auto” selector switch is provided on the booster pump control cabinet on the HMI or VFD for each pump. The “test” position includes a spring return to the “off” position and is used to initiate the operation of each pump independent of the pump pressure/speed controls.

D. SCADA Interface and Monitoring:

1. The SCADA system will monitor the following:

    a. Pump number of starts (each)

    b. Pump run time (each - based on current switches)

    c. “Lag” pump in operation (two pumps running)

    d. Suction pressure

    e. Local discharge pressure

    f. Remote discharge pressure

    g. Water flow

    h. Pump speed

2. The SCADA system operators will be alerted with the following events:

    a. High discharge pressure alarm

    b. Low discharge pressure alarm

    c. Low suction pressure alarm

    d. “Lag” pump in operation

    e. Pump in low suction override condition

    f. Pump failure to stop

    g. Pump failure to start

PART 2 - PRODUCTS

(Not Used)

PART 3 - EXECUTION

(Not Used)

END OF SECTION

SECTION 23 11 23

FACILITY NATURAL GAS PIPING

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide new and modify existing gas piping systems, complete and ready for operation. The Work of this Section shall include all labor, materials, tools, equipment and appurtenances, and performing all operations necessary to furnish and install complete and operable systems in accordance with this Section of these Specifications, the Drawings, and the codes and standards listed herein.

B. Coordinate with Dominion Energy as to any Local restrictions or requirements relative to the installation of the system.

C. Limits of Work shall be as indicated on the Drawings. Items of Work shall consist of the following:

1. All gas piping downstream of gas meter/regulator outlets. Meter/regulators and gas piping upstream of meter/regulators will be furnished and installed by the local gas utility in accordance with their rules and regulations.

2. Painting of pipe, fittings, and valves.

1.02 REFERENCES:

A. Except as specified herein, the latest edition of the standards listed below form a part of this Specification to the extent referenced in this Section. Where earlier editions of standards are adopted as referenced in applicable codes, those shall govern. The publications are referred to within the text by the basic designation only.

B. In each of the standards referred to herein, consider the advisory provisions to be mandatory, as though the word, "shall" had been substituted for "should" wherever it appears.

C. American National Standards Institute (ANSI):

1. B109.1: Diaphragm-Type Gas Displacement Meters (Under 500 Cubic Feet per Hour Capacity)

2. B109.2: Diaphragm Type Gas Displacement Meters (500 Cubic Feet per Hour Capacity and Over)

3. B109.3: Rotary Type Gas Displacement Meters

4. LC-1: Fuel Gas Piping Systems Using Corrugated Stainless Steel Tubing

5. LC-4: Press-Connect Metallic Fittings For Use in Fuel Gas Distribution Systems

6. Z21.24: Connectors for Gas Appliances

7. Z21.41: Quick-Disconnect Devices for Use with Gas Fuel Appliances

8. Z21.45: Flexible Connectors of Other Than All-Metal Construction for Gas Appliances

9. Z21.69: Connectors for Movable Gas Appliances

10. Z21.70: Earthquake Actuated Automatic Gas Shutoff Systems

11. Z21.80: Line Pressure Regulators

12. Z21.90: Gas Convenience Outlets and Optional Enclosures

D. American Society of Mechanical Engineers (ASME):

1. B1.1: Unified Inch Screw Threads (UN and UNR Thread Form)

2. B1.20.1: Pipe Threads, General Purpose, Inch

3. B2.1: Pipe Threads

4. B16.3: Malleable Iron Threaded Fittings Class 150 and 300.

5. B16.5: Pipe Flanges and Flanged Fittings NPS 1/2 Through NPS 24 Metric/Inch Standard

6. B16.9: Factory-Made Wrought Steel Buttwelding Fittings

7. B16.11: Forged Fittings, Socket-Welding and Threaded

8. B16.38: Large Metallic Valves for Gas Distribution (Manually Operated, NPS 2 1/2 to 12, 125 psig Maximum)

9. B16.39: Malleable Iron Threaded Pipe Unions

10. B16.40: Manually Operated Thermoplastic Gas Shutoffs and Valves in Gas Distribution Systems

11. B18.2.1: Square and Hex Bolts and Screws, Inch Series

12. B18.2.2: Square and Hex Nuts

13. B31.8: Gas Transmission and Distribution Piping Systems

E. ASTM International (ASTM):

1. A36: Carbon Structural Steel

2. A53: Standard Specification for Pipe, Steel, Black and Hot-Dipped, Zinc-Coated, Welded and Seamless

3. A182: Standard Specification for Forged or Rolled Alloy and Stainless-Steel Pipe Flanges, Forged Fittings, and Valves and Parts for High-Temperature Service

4. A194: Carbon and Alloy Steel Nuts for Bolts for High Pressure or High Temperature Service or Both

5. A403: Standard Specification for Wrought Austenitic Stainless-Steel Piping Fittings

6. B61: Standard Specification for Steam or Valve Bronze Castings

7. B88: Standard Specification for Seamless Copper Water Tube

8. D2513: Thermoplastic Gas Pressure Pipe, Tubing, and Fittings

9. D2517: Reinforced Epoxy Resin Gas Pressure Pipe and Fittings

10. D2683: Socket-Type Polyethylene Fittings for Outside Diameter-Controlled Polyethylene Pipe and Tubing

11. F1973: Standard Specification for Factory Assembled Anodeless Risers and Transition Fittings in Polyethylene (PE) and Polyamide 11 (PA11) and Polyamide 12 (PA12) Fuel Gas Distribution Systems

F. Manufacturers Standardization Society of the Valve and Fittings Industry (MSS):

1. SP-58: Pipe Hangers and Supports - Materials, Design, Manufacture, Application, and Installation

G. Sheet Metal And Air Conditioning Contractors' National Association (SMACNA):

1. SMACNA Seismic Restraint Mnl: Seismic Restraint Manual: Guidelines for Mechanical Systems

H. U.S. National Archives And Records Administration (NARA):

1. 49 CFR 192: Transportation of Natural and Other Gas by Pipeline: Minimum Federal Safety Standards

I. National Fire Protection Association (NFPA):

1. NFPA 54: National Fuel Gas Code

J. Manufacturers' Standardization Society (MSS):

1. SP-43: Wrought Stainless Steel Butt-Welding Fittings

K. Fuel Gas Code 2015 of Utah (Adopts with Amendments the International Fuel Gas Code 2015 (IFGC 2015))

1.03 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Shop Drawings: Coordination Drawings - Prepare as specified in Paragraph "Cooperation and Coordination with Other Trades" of this Section.

C. Product Data: Annotate descriptive data to show the specific manufacturer, model, type, size capacity, curves, wiring diagrams, options, etc. of each item.

1. Pipe and fittings

2. Casings

3. Warning and identification tape

4. Valves

5. Valve boxes

6. Gas equipment connectors

7. Meters

8. Regulators

9. Pipe hangers and supports

10. Access panels

D. Certification: Submit documentation certifying completion of the following items in compliance with this Section.

1. Metal welding inspection

2. PE fusion welding inspection

3. Piping pressure tests

4. System purging

E. Certificates and Licenses: Prepare as specified in Part 1 of this Section.

1. Qualifications of Installer

2. Qualifications of Construction Supervisor

F. Manufacturer's Instructions: Submit manufacturer's installation instructions and manufacturer's visual joint appearance chart.

1. PE pipe and fittings

G. Operation and Maintenance Manuals: Prepare manuals in accordance with Section 01 78 23.

1. Valves

2. Meters

3. Regulators

H. Test Data: Submit piping system leakage test sheets as specified in Section 22 05 00.

I. Closeout Submittals:

1. Record Drawings: Prepare as specified in Part 1 of this Section.

1.04 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

B. Qualifications of Installer:

1. Prior to installation, submit data showing the name and license of the installing contractor and that he has successfully installed systems of the same type and design as specified herein. Data shall include names and locations of at least two installations of such systems. Indicate type and design of each system and certify that each system has performed satisfactorily in the manner intended for not less than 18 months. The installing contractor shall be licensed to perform applicable gas piping systems installation in the state in which the project is located.

C. Qualifications of Welder:

1. Piping shall be welded in accordance with qualified procedures using performance qualified welders and welding operators. The Authority Having Jurisdiction shall be notified 24 hours in advance of any required testing and the tests shall be performed at the work site. The welder or welding operator shall apply his

assigned symbol near each weld he makes as a permanent record. Prior to installation, submit data for acceptance showing the name and certification of each welder and welding operator to be used on the project. Submit each welder's identification symbols, assigned number, or letter, used to identify work of the welder. Welders making defective welds after passing a qualification test shall be given requalification test and, upon failing to pass this test, shall not be permitted to work on this Contract.

a. Steel Welder's Qualifications: Comply with ASME B31.8. Each steel welder shall have a copy of a certified ASME B31.8 qualification test report. Conduct a qualification test for each welder and submit results for acceptance.

b. PE Welder's Qualifications: Supervising and installing personnel shall be trained by a PE pipe manufacturer's sponsored course of not less than one week duration, or present proof satisfactory to the Engineer that personnel are currently working in the installation of PE gas distribution lines. Conduct a qualification test for each welder and submit results for acceptance.

c. Safety Standards: 49 CFR 192.

D. Qualifications of Construction Supervisor:

1. Provide a Construction Supervisor with a minimum of 5 years of experience in fuel gas piping construction supervision who shall be responsible for the installation of the Work of this Section of the Specifications. The Construction Supervisor shall be licensed to perform applicable fuel gas piping systems supervision in the state in which the project is located. Prior to installation, submit data for acceptance showing the name and license of the Construction Supervisor.

1.05 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

B. Shipping:

1. All equipment, material and spare parts shall be shipped, stored, handled and installed in such a manner as not to degrade quality, serviceability, or appearance. Equipment and material warranties shall not be voided by actions of the Contractor.

C. Receiving:

1. All equipment, material and spare parts shall be delivered to the site in original packages or containers bearing the manufacturer's labels and product identification.

2. Inspect for damage and correctness, and inventory items, upon delivery to site.

3. Store and safeguard equipment, material and spare parts in accordance with manufacturer's recommendations.

1.06 SPECIAL REQUIREMENTS:

A. Refer to applicable sections of Division 1 with regard to providing the following:

1. Submittal of manufacturer's specifications, catalog data, descriptive matter, illustrations, diagrams, etc., including complete motor data for all equipment.

2. Nameplates

3. Foundations, installations, and grouting

4. Operating and maintenance instructions and parts lists

5. Lubricants

6. Special tools

7. Bolts, anchor bolts, and nuts

8. Concrete inserts

9. Sleeves

10. Electric motors

11. Voltage rating of motors

12. Equipment drive guards

1.07 COOPERATION AND COORDINATION WITH OTHER TRADES:

A. Work shall be performed in cooperation with other trades on the project and so scheduled as to allow efficient completion of the project. Materials and equipment shall be installed as fast as conditions will permit, and installed promptly when and as directed.

B. Furnish to all other trades advance information on location and size of all concrete pads, chases, frames, boxes, sleeves, and openings needed for the Work, and also furnish layout information and shop drawings necessary to permit other trades affected by the Work to install their work properly coordinated and without delay.

C. Where there is evidence that Work installed interferes with the work of other Sections, assist in working out space conditions to make satisfactory adjustments.

D. With the acceptance of the Engineer and without extra cost to the Owner, make reasonable modifications in Work specified under this Section of the Specifications required to coordinate with normal structural interference's, or for proper execution of specified work.

E. If work is installed before coordinated with other trades so as to cause interference with the work of such trades, make all necessary changes in Work under this Section of the Specifications at no additional cost to the Owner.

F. Protect all materials and work of other trades from damage that may be caused by the Work required under this Section of the Specifications and be responsible for repairing any damages caused by such work without any additional cost to the Owner.

G. Follow Drawings in layout work. Check Drawings of, and coordinate with, other trades to verify special provisions, installation requirements and spaces in which Work provided under this Section of the Specifications will be installed. Maintain maximum headroom or space conditions at all points. Where headroom or space conditions appear inadequate, notify the Engineer before proceeding.

H. Prepare and submit for acceptance Coordination Drawings consisting of 3/8 inch = 1 foot-0 inches scale or larger working plans and sections, clearly showing how this Work is to be installed in relation to the work of other Sections. Coordination Drawings shall be based upon accepted equipment submittals.

I. Attend regular coordination and job progress meetings required.

1.08 PRODUCTS FURNISHED BUT NOT INSTALLED UNDER THIS SECTION:

A. All electrical apparatus and controls associated with equipment installed or modified under this Section but which are not integral with the equipment served, shall be furnished under Division 26. All mounting and wiring of non-integral electrical apparatus and controls, and interconnecting wiring to equipment served will be done under Division 26.

B. Access panels shall be furnished under this Section and installed by the trade responsible for the appropriate Section of the Specifications for the surface upon which the panels are mounted. Prepare a schedule showing location, size and function of all required access panels and deliver schedule to representatives of all installing trades.

C. Inserts and anchor bolts shall be furnished under this Section and installed under Section 03 30 00. Prepare a schedule showing location, size and function of all required inserts and anchor bolts and deliver schedule to representative of the installing trade.

D. Pipe sleeves shall be furnished under this Section and installed by the trade whose finished interior surfaces will be penetrated. Prepare a schedule showing location, size and function of all required pipe sleeves and deliver schedule to representatives of all installing trades.

1.09 PRODUCTS INSTALLED BUT NOT FURNISHED UNDER THIS SECTION:

A. Gas meters and regulators will be furnished by the Gas Utility.

1.10 REMOVAL WORK:

A. Particular care shall be taken to avoid creating hazards on the site or causing disruption of service in the adjoining buildings.

B. All existing equipment indicated to be removed shall be done in a neat and workmanlike manner. All existing equipment indicated to be turned over to the Owner shall be presented to the Owner in good condition at a location designated by the Owner. All other equipment shall be removed from the premises and disposed of at an approved disposal or recycling facility.

C. Remove all abandoned piping and equipment not built into building construction. Where ceilings or walls are removed all abandoned conduit and piping shall be removed and ends of live services capped. Abandoned elements built into walls or located above existing ceilings shall remain and ends capped and marked abandoned.

D. Should any asbestos and/or asbestos related products or materials be encountered during the performance of the Work, stop work immediately and inform the Engineer and the Owner of the presence of asbestos.

1.11 ELECTRICAL WORK:

A. All electrical apparatus and controls associated with equipment installed or modified under this Section but which are not integral with the equipment served, shall be furnished under Division 26. All mounting and wiring of non-integral electrical apparatus and controls, and interconnecting wiring to equipment served will be done under Division 26.

B. All equipment furnished under this Section requiring motors shall have motors factory furnished and installed by the manufacturer of the equipment served and shall be mounted and aligned so as to run free and true. Provide internal wiring and motors for mechanical equipment as an integral part of the equipment. Motor starters and contactors shall be factory-furnished and wired as an integral part of packaged mechanical equipment where indicated on the Drawings. Disconnect switches, and all other motor starters and contactors shall be furnished, installed and wired by Division 26.

C. When motors and other associated electrical apparatus furnished are larger than sizes indicated on the Drawings, the cost of additional electrical service and related work shall be included under the Section that furnished that motor.

1.12 CODES, PERMITS AND FEES:

A. Except for additional requirements as specified or indicated under the Work of this Section, materials, workmanship and equipment shall conform to the governing edition of the following regulations, and agency requirements. In the standards referred to herein, the advisory provisions shall be considered to be mandatory, as though the word "shall" had been substituted for "should" wherever it appears.

1. State and Local Building Codes including, but not limited to, the Utah Fuel Gas Code and the 2018 International Building Code.

2. Local Fire Department.

3. Local Gas Utility.

4. Occupational Safety and Health Administration (OSHA).

5. Any other local codes or requirements of Authorities Having Jurisdiction.

B. Pay for all fees and give all notices, file all plans, obtain all permits and licenses, and obtain all necessary approvals from Authorities Having Jurisdiction. Deliver all certificates of inspection to the Authorities Having Jurisdiction. No work shall be covered before examination and approval by Authorities Having Jurisdiction. Replace imperfect or condemned work to conform to inspectional requirements, satisfactory to the Architect, Owner, Engineer and Authorities Having Jurisdiction without extra cost to the Owner. If Work is covered before inspection and acceptance, pay costs of uncovering and reinstalling the covering, whether it meets contract requirements or not.

1.13 RECORD DRAWINGS:

A. Prepare and maintain Record Drawing to meet the requirements of this Section of the Contract Specifications.

B. As work progresses and for the duration of the Contract, maintain a complete and separate set of prints of Drawings at the job site at all times. On a daily basis, record work completed and all changes from original Drawings clearly and accurately, including work installed as a modification or addition to the original design such as change orders, instructions issued by the Engineer, or conditions encountered in the field. Record valve tags as they are installed. In addition, take photographs of all concealed equipment in gypsum board ceilings, shafts, underground (buried) piping routes and supports and other concealed, inaccessible work. At completion of work, make copies of photographs with written explanation on back. These shall become part of Record Drawings.

C. Record drawings shall show record condition of pipe routing and sizes, valve locations, details and sections, riser diagrams, and control changes. Schedules shall show actual manufacturer and make and model numbers of final equipment installation. Remove all

superseded data to show the completed work. Accurately indicate the location, size, type, and elevation of new buried piping and their relationship to existing buried piping.

D. The Record Drawings will be used as a guide for determining the progress of the Work installed. They shall be inspected on a regular basis and shall be corrected immediately if found inaccurate or incomplete. Requisitions for payment will not be accepted until the Record Drawings are accurate and up-to-date.

E. At completion of Work prepare a complete set of marked-up Record Drawings on bond paper showing all systems as actually installed. The Contract Drawing electronic CAD files will be made available for this Contractor's use to serve as backgrounds for the Record Drawings. Provide all drawings necessary to show the required record information. Submit marked-up prints to the Engineer for comments as to compliance with this Section. Make all modifications so noted by the Engineer.

F. Certify the accuracy of the Record Drawings. Record Drawings shall become the property of the Owner.

G. When required by jurisdiction, submit the Record Drawings for approval by the Authority Having Jurisdiction in a form acceptable to the jurisdiction.

PART 2 - PRODUCTS

2.01 PIPE, FITTINGS AND JOINTS:

A. Coated Black Steel - Welded Joints: "Yellow Jacket" Schedule 40 mild black carbon steel, ASTM A53, Grade B, factory coated with yellow plastic, mill or site beveled, and complete with forged steel butt welding fittings and welded joints. All bare metal surfaces are to be cleaned and corrosion protected with a suitable Denso primer and tape corrosion protection system.

B. Polyethylene (Buried Piping): Safety yellow colored medium density polyethylene (MDPE) pipe shall be in accordance with ASTM D 2513, 100 psig working pressure, Standard Dimension Ratio (SDR), the ratio of pipe diameter to wall thickness, 11.5 maximum.

1. Manufacturers:

   a. Performance Pipe Driscoplex 6500 Series

   b. JM Eagle

   c. ENDOT Industries, Inc. Yellow Gas Pipe

2. Socket Fittings: Per ASTM D2683.

3. Butt-Fusion Fittings: Per ASTM D2513, molded.

4. Buried Utility Warning and Identification Tape:

   a. Provide detectable aluminum-foil plastic-backed tape or detectable magnetic plastic tape manufactured specifically for warning and identification of buried piping. Tape shall be detectable by an electronic detection instrument. Provide tape in rolls, 3 inch minimum width, color-coded yellow for natural gas, with warning and identification imprinted in bold black letters continuously and repeatedly over entire tape length. Warning and identification shall be "CAUTION BURIED GAS PIPING BELOW" or similar wording. Use permanent code and letter coloring unaffected by moisture and other substances contained in trench backfill material. Refer to Section 31 23 33 for details.

   b. Manufacturer shall be:

      (1) Seton

      (2) Reef Industries, Inc.

      (3) Terra Tape Security Line Detectable

      (4) Christy's

      (5) Presco

5. Casing:

   a. Where indicated at railroad or other crossing, provide ASTM A53, galvanized pipe, Schedule 40, with extruded polyethylene coating.

C. Uncoated Black Steel – Screwed Joints: Schedule 40 mild black carbon steel, ASTM A53, Grade B, complete with malleable cast iron screwed fittings to ANSI B2.1, and screwed joints.

D. Uncoated Black Steel – Welded Joints: Schedule 40 mild black carbon steel, ASTM A53, Grade B, mill or site beveled, complete with factory made forged steel butt welding fittings and welded joints.

E. Copper-Uncoated: Type "K" seamless copper tubing to ASTM B88, hard temper with wrought copper capillary brazed joint type fittings to ASTM B61, and brazed joints made with "Sil-Fos" or "Sil-Fos 5" brazing alloy, or, soft temper with flared brass fittings of a single 45 degree flare type, forged or with a machined long nut and copper to copper threaded connectors, and, where required, flared brass copper to NPS adapters.

F. Coated Copper: Type "K" soft temper as above but with a factory applied external yellow plastic coating approved by governing authorities.

G. Flexible Stainless Steel: Flexible, CGA certified, 125 psi rated, gas-tight, convoluted stainless steel tubing factory jacketed with a bright yellow PVC coating which is continuously identified. The tubing is to be supplied in coils and is to be complete with factory attached stainless steel end fittings, and adapter unions, protective plates, and steel clamps. Acceptable products are:

1. Flex Pression Ltd. (Westburne) "GAZFLEX"

2. Tru-Flex Metal Hose Corp. "Pro-Flex"

3. Titeflex Corp. "Gastite"

4. Omega Flex Canada "TracPipe"

H. Aboveground Fittings:

1. Pipe: Black steel, ASTM A 53, Type E or F, Grade A or B, Schedule 40, threaded ends or plain end socket welded for sizes 2 inches and smaller; otherwise, plain end beveled for butt welding.

2. Threaded Fittings: ASME B16.3, black malleable iron.

3. Socket-Welding Fittings: ASME B16.11, forged steel.

4. Butt-Welding Fittings: ASME B16.9, with backing rings of compatible material.

5. Unions: ASME B16.39, black malleable iron.

6. Flanges and Flanged Fittings: ASME B16.5 steel flanges or convoluted steel flanges conforming to ASME BPVC SEC VIII D1. Flange faces shall have integral grooves of rectangular cross sections which afford containment for self-energizing gasket material.

   a. Gaskets: Fluorinated elastomer, compatible with flange faces.

   b. Bolting: Stainless steel; ASTM A 193, Grade B8M or B8MA, Type 316, for bolts; and ASTM A 194, Grade 8M, Type 316, for nuts. Dimensions of bolts, studs, and nuts shall conform with ASME B18.2.1 and ASME B18.2.2 with coarse threads conforming to ASME B1.1, with Class 2A fit for bolts and studs and Class 2B fit for nuts. Bolts and bolt-studs shall extend through the nuts and may have reduced shanks of a diameter not less than the diameter at roof of threads. Bolts shall have American Standard regular square or heavy hexagon heads. Nuts shall be American Standard heavy semi-finished hexagon.

7. Pipe Thread Paste or Tape: Anti-seize and sealant paste or tape of polytetrafluoroethylene (PTFE).

8. Welding Filler Metal: ASME B31.8.

I. Risers:

1. Manufacturer's standard anodeless riser, transition from plastic to steel pipe with 7 to 12 mil thick epoxy coating meeting the requirements of ASTM F1973. Use swaged gas-tight construction with O-ring seals, metal insert, and protective sleeve. Provide remote bolt-on or bracket or wall-mounted riser supports as indicated.

a. Manufacturer shall be:

(1) GF Central Plastics

(2) Elster Perfection

J. Transition Fittings:

1. Steel to Plastic (PE): As specified for "riser" except designed for steel-to-plastic with tapping tee or sleeve. Coat or wrap exposed steel pipe with heavy plastic coating.

2. Plastic to Plastic: Manufacturer's standard bolt-on (PVC to PE) plastic tapping saddle tee, UL listed for gas service, rated for 100 psig, and O-ring seals. Manufacturer's standard slip-on PE mechanical coupling, molded, with stainless-steel ring support, O-ring seals, and rated for 150 psig gas service.

2.02 VALVES, BURIED:

A. Shutoff Valves:

1. Metallic ball valves, ANSI B16.33 corrosion-resisting steel, with threaded or flanged ends. Provide polytetrafluoroethylene (PTFE) seats.

2. PE ball or plug valves, ASME B16.40 and ASTM D 2513, Class C materials (PE 2306 or PE 3406), strength rating of Class 4 location with class factor of 0.20, and SDR matching PE pipe dimensions and working pressure.

a. Manufacturers:

(1) Poly-Valve

(2) Aqua-Fuse by CMF Global

(3) Lyall-Polytec

(4) GF Central Plastics

B. Valve Boxes:

1. Provide rectangular concrete valve box, sized large enough for removal of valve without removing box. Cast the word "Gas" into the box cover. Use valve box for areas as follows:

a. Roads and Traffic Areas: Heavy duty, cast iron cover.

b. Other Areas: Standard duty, concrete cover.

2.03 VALVES, ABOVEGROUND:

A. Provide lockable valves where located outdoors and where otherwise indicated. Valves shall be of only one of the types specified herein below.

B. Earthquake Automatic Gas Shutoff Valve:

1. ANSI Z21.70 and UL listed or AGA listed or International Association of Plumbing and Mechanical Officials (IAPMO) listed.

2. The valve shall provide automatic shut off when triggered by a magnitude 5.5 seismic event. Manually resettable on both sides of valve.

C. Ball Type (1/4-inch to 4-inch diameter): minimum 450 psi WOG rated, 1/4 turn, full port non-lubricated brass ball valves, each complete with a Teflon PTFE seat, chrome plated solid ball, removable lever handle, and screwed ends. Acceptable products are:

1. Neo Valves #525

2. Kitz Corp. Code 58

3. Toyo Valve Co. Fig. 5044A

4. MAS B-3

5. Nibco #T-FP-600

D. Plug Type (4-inch to 8-inch diameter): Plain face flanged, Class 125, 1380 kPa rated, 1/4 turn, cast iron lubricated plug valves, each wrench operated and complete with cylindrical plug with lubricant grooves, lubricant screw, and lubricant receptacle. Acceptable products are:

1. Neo Valves #1AS40114

2. Newman Hattersley #171M

3. KITZ 150 SCTAM-FS (flanged, 150 class, ball valve, 1/2-inch to 10 inches) CGA 3.16

2.04 NATURAL GAS CONVENIENCE OUTLET:

A. Neo Valves Model 3/375 quick-connect type outlets with interlocking safety cam to prevent release of the appliance connector until the valve is off, integral thermal protection to prevent gas flow if the outlet is exposed to temperatures exceeding 200 degrees F, and a wall enclosure box.

2.05 NATURAL GAS PRESSURE REDUCING VALVE:

A. Fisher (an Emerson Company) 1 inch x 1 inch Type S102C direct operating natural gas pressure reducing regulator with a cast iron body, 1 inch NPT connections, 9/16-inch orifice, and internal relief.

2.06 PRESSURE REDUCING REGULATORS:

A. Provide Fisher pressure reducing regulators as presented in Schedule 23 11 23-1. Also provide pressure reducing regulators to suit the building load complete with relief.

2.07 GAS EQUIPMENT CONNECTORS:

A. All gas equipment connectors shall be AGA-approved.

1. Flexible Connectors: ANSI Z21.45 or ANSI Z21.24 and approved for use in Utah, maximum length of the connector shall not exceed 36 inches.

2. Quick Disconnect Couplings: ANSI Z21.41.

3. Semi-Rigid Tubing and Fittings: ANSI Z21.69.

2.08 METERS:

A. ANSI B109.2 pipe mounted, diaphragm or bellow style, enamel coated steel case. Provide combined register totalizer reading in cubic feet, water escape hole in housing, and means for sealing against tampering. Meters shall have corrosion resistant factory painted finish.

2.09 REGULATORS:

A. AGA-approved, self-contained with spring-loaded diaphragm pressure regulating valve and atmospheric vent, corrosion resistant construction, pressure operating range as required for the pressure reduction indicated, volume capacity not less than indicated, threaded ends for sizes 2-inch and smaller, otherwise flanged. Regulators shall have corrosion resistant factory painted finish. Regulators shall be designed for the gas used.

2.10 PRESSURE GAUGES:

A. ASME B 40.1.

2.11 PIPE HANGERS AND SUPPORTS:

A. Provide MSS SP-58, Type 1, 7, and 41 hangers with adjustable type steel support rods, except as specified or indicated otherwise. Attach to steel joists with Type 19 or 23 clamps and retaining straps. Attach to Steel W or S beams with Type 21, 28, 29, or 30 clamps. Attach to steel angles and vertical web steel channels with Type 20 clamp with beam clamp channel adapter. Attach to horizontal web steel channel with drilled hole on centerline and double nut and flat washer. Attach to wood framed structures using wood screws designed for use with threaded rod adapters, or through-bolted with double nut and flat washer. Attach to concrete with Type 18 insert or drilled expansion anchor. Hangers, supports, rods and fasteners shall be hot-dipped galvanized steel. Hangers and supports in contact with bare copper tubing shall be PVC coated. Hangers and supports shall be Series 300 stainless steel. Rods and fasteners shall be Series 300 stainless steel.

2.12 SUPPLEMENTARY STEEL AND CHANNELS:

A. Unless otherwise indicated on the Structural Drawings, provide all supplementary steel and factory fabricated channels required for proper installation, mounting and support of all equipment and systems provided under this Section.

B. Supporting channels and supplementary steel shall be of sufficient strength and size to allow only a minimum deflection in conformance with the manufacturer's requirements for the specific loading on the system installed herein.

C. All supplementary steel shall be ASTM A36 factory-formed standard mill finished structural shapes, and shall be steel, field painted after fabrication . Channels shall be painted steel.

2.13 PIPE SLEEVES:

A. Sleeves in Masonry and Concrete Walls, Floors, Ceilings, and Flat Roofs: Schedule 40 hot dipped galvanized, standard weight ductile-iron or cast-iron pipe sleeves. Sleeves available from the manufacturer of mechanically adjustable segmented elastomeric seals shall be permitted subject to acceptance by the Engineer. Provide minimum 2 inch high waterstop for sleeves in exterior walls and floors.

B. Sleeves in Non-Masonry or Non-Concrete Walls, Floors, and Roofs: Hot-dip galvanized steel sheet, 26 gage minimum thickness.

C. Mechanically Adjustable Segmented Elastomeric Seals: Seals shall have low durometer EPDM seal elements and series 300 stainless steel hardware.

2.14 PIPE ESCUTCHEONS:

A. General: Provide pipe escutcheons at all pipe penetrations where penetration is exposed to view as specified herein with inside diameter closely fitting pipe outside diameter. Select outside diameter of escutcheon to completely cover pipe penetration hole in

floors, wall, or ceilings; and pipe sleeve extension, if any. Escutcheons shall be held in place by internal spring tension or set screws.

B. Provide pipe escutcheons in finished spaces. Pipe escutcheons shall be of stainless steel, anodized aluminum or chrome-plated brass, solid or split hinged.

2.15 ACCESS PANELS:

A. Access panels shall give access to each valve in concealed spaces above non removable (hard) suspended ceilings, and to all other concealed parts of the system. Access panels shall be located where indicated on the Drawings and/or where otherwise require accessibility for the proper inspection, operation and maintenance of the system.

B. Access panels shall be Milcor Type M, 16 inch by 16 inch minimum, as manufactured by Inryco, Inc. Door shall be constructed of 18 gage galvanized steel with frame constructed of 16 gage galvanized steel. Casing bead shall be galvanized steel. Hinge shall be continuous steel with stainless steel pin. Locks shall be flush-screwdriver operated, with metal cam. Galvanized steel sleeve shall be welded to panel for access to cam lock control. Prime coat shall be factory applied rust-inhibitive light grey paint.

PART 3 - EXECUTION

3.01 NATURAL GAS SERVICE:

A. Make all required arrangements with Dominion Energy on behalf of the Owner for installation of natural gas service piping with gas pressure regulator and meter assembly where shown.

B. Arrange for permits, inspections, and tests, in accordance with applicable State and local codes, at the contractor's expense.

C. Verify all measurements at the Project Site.

D. Avoid interferences with other trades.

3.02 NATURAL GAS PIPING INSTALLATION REQUIREMENTS:

A. Installation, workmanship, inspection and testing shall be in accordance with the specified Fuel Gas Code with the additions specified herein. Install natural gas piping upstream of meter/regulators or upstream of building connections in accordance with ASME B31.8. Install piping straight and true to bear evenly on hangers and supports. Keep the interior and ends of new piping and existing piping affected by the Work thoroughly cleaned of water and foreign matter. Keep piping systems clean during installation by means of plugs or other accepted methods. When work is not in progress, securely close open ends of piping to prevent entry of water and foreign matter. Inspect piping before placing into position.

B. Natural Gas Piping shall not be permitted in Electrical Rooms and stairwells.

C. Piping and other apparatus shall not be installed in such a manner so as to interfere with the full swing of doors, movement of personnel and equipment, and access to other equipment.

D. Make provisions for pipe expansion and contraction with suitable anchors and offsets, expansion joints, or expansion loops. Make provisions in buried piping for differential settlement. Install piping to allow freedom of movement in all planes without imposing undue stress on any section of the main piping, branch piping, equipment and structure.

E. Piping: Cut pipe to actual dimensions and assemble to prevent residual stress. Provide supply connections entering the building as indicated. Within buildings, run piping parallel to structure lines and conceal in finished spaces. Fittings installed in concealed locations shall be limited to the following types: threaded elbows, tees, and couplings, brazed fittings, welded fittings, and fittings listed to ANSI LC-1 or ANSI LC-4. Terminate each vertical supply pipe to burner or appliance with tee, nipple and cap to form a sediment trap. To supply multiple items of gas-burning equipment, provide manifold with inlet connections at both ends.

1. Cleanliness:

a. Clean inside of pipe and fittings before installation. Blow lines clear using 80 to 100 psig clean dry compressed air. Rap steel lines sharply along entire pipe length before blowing clear.

2. Buried Polyethylene (PE) Piping:

a. Provide totally PE piping. Buried piping shall not be permitted under any building and/or structure. Terminate buried piping not more than 6 inches above grade. Prior to installation, obtain printed instructions and technical assistance in proper installation techniques from pipe manufacturer. When joining new PE pipe to existing pipe line, ascertain when procedural changes in the fusion process is necessary to attain optimum bonding.

(1) PE Piping: Provide fusion-welded joints except where transitions have been specified. Use electrically heated tools, thermostatically controlled and equipped with temperature indication. (Where connection must be made to existing plastic pipe, Contractor shall be responsible for determination of compatibility of materials and procedural changes in fusion process necessary to attain maximum integrity of bond.)

(2) Laying PE Pipe: Minimum cover over pipe shall be 30 inches below finish grade or 36 inches below any drainage ditches or deeper when indicated. Minimum cover for services lines to any building or structure shall be 18 inches. Maintain 6 inches of clearance between

natural gas piping and any other utility or structure. If minimum clearance cannot be maintained, the natural gas pipe shall be protected with a casing pipe. Service lines shall be sloped to drain back to the distribution pipe. Lay in accordance with manufacturer's printed instructions.

(3) Buried gas piping shall not penetrate building foundation walls at any point below grade per FGC of Utah Section 404.6. Gas piping shall enter buildings or structures at a point above grade and the annular space between the pipe and the wall shall be sealed.

b. Excavating and Backfilling: Pipe bedding and compacted backfill shall be provided under this Section of the Specifications in accordance with the requirements of Section 31 22 00. Pipe bedding shall be 6 inches deep. Compacted backfill shall be to a point 12 inches above the crown of buried pipe. Bedding and compacted backfill shall be non-corrosive material such as cleaned washed sand, and contain no stones, metal, rubbish of any kind, frozen material, organic matter, or any other material capable of damaging piping or coating, and/or of settling. Gas lines shall be buried in the trenches separate from all other utilities including other gas lines. Trenches shall be wide enough to permit at least 6 inches spacing between the sides and floor of the trench. Make provisions in buried piping for differential settlement, e.g. snaking the piping in the trench before backfilling. Coordinate provision of utility warning identification tape with backfill operation. Bury utility warning and identification tape with printed side up at a depth of 12 inches below the top surface of earth or the top surface of the subgrade under pavements.

c. PE Pipe Installation Guidelines:

(1) Acceptable plastic PE pipe is manufactured according to standard ASTM D2513 and is marked with “ASTM D2513”. The PE type designations recommended are PE 2406, and PE 3408.

(2) PE plastic pipe is unsuitable for aboveground installation. Plastic pipe must be buried or inserted.

(3) Make each joint in accordance with written procedures that have been proven by test to produce strong gas-tight joints. PE plastic pipe joining procedures can be obtained from qualified manufacturers. Do not purchase a product if the manufacturer or supplier does not certify it for qualified joining procedures.

(4) All pipe joining procedures must be conducted by qualified person following the written joining procedures for each type of pipe and fitting used. No person shall make a plastic pipe joint unless that person has been qualified under the applicable joining procedure by

making a specimen joint that passes inspection and test. The specimen joint must be visually examined during and after joining and found to have the same appearance as a joint or photograph of a joint that is acceptable under the procedure. In the case of heat fusion, the specimen must be cut into at least three longitudinal straps, each of which is:

(a) Visually examined and found not to contain voids or discontinuities on the cut surfaces of the joint area;

(b) Deformed by bending, torque, or impact, and if failure occurs, it must not initiate in the joint area.

(5) Install properly designed valves in a manner that will protect the plastic material. Protect the pipe from excessive twisting, shearing, or cutting loads when the valve is operated. Protect from any secondary stresses that might be induced through the valve or its enclosure.

(6) Prevent pullout and joint separation. Plastic pipe must be installed in such a manner that expansion and contraction of the pipe will not cause pullout or separation of the joint.

(7) When inserting plastic pipe in a metal pipe, make allowance for thermal expansion and contraction. Make an allowance at lateral and end connections on inserted plastic pipes, particularly those over 50 feet in length. End connections must be designed to prevent pullout caused by thermal contraction. Fittings must be able to restrain a force equal to or greater than the strength of the pipe. To minimize the stress caused by thermal contraction, pipes inserted in the summer should be allowed to cool to ground temperature before tie-ins are made. Inserted pipes, especially those pulled in, should be relaxed, mechanically compressed, or cooled to avoid initial tensile stress. Operators unfamiliar with proper insertion techniques must have a qualified person develop the procedures.

(8) Repair or replace imperfections or damages before placing the pipe in service.

(9) Install all plastic mains and service lines below ground level. Where the pipe is installed in a vault or other below-grade enclosure, it must be completely encased in gas-tight metal pipe with fittings that are protected from corrosion. Plastic pipe installation must minimize shear and other stresses. Plastic mains and service lines that are not encased must have an electrically conductive wire or other means of locating the pipe. Plastic lines must not be used to support external loads.

(10) A yellow insulated copper tracer wire shall be installed adjacent to underground PE pipe. Access shall be provided to the tracer wire of the tracer wire shall terminate above ground at each end of the PE piping. The tracer wire size shall not be less than 12 AWG solid copper and the insulation type shall be 30 to 45 mils polyethylene suitable for direct burial, Southwire Tracer Wire, or approved equal.

(11) Ensure that plastic PE pipe is continually supported along its entire length by properly tamped and compacted soil. To prevent any shear or other stress concentrations use external stiffeners at connections to main, valves, meter risers, and other places where compression fittings might be used.

(12) In laying of plastic PE pipe, ensure adequate slack (snaking) in the pipe to prevent pullout due to thermal contraction.

(13) Suitable bedding (sand) and backfill must be provided. Ensure backfill with material that does not contain any large or sharp rocks, broken glass, or other objects that could cut or puncture the pipe.

(14) Take special care to prevent coal tar type coatings or petroleum base tape from contacting the plastic pipe. It can cause plastic pipe to deteriorate.

(15) Static electricity can ignite a flammable gas-air atmosphere. When working with plastic pipe of any kind where there is (or there may be) the possibility of a flammable gas-air atmosphere, take the following precautions:

(a) Use a grounded wet tape conductor wound around, or laid in contact with, the entire section of the exposed piping.

(b) If gas is already present, wet the pipe starting from the ground end with a very dilute water and detergent solution. Apply tape immediately and leave it in place.

(c) Wet the tape occasionally with water. Where temperatures are below freezing (32 degrees F) add glycol to the water to maintain tape flexibility. Ground the tape with a metal pin driven into the ground.

(d) Do not vent gas using an ungrounded plastic pipe or tubing. Even with grounded metal piping, venting gas with high scale or dust content could generate an electric charge in the gas resulting in an arc from the dusty gas cloud back to the pipe which could ignite the gas. Vent gas only at a downwind location remote from people or flammable material.

i. Dissipating the static charge buildup with wet rags, a bare copper wire, or other similar techniques may not be as effective as the above procedure. In all cases, use appropriate safety equipment such as flame resistant and static free clothing, breathing apparatus, etc.

(16) In transition area where the plastic pipe is connected to a fitting, valve, or riser, the use of protective sleeves may be needed to distribute excessive stresses, along with attention to adequate backfill and support.

3. Aboveground Steel Piping:

a. Determine and establish measurements for piping at job site and accurately cut pipe lengths accordingly. For 2-inch diameter and smaller, use threaded or socket-welded joints. For 2 1/2-inch diameter and larger, use flanged or butt-welded joints.

(1) Threaded Joints: Where possible use pipe with factory-cut threads, otherwise cut pipe ends square, remove fins and burrs and cut taper pipe threads in accordance with ASME B1.20.1. Provide threads smooth, clean and full-cut. Anti-seize jointing compound for pipe threads shall be polytetrafluoroethylene (PTFE) pipe thread paste, pipe cement and oil, or PTFE powder and oil. PTFE tape is also acceptable. Apply jointing compound to male threads only. Work piping into place without springing or forcing. Backing off to permit alignment of threaded joints will not be permitted. Engage threads so that not more than three threads remain exposed. Use unions for connections to valves, meters, and regulators for which a mean of disconnection is not otherwise provided.

(2) Welded Joints: Weld by the shielded metal-arc process, using covered electrodes and in accordance with procedures established and qualified in accordance with ASME B31.8.

(3) Flanged Joints: Use flanged joints for connecting welded joint pipe and fittings to valves, meters and regulators to provide for disconnection. Install joints so that flange faces bear uniformly on gaskets. Engage bolts so that there is complete threading through the

nuts and tighten so that bolts are uniformly stressed and equally torqued.

(4) Pipe Size Changes: Use reducing fittings for changes in pipe size. Size changes made with bushings will not be accepted.

4. Connections to Existing Pipeline:

a. When making connections to live gas mains, use pressure tight installation equipment operated by workmen trained and experienced in making hot taps. For connections to existing underground pipeline or service branch, use transition fittings for dissimilar materials.

5. Wrapping:

a. Where connection to existing steel line is made underground, tape wrap new steel transition fittings and exposed existing pipe having damaged coating. Clean pipe to bare metal. Initially stretch first layer of tape to conform to the surface while spirally half-lapping. Apply a second layer, half-lapped and spiraled as the first layer, but with spirals perpendicular to first wrapping. Use 10 mil minimum thick polyethylene tape. In lieu of tape wrap, heat shrinkable 10 mil minimum thick polyethylene sleeve may be used.

F. Valves:

1. Install valves approximately at locations indicated. Orient stems vertically, with operators on top, or horizontally. Provide support for valves to resist operating torque applied to PE pipes.

2. Stop Valve and Shutoff Valve:

a. Provide stop valve on service branch at connection to main and shut-off valve on riser outside of each building. Provide shut-off valve at connection to each gas utilization appliance and where otherwise indicated.

G. Gas Regulators:

1. Provide plug cock shutoff valve on both sides of each regulator. Install regulators outside of buildings and 18 inches aboveground on riser., unless specifically detailed otherwise. Install gas meter in conjunction with pressure regulator. On outlet side of regulator or meter, provide a union and a 3/8 inch gage tap with plug.

H. Pipe Hangers and Supports:

1. Selection, application, and installation of piping hangers and supports shall conform with MSS SP-58, unless otherwise indicated.

2. Furnish and install safe and substantial means of support for all parts of the piping system. Attach all pipes securely to the structure in correct alignment and pitch, to prevent vibration and to effectively care for expansion and contraction.

3. All piping shall be hung to true alignment, using appropriate hanger arrangements. Wire and strap hangers shall not be permitted. Hangers shall be located so that piping and hangers will be clear of other piping, hangers, conduits, lighting fixtures, equipment, ceiling suspension systems, ductwork and other obstructions.

4. Supplementary steel and channels shall be firmly connected to the building construction in a manner accepted by the Engineer, or as otherwise shown on the Drawings. Equipment and piping shall not be supported from metal decking or plaster ceilings.

5. Rod sizes, MSS SP-58.

6. Maximum Spacing Between Supports:

   a. Support piping within one foot on either side of regulators, flanged valves, and changes in direction. Support within 2 feet of wall penetrations.

   b. Vertical Piping: Support piping at each floor, but at not more than 10 foot intervals, with pipe riser clamps or offset pipe clamps. Support within 2 feet of floor and roof penetrations.

   c. Horizontal Piping: Locate supports within one foot of each change of direction. Support straight runs of steel piping and copper tubing as follows:

Maximum Spacing Feet									
Nominal Pipe Size inches	**One and under**	**1-1/4**	**1-1/2**	**2**	**2-1/2**	**3**	**4**	**5**	**6**
Steel Pipe (Vapor)	8	9	12	13	14	15	17	19	21
Copper Tube (Vapor)	6	9	10	11	13	14	16	18	20

I. Seismic Bracing Requirements

1. Piping and equipment shall be supported and braced to resist seismic loads where required by the specified Building Code. Provide seismic restraints in accordance with SMACNA Seismic Restraint Mnl unless otherwise required by the specified building code.

J. Pipe Through-Penetrations:

1. Furnish pipe sleeves where pipe passes through walls, floors, ceilings, roofs, and partitions. Sleeves will be installed, secured in proper position and location during construction by the trade whose element will be penetrated. Such trades include concrete, masonry, steel siding in the case of a steel building, and dry wall in the case of framed construction. Core drilled holes in masonry and concrete may be provided by this Section in lieu of pipe sleeves, however cored drilled holes in masonry shall have cavities completely grouted. Furnish sleeves of sufficient length to pass through entire thickness of walls, floors, ceilings, roofs, and partitions.

2. Pipe Penetrations Through Building Interior Construction: Provide not less than 1/4 inch one inch space between exterior of piping and interior of sleeve or core-drilled hole. Firmly pack space with mineral wool insulation. For non-fire rated assemblies, seal at both ends of the sleeve or core-drilled hole with plastic waterproof cement which will dry to a firm but pliable mass or silicone. Seal both ends of penetrations through fire rated assemblies to maintain fire resistive integrity with UL listed fill, void, or cavity material.

3. Pipe Penetrations Through Building Exterior Construction: Provide a mechanically adjustable segmented elastomeric seal, with sleeve sized as recommended by seal manufacturer. Seals shall have EPDM seal elements and Series 300 stainless steel hardware.

4. Extend sleeves in floor slabs 2 inches above the finished floor.

5. Seismic-braced Pipe:

    a. Proper clearances between penetrating gas system piping and any barrier shall be provided. The penetration holes shall be sized such that the hole diameter is 2 inches larger for pipe diameters 1-inch nominal to 3-inch nominal, and 4 inches larger for 4 inch and larger nominal diameter pipe.

    b. All open space around seismically braced through-penetrations shall be protected by a Listed, flexible through-penetration seal system.

K. Final Connections: Make final connections to equipment and appliances using rigid pipe and fittings, except for the following:

1. Domestic Water Heaters:

    a. Connect with semi-rigid tubing and fittings.

2. Equipment:

   a. Install flexible connectors. Connectors shall be long enough to permit movement of equipment for cleaning and to afford access to coupling.

3. Generators and HVAC equipment.

4. Install flexible connectors. Connectors shall have sufficient slack to avoid all stresses associated with generator vibration.

L. Provide full pipe diameter 6-inch long drip pockets at the bottom of all vertical risers, at all piping low points, and wherever else shown and/or required.

M. Identify all natural gas piping with two coats of safety yellow enamel applied over primer, and SMS Ltd. coil type vinyl identification makers with arrows.

3.03 DIGESTER (METHANE) GAS PIPING INSTALLATION REQUIREMENTS:

A. Provide digester gas piping to connect the piping train integral with the digester gas burners of the boilers, and provide all required vent piping. Extend the piping from termination of methane gas yard piping as shown.

B. Pipe is to be Type 316L stainless steel with Type 316 stainless steel pipe hangers and supports.

C. Do all digester gas piping work and connect the burners in accordance with requirements of ANSI B149.6, Installation Code for Digester Gas Systems, and requirements of any other regulatory authority.

D. Slope digester gas piping in the direction of flow to low points, and equip all low points with accessible and easily seen sediment traps and drip traps in accordance with ANSI B149.6 requirements.

E. Where digester gas piping penetrates an exterior concrete or masonry wall, foundation, etc., coat the portion of pipe in the wall with proper tar epoxy or wrap with suitable Denso or approved equivalent protection tape overlapped 50 percent.

F. Identify all exposed digester gas piping with two coats of suitable yellow - orange enamel applied over primer, and SMS Ltd. coil type vinyl identification markers with flow arrows.

3.04 INSTALLATION OF SHUT-OFF VALVES:

A. Provide TSSA approved ball type or lubricated plug type shut-off valves to isolate equipment, and wherever else shown.

B. Ensure that valves are located for easy accessibility and maintenance.

3.05 INSTALLATION OF NATURAL GAS CONVENIENCE OUTLETS:

A. Provide natural gas convenience outlets and wall mount where shown.

B. Provide a shut-off valve in connecting piping, confirm exact location prior to roughing-in, and ensure that the outlet is rigidly secured in place.

3.06 FIELD QUALITY CONTROL:

A. Prior to initial operation, inspect systems for compliance with Drawings, Specifications and accepted submittals. As part of inspection, perform inspections, tests and purging in compliance with the specified requirements. Have systems accepted by the Engineer before concealing.

B. Test Procedures and Reports:

1. Prepare and submit procedures, material and equipment for all specified tests to the Engineer for acceptance prior to the planned tests. Material and equipment used in testing shall be subject to inspection by the Engineer.

2. Provide all material and labor required for testing. Instruments, test equipment, and test personnel required to properly conduct all tests shall be provided. Provide water, fuel, electricity. The Owner will furnish water, fuel and electricity for the tests.

3. Repair defects disclosed by tests or, if required by the Engineer, replace defective work with new work without additional cost. If any deficiencies are revealed during test, such deficiencies shall be corrected and the tests reconducted at no additional cost.

4. Test reports shall include accepted test procedures, test results, deficiencies identified, and recommended corrective actions. Provide a complete explanation including supporting documentation detailing the design deficiencies. State that no deficiencies are evident if that is the case. When tests have been completed and corrections made, submit signed and dated test reports.

C. Metal Welding Inspection:

1. Inspect for compliance with the specified Fuel Gas Code except natural gas piping upstream of meter/regulators shall be inspected for compliance with ASME B31.8. Replace, repair and then re-inspect defective welds.

D. PE Fusion Welding Inspection:

1. Visually inspect butt joints by comparing with, manufacturer's visual joint appearance chart. Inspect fusion joints for proper fused connection. Replace defective joints by cutting out defective joints or replacing fittings. Inspect 100 percent of all joints and reinspect all corrections. Arrange with the pipe

manufacturer's representative in the presence of the Engineer to make first time inspection.

E. Piping Pressure Tests:

1. Test system gas tight in accordance with the specified Fuel Gas Code with the additions specified herein. For natural gas piping upstream of meter/regulators, test system gas tight in accordance with ASME B31.8. Use test pressure of 1-1/2 times maximum working pressure, but in no case less than 50 psig. Do not test until every joint has set and cool at least 8 hours at temperatures above 50 degrees F. Use clean dry air or inert gas, such as nitrogen or carbon dioxide, for testing. Systems which may be contaminated by gas shall first be purged as specified. Make tests on entire system or on sections that can be isolated by valves. After pressurization, isolate entire piping system from sources of air during test period. Maintain test pressure for at least 8 hours between times of first and last reading of pressure and temperature. Take first reading at least one hour after test pressure has been applied. Do not take test readings during rapid weather changes.

   a. For buried piping, conduct testing before backfilling; however, place sufficient backfill material between fittings to hold pipe in place during tests. Provide gas temperature same as actual trench conditions.

2. There shall be no reduction in the applied test pressure other than that due to a change in ambient temperature. Allow for ambient temperature change in accordance with the relationship PF + 14.7 = (P1 + 14.7) (T2 +460) / T1 + 460), in which "T" and "P" represent Fahrenheit temperature and gage pressure, respectively, subscripts "1" and "2" denote initial and final readings, and "PF" is the calculated final pressure. If "PF" exceeds the measured final pressure (final gage reading) by 1/2 psi or more, isolate sections of the piping system, retest each section individually, and apply a solution of warm soapy water to joints of each section for which a reduction in pressure occurs after allowing for ambient temperature change. In performing tests, use a test gage calibrated in one psi increments and readable to 1/2 psi.

3. Correct defects in Work and repeat test until no reduction in pressure occurs.

F. System Purging: After completing pressure tests, and before testing a gas contaminated line, purge line with nitrogen at junction with main line to remove all air and gas. Clean completed line by attaching a test pilot fixture at capped stub-in line at building location and let gas flow until test pilot ignites. Procedures shall conform to the specified Fuel Gas Code and ASME B31.8, whichever is more stringent.

CAUTION

Failure to purge may result in explosion within line when air-to-gas is at correct mixture.

G. Functional Testing: All equipment, control devices and signaling devices shall be tested individually to demonstrate proper operation. Test all control panel functions to demonstrate proper operation. Test all control system functions to demonstrate proper operation in accordance with the specified control sequences. Monitoring signals to the facility Supervisory Control and Data Acquisition (SCADA) system shall be verified.

3.07 MANUFACTURER'S INSTRUCTIONS AND SERVICES:

A. Obtain instructions from the manufacturer for the proper method of installation and connection of the equipment that is to be installed. Obtain all information that is necessary to facilitate the Work and to complete the project.

B. Provide manufacturer's services in accordance with Section 01 78 25. Services shall be provided for the satisfactory completion of installation, start-up, testing and training for those equipment and systems described herein below.

1. Gas booster system

C. Upon completion of all Work, furnish, in duplicate, certificates of inspection from equipment manufacturers stating that authorized factory engineers have inspected and tested the operation of their respective equipment and found same to be in satisfactory operating condition.

3.08 PAINTING:

A. Field painting of above ground gas piping shall be provided under this Section in accordance with Section 09 90 00.

B. Field touch up all damaged factory or shop applied coatings for material and equipment furnished under this Section in accordance with the manufacturer's recommendation.

C. Provide shop painting system, under this Section, of the following. Color of finish coat shall be yellow.

1. Hangers and supports in exposed locations.

2. Pipe, fittings and valves in exposed locations.

D. Do not apply paint until piping tests have been completed and accepted by the Engineer.

3.09 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

3.10 SCHEDULES:

Schedule 23 11 23-1			
Building	**Projected Gas Load[1] S. Cubic feet/hr.**	**Regulator (Fisher) Model**	**Relief (Fisher) Model**
IPS	160	S202H 1-1/2-inch body 1/4-inch orifice	289A 1/4-inch

SECTION 23 13 25

FACILITY ABOVEGROUND DIESEL FUEL-OIL STORAGE TANKS

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide Facility Aboveground Diesel Fuel-Oil Storage Tanks as indicated and in compliance with Contract Documents.

1. Concrete-vaulted, steel, fuel-oil ASTs

2. Leak Detection and Monitoring System

3. Fuel Polishing System

4. Master Control Panel

5. Fuel Transfer System

6. Return Pump System

7. Vehicle Fuel Dispensing Unit

B. These specifications are written based on the Oldcastle Convault tank. The Envirosafe Fireguard tank may be an acceptable alternate if the size and configuration will meet the intent of the design drawings.

C. The tank system must comply with all provisions of: 1) UFC 79-7, Appendix A-II-F, for both Vehicle Impact Protection and Projectile Resistance; 2) NFPA 30 and 30A; 3) IFC Chapter 22; and 4) IFC Chapter 34.

1.03 DEFINITIONS:

A. AST: Aboveground storage tank.

1.04 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Product Data: For each type of product.

1. Include construction details, material descriptions, and dimensions of individual components and profiles.

2. Include rated capacities, operating characteristics, electrical characteristics, and furnished specialties and accessories.

3. Fuel-oil storage tank accessories.

C. Shop Drawings:

1. Include plans, elevations, sections, anchors, and lifting or supporting points.

2. Indicate dimensions, components, and location and size of each field connection.

3. Shop Drawing Scale: 1/4 inch per foot (1:50).

D. Site Survey: Plans, drawn to scale, on which fuel-oil storage tanks are shown and coordinated with other services and utilities.

E. Qualification Data: For qualified professional engineer.

F. Seismic Qualification Data: For ASTs, accessories, and components, from manufacturer.

1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.

2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.

3. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.

G. Brazing certificates.

H. Welding certificates.

I. Field quality-control reports.

J. Sample Warranty: For special warranty.

K. Operation and Maintenance Data: For fuel-oil equipment and accessories to include in emergency, operation, and maintenance manuals.

1.05 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.06 SPARE PARTS:

A. Comply with the requirements specified in Section 01 61 00.

1.07 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 43 00.

B. EPA Compliance: Comply with EPA and state and local authorities having jurisdiction. Include recording of fuel-oil storage tanks and monitoring of tanks.

C. Steel Support Welding Qualifications: Qualify procedures and personnel according to AWS D1.1, "Structural Welding Code - Steel."

1.08 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

1.09 WARRANTY:

A. Special Warranty: Manufacturer agrees to repair or replace components of fuel-oil storage tanks and components that fail in materials or workmanship within specified warranty period.

1. Storage Tanks:

a. Failures include, but are not limited to, the following when used for storage of fuel oil at temperatures not exceeding 150 degrees F:

(1) Structural failures including cracking, breakup, and collapse.

b. Warranty Period: 30 years from date of Substantial Completion.

PART 2 - PRODUCTS

2.01 PERFORMANCE REQUIREMENTS:

A. Delegated Design: Engage a qualified professional engineer, as defined in Section 01 43 00, to design restraint and anchors for fuel-oil ASTs, and equipment, including comprehensive engineering analysis, using performance requirements and design criteria indicated.

B. Seismic Performance: Factory-installed support attachments for AST shall withstand the effects of earthquake motions determined according to ASCE 7.

1. The term "withstand" means "the unit will remain in place without separation of any parts when subjected to the seismic forces specified and the unit will be fully operational after the seismic event."

2.02 CONCRETE-VAULTED, STEEL, FUEL-OIL AST:

A. Manufacturers:

1. Oldcastle Convault.

2. Envirosafe Fireguard (potential alternate tank)

B. Description: UL 142 and UL 2085; thermally insulated, fire-resistant and protected, double-wall, horizontal, steel tank; with primary- and secondary-containment walls and insulation and with interstitial space.

C. Construction: Fabricated with welded, carbon steel and insulation and encased in concrete that will protect from bullets; suitable for operation at atmospheric pressure and for storing fuel oil with specific gravity up to 1.1 and with test temperature according to UL 2085.

Secondary Containment and Corrosion Protection: The tank system shall include secondary containment consisting of an impervious barrier of 30 mil High-Density Polyethylene geomembrane enclosing the primary steel tank and insulation material to contain leaks from the primary tank and isolating the primary tank from the concrete to protect against corrosion. The secondary containment shall be impervious to corrosion, including damage or failure due to microbial infestation.

1. Secondary containment comprised of a steel jacket not encased with concrete will not be permitted.

D. Concrete Encasement: A vaulted concrete enclosure shall encase and protect both the primary steel tank and the secondary containment. The concrete encasement shall be 6 inches thick with a minimum design strength of 4000 psi. The concrete design shall include the following for long-term durability: air entrainment, water-reducing admixture, and steel reinforcement. Concrete placement shall be a visually verifiable monolithic (seamless) pour to ensure the absence of voids on all sides and beneath the steel tank.

E. The vault enclosure shall have concrete support legs of unitized monolithic construction raising the concrete enclosure a minimum of 3 inches above the ground to meet visual inspection requirements. A mid-level seam or other cold joint construction which could compromise the liquid tightness (secondary containment) and fire protection capability of the vault is not permitted.

F. Thermal Protection: The tank system construction shall include covering the outer surface of the primary steel tank with a minimum 1/4 inch of polystyrene foam panels and 6 inches thick reinforced concrete for thermal insulation to protect against temperature extremes.

G. Corrosion Protection: All steel outside the concrete encasement shall be anti-oxidant powder coated to inhibit corrosion and meet ASTM B117.

H. Ballistics Resistance: The tank system shall carry a listing under UL Ballistics Standard 752, Levels 5,6, and 8, signifying bullet-resisting protection against penetration, passage of fragments of projectiles, or fragmentation of the vault enclosure to the extent that any protected material, including the secondary containment and primary tank are not damaged.

I. Fire Resistance: The tank system shall be designed and tested to provide 2 hour fire protection for the primary tank as per UL 2085 2-hour furnace fire test and 2 hour simulated pool fire test. The average maximum rise in temperature of the primary tank during the test shall not exceed 260 degrees F and the maximum temperature of any single point on the primary tank shall not exceed 400 degrees F. No steel members shall penetrate the walls or floor of the concrete encasement to assure isolation from pool fire heat.

J. Leak Monitoring: A thru-tank leak detection monitoring tube terminating between the primary tank and the secondary containment shall be provided to monitor any leaks from the primary tank.

K. Spill/Overfill Containment: The tank system shall include a UL listed 7-gallon spill/overfill container manufactured as an integral part of the primary tank, surrounding the fill pipe, and protected by 2-hour fire rating of the enclosure. The spill/overfill container shall include a stick port and normally closed drain valve to release spilled product into the main tank. Exterior steel shall be anti-oxidant powder coated to inhibit rust. Overfill containment systems that are designed to release spilled product into the interstitial area will not be accepted.

L. Overfill Protection: Overfill protection shall be provided by the following methods: a) direct reading level gauge visible from fill pipe access; b) valve rated for pressurized delivery located within fill pipe to close automatically at 95 percent full level; and c) high level alarm.

M. Exterior Finish: The tank system exterior shall be a low maintenance architectural exterior concrete finish. Models with fiber clad or painted steel exterior tanks will not be accepted.

N. Capacities and Characteristics:

1. Capacity: 12,000 gallons

2. Width: 8 feet-0 inches

3. Length: 34 feet-1 inches

4. Height: 8 feet-3-1/4 inches

5. Connection Sizes:

    a. Fill Line: 4-inch diameter

    b. Other Ports: 6 x 4-inch diameter

    c. Emergency Vent: 8-inch diameter

    d. Return: 2-inch diameter

    e. Leak Detection Port: 2-inch diameter

    f. Communication Port: 1-inch diameter

6. Accessway:

    a. Number Required: 1

    b. Diameter: 24-inch

7. Fuel-Oil Grade Number: Diesel

2.03 FUEL-OIL AST ACCESSORIES:

A. Tank Manholes: 22-inch-minimum diameter; bolted, flanged, and gasketed; centered on top of tank.

B. Threaded pipe connection fittings on top of tank, for fill, supply, return, vent, sounding, and gaging. Include cast-iron plugs for shipping.

C. Striker Plates: Inside tank, on bottom below fill, vent, sounding, gage, and other tube openings.

D. Lifting Lugs: For handling and installation.

E. Supply Tube: Extension of supply piping fitting into tank, terminating 6 inches above tank bottom and cut at a 45-degree angle (1:1 slope).

F. Sounding and Gage Tubes: Extension of fitting into tank, terminating 6 inches above tank bottom and cut at a 45-degree angle (1:1 slope).

G. Two-Level Float Switch: Each AST shall be provided with a two-level float switch. Fitting size and length shall be recommended by the AST manufacturer. Float switch fitting, stem, and float material shall be stainless steel. Level 1 shall be low level indication and Level 2 shall be high level indication.

2.04 LIQUID-LEVEL GAGE SYSTEM:

A. Manufacturer:

1. Veeder-Root Magnetostrictive (MAG) Plus Probe

B. Description: Calibrated liquid-level gage system complying with UL 1238 with probes or other sensors and remote annunciator panel. Maximum diameter 4-inch. Provide sensor riser cap and adapter kit, if re-quired, to match tank port.

C. Annunciator Panel: With visual and audible, high-tank-level and low-tank-level alarms; fuel indicator with registration in gallons (liters); and overfill alarm. Include gage volume range that covers fuel-oil storage capacity.

D. Controls: Electrical, operating on 120-Vac.

2.05 INTERSTITIAL LEAK SENSOR:

A. Manufacturer:

1. Veeder-Root

B. Description: Provide interstitial leak sensor to detect the presence of liquid between the double walls of the tank. Sensor shall be compatible with diesel fuel. Maximum sensor

diameter 1.5-inch. Provide sensor riser cap and adapter kit, if required, to match tank port.

2.06 DISCRIMINTATING CONTAINMENT SUMP SENSOR:

A. Manufacturer:

1. Veeder-Root

B. Description: Provide discriminating containment sump sensor in the fill integral spill containment area of each storage tank.

2.07 DISPENSER PAN SENSOR:

A. Manufacturer:

1. Veeder-Root

B. Description: Provide discriminating sump sensor in the fuel dispenser pan.

2.08 PRESSURIZED LINE LEAK TRANSDUCER:

A. Manufacturer:

1. Veeder-Root

B. Description: Provide a digital pressurized line leak transducer at each pump to pipe connection in the system.

2.09 LEAK-DETECTION AND MONITORING SYSTEM:

A. Cable and Sensor System: Comply with UL 1238.

1. Manufacturers:

a. Veeder-Root TLS-450 Plus.

2. Calibrated leak-detection and monitoring system with probes and other sensors and remote alarm panel for the fuel storage tanks, belly tanks, dispenser, and relative electrical cabinets.

3. Include fittings and devices required for testing.

4. Controls: Electrical, operating on 120-Vac.

B. System Requirements

1. For the fuel storage tanks, provide alarms from Magnetostrictive level probes (high-level and low-level), interstitial liquid sensors, discriminating sump sensors, pressurized line leak transducers, and mag sensors to SCADA.

2. For the belly tanks, provide alarms from interstitial leak sensors to SCADA.

3. For the Supply FOP Cabinet, Return FOP Cabinet, and Fuel Polishing Cabinet, provide alarms from pressurized line leak detection, and liquid sensors to SCADA.

4. For the dispenser, provide alarms from a mag sensor, hook signal, and dispenser pan sensor to SCADA.

2.10 FUEL OIL:

A. Diesel Fuel Oil: ASTM D975, Grade Low Sulfur, high volatility.

2.11 SOURCE QUALITY CONTROL:

A. Affix standards organization's code stamp.

2.12 ANTI-SIPHON VALVE:

A. Provide an Anti-Siphon Valve on the fuel oil supply connection to the AST. Valve shall be in a 90 degree configuration and have a ductile iron body, stainless steel cap and spring, stainless steel plunger with Viton disc, stainless steel thermal expansion valve with Viton seal. Valve shall be normally closed and design for the site elevation.

B. Manufacturer:

1. Morrison Bros. Co. – Model 910

2.13 FUEL TRANSFER SYSTEM:

A. Provide a heavy-duty fuel transfer system that moves fuel to the requesting tank from the source tanks. System shall be a dual pump system suitable for servicing multiple tanks. System controller shall be designed to communicate with the Master Control Panel. The Fuel Transfer System shall include the following:

1. NEMA 4 rate enclosure, powder coated

2. Pumps: Continuous duty, 7 gpm, 3/4 HP spur gear pump, 120V, 1 phase, 60 Hertz

3. Strainers: 20 mesh wye-strainer

4. Mechanical water separator and water detection alarm module

5. Cabinet leak detector

6. System Controller with safety and alarm features including high vacuum, high pressure, and no flow

7. Cabinet heater

8. Miscellaneous Items as required for a complete system including, but not limited to, pressure relief port, pressure gauges, pressure switches, vacuum gauges, vacuum switches, check valves, wye strainers, flow switches, and ball valves.

B. Manufacturer:

1. AXI, International – FTS-2000

2.14 RETURN PUMP SYSTEM:

A. Provide a dual pump return fuel pump system for each generator belly tank designed to transfer fuel from the belly tank to the fuel-oil storage tanks and shall operate based on the fuel level in the belly tank. System shall be designed to communicate with the Master Control Panel. The Return Pump System shall include the following:

1. Return Pumps: 10 gpm, 1 HP, 120V, 1 Phase, 60 Hertz

2. Pump System Controller: Fully automated UL508a

3. NEMA 4 rated enclosure, powder coated

4. 4-Position Float

5. Cabinet leak detector

6. Miscellaneous Items as required for a complete system including, but not limited to, check valves, wye strainers, flow switches, and ball valves.

B. Manufacturer:

1. AXI, International – OPS 1016

2.15 FUEL POLISHING SYSTEM:

A. Provide a fuel polishing system for each fuel-oil storage tank. System shall be a programmable, fully-automated, fuel maintenance system that removes water, sludge, and other contaminants from the fuel-oil storage tank. The Fuel Polishing System shall include the following:

1. NEMA 4 rated enclosure, powder coated

2. 10 gpm/600 gph pump, 3/4 HP gear pump, 120V, 1 phase, 60 Hertz

3. Primary Filter: 10-micron particulate or 60-micron stainless steel screen with centrifugal water separator.

4. Secondary Filter: 3-micron particulate filter

5. Fuel Conditioner: Inline magnetic conditioner

6. System Controller with safety and alarm features

7. Water detection sensor and water detection alarm module

8. Cabinet leak detector

9. Miscellaneous items as required for a complete system including, but not limited to, vacuum gauge, vacuum switch, pressure gauges, pressure switch, ball valves, enclosure leak detector, and water drain valve.

B. Manufacturer:

1. AXI, International – STS 6010

2.16 MASTER CONTROL PANEL:

A. Provide a Master Control Panel (MCP) designed to communicate and operate with the Fuel Transfer System and the Return Pump System. The MCP shall also provide alarms and tank levels to the plant SCADA system. The MCP will monitor the generator day tanks' call for fuel and determine which tank and which pump(s) will be required to run to supply fuel to the day tanks. It will also control the valve selection to ensure fluid flow is to and from the proper storage tank.

B. MCP enclosure shall be stainless steel and NEMA 4X rated. Power supply shall be 1-phase, 115 VAC and provided with a UPS and backup battery. MCP shall include a 15-inch touch screen HMI. MCP shall be UL508A listed.

C. Manufacturer:

1. AXI, International

2.17 VEHICLE FUEL DISPENING UNIT:

A. Manufacturer:

1. Gasboy/Gilbarco Veeder-Root

2. Wayne Select

3. Bennett

B. Furnish and install a pedestal mounted diesel fuel dispenser unit suitable for use in outdoor, below freezing environment with the following components:

1. 2-inch inlet connection (maximum)

2. 1-inch outlet connection

3. Flow proportion valve to set maximum flow rate

4. Dispensing pump with maximum 26 gpm capacity and maximum 50 psi pressure

5. Hose hook with 20 feet of 1-inch diameter hose and fuel nozzle

6. Digital flow meter

7. Containment

8. Stainless steel top, sides and base

C. Electrical requirement – 120V, 60 Hz

PART 3 - EXECUTION

3.01 EXAMINATION:

A. Examine roughing-in for aboveground fuel-oil storage tanks to verify actual locations.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 EARTHWORK:

A. Comply with requirements in Section 31 23 00 for excavating, trenching, and backfilling.

B. Allow for cast-in-place, concrete base.

3.03 FUEL-OIL AST INSTALLATION:

A. Install tank bases and supports.

B. Concrete Bases: Anchor AST to concrete base according to equipment manufacturer's written instructions and according to seismic codes at Project.

1. Construct concrete bases of dimensions indicated, but not less than 4 inches larger in both directions than supported unit.

2. Install dowel rods to connect concrete base to concrete floor. Unless otherwise indicated, install dowel rods on 18-inch centers around the full perimeter of the base.

3. Install epoxy-coated anchor bolts for supported equipment that extend through concrete base, and anchor into structural concrete floor.

4. Place and secure anchorage devices. Use supported equipment manufacturer's setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.

5. Install anchor bolts to elevations required for proper attachment to supported equipment.

6. Use 4,500-psi, 28-day, compressive-strength concrete and reinforcement as specified in Section 03 30 00.

C. Connect piping and vent fittings.

D. Install ground connections.

E. Install tank leak-detection and monitoring devices.

F. Install steel ASTs according to STI R912.

G. Install insulated and concrete-vaulted, steel ASTs according to STI R942.

H. Fill storage tanks with fuel oil.

3.04 LIQUID-LEVEL GAGE SYSTEM INSTALLATION:

A. Install liquid-level gage system. Install panel inside building where indicated.

3.05 LEAK-DETECTION AND MONITORING SYSTEM INSTALLATION:

A. Install leak-detection and monitoring system. Install alarm panel inside building where indicated.

1. Double-Wall, Fuel-Oil Storage Tanks: Install probes in interstitial space per the probe manufacturer’s written installation instructions.

2. Install liquid-level gage.

3. Install discriminating sump sensor

4. Install dispenser pan sensor

5. Install pressurized line leak detectors

3.06 VEHICLE FUEL DISPENSING UNIT INSTALLATION

A. Install the vehicle fuel dispensing unit in accordance with the manufacturer's written instructions.

3.07 LABELING AND IDENTIFYING:

A. Nameplates, pipe identification, and signs are specified in Section 23 05 53.

3.08 FIELD QUALITY CONTROL:

A. Manufacturer's Field Service: Engage a factory-authorized service representative to test and inspect components, assemblies, and equipment installations, including connections.

B. Perform the following tests and inspections with the assistance of a factory-authorized service representative:

1. Tanks: Minimum hydrostatic or compressed-air test pressures for fuel-oil storage tanks that have not been factory tested and do not bear the ASME code stamp or a listing mark acceptable to authorities having jurisdiction:

a. Double-Wall Tanks:

(1) Inner Tanks: Minimum 3 psig and maximum 5 psig.

(2) Interstitial Space: Minimum 3 psig and maximum 5 psig, or 5.3-inches Hg vacuum.

2. Where vertical height of fill and vent pipes is such that the static head imposed on the bottom of the tank is greater than 10 psig , hydrostatically test the tank and fill and vent pipes to a pressure equal to the static head thus imposed.

3. Maintain the test pressure for one hour.

C. ASTs will be considered defective if they do not pass tests and inspections.

D. Prepare test and inspection reports.

3.09 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 23 31 13

METAL DUCTS

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide metal ducts as indicated and in compliance with Contract Documents.

1. Single-wall rectangular ducts and fittings.

2. Single-wall round ducts and fittings.

3. Sheet metal materials.

4. Sealants and gaskets.

5. Hangers and supports.

6. Seismic-restraint devices.

1.03 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Product Data: For each type of the following products:

1. Liners and adhesives

2. Sealants and gaskets

3. Seismic-restraint devices

C. Shop Drawings:

1. Factory- and shop-fabricated ducts and fittings

2. Fittings

3. Reinforcement and spacing

4. Seam and joint construction

5. Penetrations through fire-rated and other partitions

6. Equipment installation based on equipment being used on Project

7. Locations for duct accessories, including dampers, turning vanes, and access doors and panels

8. Hangers and supports, including methods for duct and building attachment, seismic restraints, and vibration isolation

D. Delegated-Design Submittal:

1. Sheet metal thicknesses

2. Joint and seam construction and sealing

3. Reinforcement details and spacing

4. Materials, fabrication, assembly, and spacing of hangers and supports.

5. Design Calculations: Calculations, including analysis data signed and sealed by the qualified professional engineer responsible for their preparation] for selecting hangers and supports and seismic restraints.

1.04 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.05 SPARE PARTS:

A. Comply with the requirements specified in Section 01 61 00.

1.06 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

B. Welding Qualifications: Qualify procedures and personnel in accordance with the following:

1. AWS D1.1, "Structural Welding Code - Steel," for hangers and supports

2. AWS D1.2, "Structural Welding Code - Aluminum," for aluminum supports

3. AWS D9.1, "Sheet Metal Welding Code," for duct joint and seam welding

PART 2 - PRODUCTS

2.01 PERFORMANCE REQUIREMENTS:

A. Delegated Duct Design: Duct construction, including sheet metal thicknesses, seam and joint construction, reinforcements, and hangers and supports, shall comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible" and with performance requirements and design criteria indicated in "Duct Schedule" Article.

B. Structural Performance: Duct hangers and supports and seismic restraints shall withstand the effects of gravity and seismic loads and stresses within limits and under conditions described in SMACNA's "HVAC Duct Construction Standards - Metal and Flexible" and ASCE/SEI 7. Seismically brace duct hangers and supports in accordance with SMACNA's "Seismic Restraint Manual: Guidelines for Mechanical Systems.

1. Refer to the requirements in Section 01 41 20.

C. Airstream Surfaces: Surfaces in contact with airstream shall comply with requirements in ASHRAE 62.1.

D. ASHRAE Compliance: Applicable requirements in ASHRAE 62.1, Section 5 - "Systems and Equipment," and Section 7 - "Construction and System Startup."

E. ASHRAE/IES Compliance: Applicable requirements in ASHRAE/IES 90.1, Section 6.4.4 - "HVAC System Construction and Insulation."

F. Duct Dimensions: Unless otherwise indicated, all duct dimensions indicated on Drawings are inside clear dimensions and do not include insulation or duct wall thickness.

2.02 SINGLE-WALL RECTANGULAR DUCTS AND FITTINGS:

A. General Fabrication Requirements: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible" based on indicated static-pressure class unless otherwise indicated.

1. Construct ducts of galvanized sheet steel unless otherwise indicated.

2. For ducts exposed to weather, construct of Type 316 stainless steel indicated by manufacturer to be suitable for outdoor installation.

B. Transverse Joints: Fabricate joints in accordance with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Figure 2-1, "Rectangular Duct/Transverse Joints," for static-pressure class, applicable sealing requirements, materials involved, duct-support intervals, and other provisions in SMACNA's "HVAC Duct Construction Standards - Metal and Flexible."

1. For ducts with longest side less than 36 inches , select joint types in accordance with Figure 2-1.

2. For ducts with longest side 36 inches or greater, use flange joint connector Type T-22, T-24, T-24A, T-25a, or T-25b. Factory-fabricated flanged duct connection system may be used if submitted and approved by engineer of record.

C. Longitudinal Seams: Select seam types and fabricate in accordance with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Figure 2-2, "Rectangular Duct/Longitudinal Seams," for static-pressure class, applicable sealing requirements, materials involved, duct-support intervals, and other provisions in SMACNA's "HVAC Duct Construction Standards - Metal and Flexible." All longitudinal seams shall be Pittsburgh lock seams unless otherwise specified for specific application.

D. Elbows, Transitions, Offsets, Branch Connections, and Other Duct Construction: Select types and fabricate in accordance with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Ch. 4, "Fittings and Other Construction," for static-pressure class, applicable sealing requirements, materials involved, duct-support intervals, and other provisions in SMACNA's "HVAC Duct Construction Standards - Metal and Flexible."

2.03 SINGLE-WALL ROUND DUCTS AND FITTINGS:

A. General Fabrication Requirements: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Ch. 3, "Round, Oval, and Flexible Duct," based on indicated static-pressure class unless otherwise indicated.

1. Construct ducts of galvanized sheet steel unless otherwise indicated.

2. For ducts exposed to weather, construct of Type 316 stainless steel indicated by manufacturer to be suitable for outdoor installation.

B. Transverse Joints: Select joint types and fabricate in accordance with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Figure 3-1, "Round Duct Transverse Joints," for static-pressure class, applicable sealing requirements, materials involved, duct-support intervals, and other provisions in SMACNA's "HVAC Duct Construction Standards - Metal and Flexible."

1. Transverse Joints in Ducts Larger Than 48 Inches in Diameter: Flanged.

C. Longitudinal Seams: Select seam types and fabricate in accordance with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Figure 3-2, "Round Duct Longitudinal Seams," for static-pressure class, applicable sealing requirements, materials involved, duct-support intervals, and other provisions in SMACNA's "HVAC Duct Construction Standards - Metal and Flexible."

1. Fabricate round ducts larger than 90 inches in diameter with butt-welded longitudinal seams.

D. Tees and Laterals: Select types and fabricate in accordance with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Figure 3-5, "90 Degree Tees and Laterals," and Figure 3-6, "Conical Tees," for static-pressure class, applicable sealing requirements, materials involved, duct-support intervals, and other provisions in SMACNA's "HVAC Duct Construction Standards - Metal and Flexible."

2.04 SHEET METAL MATERIALS:

A. General Material Requirements: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible" for acceptable materials, material thicknesses, and duct construction methods unless otherwise indicated. Sheet metal materials shall be free of pitting, seam marks, roller marks, stains, discolorations, and other imperfections.

B. Galvanized Sheet Steel: Comply with ASTM A653.

1. Galvanized Coating Designation: G90.

C. Stainless-Steel Sheets: Comply with ASTM A480, Type 316, as indicated in "Duct Schedule" Article; cold rolled, annealed, sheet. Exposed surface finish shall be No. 2B, No. 2D, No. 3, or No. 4 as indicated in "Duct Schedule" Article.

D. Aluminum Sheets: Comply with ASTM B209 Alloy 3003, H14 temper; with mill finish for concealed ducts, and standard, one-side bright finish for duct surfaces exposed to view.

E. Reinforcement Shapes and Plates: ASTM A36, steel plates, shapes, and bars; black and galvanized.

1. Where black- and galvanized-steel shapes and plates are used to reinforce aluminum ducts, isolate the different metals with butyl rubber, neoprene, or EPDM gasket materials.

F. Tie Rods: Galvanized steel, 1/4-inch-minimum diameter for lengths 36 inches or less; 3/8-inch-minimum diameter for lengths longer than 36 inches.

2.05 DUCT LINER:

A. Fibrous-Glass Duct Liner: Comply with ASTM C1071, NFPA 90A, and with NAIMA AH124, "Fibrous Glass Duct Liner Standard."

1. Manufacturers:

a. Knauf Fiberglass

b. Johns Manville

2. Maximum Thermal Conductivity:

a. Type I, Flexible: 0.27 Btu x in./h x sq. ft. x degrees F at 75 degrees F mean temperature.

b. Type II, Rigid: 0.23 Btu x in./h x sq. ft. x degrees F at 75 degrees F mean temperature.

3. Antimicrobial Erosion-Resistant Coating: Apply to the surface of the liner that will form the interior surface of the duct to act as a moisture repellent and erosion-resistant coating. Antimicrobial compound shall be tested for efficacy by an NRTL and registered by the EPA for use in HVAC systems.

4. Water-Based Liner Adhesive: Comply with NFPA 90A or NFPA 90B and with ASTM C916.

a. Adhesive shall have a VOC content of 80 g/L or less.

B. Insulation Pins and Washers:

1. Cupped-Head, Capacitor-Discharge-Weld Pins: Copper- or zinc-coated steel pin, fully annealed for capacitor-discharge welding, length to suit depth of insulation indicated with integral 1-1/2-inch galvanized carbon-steel washer.

2. Insulation-Retaining Washers: Self-locking washers formed from 0.016-inch thick galvanized steel aluminum or stainless steel to match duct construction; with beveled edge sized as required to hold insulation securely in place, but not less than 1-1/2 inches in diameter.

2.06 SEALANT AND GASKETS:

A. General Sealant and Gasket Requirements: Surface-burning characteristics for sealants and gaskets shall be a maximum flame-spread index of 25 and a maximum smoke-developed index of 50 when tested in accordance with UL 723; certified by an NRTL.

B. Two-Part Tape Sealing System:

1. Tape: Woven cotton fiber impregnated with mineral gypsum and modified acrylic/silicone activator to react exothermically with tape to form hard, durable, airtight seal.

2. Tape Width: 4 inches.

3. Sealant: Modified styrene acrylic.

4. Water resistant.

5. Mold and mildew resistant.

6. Maximum Static-Pressure Class: 10 inch wg, positive and negative.

7. Service: Indoor and outdoor.

8. Service Temperature: -40 to plus 200 degrees F.

9. Substrate: Compatible with galvanized sheet steel , stainless steel, or aluminum.

10. Sealant shall have a VOC content of 420 g/L or less.

C. Water-Based Joint and Seam Sealant:

1. Application Method: Brush on.

2. Solids Content: Minimum 65 percent.

3. Shore A Hardness: Minimum 20.

4. Water resistant.

5. Mold and mildew resistant.

6. VOC: Maximum 75 g/L (less water).

7. Maximum Static-Pressure Class: 10 inch wg, positive and negative.

8. Service: Indoor or outdoor.

9. Substrate: Compatible with galvanized sheet steel, stainless steel, or aluminum sheets.

10. Sealant shall have a VOC content of 420 g/L or less.

11. Maximum Static-Pressure Class: 10-inch wg, positive or negative.

12. Service: Indoor or outdoor.

13. Substrate: Compatible with galvanized sheet steel (both PVC coated and bare), stainless steel, or aluminum sheets.

D. Flanged Joint Sealant: Comply with ASTM C920.

1. General: Single-component, acid-curing, silicone, elastomeric

2. Type: S

3. Grade: NS

4. Class: 25

5. Use: O

6. Sealant shall have a VOC content of 420 g/L or less

E. Flange Gaskets: Butyl rubber, neoprene, or EPDM polymer with polyisobutylene plasticizer.

F. Round Duct Joint O-Ring Seals:

1. Seal shall provide maximum leakage class of 3 cfm/100 sq. ft. at 1-inch wg and shall be rated for 10-inch wg static-pressure class, positive or negative.

2. EPDM O-ring to seal in concave bead in coupling or fitting spigot.

3. Double-lipped, EPDM O-ring seal, mechanically fastened to factory-fabricated couplings and fitting spigots.

2.07 HANGERS AND SUPPORTS:

A. Hanger Rods for Noncorrosive Environments: Galvanized-steel rods and nuts.

B. Hanger Rods for Corrosive Environments: Electrogalvanized, all-thread rods or galvanized rods with threads painted with zinc-chromate primer after installation.

C. Strap and Rod Sizes: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Table 5-1 (Table 5-1M), "Rectangular Duct Hangers Minimum Size," and Table 5-2, "Minimum Hanger Sizes for Round Duct."

D. Steel Cables for Galvanized-Steel Ducts: Galvanized steel complying with ASTM A603.

E. Steel Cables for Stainless-Steel Ducts: Stainless steel complying with ASTM A492.

F. Steel Cable End Connections: Galvanized-steel assemblies with brackets, swivel, and bolts designed for duct hanger service; with an automatic-locking and clamping device.

G. Duct Attachments: Sheet metal screws, blind rivets, or self-tapping metal screws; compatible with duct materials.

H. Trapeze and Riser Supports:

1. Supports for Galvanized-Steel Ducts: Galvanized-steel shapes and plates.

2. Supports for Stainless-Steel Ducts: Stainless-steel shapes and plates.

3. Supports for Aluminum Ducts: Aluminum or galvanized steel coated with zinc chromate.

2.08 SEISMIC-RESTRAINT DEVICES:

A. Refer to Sections 01 41 20 and 23 05 48 for requirements for restraint components and applications.

PART 3 - EXECUTION

3.01 DUCT INSTALLATION:

A. Drawing plans, schematics, and diagrams indicate general location and arrangement of duct system. Indicated duct locations, configurations, and arrangements were used to size ducts and calculate friction loss for air-handling equipment sizing and for other design considerations. Install duct systems as indicated unless deviations to layout are approved on Shop Drawings and coordination drawings.

B. Install ducts in accordance with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible" unless otherwise indicated.

C. Install ducts in maximum practical lengths with fewest possible joints.

D. Install factory- or shop-fabricated fittings for changes in direction, size, and shape and for branch connections.

E. Unless otherwise indicated, install ducts vertically and horizontally, and parallel and perpendicular to building lines.

F. Install ducts close to walls, overhead construction, columns, and other structural and permanent enclosure elements of building.

G. Install ducts with a clearance of 1 inch, plus allowance for insulation thickness.

H. Route ducts to avoid passing through transformer vaults and electrical equipment rooms and enclosures.

I. Where ducts pass through non-fire-rated interior partitions and exterior walls and are exposed to view, cover the opening between the partition and duct or duct insulation with sheet metal flanges of same metal thickness as the duct. Overlap openings on four sides by at least 1-1/2 inches.

J. Install fire, combination fire/smoke, and smoke dampers where indicated on Drawings and as required by code, and by local authorities having jurisdiction. Comply with requirements in Section 23 33 00 for fire and smoke dampers and specific installation requirements of the damper UL listing.

K. Install heating coils, cooling coils, air filters, dampers, and all other duct-mounted accessories in air ducts where indicated on Drawings.

L. Protect duct interiors from moisture, construction debris and dust, and other foreign materials both before and after installation. Comply with SMACNA's "IAQ Guidelines for Occupied Buildings Under Construction," Appendix G, "Duct Cleanliness for New Construction Guidelines."

M. Elbows: Use long-radius elbows wherever they fit.

1. Fabricate 90-degree rectangular mitered elbows to include turning vanes.

2. Fabricate 90-degree round elbows with a minimum of three segments for 12 inches and smaller and a minimum of five segments for 14 inches and larger.

N. Branch Connections: Use lateral or conical branch connections.

3.02 INSTALLATION OF EXPOSED DUCTWORK:

A. Protect ducts exposed in finished spaces from being dented, scratched, or damaged.

B. Trim duct sealants flush with metal. Create a smooth and uniform exposed bead. Do not use two-part tape sealing system.

C. Grind welds to provide smooth surface free of burrs, sharp edges, and weld splatter. When welding stainless steel with a No. 3 or 4 finish, grind the welds flush, polish the exposed welds, and treat the welds to remove discoloration caused by welding.

D. Maintain consistency, symmetry, and uniformity in arrangement and fabrication of fittings, hangers and supports, duct accessories, and air outlets.

E. Repair or replace damaged sections and finished work that does not comply with these requirements.

3.03 DUCTWORK EXPOSED TO WEATHER:

A. All external joints are to have secure watertight mechanical connections. Seal all openings to provide weatherproof construction.

B. Construct ductwork to resist external loads of wind, snow, ice, and other effects of weather. Provide necessary supporting structures.

C. Single Wall:

1. Ductwork shall be galvanized steel or Type 316 stainless steel as indicated.

2. Where ducts have external insulation, provide weatherproof aluminum jacket. See Section 23 07 13.

3.04 DUCT SEALING:

A. Seal ducts at a minimum to the following seal classes in accordance with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible":

1. Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible."

2. Outdoor, Supply-Air Ducts: Seal Class A.

3. Outdoor, Exhaust Ducts: Seal Class C.

4. Outdoor, Return-Air Ducts: Seal Class C.

5. Unconditioned Space, Supply-Air Ducts in Pressure Classes 2-Inch wg and Lower: Seal Class B.

6. Unconditioned Space, Supply-Air Ducts in Pressure Classes Higher Than 2-Inch wg: Seal Class A.

7. Unconditioned Space, Exhaust Ducts: Seal Class C.

8. Unconditioned Space, Return-Air Ducts: Seal Class B.

9. Conditioned Space, Supply-Air Ducts in Pressure Classes 2-Inch wg and Lower: Seal Class C.

10. Conditioned Space, Supply-Air Ducts in Pressure Classes Higher Than 2-Inch wg: Seal Class B.

11. Conditioned Space, Exhaust Ducts: Seal Class B.

12. Conditioned Space, Return-Air Ducts: Seal Class C.

3.05 HANGER AND SUPPORT INSTALLATION:

A. Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Chapter 5, "Hangers and Supports."

B. Building Attachments: Concrete inserts, powder-actuated fasteners, or structural-steel fasteners appropriate for construction materials to which hangers are being attached.

1. Where practical, install concrete inserts before placing concrete.

2. Install powder-actuated concrete fasteners after concrete is placed and completely cured.

3. Use powder-actuated concrete fasteners for standard-weight aggregate concretes or for slabs more than 4 inches thick.

4. Do not use powder-actuated concrete fasteners for lightweight-aggregate concretes or for slabs less than 4 inches thick.

5. Do not use powder-actuated concrete fasteners for seismic restraints.

C. Hanger Spacing: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Table 5-1 (Table 5-1M), "Rectangular Duct Hangers Minimum Size," and Table 5-2, "Minimum Hanger Sizes for Round Duct," for maximum hanger spacing; install hangers and supports within 24 inches of each elbow and within 48 inches of each branch intersection.

D. Hangers Exposed to View: Threaded rod and angle or channel supports.

E. Support vertical ducts with steel angles or channel secured to the sides of the duct with welds, bolts, sheet metal screws, or blind rivets; support at each floor and at a maximum intervals of 16 feet .

F. Install upper attachments to structures. Select and size upper attachments with pull-out, tension, and shear capacities appropriate for supported loads and building materials where used.

3.06 SEISMIC-RESTRAINT-DEVICE INSTALLATION:

A. Install ducts with hangers and braces designed to support the duct and to restrain against seismic forces required by applicable building codes. Comply with SMACNA's "Seismic

Restraint Manual: Guidelines for Mechanical Systems", Sections 01 41 20 and Section 23 05 48.

B. Select seismic-restraint devices with capacities adequate to carry present and future static and seismic loads.

C. Install cables so they do not bend across edges of adjacent equipment or building structure.

D. Install cable restraints on ducts that are suspended with vibration isolators.

E. Install seismic-restraint devices using methods approved by an agency acceptable to authorities having jurisdiction.

F. Attachment to Structure: If specific attachment is not indicated, anchor bracing and restraints to structure, to flanges of beams, to upper truss chords of bar joists, or to concrete members.

G. Drilling for and Setting Anchors:

1. Identify position of reinforcing steel and other embedded items prior to drilling holes for anchors. Do not damage existing reinforcement or embedded items during drilling. Notify Architect if reinforcing steel or other embedded items are encountered during drilling. Locate and avoid prestressed tendons, electrical and telecommunications conduit, and gas lines.

2. Do not drill holes in concrete or masonry until concrete, mortar, or grout has achieved full design strength.

3. Wedge Anchors: Protect threads from damage during anchor installation. Heavy-duty sleeve anchors shall be installed with sleeve fully engaged in the structural element to which anchor is to be fastened.

4. Set anchors to manufacturer's recommended torque, using a torque wrench.

5. Install zinc-coated steel anchors for interior applications and stainless-steel anchors for applications exposed to weather.

3.07 CONNECTIONS:

A. Make connections to equipment with flexible connectors complying with Section 23 33 00.

B. Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible" for branch, outlet and inlet, and terminal unit connections.

3.08 FIELD QUALITY CONTROL:

A. Perform tests and inspections.

B. Leakage Tests:

1. Comply with SMACNA's "HVAC Air Duct Leakage Test Manual." Submit a test report for each test.

2. Test the following systems:

a. Supply Ducts with a Pressure Class of 2 Inch wg or Higher: Test representative duct sections totaling no less than 25 percent of total installed duct area for each designated pressure class.

b. Return Ducts with a Pressure Class of 2 Inch wg or Higher: Test representative duct sections totaling no less than 25 percent of total installed duct area for each designated pressure class.

c. Exhaust Ducts with a Pressure Class of 2 Inch wg or Higher: Test representative duct sections totaling no less than 25 percent of total installed duct area for each designated pressure class.

d. Outdoor-Air Ducts with a Pressure Class of 2 Inch wg or Higher: Test representative duct sections totaling no less than 25 percent of total installed duct area for each designated pressure class.

3. Disassemble, reassemble, and seal segments of systems to accommodate leakage testing and for compliance with test requirements.

4. Testing of each duct section is to be performed with access doors, coils, filters, dampers, and other duct-mounted devices in place as designed. No devices are to be removed or blanked off so as to reduce or prevent additional leakage.

5. Test for leaks before applying external insulation.

6. Conduct tests at static pressures equal to maximum design pressure of system or section being tested. If static-pressure classes are not indicated, test system at maximum system design pressure. Do not pressurize systems above maximum design operating pressure.

7. Give seven days' advance notice for testing.

3.09 DUCT CLEANING:

A. Clean new duct system(s) before testing, adjusting, and balancing.

B. Use duct cleaning methodology as indicated in NADCA ACR.

C. Use service openings for entry and inspection.

1. Provide openings with access panels appropriate for duct static-pressure and leakage class at dampers, coils, and any other locations where required for inspection and cleaning access. Provide insulated panels for insulated or lined duct. Patch insulation and liner as recommended by duct liner manufacturer. Comply with Section 23 33 00 for access panels and doors.

2. Disconnect and reconnect flexible ducts as needed for cleaning and inspection.

3. Remove and reinstall ceiling to gain access during the cleaning process.

D. Particulate Collection and Odor Control:

1. When venting vacuuming system inside the building, use HEPA filtration with 99.97 percent collection efficiency for 0.3-micron-size (or larger) particles.

2. When venting vacuuming system to outdoors, use filter to collect debris removed from HVAC system, and locate exhaust downwind and away from air intakes and other points of entry into building.

E. Clean the following components by removing surface contaminants and deposits:

1. Air outlets and inlets (registers, grilles, and diffusers).

2. Supply, return, and exhaust fans including fan housings, plenums (except ceiling supply and return plenums), scrolls, blades or vanes, shafts, baffles, dampers, and drive assemblies.

3. Air-handling unit internal surfaces and components including mixing box, coil section, air wash systems, spray eliminators, condensate drain pans, humidifiers and dehumidifiers, filters and filter sections, and condensate collectors and drains.

4. Coils and related components.

5. Return-air ducts, dampers, actuators, and turning vanes except in ceiling plenums and mechanical equipment rooms.

6. Supply-air ducts, dampers, actuators, and turning vanes.

7. Dedicated exhaust and ventilation components and makeup air systems.

F. Mechanical Cleaning Methodology:

1. Clean metal duct systems using mechanical cleaning methods that extract contaminants from within duct systems and remove contaminants from building.

2. Use vacuum-collection devices that are operated continuously during cleaning. Connect vacuum device to downstream end of duct sections so areas being cleaned are under negative pressure.

3. Use mechanical agitation to dislodge debris adhered to interior duct surfaces without damaging integrity of metal ducts, duct liner, or duct accessories.

4. Clean fibrous-glass duct liner with HEPA vacuuming equipment; do not permit duct liner to get wet. Replace fibrous-glass duct liner that is damaged, deteriorated, or delaminated or that has friable material, mold, or fungus growth.

5. Clean coils and coil drain pans in accordance with NADCA ACR. Keep drain pan operational. Rinse coils with clean water to remove latent residues and cleaning materials; comb and straighten fins.

6. Provide drainage and cleanup for wash-down procedures.

7. Antimicrobial Agents and Coatings: Apply EPA-registered antimicrobial agents if fungus is present. Apply antimicrobial agents in accordance with manufacturer's written instructions after removal of surface deposits and debris.

3.10 STARTUP:

A. Air Balance: Comply with requirements in Section 23 05 93.

3.11 DUCT SCHEDULE:

Wet Wells 1& 2 Supply and Exhaust Fans (01-F-81430 & 81440)	Stainless Steel
Pump Rm 101 (01-MAU-81210)	Galvanized
Pump Rm 101 Supply and Exhaust Fans (01-F-81410 & 81420)	Galvanized
Medium Voltage Electrical Rm 101 (10-AHU-81310 / 81320)	Galvanized

A. Fabricate ducts with materials indicated above and as follows:

1. Fabricate all ducts to achieve SMACNA pressure class, seal class, and leakage class as indicated below.

B. Supply Ducts:

1. Ducts Connected to Fan Coil Units and Terminal Units:

a. Pressure Class: Positive 2 inch wg.

b. Minimum SMACNA Seal Class: B.

c. SMACNA Leakage Class for Rectangular: 12.

d. SMACNA Leakage Class for Round and Flat Oval: 6.

2. Ducts Connected to Constant and Variable Volume Air-Handling Units and Makeup Air Units:

a. Pressure Class: Positive 3 inch wg.

b. Minimum SMACNA Seal Class: B.

c. SMACNA Leakage Class for Rectangular: 12.

d. SMACNA Leakage Class for Round and Flat Oval: 6.

C. Return Ducts:

1. Ducts Connected to Fan Coil Units and Terminal Units:

a. Pressure Class: Positive or negative 2 inch wg.

b. Minimum SMACNA Seal Class: B.

c. SMACNA Leakage Class for Rectangular: 12.

d. SMACNA Leakage Class for Round and Flat Oval: 6.

2. Ducts Connected to Air-Handling Units and Makeup Air Units:

a. Pressure Class: Positive or negative 2 inch wg.

b. Minimum SMACNA Seal Class: B.

c. SMACNA Leakage Class for Rectangular: 12.

d. SMACNA Leakage Class for Round and Flat Oval: 6.

D. Exhaust Ducts:

1. Ducts Connected to Fans Exhausting (ASHRAE 62.1, Class 1 and 2) Air:

a. Pressure Class: Negative 2 inch wg.

b. Minimum SMACNA Seal Class: B.

c. SMACNA Leakage Class for Rectangular: 12.

d. SMACNA Leakage Class for Round and Flat Oval: 6.

2. Ducts Connected to High-Humidity or Corrosive Locations:

    a. Type 316, stainless-steel sheet.

    b. Exposed to View: No. 4 finish.

    c. Concealed: No. 2D finish.

    d. Welded longitudinal seams; welded or flanged transverse joints with water-tight EPDM gaskets.

    e. Pressure Class: Positive or negative 3 inch wg.

    f. Airtight/watertight.

E. Outdoor-Air (Not Filtered, Heated, or Cooled) Ducts:

1. Ducts Connected to Fan Coil Units and Terminal Units:

    a. Pressure Class: Positive or negative 2 inch wg.

    b. Minimum SMACNA Seal Class: B.

    c. SMACNA Leakage Class for Rectangular: 12.

    d. SMACNA Leakage Class for Round and Flat Oval: 6.

2. Ducts Connected to Air-Handling Units and Makeup Air Units:

    a. Pressure Class: Positive or negative 2 inch wg.

    b. Minimum SMACNA Seal Class: B.

    c. SMACNA Leakage Class for Rectangular: 12.

    d. SMACNA Leakage Class for Round and Flat Oval: 6.

F. Intermediate Reinforcement:

1. Galvanized-Steel Ducts: Galvanized steel.

2. Stainless-Steel Ducts:

    a. Exposed to Airstream: Match duct material.

    b. Not Exposed to Airstream: Match duct material.

G. Liner where indicated on plans:

1. Supply-Air Ducts: Fibrous glass, Type I 1 inch(es) thick.

2. Return-Air Ducts: Fibrous glass, Type I 1 inch(es) thick.

3. Supply Fan Plenums: Fibrous glass, Type I 1 inch(es) thick.

4. Return Plenums: Fibrous glass, Type I 1 inch(es) thick.

H. Elbow Configuration:

1. Rectangular Duct: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Figure 4-2, "Rectangular Elbows."

   a. Velocity 1000 fpm or Lower:

      (1) Mitered Type RE 4 without vanes.

   b. Velocity 1000 or Higher:

      (1) Mitered Type RE 2 with vanes complying with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Figure 4-3, "Vanes and Vane Runners," and Figure 4-4, "Vane Support in Elbows."

2. Rectangular Duct: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Figure 4-2, "Rectangular Elbows."

   a. Radius Type RE 1 with minimum 1.5 radius-to-diameter ratio.

   b. Radius Type RE 3 with minimum 1.0 radius-to-diameter ratio and two vanes.

   c. Mitered Type RE 2 with vanes complying with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Figure 4-3, "Vanes and Vane Runners," and Figure 4-4, "Vane Support in Elbows."

3. Round Duct: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Figure 3-4, "Round Duct Elbows."

   a. Minimum Radius-to-Diameter Ratio and Elbow Segments: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Table 3-1, "Mitered Elbows." Elbows with less than 90-degree change of direction have proportionately fewer segments.

      (1) Velocity 1000 fpm or Lower: 0.5 radius-to-diameter ratio and three segments for 90-degree elbow.

(2) Velocity 1000 to 1500 fpm: 1.0 radius-to-diameter ratio and four segments for 90-degree elbow.

(3) Velocity 1500 fpm or Higher: 1.5 radius-to-diameter ratio and five segments for 90-degree elbow.

b. Round Elbows, 12 Inches and Smaller in Diameter: Stamped or pleated.

c. Round Elbows, 14 Inches and Larger in Diameter: Standing seam.

3.12 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

Page Intentionally Left Blank

SECTION 23 33 00

AIR DUCT ACCESSORIES

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide backdraft and pressure relief dampers, barometric relief dampers, manual volume dampers, control dampers, fire dampers, turning vanes, remote damper operators, duct-mounted access doors, flexible connectors, duct accessory hardware]as indicated and in compliance with Contract Documents.

1.02 REFERENCES:

1.03 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Shop Drawings: For duct accessories. Include plans, elevations, sections, details and attachments to other work.

1. Detail duct accessories fabrication and installation in ducts and other construction. Include dimensions, weights, loads, and required clearances; and method of field assembly into duct systems and other construction. Include the following:

a. Special fittings.

b. Manual volume damper installations.

c. Control-damper installations.

d. Fire-damper, smoke-damper, combination fire- and smoke-damper, ceiling, and corridor damper installations, including sleeves; and duct-mounted access doors and remote damper operators.

C. Operation and Maintenance Data: For air duct accessories to include in operation and maintenance manuals.

D. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Fusible Links: Furnish quantity equal to 10 percent of amount installed.

1.04 SPARE PARTS:

A. Comply with the requirements specified in Section 01 61 00.

1.05 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

1.06 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

PART 2 - PRODUCTS

2.01 ASSEMBLY DESCRIPTION:

A. Comply with NFPA 90A, "Installation of Air Conditioning and Ventilating Systems".

B. Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible" for acceptable materials, material thicknesses, and duct construction methods unless otherwise indicated. Sheet metal materials shall be free of pitting, seam marks, roller marks, stains, discolorations, and other imperfections.

2.02 MATERIALS:

A. Galvanized Sheet Steel: Comply with ASTM A653.

1. Galvanized Coating Designation: G90.

B. Stainless-Steel Sheets: Comply with ASTM A480, Type 316, and having a No. 4 finish.

C. Aluminum Sheets: Comply with ASTM B209, Alloy 3003, Temper H14; with mill finish for concealed ducts and standard, 1-side bright finish for exposed ducts.

D. Extruded Aluminum: Comply with ASTM B221, Alloy 6063, Temper T5.

E. Hard Aluminum: Comply with ASTM B221, Alloy 6065 T6.

F. Reinforcement Shapes and Plates: Galvanized-steel reinforcement where installed on galvanized sheet metal ducts; compatible materials for aluminum and stainless-steel ducts.

2.03 BACKDRAFT DAMPERS:

A. Manufacturers:

1. Tamco

2. Ruskin

3. Nailor

B. Channel Frame Material: Minimum 0.06 inch extruded aluminum.

C. Frame Construction: Channel-shaped, with zinc-plated mechanical assembly and duct mounting flange.

D. Blades Material: Minimum 0.06 inch extruded aluminum.

E. Blades Construction: Multiple single-piece blades, off-center pivoted, maximum 5-inch width.

F. Blade Action: Linked parallel.

G. Bearings: Celcon on zinc-plated steel pivots.

H. Blade and Jamb Seals: Extruded silicone.

I. Crank Arms: Hard aluminum.

J. Linkage: Hard Aluminum 11/32 inch rod

K. Blade Axles: Zinc-plated steel.

L. Tie Bars and Brackets: Aluminum.

M. Bearings: Synthetic pivot bushings.

N. Operational Temperature Range: Minus 40 degrees F to 212 degrees F.

O. Air Leakage: Shall not exceed 4.32 cfm/ft² against 1 in. w.g. differential static pressure at standard air.

P. Operational Temperature Range: Minus 40 degrees F to 212 degrees F.

Q. Air Leakage: Shall not exceed 6.93 cfm/ft² against 1 inch w.g. differential static pressure at standard air for dampers greater than 24 inches in height or width and 11.38 cfm/ft² against 1 inch w.g. differential static pressure at standard air dampers less than 24 inches in height or width.

R. Standard of Acceptance: Tamco; Series 7000

2.04 BAROMETRIC RELIEF DAMPERS:

A. Manufacturers:

1. Tamco

2. Ruskin

3. Nailor

B. Suitable for horizontal or vertical mounting.

C. Channel Frame Material: Minimum 0.06 inch extruded aluminum.

D. Frame Construction: Channel-shaped, with zinc-plated mechanical assembly and duct mounting flange.

E. Blades Material: Minimum 0.06 inch extruded aluminum.

F. Blades Construction: Multiple single-piece blades, off-center pivoted, maximum 5-inch width.

G. Blade Action: Linked parallel.

H. Bearings: Celcon on zinc-plated steel pivots.

I. Blade and Jamb Seals: Mechanically fastened extruded silicone.

J. Crank Arms: Hard aluminum.

K. Linkage: Hard Aluminum 11/32 inch rod.

L. Blade Axles: Zinc-plated steel.

M. Tie Bars and Brackets: Aluminum.

N. Bearings: Synthetic pivot bushings.

O. Counter Balance Weights: Aluminum (6061-T6) mounted on each blade. Counter-weights shall be fully adjustable, such that they may be set to relieve air pressure differentials less than .01 inch w.g.

P. Operational Temperature Range: Minus 40 degrees F to 212 degrees F.

Q. Air Leakage: Shall not exceed 4.32 cfm/ft² against 1 in. w.g. differential static pressure at standard air on a 24 inch x 24 inch unit.

R. Standard of Acceptance: Tamco; Series 7000 CW

2.05 MANUAL VOLUME DAMPERS:

A. Single Blade Dampers:

1. Material: Fabricate from same material as duct, but one sheet metal thickness heavier. V-groove stiffened.

2. Configuration: Size and configuration to recommendations of SMACNA, except maximum height 8 inches.

3. Control: Locking quadrant with shaft extension to accommodate insulation thickness.

4. Shaft: Continuous.

5. Bearings: Inside and outside bronze end bearings.

6. Frame: Channel frame of same material as adjacent duct, complete with angle stop.

B. Multi-Bladed Dampers:

1. Material: Factory manufactured of material compatible with duct. Metal thickness and construction to recommendations of SMACNA.

2. Blade Height: Maximum blade height: 8 inches.

3. Bearings: Bronze bushings.

4. Shaft: Continuous.

5. Configuration: Linkage with opposed blade operation.

6. Control: Shaft extension with locking quadrant.

7. Frame: Channel frame of same material as adjacent duct, complete with angle stop.

2.06 FIRE DAMPERS:

A. Manufacturers:

1. E H Price

2. Ruskin

3. Nailor

4. Greenheck

B. Type: Dynamic; rated and labeled according to UL 555 by an NRTL.

C. Fire Rating: 1-1/2 and 3 hours to suite separation rating.

D. Frame: Curtain type with blades outside airstream except when located behind grille where blades may be inside airstream; fabricated with roll-formed, 0.034-inch-thick galvanized steel; with mitered and interlocking corners. Provide stainless steel to match duct construction or in corrosive atmospheres.

E. Mounting Sleeve: Factory- or field-installed, galvanized sheet steel.

1. Minimum Thickness: As indicated in manufacturer's instructions to meet code requirements, and of length to suit application.

F. Mounting Orientation: Vertical or horizontal as required.

G. Blades: Roll-formed, interlocking, galvanized sheet steel. In place of interlocking blades, use full-length, 0.034-inch-thick, galvanized-steel blade connectors.

H. Horizontal Dampers: Include blade lock and stainless-steel closure spring.

I. Heat-Responsive Device: Replaceable, 165 degrees F rated, fusible links.

2.07 TURNING VANES:

A. General Requirements: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible"; Figures 4-3, "Vanes and Vane Runners," and 4-4, "Vane Support in Elbows."

B. Vane Construction: Single wall for ducts up to 48 inches wide and double wall for larger dimensions.

2.08 DUCT-MOUNTED ACCESS DOORS:

A. Manufacturers:

1. Acudor

2. Ductmate

3. Duro Dyne

4. Ruskin

5. Nailor

B. Duct-Mounted Access Doors: Fabricate access panels according to SMACNA's "HVAC Duct Construction Standards - Metal and Flexible"; Figures 7-2 (7-2M), "Duct Access Doors and Panels," and 7-3, "Access Doors - Round Duct."

1. Door:

a. Double wall, rectangular.

b. Galvanized sheet metal with insulation fill and thickness as indicated for duct pressure class.

c. Hinges and Latches: 1-by-1-inch butt or piano hinge and cam latches.

d. Fabricate doors airtight and suitable for duct pressure class.

2. Frame: Galvanized sheet steel, with bend-over tabs and foam gaskets.

3. Number of Hinges and Locks:

   a. Access Doors Less than 12 Inches Square: No hinges and two sash locks.

   b. Access Doors up to 18 Inches Square: Two hinges and two sash locks.

   c. Access Doors up to 24 by 48 Inches: Three hinges and two compression latches with handles.

   d. Access Doors Larger than 24 by 48 Inches: Four hinges and two compression latches with handles.

2.09 FLEXIBLE CONNECTORS:

A. Manufacturers:

   1. Duro Dyne

   2. Ductmate

   3. Ventfabrics

B. Materials: Flame-retardant or noncombustible fabrics.

C. Coatings and Adhesives: Comply with UL 181, Class 1.

D. Metal-Edged Connectors: Factory fabricated with a fabric strip minimum 3 inches wide attached to two strips of 3-inch-wide, 0.028-inch-thick, galvanized sheet steel or 0.032-inch-thick aluminum sheets. Provide metal compatible with connected ducts.

E. Indoor System, Flexible Connector Fabric: Glass fabric double coated with neoprene.

   1. Minimum Weight: 26 oz./sq. yd

   2. Tensile Strength: 480 lbf/inch in the warp and 360 lbf/inch in the filling

   3. Service Temperature: Minus 40 to plus 200 degrees F

F. Outdoor System, Flexible Connector Fabric: Glass fabric double coated with weatherproof, synthetic rubber resistant to UV rays and ozone.

   1. Minimum Weight: 24 oz./sq. yd

   2. Tensile Strength: 530 lbf/inch in the warp and 440 lbf/inch in the filling

   3. Service Temperature: Minus 50 to plus 250 degrees F

G. High-Corrosive-Environment System, Flexible Connectors: Glass fabric with chemical-resistant coating.

1. Minimum Weight: 14 oz./sq. yd

2. Tensile Strength: 450 lbf/inch in the warp and 340 lbf/inch in the filling

3. Service Temperature: Minus 67 to plus 500 degrees F

2.10 DUCT ACCESSORY HARDWARE:

A. Instrument Test Holes: Cast iron or cast aluminum to suit duct material, including screw cap and gasket. Size to allow insertion of pitot tube and other testing instruments and of length to suit duct-insulation thickness.

B. Adhesives: High strength, quick setting, neoprene based, waterproof, and resistant to gasoline and grease.

PART 3 - EXECUTION

3.01 INSTALLATION:

A. Install duct accessories according to applicable details in SMACNA's "HVAC Duct Construction Standards - Metal and Flexible" for metal ducts and in NAIMA AH116, "Fibrous Glass Duct Construction Standards," for fibrous-glass ducts.

B. Install duct accessories of materials suited to duct materials; use galvanized-steel accessories in galvanized-steel and fibrous-glass ducts, stainless-steel accessories in stainless-steel ducts, and aluminum accessories in aluminum ducts.

C. Compliance with ASHRAE/IESNA 90.1-2004 includes Section 6.4.3.3.3 - "Shutoff Damper Controls," restricts the use of backdraft dampers, and requires control dampers for certain applications. Install control dampers at inlet of exhaust fans or exhaust ducts as close as possible to exhaust fan unless otherwise indicated.

D. Install volume dampers at points on supply, return, and exhaust systems where branches extend from larger ducts. Where dampers are installed in ducts having duct liner, install dampers with hat channels of same depth as liner, and terminate liner with nosing at hat channel.

1. Install steel volume dampers in steel ducts.

2. Install aluminum volume dampers in aluminum ducts.

3. Install 316 stainless steel volume dampers in stainless steel and FRP ducts.

E. Set dampers to fully open position before testing, adjusting, and balancing.

F. Install test holes at fan inlets and outlets and elsewhere as indicated.

G. Install fire dampers according to UL listing.

H. Install duct access doors on sides of ducts to allow for inspecting, adjusting, and maintaining accessories and equipment at the following locations:

1. On both sides of duct coils.

2. Upstream from duct filters.

3. At outdoor-air intakes and mixed-air plenums.

4. At drain pans and seals.

5. Downstream from manual volume dampers, control dampers, backdraft dampers, and equipment.

6. Adjacent to and close enough to fire dampers, to reset or reinstall fusible links. Access doors for access to fire dampers having fusible links shall be pressure relief access doors and shall be outward operation for access doors installed upstream from dampers and inward operation for access doors installed downstream from dampers.

7. At each change in direction and at maximum 50-foot spacing.

8. Upstream and downstream from turning vanes.

9. Control devices requiring inspection.

10. Elsewhere as indicated.

I. Install access doors with swing against duct static pressure.

J. Access Door Sizes:

1. One-Hand or Inspection Access: 8 by 5 inches

2. Two-Hand Access: 12 by 6 inches

3. Head and Hand Access: 18 by 10 inches

4. Head and Shoulders Access: 21 by 14 inches

5. Body Access: 25 by 14 inches

6. Body plus Ladder Access: 25 by 17 inches

K. Label access doors according to Section 23 05 53 to indicate the purpose of access door.

L. Install flexible connectors to connect ducts to equipment.

M. For fans developing static pressures of 5-inch w.g. and more, cover flexible connectors with loaded vinyl sheet held in place with metal straps.

N. Connect diffusers to ducts directly.

O. Install duct test holes where required for testing and balancing purposes.

P. Install thrust limits at centerline of thrust, symmetrical on both sides of equipment. Attach thrust limits at centerline of thrust and adjust to a maximum of 1/4-inch movement during start and stop of fans.

3.02 FIELD QUALITY CONTROL:

A. Tests and Inspections:

1. Operate dampers to verify full range of movement.

2. Inspect locations of access doors and verify that purpose of access door can be performed.

3. Operate fire dampers to verify full range of movement and verify that proper heat-response device is installed.

4. Inspect turning vanes for proper and secure installation.

3.03 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

Page Intentionally Left Blank

SECTION 23 34 00

FANS AND ACCESSORIES

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide fans and accessories as indicated and in compliance with Contract Documents.

1.02 REFERENCES:

A. Air Movement and Control Association Inc. (AMCA):

1. 210: Laboratory Methods of Testing Fans for Rating

2. 211: Certified Ratings Program – Product Rating Manual for Fan Air Performance

3. 300: Reverberant Room Method for Sound Testing of Fans

4. 311: Certified Sound Ratings Program for Air Moving Devices

B. American National Standards Institute (ANSI):

1. S2.19: Mechanical Vibration – Balance Quality Requirements for Rigid Rotors

C. ASTM International (ASTM):

1. B117: Standard Practice for Operating Salt Spray (Fog) Apparatus

D. The Institute of Electrical and Electronics Engineers, Inc. (IEEE):

1. 519: Recommended Practices and Requirements for Harmonic Control in Electrical Power Systems

E. National Fire Protection Association (NFPA):

1. 90A: Standard for the Installation of Air Conditioning and Ventilating Systems

1.03 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Shop Drawings: Submit complete material, construction and performance shop drawings for fans and accessories. Include the following:

1. Certified fan performance curves.

2. For fans where sound data is scheduled, certified sound power data which conforms to specified levels.

3. Complete motor data, including manufacturer.

4. Complete accessories data, including drawings (i.e., disconnects, curbs, dampers, belts, bearings, sheave sizes, coatings, etc.).

C. Delegated Design Submittals: For each device, equipment or appurtenance provide written certification from Professional Engineer licensed in the State of Utah stating that supports systems and anchorage for equipment have been designed according to the requirements of Section 1613 of the building codes of Utah, Salt Lake City and ASCE/SEI 7, and in accordance with Specification 01 41 20. Submit calculations stamped by a Professional Engineer licensed in the State of Utah for support systems and anchorage for wind, seismic, and all other pertinent loads.

D. Shop Drawings must confirm that proposed fan equipment conforms to requirements of this Section of the Specification.

1.04 SPARE PARTS:

A. Comply with the requirements specified in Section 01 61 00.

1.05 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

1.06 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

PART 2 - PRODUCTS

2.01 GENERAL:

A. Incorporate any requirements not listed here for each individual fan as noted on the Equipment Schedules on the drawings.

2.02 MEDIUM PRESSURE TUBE AXIAL FANS:

A. Vaneaxial, AMCA air performance and sound certified, bearing the AMCA seal on the fan, vaneaxial fans as per the Drawing schedule, with performance rating certification in accordance with results of tests performed in accordance with AMCA Publication 211. Each fan is to be complete with the following:

1. Housing: Fan housing shall be constructed of continuously welded steel and include an integral punched inlet and outlet flange to prevent air leakage. Fans shall

incorporate universal a mounting system to allow for field transitions from horizontal base mount, horizontal ceiling hung, vertical base mount or vertical ceiling hung configurations. Housing and bearing support shall be constructed of welded structural steel members to prevent vibration and rigidly support the shaft and bearings. Belts, bearings and drives shall be protected from the airstream by heavy gauge steel belt tubes bolted bearing covers.

2. Wheel: The fan propeller shall be fabricated steel available in two levels of construction and include "Low and High" pressure blade pitch angles. Airfoil blades shall be continuously welded to heavy duty hubs to ensure long life in the harshest commercial or industrial applications. A standard square key or tapered bushing shall lock to propeller to the fan shaft. Hubs shall be two piece aluminum castings that securely lock the blades in place. Wheels shall be statically and dynamically balanced to balance grade G6.3 per ANSI S2.19. Aluminum propeller parts shall not require protective coatings. The wheel and fan inlet shall be carefully matched and shall have precise running tolerances for maximum performance and operating efficiency.

3. Bearings: Flanged mounted, grease lubricated, ball or roller type isolated from the air stream, sized for an AFBMA L-50 average life expectancy of 200,000 hours at maximum published fan RPM, and equipped with extended lubrication lines terminating on the fan housing in a grease nipple.

4. Fan Motors and Drive: Motors shall meet or exceed EPACT (Energy Policy ACT) efficiencies. Motors to be NEMA T-frame, 1800 or 3600 RPM, Open Drip Proof (ODP) with a 1.15 service factor. Drive belts and sheaves shall be sized for 150% of the fan operating brake horsepower, and shall be readily and easily accessible for service, if required. Fan shaft to be turned and polished steel that is sized so the first critical speed is at least 25% over the maximum operating speed for each pressure class. Fan shaft bearings shall be Air Handling Quality, bearings shall be heavy-duty grease lubricated, self-aligning or roller pillow block type. Air Handling Quality bearings to be designed with low swivel torque to allow the outer race of the bearing to pivot or swivel within the cast pillow block. Bearings shall be 100% tested for noise and vibration by the manufacturer. Bearings shall be 100% tested to insure the inner race diameter is within tolerance to prevent vibration. Bearings shall be selected for a basic rating fatigue life (L-10) of 80,000 hours at maximum operating speed for each pressure class {Average Life or (L-50) of 400,000 hours} for horizontal mount and a basic rating fatigue life L(10) of 40,000 hours at maximum operating speed {Average Life or (L-50) of 200,000 hours} for vertical mount. Bearings shall be fixed to the fan shaft using concentric mounting locking collars, which reduce vibration, increase service life, and improve serviceability. Bearings that use set screws shall not be allowed. Bearings shall have Zerk fittings to allow for lubrication.

5. Spring Hangers: Vibration isolation spring hangers sized to suit the fan, selected to operate at 2/3 solid load, and supplied loose.

6. Finish: After fabrication all carbon steel components shall be cleaned and chemically treated by a phosphatizing process to insure proper removal of grease, oil, scale, etc. Fan shall then be coated with a minimum of 2-4 mils of Polyester Urethane, electrostatically applied and baked. Coating must exceed 1,000-hour salt spray under ASTM B117 test method.

7. Disconnect switches: Factory supplied, mounted and wired with housing suitable to exposure.

B. Manufacturers:

1. Greenheck

2. Twin City Fan and Fan Blower Co.

3. New York Blower

2.03 CEILING MOUNT EXHAUST FANS

A. General Description

1. Base fan performance at standard conditions (density 0.075 Lb/ft3)

2. Ceiling mounted applications.

3. Maximum operating temperatures is 130 Fahrenheit (54.4 Celsius).

4. UL/cUL listed for above bathtub exhaust.

5. Fans are UL/cUL listed 507 - Electric Fans.

6. Each fan shall bear a permanently affixed manufacture's nameplate containing the model number and individual serial number.

7. Wheel:

a. Forward curved centrifugal wheel.

b. Constructed of calcium carbonate filled polypropylene.

c. Statically and dynamically balanced in accordance to AMCA Standard 204-05.

8. Motors:

a. Motor enclosures shall be open driproof (ODP), opening in the frame body and or end brackets.

b. Motors are permanently lubricated sleeve bearing type to match with the fan load and furnished at the specific voltage and phase.

c. Motors shall be mounted on vibration isolators and be accessible for maintenance.

d. Compatible for use with speed controls.

e. Thermal overload protection.

9. Housing:

a. Constructed of heavy gauge galvanized steel.

10. Backdraft dampers.

a. Aluminum.

11. Flexible connections:

a. To Section 23 33 00 - Air Duct Accessories.

12. Resiliently mount direct driven fan and motor.

13. Motor shall be plug-in type with permanently lubricated bearings.

14. Provide one piece aluminum intake grille.

B. Manufacturers:

1. Greenheck

2. Broan

3. PennBarry

PART 3 - EXECUTION

3.01 GENERAL:

A. The installation of all fans is to meet the seismic restraint requirements as stated in Section 01 41 20 and Section 23 05 48.

3.02 INSTALLATION OF INLINE FANS:

A. Provide inline centrifugal fans where shown.

B. Provide flexible duct connectors.

C. Install with motor on the bottom or side for ease of servicing.

D. Install mounting brackets for each fan and secure in place with vibration isolators and hanger rods, independent of connecting ductwork.

3.03 INSTALLATION OF CEILING EXHAUST FANS:

A. Provide ceiling exhaust fans where shown.

B. Rigidly secure each fan housing in place in the ceiling space and coordinate installation with:

1. The air distribution work where duct connection are specified.

2. The electrical work of Division 26 where electrical power connection to the housing receptacle is specified.

C. Install fan-motor assemblies and plug into housing receptacles.

D. Install accessories supplied loose.

E. When installation is complete, check and test operation and adjust as required.

3.04 INSTALLATION OF VANEAXIAL FANS:

A. Provide vaneaxial fans where shown.

B. Unless otherwise indicated or specified, suspend each fan from the structure, independent of connecting ductwork, by means of hanger rods and vibration isolation spring hangers.

C. When installation is complete, check and test operation and adjust as required.

3.05 CONTROLS:

A. Coordinate with HVAC control contractor to ensure tie-in between BMS controllers and VFD hard-wired control circuit.

3.06 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

3.07 SCHEDULES:

A. See Drawings.

END OF SECTION

SECTION 23 37 13.13

AIR DIFFUSERS

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide round ceiling diffusers, rectangular and square ceiling diffusers, perforated diffusers, louver face diffusers, linear bar diffusers, high-capacity drum louver diffusers, as indicated and in compliance with Contract Documents.

1.02 REFERENCES:

A. American Society of Heating, Refrigerating and Air-Conditioning Engineers (ASHRAE):

1. 70: Method of Testing the Performance of Air Outlets and Air Inlets

1.03 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Product Data: For each type of product.

1. Data Sheet: Indicate materials of construction, finish, and mounting details; and performance data including throw and drop, static-pressure drop, and noise ratings.

2. Diffuser Schedule: Indicate drawing designation, room location, quantity, model number, size, and accessories furnished.

1.04 SPARE PARTS:

A. Comply with the requirements specified in Section 01 61 00.

1.05 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

1.06 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

PART 2 - PRODUCTS

2.01 TYPE DL-1: HIGH-CAPACITY DRUM LOUVER DIFFUSERS:

A. Manufacturers:

1. Price

2. Titus

3. Nailor

B. Airflow Principle: Extended distance for high airflow rates

C. Material: Aluminum, heavy gage extruded

D. Finish: Powder Coat

E. Border: 1-1/4-inch width with countersunk screw holes

F. Gasket between drum and border

G. Body: Drum shaped; adjustable vertically

H. Blades: Individually adjustable horizontally

I. Mounting: Surface

J. Size: As scheduled or indicated on drawings

K. Accessories:

1. Opposed-blade steel damper

2.02 SOURCE QUALITY CONTROL:

A. Verification of Performance: Rate diffusers according to ASHRAE 70, "Method of Testing for Rating the Performance of Air Outlets and Inlets."

PART 3 - EXECUTION

3.01 EXAMINATION:

A. Examine areas where diffusers are installed for compliance with requirements for installation tolerances and other conditions affecting performance of equipment.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 INSTALLATION:

A. Install diffusers level and plumb.

B. Ceiling-Mounted Outlets and Inlets: Drawings indicate general arrangement of ducts, fittings, and accessories. Air outlet and inlet locations have been indicated to achieve design requirements for air volume, noise criteria, airflow pattern, throw, and pressure drop. Make final locations where indicated, as much as practical. For units installed in lay-in ceiling panels, locate units in the center of panel. Where architectural features or other items conflict with installation, notify Architect for a determination of final location.

C. Review the architectural reflected ceiling plan and confirm the indicated diffuser mounting style is compatible the ceiling type. Any conflicts are to be brought to the Engineer's attention for resolution.

D. Install diffusers with airtight connections to ducts and to allow service and maintenance of dampers, air extractors, and fire dampers.

3.03 ADJUSTING:

A. After installation, adjust diffusers to air patterns indicated, or as directed, before starting air balancing.

3.04 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

Page Intentionally Left Blank

SECTION 23 37 13.23

REGISTERS AND GRILLES

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide adjustable blade face registers and grilles, fixed face registers and grilles as indicated and in compliance with Contract Documents.

1.02 REFERENCES:

A. American Society of Heating, Refrigerating and Air-Conditioning Engineers (ASHRAE):

1. 70: Method of Testing the Performance of Air Outlets and Air Inlets

1.03 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Product Data: For each type of product.

1. Data Sheet: Indicate materials of construction, finish, and mounting details; and performance data including throw and drop, static-pressure drop, and noise ratings.

2. Register and Grille Schedule: Indicate drawing designation, room location, quantity, model number, size, and accessories furnished.

1.04 SPARE PARTS:

A. Comply with the requirements specified in Section 01 61 00.

1.05 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

1.06 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

PART 2 - PRODUCTS

2.01 REGISTERS:

A. Type SR-1: Aluminum Adjustable Blade Face Supply Register:

1. Manufacturers:

a. Price

b. Titus

c. Nailor

2. Make/Model: Per Equipment Schedule

3. Material: Extruded Aluminum

4. Finish: Powder Coat

5. Face Blade Arrangement: Adjustable double deflection with front and rear blades spaced 1-1/2 inch on center

6. Frame: 1-1/4 inches wide

7. Mounting: Countersunk screw

8. Damper Type: Aluminum adjustable opposed blade

2.02 GRILLES:

A. Type RG-1: Aluminum Eggcrate Core Return Grille:

1. Manufacturers:

a. Price

b. Titus

c. Nailor

2. Make/Model: Per Equipment Schedule

3. Material: Aluminum

4. Finish: Powder Coat

5. Face Blade Arrangement: Fixed 1/2 inch x 1/2 inch x 1/2 inch deep aluminum grid.

6. Frame: 1-1/4 inches wide

7. Mounting: Countersunk screw for surface, lay-in no screw hole for T-bar

8. Damper Type: None

PART 3 - EXECUTION

3.01 EXAMINATION:

A. Examine areas where registers and grilles are installed for compliance with requirements for installation tolerances and other conditions affecting performance of equipment.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 INSTALLATION:

A. Install registers and grilles level and plumb.

B. Outlets and Inlets Locations: Drawings indicate general arrangement of ducts, fittings, and accessories. Air outlet and inlet locations have been indicated to achieve design requirements for air volume, noise criteria, airflow pattern, throw, and pressure drop. Make final locations where indicated, as much as practical. For units installed in lay-in ceiling panels, locate units in the center of panel. Where architectural features or other items conflict with installation, notify Architect for a determination of final location.

C. Install registers and grilles with airtight connections to ducts and to allow service and maintenance of dampers, air extractors, and fire dampers.

3.03 ADJUSTING:

A. After installation, adjust registers and grilles to air patterns indicated, or as directed, before starting air balancing.

3.04 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

SECTION 23 41 00

PARTICULATE AIR FILTRATION

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide flat panel filters, pleated panel filters, front- or back-access filter frames, side-access filter housings, filter gauges as indicated and in compliance with Contract Documents.

1.02 REFERENCES:

A. American Society of Heating, Refrigerating and Air-Conditioning Engineers (ASHRAE):

1. 52.2: Method of Testing General Ventilation Air-Cleaning Devices for Removal Efficiency by Particle Size

B. National Fire Protection Association (NFPA):

1. 90A: Standards for the Installation of Air-Conditioning and Ventilating Systems

C. Underwriters' Laboratories, Inc. (UL):

1. 900: Standard for Safety Air Filter Units

1.03 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Product Data: For each type of product. Include dimensions; operating characteristics; required clearances and access; rated flow capacity, including initial and final pressure drop at rated airflow; efficiency and test method; fire classification; furnished specialties; and accessories for each model indicated.

C. Shop Drawings: For air filters. Include plans, elevations, sections, details, and attachments to other work.

1. Show filter rack assembly, dimensions, materials, and methods of assembly of components.

2. Include setting drawings, templates, and requirements for installing anchor bolts and anchorages.

D. Seismic Qualification Data: Certificates, for filters, accessories, and components from manufacturer.

1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.

2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.

3. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.

E. Operation and Maintenance Data: For each type of filter and rack to include in emergency, operation, and maintenance manuals.

F. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Provide one complete set(s) of filters for each filter bank.

1.04 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.05 SPARE PARTS:

A. Comply with the requirements specified in Section 01 61 00.

1.06 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

1.07 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

B. Deliver and store products in a clean, dry place.

C. Comply with manufacturer's written rigging and installation instructions for unloading and moving to final installed location.

D. Handle products carefully to prevent damage, breaking, denting, and scoring. Do not install damaged products.

E. Protect products from weather, dirt, dust, water, construction debris, and physical damage.

1. Retain factory-applied coverings on equipment to protect finishes during construction and remove just prior to operating unit.

2. Cover unit openings before installation to prevent dirt and dust from entering inside of units. If required to remover coverings during unit installation, reapply coverings over openings after unit installation and remove just prior to operating unit.

3. Replace installed products damaged during construction.

PART 2 - PRODUCTS

2.01 PERFORMANCE REQUIREMENTS:

A. Seismic Performance: Filters shall withstand the effects of earthquake motions determined according to ASCE/SEI 7 and criteria documented in Section 01 41 20.

1. The term "withstand" means "the unit will remain in place without separation of any parts when subjected to the seismic forces specified and the unit will be fully operational after the seismic event."

2. Component Importance Factor: 1.5.

B. ASHRAE Compliance:

1. Comply with applicable requirements in ASHRAE 62.1, Section 4 - "Outdoor Air Quality"; Section 5 - "Systems and Equipment"; and Section 7 - "Construction and Startup."

2. Comply with ASHRAE 52.2 for MERV for methods of testing and rating air-filter units.

C. Comply with NFPA 90A.

D. Comply with UL 900.

E. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

2.02 PLEATED PANEL FILTERS:

A. Description: Factory-fabricated, self-supported, extended-surface, pleated, panel-type, disposable air filters with holding frames.

1. Manufacturers:

a. Camfil

b. AAF Flanders

B. Source Limitations: Obtain from single source from single manufacturer.

C. Capacities and Characteristics:

1. Face Size: As per equipment schedule

2. Depth: 2 inches nominal.

3. Initial Resistance: 0.1-inch wg at 350 fpm.

4. Recommended Final Resistance: 1.0 inches wg.

5. Minimum Efficiency Reporting Value: MERV 8, with "Composite Average Particle Size Efficiency, Percent in Size Range, Micrometers" according to ASHRAE 52.2.

6. Access: Side.

D. Media: Cotton and synthetic fibers or 100 percent synthetic fibers coated with non-flammable adhesive.

1. Separators shall be bonded to the media to maintain pleat configuration.

2. Welded-wire or expanded metal grid shall be on downstream side to maintain pleat.

3. Media shall be bonded to frame to prevent air bypass.

E. Filter-Media Frame: Moisture resistant two piece cardboard frame with diagonal supports sealed or bonded to the media.

2.03 SIDE-ACCESS FILTER HOUSINGS:

A. Description: Factory-assembled, side-service housings, constructed of to match duct material, with flanges to connect to duct or casing system.

1. Manufacturers:

a. Camfil

b. AAF Flanders

B. Source Limitations: Obtain from single source from single manufacturer.

C. Prefilters: Integral tracks to accommodate 2-inch thick, disposable filters.

D. Access Doors: Hinged, with continuous gaskets on perimeter and positive-locking devices, and arranged so filter cartridges can be loaded from either access door.

E. Sealing: Incorporate positive-sealing gasket material on channels to seal top and bottom of filter cartridge frames and to prevent bypass of unfiltered air.

2.04 FILTER GAUGES:

A. Diaphragm-type gauge with dial and pointer in metal case, vent valves, black figures on white background, and front recalibration adjustment.

1. Manufacturers:

a. Dwyer – 2000 Magnehelic

B. Source Limitations: Obtain from single source from single manufacturer.

1. Diameter: 4-1/2 inches.

2. Scale Range for Filter Media Having a Recommended Final Resistance of 0.5- to 1.0-Inch wg or Less: 0- to 1.0-inch wg.

C. Accessories: Static-pressure tips, tubing, gauge connections, and mounting bracket.

PART 3 - EXECUTION

3.01 EXAMINATION:

A. Examine ducts, air-handling units, and conditions for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 INSTALLATION OF FILTERS:

A. Position each filter unit with clearance for normal service and maintenance. Anchor filter holding frames to substrate.

B. Install filters in position to prevent passage of unfiltered air.

C. Install filter gauge for each filter bank.

D. Do not operate fan system until filters (temporary or permanent) are in place. Replace temporary filters used during construction and testing with new, clean filters.

E. Coordinate filter installations with duct and air-handling-unit installations.

3.03 INSTALLATION OF FILTER GAUGES:

A. Install filter gauge for each filter bank.

B. Install filter-gauge, static-pressure tips upstream and downstream from filters. Install filter gauges on filter banks with separate static-pressure taps upstream and downstream from filters. Mount filter gauges on outside of filter housing or filter plenum in an accessible position. Adjust and level inclined gauges.

3.04 CONTROL CONNECTIONS:

A. Install control and electrical power wiring to field-mounted control devices.

B. Connect control wiring between pressure sensors and control system.

3.05 CLEANING:

A. After completing system installation and testing, adjusting, and balancing of air-handling and air-distribution systems, clean filter housings and install new filter media.

3.06 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 23 42 00

GAS-PHASE AIR FILTRATION

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide gas-phase panel filters, side-access filter housings, filter gages as indicated and in compliance with Contract Documents.

1.02 REFERENCES:

A. American Society of Civil Engineers (ASCE):

1. 7: Seismic Loads: Guide to the Seismic Load Provision

B. American Society of Heating, Refrigerating and Air-Conditioning Engineers (ASHRAE):

1. 52.2: Method of Testing General Ventilation Air-Cleaning Devices for Removal Efficiency by Particle Size

2. 62.1: Ventilation for Acceptable Indoor Air Quality

C. ASTM International (ASTM):

1. D3467: Standard Test Method for Carbon Tetrachloride Activity of Activated Carbon

2. D3802: Standard Test Method for Ball-Pan Hardness of Activated Carbon

D. National Fire Protection Association (NFPA):

1. 70: National Electrical Code.

2. 90A: Standards for the Installation of Air-Conditioning and Ventilating Systems

E. Underwriters' Laboratories, Inc. (UL):

1. 900: Standard for Safety Air Filter Units

1.03 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Product Data: For each type of product. Include dimensions; operating characteristics; required clearances and access; rated flow capacity, including initial and final pressure drop

at rated airflow; efficiency and test method; fire classification; furnished specialties; and accessories for each model indicated.

C. Shop Drawings: For gas-phase air filters. Include plans, elevations, sections, details, and attachments to other work.

1. Show filter rack assembly, dimensions, materials, and methods of assembly of components.

D. Seismic Qualification Data: Certificates, for gas-phase filters, accessories, and components from manufacturer.

1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.

2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.

3. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.

E. Operation and Maintenance Data: For each type of gas-phase filter and rack to include in emergency, operation, and maintenance manuals.

F. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Provide one complete set(s) of filters for each filter or filter bank.

1.04 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.05 SPARE PARTS:

A. Comply with the requirements specified in Section 01 61 00.

1.06 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

1.07 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

B. Deliver and store products in a clean, dry place.

C. Comply with manufacturer's written rigging and installation instructions for unloading and moving to final installed location.

D. Handle products carefully to prevent damage, breaking, denting, and scoring. Do not install damaged products.

E. Protect products from weather, dirt, dust, water, construction debris, and physical damage.

1. Retain factory-applied coverings on equipment to protect finishes during construction and remove just prior to operating unit.

2. Cover unit openings before installation to prevent dirt and dust from entering inside of units. If required to remover coverings during unit installation, reapply coverings over openings after unit installation and remove just prior to operating unit.

3. Replace installed products damaged during construction.

PART 2 - PRODUCTS

2.01 PERFORMANCE REQUIREMENTS:

A. Seismic Performance: Filters shall withstand the effects of earthquake motions determined according to ASCE/SEI 7.

1. The term "withstand" means "the unit will remain in place without separation of any parts when subjected to the seismic forces specified and the unit will be fully operational after the seismic event."

2. Component Importance Factor: 1.5

B. ASHRAE 62.1 Compliance: Section 5, "Systems and Equipment" and Section 7, "Construction and System Start-up."

C. Comply with NFPA 90A.

2.02 GAS-PHASE PANEL FILTERS:

A. Description: Factory-fabricated panel or pleated adsorbent media filter.

B. Manufacturers:

1. Camfil

2. AAF Flanders

C. Filter Unit Class: UL 900, Class 2

D. Capacities and Characteristics:

1. Face Size: As per Equipment Schedule

2. Depth: 2 inches nominal

3. Maximum or Rated Face Velocity: 500 fpm

4. Service Access Location (Front, Back, Side): Side

5. Initial Resistance: 0.10-inch wg

E. Media:

1. Flat-panel or pleated, multilayer filter with an inlet layer of nonwoven polyester fibers, bonded or supported by a grid, to a layer of impregnated activated carbon and potassium permanganate suitable for the removal of corrosive and acidic gases like H_2S.

2. Housed in a self-supporting frame.

F. Maximum Continuous Operating Temperature: 150 degrees F.

G. Pre-installation Protection: Package each gas-phase filter in a sealed polyethylene bag to prevent unintentional adsorption prior to installation.

2.03 SIDE-ACCESS FILTER HOUSINGS:

A. Description: Factory-assembled, side-service housings, constructed to match duct material, with flanges to connect to duct or casing system.

1. Manufacturers:

a. Camfil.

b. AAF Flanders

B. Source Limitations: Obtain from single source from single manufacturer.

C. Prefilters: Integral tracks to accommodate 2-inch thick, disposable filters.

D. Access Doors: Hinged, with continuous gaskets on perimeter and positive-locking devices, and arranged so filter cartridges can be loaded from either access door.

E. Sealing: Incorporate positive-sealing gasket material on channels of filter cartridge frames to prevent bypass of unfiltered air.

2.04 FILTER GAUGES:

A. Diaphragm-type gauge with dial and pointer in metal case, vent valves, black figures on white background, and front recalibration adjustment.

1. Manufacturers:

a. Dwyer – 2000 Magnehelic

B. Source Limitations: Obtain from single source from single manufacturer.

1. Diameter: 4-1/2 inches

2. Scale Range for Filter Media Having a Recommended Final Resistance of 0.5- to 1.0-inch wg or Less: 0- to 1.0-inch wg.

C. Accessories: Static-pressure tips, tubing, gauge connections, and mounting bracket.

PART 3 - EXECUTION

3.01 EXAMINATION:

A. Examine ducts, air-handling units, and conditions for compliance with requirements for installation tolerances and other conditions affecting performance.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 INSTALLATION:

A. Position each filter unit with required clearance for service and maintenance. Anchor filter-mounting frames to substrate.

B. Install filters in position to prevent passage of unfiltered air.

C. Do not operate fan system until particulate filters (temporary or permanent) are in place. Replace temporary filters used during construction and testing with new, clean filters.

D. Do not install gas-phase filters until fan system is clean and there is no risk of construction debris loading the filter.

E. Install filter-gauge, static-pressure taps upstream and downstream from each filter bank. Install filter gauges on filter banks with separate static-pressure taps upstream and downstream of filters. Mount filter gauges on outside of filter housing or filter plenum in an accessible position. Adjust and level inclined gauges.

F. Coordinate filter installations with duct and air-handling-unit installations.

G. Install all manufacturer-provided accessories in accordance with manufacturer's written installation instructions.

3.03 CONTROL CONNECTIONS:

A. Install control and electrical power wiring to field-mounted control devices.

B. Connect control wiring between pressure sensors and control system.

3.04 FIELD QUALITY CONTROL:

A. Manufacturer's Field Service: Engage a factory-authorized service representative to test and inspect components, assemblies, and equipment installations, including connections.

B. Perform the following tests and inspections with the assistance of a factory-authorized service representative:

1. Test for leakage of unfiltered air while system is operating.

C. Air filters will be considered defective if they do not pass tests and inspections.

D. Prepare test and inspection reports.

3.05 CLEANING:

A. After completing system installation and testing, adjusting, and balancing air-handling and air-distribution systems, clean filter housings and install new particulate filter media.

3.06 DEMONSTRATION

A. Train Owner's maintenance personnel to adjust, operate, and maintain filters.

3.07 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 23 70 00

AIR CONDITIONING EQUIPMENT

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide air conditioning equipment as indicated and in compliance with Contract Documents.

1.02 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Shop Drawings: Submit shop drawings for all products specified in this Section.

C. Include certified power and control wiring schematics with each shop drawing.

D. Delegated Design Submittals: For each device, equipment or appurtenance provide written certification from Professional Engineer licensed in the State of Utah stating that supports systems and anchorage for equipment have been designed according to the requirements of Section 1613 of the building codes of Utah, Salt Lake City and ASCE/SEI 7, and in accordance with Specification 01 41 20. Submit calculations stamped by a Professional Engineer licensed in the State of Utah for support systems and anchorage for wind, seismic, and all other pertinent loads.

1.03 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

B. Manufacturer's Quality System:

1. Registered to ISO 9001:2000 Quality Standard, including in-house engineering for product design activities.

2. The control must be UL tested and certified.

1.04 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

PART 2 - PRODUCTS

2.01 WALL MOUNTED DUCTLESS AIR CONDITIONING UNITS AND CONDENSING UNITS:

A. General:

1. System consisting of an indoor evaporator unit, a remote air cooled condensing unit, and a wall mounting 12 volt DC electronic controller

B. Basis of Design:

1. Mitsubishi Electric air cooled inverter air-conditioning split system Model PUY/PKA series as scheduled:

2. Acceptable Manufacturers:

a. Mitsubishi Electric (MITS Air Conditioning Inc.)

b. Daikin AC (Americas), Inc.

c. Carrier

C. Evaporator Units: Each wall mounting evaporator unit is to be complete with:

1. A casing with air intake grille, supply air outlet with manually adjustable guide vanes for direction of vertical air flow, and swing-flow louvres to automatically change the direction of horizontal air flow.

2. A line flow fan with a multi speed single phase induction motor not to exceed 41 dBa on high speed.

3. An evaporator coil.

4. A high impact molded plastic casing in an off white finish.

5. A PP honeycomb long life washable filter.

6. A wired wall mounted remote controller with unit start/stop, room temperature set point adjustment and fan speed adjustment.

7. Condensate pumping package.

D. Condensing Units: Each remote condensing unit is to be of horizontal draw-through design and complete with:

1. A minimum 0.6 mm thick zinc coated alloy steel casing with an external acrylic polyester enamel finish, removable top and front panels, and grille type guards for the condenser coil and condenser fan.

2. A compressor.

3. A condensing coil and a condenser fan.

4. A linear inverter to modulate the capacity of the system in accordance with a microprocessor based control system and inverter system shall control the capacity and power consumption from 8 percent to 10 percent.

5. Unit shall be microprocessor controlled with full diagnostic features.

6. Noise level shall not exceed 58 dBa.

7. Factory installed low ambient controls to enable unit to operate to -40 degrees F.

8. High pressure protection, over current protection and DC bus current protection.

2.02 ELECTRICAL REQUIREMENTS:

A. *Dewatering* Outdoor Units:

1. Each outdoor unit will require a 208-230 VAC single-phase power supply. 60 amp breaker.

B. *Dewatering* Indoor Units:

1. Each indoor unit will require a 208-230 VAC single-phase power supply. 15 amp breaker

C. Power:

1. *Refer to equipment schedules on drawings.*

D. Control circuit (Transmission line):

1. Control will be via a 30vdc M-net fuzzy logic signal generated by the outdoor unit. This signal will be sent to the indoor units via a 2 core 16 g non-polar screened cable. All indoor units, outdoor units and Local Network controls will be coupled to this network in a daisy chain or star connection fashion. Network communication to remaining operating system components will not be effected in the case of an individual component failure such as indoor units or controllers.

PART 3 - EXECUTION

3.01 GENERAL INSTALLATION REQUIREMENTS:

A. Some equipment will be shipped to the site with an operating charge of refrigerant. Some equipment will be dehydrated and shipped to the site. Provide all required

refrigerant, and, where equipment is not complete with a refrigerant charging valve, site install a charging valve in an accessible location.

3.02 AIR CONDITIONING UNITS AND CONDENSING UNITS:

A. Provide split system air conditioning systems.

B. Secure evaporator units to the wall where shown, approximately 2.3 m above the finished floor. Ensure that the units are level and plumb. Avoid installing above permanently located electrical or electronic equipment.

C. All refrigeration piping must be separately insulated.

D. Obtain final refrigerant piping and wiring diagrams from supplier.

E. Provide all required control wiring and power wiring required for a complete installation.

F. Hand a remote controller for each system to the electrical trade at the site for installation as part of the Work of Division 26. Supply certified control and power wiring schematics and hand to the electrical trade with the controllers.

G. The Refrigerant Distribution circuit and Piping shall be designed and selected according to the manufacturers specifications.

H. Plumb the condensate pump discharge to the nearest drain.

I. Manufacturer's agent shall commission the system.

3.03 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 23 73 33.16

INDOOR, INDIRECT, GAS-FIRED HEATING AND VENTILATING UNITS

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide indirect, gas-fired heating and ventilating units, including the following components as indicated and in compliance with Contract Documents.

1. Casings

2. Fans, drives, and motors

3. Air filtration

4. Dampers

5. Indirect, gas-fired burners

6. Unit control panel

7. Controls

H. Underwriters' Laboratories, Inc. (UL):

1. 900: Standard for Safety Air Filter Units

1.03 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Product Data: For each indoor, indirect, gas-fired heating and ventilating unit.

1. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes.

2. Include rated capacities, operating characteristics, electrical characteristics, and furnished specialties and accessories.

3. Include unit dimensions and weight.

4. Include cabinet material, metal thickness, finishes, insulation, and accessories.

5. Fans:

   a. Include certified fan-performance curves with system operating conditions indicated.

   b. Include certified fan-sound power ratings.

   c. Include fan construction and accessories.

   d. Include motor ratings, electrical characteristics, and motor accessories.

6. Include filters with performance characteristics.

7. Include direct, gas-fired burners with performance characteristics.

8. Include dampers, including housings, linkages, and operators.

C. Shop Drawings: For each type and configuration of indoor, indirect, gas-fired heating and ventilating unit.

1. Include plans, elevations, sections, and mounting details.

2. Include details of equipment assemblies. Indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.

3. Detail fabrication and assembly of gas-fired heating and ventilating units, as well as procedures and diagrams.

4. Include diagrams for power, signal, and control wiring.

D. Delegated Design Submittals: For each device, equipment or appurtenance provide written certification from Professional Engineer licensed in the State of Utah stating that supports systems, anchorage and equipment have been designed according to the requirements of Section 1613 of the building codes of Utah, Salt Lake City and ASCE/SEI 7, and in accordance with Specification 01 41 20. Submit calculations stamped by a Professional Engineer licensed in the State of Utah for support systems and anchorage for wind, seismic, and all other pertinent loads.

E. Source quality-control reports.

F. Startup service reports.

G. Field quality-control reports.

H. Sample Warranty: For manufacturer's warranty.

I. Operation and Maintenance Data:

1. Operation and maintenance manuals shall be specific to equipment purchased and crossing out of non-applicable items is not acceptable.

a. For air-handling units to include in emergency, operation, and maintenance manuals.

2. Comply with requirements of Section 01 78 23.

J. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Filters: One set for each air-handling unit.

2. Fan Belts: One set for each air-handling unit fan.

K. Informational Submittals:

1. Coordination Drawings: Floor plans and other details, or BIM model, drawn to scale, showing the items described in this Section, and coordinated with all building trades.

2. Sample Warranty: For manufacturer's warranty.

3. Seismic Qualification Data: Certificates for indoor, indirect, gas-fired heating and ventilating units, accessories, and components, from manufacturer.

a. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.

b. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.

c. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.

d. Restraint of internal components.

4. Startup service reports.

5. Field quality-control reports.

L. Closeout Submittals:

1. Operation and Maintenance Data: For indirect, gas-fired heating and ventilating units to include in emergency, operation, and maintenance manuals.

1.04 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.05 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

1.06 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

1.07 WARRANTY:

A. Comply with the requirements specified in Section 01 78 36.

1. Warranty: Manufacturer agrees to repair or replace components of indirect, gas-fired heating and ventilating units that fail in materials or workmanship within specified warranty period.

a. Gas-Fired Heat Exchangers: One year from date of first beneficial use by buyer or any other user, within one year from date of resale by buyer in any unchanged condition, or within 18 months from date of shipment from seller, whichever occurs first.

b. Coil Heat Exchangers, Sheet Metal: One year from date of first beneficial use by buyer or any other user, within one year from date of resale by buyer in any unchanged condition, or within 18 months from date of shipment from seller, whichever occurs first.

c. All Other Parts: Two years from date of first beneficial use by buyer or any other user, within two years from date of resale by buyer in any unchanged condition, or within 30 months from date of shipment from seller, whichever occurs first.

PART 2 - PRODUCTS

2.01 PERFORMANCE REQUIREMENTS:

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

B. NFPA Compliance: Comply with NFPA 90A for design, fabrication, and installation of air-handling units and components.

C. ASHRAE 62.1 Compliance: Applicable requirements in ASHRAE 62.1, Section 5 - "Systems and Equipment" and Section 7 - "Construction and Startup."

D. ASHRAE/IES 90.1 Compliance: Applicable requirements in ASHRAE/IES 90.1, Section 6 - "Heating, Ventilating, and Air-Conditioning."

E. Delegated Design: Engage a qualified professional engineer, as defined in Section 01 45 00, to design vibration isolation and seismic restraints, including comprehensive engineering analysis by a qualified professional engineer, using performance requirements and design criteria indicated.

F. Structural Performance: Casing panels shall be self-supporting and capable of withstanding positive/negative 10-inch wg of internal static pressure, without exceeding a midpoint deflection of 0.0042 inch/inch of panel span.

G. Casing Leakage Performance: ASHRAE 111, Class 6 leakage or better at plus or minus 8 inch wg.

H. Seismic Performance: Air-handling units shall withstand the effects of earthquake motions determined according to ASCE/SEI 7.

I. The term "withstand" means "the unit will remain in place without separation of any parts from the device when subjected to the seismic forces specified and the unit will be fully operational after the seismic event."

J. Design criteria: Refer to the requirements of Section 01 41 20.

2.02 CAPACITIES AND CHARACTERISTICS

A. Refer to equipment schedules on drawings for performance and physical characteristics.

2.03 MANUFACTURERS:

A. Modine

B. Carrier

C. Trane

D. Engineered Air

2.04 UNIT CASINGS:

A. Frame: Modular and providing overall structural integrity without reliance on casing panels for structural support.

B. Base Rail:

1. Material: 14 Gauge galvanized steel, unless noted otherwise in the Equipment Schedule.

C. Casing Joints: Continuous gasketing.

D. Double-Wall Construction:

1. Outside Casing Wall:

a. Standard Material, Aluminized Steel: Minimum 18 gauge thick unless noted otherwise on the equipment schedule.

b. Alternate Material, Aluminum: Minimum 16 gauge thick when required per equipment schedule.

c. Alternate Material, Stainless Steel: Minimum 18 gauge thick when required per equipment schedule.

E. Casing Insulation:

1. Materials: 1 ½ lb density fiberglass with fire resistant acrylic coating .

2. Insulation Thickness: 1 inch .

3. Thermal Break: Provide continuity of insulation with no through-casing metal in casing walls, floors, or roofs of air-handling unit.

F. Airstream Surfaces: Surfaces in contact with airstream shall comply with requirements in ASHRAE 62.1.

G. Panels, Doors, and Windows:

1. Panels:

a. Fabrication: Formed and reinforced, double-wall and insulated panels of same materials and thicknesses as casing.

b. Fasteners: Two or more camlock type for panel lift-out operation. Arrangement shall allow panels to be opened against airflow

c. Gasket: Neoprene, applied around entire perimeters of panel frames.

d. Size: Large enough to allow unobstructed access for inspection and maintenance of air-handling unit's internal components.

2. Doors:

    a. Fabrication: Formed and reinforced, double-wall and insulated panels of same materials and thicknesses as casing complete with viewing window.

    b. Hinges: A minimum of two ball-bearing hinges or stainless-steel piano hinge and two wedge-lever latches, operable from inside and outside. Arrange doors to be opened against airflow. Provide safety latch retainers on doors so that doors do not open uncontrollably.

    c. Gasket: Neoprene, applied around entire perimeters of panel frames.

    d. Size: Large enough to allow for unobstructed access for inspection and maintenance of air-handling unit's internal components. At least 18 inches wide by full height of unit casing up to a maximum height of 72 inches.

3. Windows:

    a. Construction: Fabricate windows in access panels and doors of double-glazed, safety glass with an airspace between panes and sealed with interior and exterior rubber seals.

    b. Size: Minimum 8 inches, square or round.

4. Locations and Applications:

    a. Fan Section: Doors, with windows.

    b. Coil Section: Panels.

    c. Access Sections Immediately Upstream and Downstream of Coil Sections: Doors, with windows.

    d. Damper Section: Doors, with viewing windows.

    e. Filter Section: Doors large enough to allow periodic removal and installation of filters.

    f. Access Sections Immediately Upstream and Downstream of Filter Sections: Doors, with windows.

5. Service Lights: 100 Watt equivalent LED vaporproof luminaire with individual switched junction box located outside, adjacent to each access door and panel.

    a. Locations: Each section accessed with door or panel.

6. Convenience Outlets: One 20-A duplex GFCI receptacle per location with junction box located on outside casing wall.

2.05 FAN, DRIVE, AND MOTOR:

A. Fan and Drive Assemblies: Statically and dynamically balanced and designed for continuous operation at maximum-rated fan speed and motor horsepower.

B. Fans: Double inlet double width forward curved centrifugal, rated according to AMCA 210; galvanized steel; mounted on solid-steel shaft.

1. Shafts: With field-adjustable alignment.

2. Shaft Bearings: Heavy-duty, self-aligning, permanently lubricated ball bearings with an L50 rated life of 100,000 hours according to ABMA 9.

3. Housings: Formed- and reinforced-steel panels to form curved scroll housings with shaped cutoff and spun-metal inlet bell.

4. Mounting: For internal vibration isolation and seismic control. Factory-mount fans with manufacturer's standard vibration isolation mounting devices having a minimum static deflection of 1 inch.

5. Shaft Lubrication Lines: Extended to a location outside the casing.

6. Flexible Connector: Factory fabricated with a fabric strip minimum 3-1/2 inches wide, attached to two strips of minimum 2-3/4-inch- wide by 0.028-inch thick, galvanized-steel sheet.

a. Flexible Connector Fabric: Glass fabric, double coated with neoprene. Fabrics, coatings, and adhesives shall comply with UL 181, Class 1.

C. Drive: Factory-mounted V-belt drive, with adjustable alignment and belt tensioning, and with 1.5 service factor based on fan motor.

1. Pulleys: Cast iron or cast steel with split, tapered bushing, dynamically balanced at the factory.

2. Belts: Oil resistant, non-sparking and non-static; in matched sets for multiple-belt drives.

3. Belt Guards: Comply with requirements specified by OSHA and fabricate according to SMACNA's "HVAC Duct Construction Standards"; diamond-mesh wire screen, welded to steel angle frame; prime coated.

D. Motors:

1. Comply with NEMA designation, temperature rating, service factor, and efficiency requirements for motors specified in Section 23 05 13.

2. Motor Sizes: Maximum sizes as indicated. If not indicated, large enough so driven load will not require motor to operate in service factor range above 1.0.

3. Enclosure: Open Drip Proof.

4. Unusual Service Conditions:

   a. Altitude: 4226 feet above sea level.

5. Efficiency: Premium efficient as defined in NEMA MG 1.

6. Motor Pulleys: Adjustable pitch for use with 5-hp motors and smaller; fixed pitch for use with motors larger than 5 hp. Select pulley size so pitch adjustment is at the middle of adjustment range at fan design conditions.

7. Provide full voltage non-reversing motor starters.

2.06 AIR FILTRATION:

A. Particulate air filtration is specified in Section 23 41 00.

B. Gas-phase air filtration is specified in Section 23 42 00.

C. Side-Access Filter Mounting Frames:

1. Particulate Air Filter Frames: Match inner casing and outer casing material, and insulation thickness.

   a. Prefilters: Incorporate an integral 2-inch thick track with same access as primary filter.

   b. Sealing: Incorporate positive-sealing device to ensure seal between gasketed material on channels to seal top and bottom of filter cartridge frames to prevent bypass of unfiltered air.

2. Gas-Phase Air Filter Frames:

   a. Frames: Matching inner casing and outer casing material, and insulation thickness.

   b. Prefilters: Incorporate an integral 2-inch thick track.

   c. Sealing: Incorporate positive-sealing gasket material on channels to seal filter cartridge frames to prevent bypass of unfiltered air.

2.07 DAMPERS:

A. Retain "Dampers" or "Outdoor- and Return-Air Dampers" Paragraph below. Retain "Dampers" Paragraph if dampers are specified in Section 23 09 23.12. Retain "Outdoor- and Return-Air Dampers" Paragraph if dampers are to be provided by unit manufacturer. Not all manufacturers offer this option; consult manufacturers.

B. Extruded aluminum (6063-T5) damper frame shall not be less than 8 inches in thickness. Damper frame shall be 4 inches deep x 1 inch, with duct mounting flanges on both sides of frame. Damper frame shall have a 2-inch mounting flange on the rear of the damper, when installed as Extended Rear Flange install type. Frame to be assembled using zinc-plated steel mounting fasteners.

C. Blades shall be maximum 6-inch deep extruded aluminum (6063-T5) air-foil profiles with a minimum wall thickness of 1/16 inch.

D. Blade seals shall be extruded EPDM, secured in an integral slot within the aluminum blade extrusions and shall be mechanically fastened to prevent shrinkage and movement over the life of the damper. Adhesive or clip-on type blade seals will not be approved.

E. Frame seals shall be extruded silicone, secured in an integral slot within the aluminum frame extrusions and shall be mechanically fastened to prevent shrinkage and movement over the life of the damper. Metallic compression type jamb seals will not be approved.

F. Bearings shall be a dual bearing system composed of a Celcon inner bearing (fixed around 7/16 inch aluminum hexagon blade pivot pin, rotating within a polycarbonate outer bearing inserted in the frame. Single axle bearing, rotating in an extruded or punched hole shall not be acceptable.

G. Hexagonal control shaft shall be 7/16 inch. It shall have an adjustable length and shall be an integral part of the blade axle. A field-applied control shaft shall not be acceptable. All parts shall be zinc-plated steel.

H. Linkage hardware shall be aluminum and corrosion-resistant zinc-plated steel, installed in the frame side, out of the airstream, and accessible after installation. Linkage hardware shall be complete with cup-point trunnion screws to prevent linkage slippage. Linkage that consists of metal rubbing metal will not be approved.

I. Dampers shall be designed for operation in temperatures ranging from -40 degrees F to 212 degrees F.

J. Dampers shall be AMCA rated for Leakage Class 1A at 1-inch wg static pressure differential. Standard air leakage data to be certified under the AMCA Certified Ratings Program.

K. Dampers shall be custom made to required size, with blade stops not exceeding 1.25 inches in height.

L. Dampers shall be opposed blade action for modulating airflow control and parallel blade for two position open – close action.

M. Standard of Acceptance: TAMCO Series 1000 Air-Foil Control Damper.

N. Damper Operators: Comply with requirements in Section 23 09 23.12.

1. Operator Motors:

a. Provided by Building Control Contractor.

2. Controls:

a. Provided by Building Control Contractor.

2.08 INDIRECT-FIRED GAS BURNER:

A. Description: Factory assembled, piped, and wired; complying with ANSI Z21.47 and NFPA 54.

B. Approval: Designed and certified by and bearing label of UL.

C. Burners: Stainless steel.

1. Rated minimum turndown ratio: 30 to 1.

2. Fuel: Natural gas.

3. Ignition: Electronically controlled electric spark with flame sensor.

4. Gas Control Valve: Modulating.

5. Gas Train: Regulated, redundant, 24-V ac gas valve assembly containing pilot solenoid valve, electronic-modulating temperature control valve, pilot filter, pressure regulator, pilot shutoff, and manual shutoff all in one body.

6. High-Altitude Model: For project elevations more than 2000 feet above sea level.

D. Venting, Power: Power vented, with integral, motorized centrifugal fan interlocked with gas valve.

E. Combustion-Air Intake: Separate combustion-air intake and vent terminal assembly.

F. Heat Exchanger: Stainless steel.

G. Heat-Exchanger Drain Pan: Stainless steel.

H. Safety Controls:

1. Gas Manifold: Safety switches and controls complying with ANSI standards.

2. Vent Flow Verification: Differential pressure switch to verify open vent.

3. High Limit: Thermal switch or fuse to stop burner.

4. Purge-period timer shall automatically delay burner ignition and bypass low-limit control.

5. Airflow Proving Switch: Differential pressure switch senses correct airflow before energizing pilot.

6. Automatic-Reset, High-Limit Control Device: Stops burner and closes main gas valve if high-limit temperature is exceeded.

7. Safety Lockout Switch: Locks out ignition sequence if burner fails to light after three tries. Controls are reset manually by turning the unit off and on.

8. Control Transformer: 24 V ac.

2.09 UNIT CONTROL PANEL:

A. Factory-wired, fuse-protected control transformer, connection for power supply and field-wired unit to remote control panel.

B. Control Panel: Surface-mounted, remote panel, with engraved plastic cover, and the following lights and switches:

1. On-off-auto fan switch.

2. Heat-vent-off switch.

3. Supply-fan operation indicating light.

4. Heating operation indicating light.

5. Thermostat.

6. Damper position potentiometer.

7. Dirty-filter indicating light operated by unit-mounted differential pressure switch.

8. Safety-lockout indicating light.

9. Enclosure: NEMA 250, Type 4.

2.10 CONTROLS:

A. Comply with requirements in Section 23 09 23 and Section 23 09 93.11 for control equipment and sequence of operation.

B. Outdoor-Air Damper Control, 100 Percent Outdoor-Air Units: Outdoor-air damper shall open when supply fan starts, and close when fan stops.

C. Interface with BMS System for HVAC: Factory-installed hardware and software to enable the BMS system for HVAC to monitor, control, and display status and alarms of heating and ventilating unit.

1. Hardwired Points:

a. Room temperature.

b. Discharge-air temperature.

c. Burner operating.

2. ASHRAE 135.1 (BACnet) communication interface with the BMS system for HVAC shall enable the DDC system for HVAC operator to remotely control and monitor the heating and ventilating unit from an operator workstation. Control features and monitoring points displayed locally at heating and ventilating unit control panel shall be available through the BMS system for HVAC.

2.11 MATERIALS:

A. Steel:

1. ASTM A36 for carbon structural steel.

2. ASTM A568 for steel sheet.

B. Stainless Steel:

1. Manufacturer's standard grade for casing.

2. Manufacturer's standard type, ASTM A240 for bare steel exposed to airstream or moisture.

C. Galvanized Steel: ASTM A653.

PART 3 - EXECUTION

3.01 EXAMINATION:

A. Examine areas and conditions, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of indirect-fired heating and ventilating units.

B. Examine roughing-in for piping, ducts, and electrical systems to verify actual locations of connections before equipment installation.

C. Verify cleanliness of airflow path to include inner-casing surfaces, filters, coils, turning vanes, fan wheels, and other components.

D. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 INSTALLATION:

A. Equipment Mounting:

1. Install heating and ventilating units on cast-in-place concrete equipment bases. Coordinate sizes and locations of concrete bases with actual equipment provided. Comply with requirements for equipment bases and foundations specified in Section 03 30 00.

2. Comply with requirements for vibration isolation and seismic control devices specified in Section 23 05 48.

3. Comply with requirements for vibration isolation devices specified in Section 23 05 48.

B. Suspended Units: Suspend and brace units from structural-steel support frame using threaded steel rods and spring hangers. Comply with requirements for vibration isolation devices specified in Section 23 05 48.

C. Install gas-fired units in accordance with NFPA 54.

D. Install controls and equipment shipped by manufacturer for field installation with indirect, gas-fired heating and ventilating units.

3.03 PIPING CONNECTIONS:

A. Drawings indicate general arrangement of piping, fittings, and specialties.

1. Gas Piping: Comply with requirements in Section 23 11 23. Connect gas piping with shutoff valve and union and with sufficient clearance for burner removal and service. Make final connections of gas piping to unit with corrugated, stainless-

steel tubing flexible connectors complying with ANSI LC 1/CSA 6.26 equipment connections.

B. Drain: Comply with requirements in Section 22 13 16 for traps and accessories on piping connections to condensate drain pans under condensing heat exchangers.

C. Where installing piping adjacent to heating and ventilating units, allow space for service and maintenance.

3.04 DUCTWORK CONNECTIONS:

A. Connect supply and intake ducts to indirect, gas-fired heating and ventilating units with flexible duct connectors. Comply with requirements in Section 23 33 00 for flexible duct connectors.

3.05 ELECTRICAL CONNECTIONS:

A. MAU shall have a single connection of power to unit with unit-mounted disconnect switch accessible from outside unit and control-circuit transformer with built-in overcurrent protection.

B. Install electrical devices furnished by manufacturer, but not factory mounted, according to NFPA 70 and NECA 1.

C. Install nameplate for each electrical connection, indicating electrical equipment designation and circuit number feeding connection.

1. Nameplate shall be laminated acrylic or melamine plastic signs, as specified in Section 26 05 53.

2. Nameplate shall be laminated acrylic or melamine plastic signs with a black background and engraved white letters at least 1/2 inch high.

3.06 CONTROL CONNECTIONS:

A. Install control and electrical power wiring to field-mounted control devices.

3.07 STARTUP SERVICE:

A. Engage a factory-authorized service representative to perform startup service.

1. Complete installation and startup checks according to manufacturer's written instructions and perform the following:

a. Inspect for visible damage to burner combustion chamber.

b. Inspect casing insulation for integrity, moisture content, and adhesion.

c. Verify that clearances have been provided for servicing.

d. Verify that controls are connected and operable.

e. Verify that filters are installed.

f. Purge gas line.

g. Inspect and adjust vibration isolators and seismic restraints.

h. Verify bearing lubrication.

i. Inspect fan-wheel rotation for movement in correct direction without vibration and binding.

j. Adjust fan belts to proper alignment and tension.

B. Start unit according to manufacturer's written instructions.

1. Complete startup sheets and attach copy with Contractor's startup report.

2. Inspect and record performance of interlocks and protective devices; verify sequences.

3. Operate unit for run-in period recommended by manufacturer.

4. Perform the following operations for both minimum and maximum firing and adjust burner for peak efficiency:

a. Measure gas pressure at manifold.

b. Measure combustion-air temperature at inlet to combustion chamber.

c. Measure supply-air temperature and volume when burner is at maximum firing rate and when burner is off. Calculate useful heat to supply air.

5. Calibrate thermostats.

6. Adjust and inspect high-temperature limits.

7. Inspect dampers, if any, for proper stroke and interlock with return-air dampers.

8. Inspect controls for correct sequencing of heating, mixing dampers, refrigeration, and normal and emergency shutdown.

9. Measure and record airflow. Plot fan volumes on fan curve.

10. Verify operation of remote panel, including pilot-operation and failure modes. Inspect the following:

    a. High-limit heat.

    b. Alarms.

11. After startup and performance testing, change filters, verify bearing lubrication, and adjust belt tension.

12. Verify drain-pan performance.

13. Verify outdoor-air damper operation.

3.08 STARTUP AND TESTING:

A. Provide services of factory-trained Service Technician, specifically trained on type of equipment specified:

1. Service Technician must be present on site for all items listed below. Person-day requirements listed are exclusive of travel time, and do not relieve Contractor of the obligation to place equipment in operation as specified.

2. Comply with requirements for checkout, startup, and testing in Section 01 78 25.

3. Physical Checkout and Field Testing (Functional Completion Testing): Inspect grouting, location of anchor bolts; setting, leveling, alignment, field erection; coordination of piping, electrical and miscellaneous utility connections; certify proper installation:

    a. 1/2 person-day

4. Startup: Calibrate, check alignment and perform a functional test with water or process fluid. Tests to include all items specified.

    a. 1/2 person-day

5. Commissioning: Field performance test equipment specified.

    a. 1 person-day

3.09 TRAINING:

A. Training: Provide classroom and field operation and maintenance instruction including all materials, slides, videos, handouts and preparation to lead and teach classroom sessions.

B. Coordinate training time with the Engineer and Owner.

3.10 ADJUSTING:

A. Adjust initial temperature set points.

B. Set field-adjustable switches and circuit-breaker trip ranges as indicated.

3.11 CLEANING:

A. After completing system installation and testing, adjusting, and balancing air-handling unit and air-distribution systems and after completing startup service, clean air-handling units internally to remove foreign material and construction dirt and dust. Clean fan wheels, cabinets, dampers, coils, and filter housings, and install new, clean filters.

3.12 FIELD QUALITY CONTROL:

A. Testing Agency: Owner will engage a qualified testing agency to perform tests and inspections.

B. Testing Agency: Engage a qualified testing agency to perform tests and inspections.

C. Manufacturer's Field Service: Engage a factory-authorized service representative to test and inspect components, assemblies, and equipment installations, including connections.

D. Perform tests and inspections with the assistance of a factory-authorized service representative.

E. Units will be considered defective if they do not pass tests and inspections.

F. Prepare test and inspection reports.

3.13 DEMONSTRATION:

A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain heating and ventilating units.

3.14 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

Page Intentionally Left Blank

SECTION 23 74 16.11

PACKAGED, DX AIR-HANDLING UNITS

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide packaged, DX air-handling units with the following components as indicated and in compliance with Contract Documents.

1. Casings
2. Fans, drives, and motors
3. Coils
4. Refrigerant circuit components
5. Air filtration
6. Electric coils
7. Dampers
8. Electrical power connections
9. Controls
10. Accessories

1.03 DEFINITIONS:

A. RTU: Rooftop unit. As used in this Section, this abbreviation means packaged, small-capacity, rooftop air-conditioning units. This abbreviation is used regardless of whether the unit is mounted on the roof or on a concrete base on ground.

1.04 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Delegated Design Submittals: For each device, equipment or appurtenance provide written certification from Professional Engineer licensed in the State of Utah stating that supports systems, anchorage and equipment have been designed according to the requirements of Section 1613 of the building codes of Utah, Salt Lake City and ASCE/SEI 7, and in accordance with Specification 01 41 20. Submit calculations stamped by a Professional Engineer licensed in the State of Utah for support systems and anchorage for wind, seismic, and all other pertinent loads.

1. For RTU supports indicated to comply with performance requirements and design criteria, including analysis data signed and sealed by the qualified professional engineer responsible for their preparation.

    a. Include design calculations for selecting vibration isolators and seismic restraints and for designing vibration isolation bases.

    b. Detail mounting, securing, and flashing of roof curb to roof structure. Indicate coordinating requirements with roof membrane system.

    c. Wind and Seismic-Restraint Details: Detail fabrication and attachment of wind and seismic restraints and snubbers. Show anchorage details and indicate quantity, diameter, and depth of penetration of anchors.

C. Product Data: For each RTU:

1. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes.

2. Include rated capacities, dimensions, required clearances, characteristics, and furnished specialties and accessories.

3. Include unit dimensions and weight.

4. Include cabinet material, metal thickness, finishes, insulation, and accessories.

5. Fans:

    a. Include certified fan-performance curves with system operating conditions indicated.

    b. Include certified fan-sound power ratings.

    c. Include fan construction and accessories.

    d. Include motor ratings, electrical characteristics, and motor accessories.

6. Include certified coil-performance ratings with system operating conditions indicated.

7. Include filters with performance characteristics.

8. Include dampers, including housings, linkages, and operators.

D. Contractor Responsibility: Contractor is responsible for any costs due to adjustments/alterations to basis of design.

E. Shop Drawings: For each packaged, small-capacity, rooftop air-conditioning unit.

1. Include plans, elevations, sections, and mounting details.

2. Include details of equipment assemblies. Indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.

3. Include diagrams for power, signal, and control wiring.

F. Coordination Drawings: Floor plans and other details, or BIM model, drawn to scale, showing the items described in this Section, and coordinated with all building trades.

G. Sample Warranty: For manufacturer's warranty.

H. Seismic Qualification Data: Certificates, for RTUs, accessories, and components, from manufacturer.

1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.

2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.

3. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.

4. Restraint of internal components.

I. Product Certificates: Submit certification that specified equipment will withstand wind forces identified in "Performance Requirements" Article and in Section 23 05 48.

1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculations.

2. Dimensioned Outline Drawings of Equipment Unit: Identify center of wind force and locate and describe mounting and anchorage provisions.

3. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.

J. Source quality-control reports.

K. System startup reports.

L. Field quality-control reports.

M. Operation and Maintenance Data: For RTUs to include in emergency, operation, and maintenance manuals.

1. Operation and maintenance manuals shall be specific to equipment purchased and crossing out of non-applicable items is not acceptable.

2. Comply with requirements of Section 01 78 23.

N. Maintenance Material Submittals:

1. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

a. Filters: 2 set(s) of filters for each unit.

b. Fan Belts: One set for each belt-driven fan.

1.05 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.06 SPARE PARTS:

A. Comply with the requirements specified in Section 01 61 00.

B. Provide spare parts that are identical to and interchangeable with similar parts installed.

1. 1 set of filters.

2. 1 set of belts, if required.

C. Provide a list of recommended spare parts for the first year of operation and for the first five years of operation, including a price list and location of the nearest facility from which all spare parts can be obtained.

1.07 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

1.08 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

1.09 WARRANTY:

A. Comply with the requirements specified in Section 01 78 36.

B. Manufacturer agrees to repair or replace components of outdoor, semi-custom, air-handling unit that fail in materials or workmanship within specified warranty period.

1. Warranty Period: 1 year from date of Substantial Completion.

PART 2 - PRODUCTS

2.01 SYSTEM DESCRIPTION:

A. Packaged rooftop unit shall include compressors, evaporator coils, filters, supply fans, dampers, air-cooled condenser coils, condenser fans, electric heaters and unit controls.

B. Unit shall be factory assembled and tested including leak testing of the DX coils, pressure testing of the refrigeration circuit, and run testing of the completed unit. Run test report shall be supplied with the unit in the service compartment's literature pocket.

C. Unit shall have decals and tags to indicate lifting and rigging, service areas and caution areas for safety and to assist service personnel.

D. Unit components shall be labeled, including refrigeration system components and electrical and control components.

E. Estimated sound power levels (dB) shall be shown on the unit ratings sheet.

F. Installation, Operation, and Maintenance manual shall be supplied within the unit.

G. Laminated color-coded wiring diagram shall match factory installed wiring and shall be affixed to the interior of the of the control compartment's hinged access door.

H. Unit nameplate shall be provided in two locations on the unit, affixed to the exterior of the unit and affixed to the interior of the control compartment's hinged access door.

2.02 MANUFACTURERS:

A. AAON

B. Engineered Air

C. Trane

2.03 PERFORMANCE/DESIGN CRITERIA:

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by an NRTL, and marked for intended location and application.

B. NFPA Compliance: Comply with NFPA 90A for design, fabrication, and installation of RTUs and components.

C. ASHRAE 62.1 Compliance: Applicable requirements in ASHRAE 62.1, Section 5 - "Systems and Equipment" and Section 7 - "Construction and Startup."

D. ASHRAE 15 Compliance: For refrigeration system safety.

E. ASHRAE/IES 90.1 Compliance: Applicable requirements in ASHRAE/IES 90.1, Section 6 - "Heating, Ventilating, and Air-Conditioning."

F. UL Compliance: Comply with UL 1995.

G. Delegated Design: Engage a qualified professional engineer, as defined in Section 01 45 00, to design mounting and restraints for RTUs, including comprehensive engineering analysis.

1. Design RTU supports to comply with seismic performance requirements.

H. Seismic Performance: RTUs, accessories, and components shall withstand the effects of earthquake motions determined according to ASCE/SEI 7.

1. The term "withstand" means "the unit will remain in place without separation of any parts when subjected to the seismic forces specified and the unit will be fully operational after the seismic event."

2.04 UNIT CASINGS:

A. General Fabrication Requirements for Casings: Formed, finished and reinforced galvanized steel double-wall with impact resistant, rigid polyurethane foam panels.

B. Double-Wall Construction:

1. Outside Casing Wall: G90 galvanized steel, with pitched roof panels and knockouts with grommet seals for electrical and piping connections and lifting lugs.

2. Inside Casing Wall: G90 galvanized steel

3. Floor Plate: G90 galvanized steel

4. Casing Insulation:

a. Materials: Injected polyurethane foam insulation

b. Casing Panel R-Value: Minimum R-13

c. Insulation Density: Minimum 2 pounds/cubic foot per ASMD1929-11

d. Thermal Break: Provide continuity of insulation with no through-casing metal in casing walls, floors, or roof of unit.

C. Airstream Surfaces: Surfaces in contact with airstream shall comply with requirements in ASHRAE 62.1.

D. Leakage:

1. Cabinet leakage shall not exceed 1 percent of total airflow when tested at 3 times the minimum external static pressure provided in AHRI Standard 340/360.

2. Panel deflection shall not exceed L/240 ratio at 125 percent of design pressure.

E. Access Doors:

1. Doors:

a. Fabrication: Formed and reinforced with same materials and insulation thickness as casing.

b. Fasteners: Quarter turn, zinc cast, lockable handles. Full length stainless steel piano hinges. Arrangement shall allow panels to be opened against air-pressure differential.

c. Gasket: Neoprene, applied around entire perimeters of panel frames.

d. Size: Large enough to allow inspection and maintenance of air-handling unit's internal components.

e. Gasket: Neoprene, applied around entire perimeters of panel frames.

f. Size: Large enough to allow inspection and maintenance of air-handling unit's internal components.

2. Locations and Applications:

a. Fan Section

b. Access Section

c. Coil Section

d. Damper Section

e. Filter Section

f. Mixing Section

F. Casing Finish:

1. Exterior paint finish shall be capable of withstanding at least 2,500 hours, with no visible corrosive effects, when tested in a salt spray and fog atmosphere in accordance with ASTM B117-95 test procedure.

G. Condensate Drain Pans:

1. Location: Each type of cooling coil.

2. Construction:

a. Single-wall, double sloped 304 stainless steel

3. Drain Connection:

a. Located at lowest point of pan and sized to prevent overflow. Terminate with threaded nipple.

4. Length: Extend drain pan downstream from leaving face for distance to comply with ASHRAE 62.1.

5. Width: Entire width of water producing device.

6. Units with stacked coils shall have an intermediate drain pan to collect condensate from top coil.

2.05 FANS, DRIVES, AND MOTORS:

A. Fan and Drive Assemblies:

1. Configuration:

a. Direct dive, unhoused, backward inclined, plenum supply fans.

2. Vibration:

a. Dynamically balance

b. Rubber isolators

3. Motors:

a. Ball bearings rated for 200,000 hours service with external lubrication points.

4. VFDs:

a. Factory mounted and wired in the unit.

2.06 COILS:

A. General Requirements for Coils:

1. Comply with AHRI 410.

2. Fabricate coils section to allow for removal and replacement of coil for maintenance and to allow in-place access for service and maintenance of coil(s).

3. Coils shall not act as structural component of unit.

B. Supply-Air Refrigerant Coil:

1. Tubes: Copper

2. Fins:

a. Material: Aluminum

b. Mechanically bonded to tubes

c. Flexible, epoxy polymer e-coat over complete coil

(1) Humidity and water immersion resistance to a minimum of 1,000 hours per ASTM D2247-92 and ASTM D870-92.

(2) Corrosion durability confirmed through testing with coating capable of withstanding at least 10,000 hours of salt spray per ASTM B117-90.

(3) UV resistant polyurethane topcoat.

(4) 5 Year warranty on coatings.

C. Outdoor-Air Condenser Coil:

1. Tubes: Copper

2. Fins:

a. Material: Aluminum

b. Mechanically bonded to tubes.

c. Designed for a minimum of 10 degrees F of refrigerant sub-cooling.

d. Hydrogen or helium leak tested.

e. Flexible, epoxy polymer e-coat over complete coil:

(1) Humidity and water immersion resistance to a minimum of 1,000 hours per ASTM D2247-92 and ASTM D870-92.

(2) Corrosion durability confirmed through testing with coating capable of withstanding at least 10,000 hours of salt spray per ASTM B117-90.

(3) UV resistant polyurethane topcoat.

(4) 5 Year warranty on coatings

D. Condenser Fans:

1. High efficiency electrically commutated motor

2. Factory installed head pressure control module:

a. Modulate fan speed based on head pressure.

b. Cooling operation allowed down to 35 degrees F outdoor air temperature with adjustable compressor lockout.

E. Electric-Resistance Heating Coils: Comply with UL 1995.

1. Casing Assembly: Galvanized-steel frame.

2. Removable for replacement or service without further disassembly of the air handler.

3. Open Heating Elements: Resistance wire of 80 percent nickel and 20 percent chromium supported and insulated by floating ceramic bushings recessed into casing openings, fastened to supporting brackets, and mounted in galvanized-steel frame.

4. Overtemperature Protection: Disk-type, automatically resetting, thermal-cutout, safety device; serviceable through terminal box without removing heater from coil section.

5. Secondary Protection: Load-carrying, manually resetting or manually replaceable, thermal cutouts; factory wired in series with each heater stage.

6. Control Panel: Unit mounted with disconnecting means and overcurrent protection.

a. Full modulation capacity controlled by SCR.

b. 0-10 VDC heating control signal.

c. Airflow proving switch.

2.07 REFRIGERANT CIRCUIT COMPONENTS:

A. Compressor: Hermetic, variable speed scroll, mounted on vibration isolators; with internal overcurrent and high-temperature protection, and internal pressure relief.

B. Installation: Lockable isolated service compartment to allow access without affecting unit operation.

C. Refrigeration Specialties:

1. Refrigerant: R-410A

2. Expansion valve with replaceable thermostatic element.

3. Refrigerant filter/dryer.

4. Manual-reset high-pressure safety switch.

5. Automatic-reset low-pressure safety switch.

6. Minimum off-time relay.

7. Automatic-reset compressor motor thermal overload.

8. Brass service valves installed in compressor suction and liquid lines.

9. Low-ambient kit high-pressure sensor.

2.08 AIR FILTRATION:

A. Provide two stage filtration with first stage minimum MERV 8 particulate filtration and second stage gas-phase filtration.

B. Air filtration is specified in Section 23 41 00 and Section 23 42 00.

C. In addition to the BMS monitored filter pressure drop provide magnahelic pressure gages for visible monitoring.

2.09 OUTSIDE AIR/ECONOMIZER:

A. Unit shall include 0-100 percent economizer with motorized outside air and return air dampers and electric actuator.

1. Dampers:

a. Hollow core airfoil extruded aluminum blades

b. Gear driven

c. Rubber edge seals

d. Aluminum end seals

e. Maximum leakage 20 cfm per square foot at 4.0 in. wg. differential pressure

B. Damper Operators: Comply with requirements in Section 23 09 23.12.

C. Intake Hood: Complete with bird screen.

2.10 ELECTRICAL POWER CONNECTIONS:

A. RTU shall have a single connection of power to unit with unit-mounted disconnect switch accessible from outside unit and control-circuit transformer with built-in overcurrent protection.

2.11 CONTROLS:

A. DDC equipment controller provided and installed by the BMS contractor.

B. Unit is to be provided with all control components required to interface with the BMS controller per the control schematic drawings to achieve the specified control sequences.

C. Control equipment and sequence of operation are specified in Section 23 09 93.11.

D. Interface Requirements for HVAC Instrumentation and Control System:

1. Interface relay to provide indication of fault to the BMS.

2. Provide compatible interface for BMS for the following:

a. Monitoring supply fan start, stop, and operation.

b. Inquiring data to include outdoor-air damper position.

c. Monitoring variable-frequency drive operation.

d. Monitoring cooling load.

e. Monitoring economizer cycles.

2.12 ROOF / GROUND MOUNTED TRANSITION CURBS:

A. Curbs with vibration isolators and wind or seismic restraints are specified in Section 23 05 48.

B. Curbs are to be factory made, coordinated and supplied by the air handler manufacturer.

C. Materials: Galvanized steel with corrosion-protection coating, watertight gaskets, and factory-installed wood nailer; complying with NRCA standards.

1. Curb Insulation and Adhesive: Comply with NFPA 90A or NFPA 90B.

a. Materials: ASTM C1071, Type I or II.

2. Application: Factory applied with adhesive and mechanical fasteners to the internal surface of curb.

a. Liner Adhesive: Comply with ASTM C916, Type I.

b. Mechanical Fasteners: Galvanized steel, suitable for adhesive attachment, mechanical attachment, or welding attachment to duct without damaging liner when applied as recommended by manufacturer and without causing leakage in cabinet.

c. Liner materials applied in this location shall have airstream surface coated with a temperature-resistant coating or faced with a plain or coated fibrous mat or fabric depending on service air velocity.

d. Liner Adhesive: Comply with ASTM C916, Type I.

D. Curb Dimensions: Grade mounted curbs are to provide a minimum of 56” clearance to the underside of the RTU and 17” to the underside of the connecting ductwork in the case of a directional transition curb.

2.13 ACCESSORIES:

A. Duplex, 115-V, ground-fault-interrupter outlet with 15-A overcurrent protection. Include transformer if required. Outlet shall be energized even if the unit main disconnect is open.

B. Filter differential pressure switch with sensor tubing on either side of filter. Set for final filter pressure loss.

C. Remote potentiometer to adjust minimum economizer damper position.

D. Safeties:

1. Smoke detector

E. Coil guards of painted, galvanized-steel wire.

F. Door switches to disable heating or reset set point when open.

PART 3 - EXECUTION

3.01 EXAMINATION:

A. Examine substrates, areas, and conditions, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of RTUs.

B. Examine roughing-in for RTUs to verify actual locations of piping and duct connections before equipment installation.

C. Examine roofs for suitable conditions where RTUs will be installed.

D. Proceed with installation only after unsatisfactory conditions have been corrected.

E. Coordinate any housekeeping pad requirements and location with other trades.

3.02 PREPARATION:

A. Curb: Install RTUs on curbs and coordinate roof or wall penetrations and sealing with metal building manufacturer. Secure RTUs to upper curb rail, and secure curb base to roof framing or concrete base with anchor bolts. Coordinate sizes and locations of roof curbs with actual equipment provided.

3.03 DUCT CONNECTIONS:

A. Comply with duct installation requirements specified in other HVAC Sections. Drawings indicate general arrangement of ducts. The following are specific connection requirements:

1. Install ducts to termination at roof curb.

2. Connect supply ducts to RTUs with flexible duct connectors specified in Section 23 33 00.

3. Duct connection configurations to curbs as shown on drawings are representative. Adjustments required by site conditions or non-base of design equipment are the responsibility of the contractor. The contractor will coordinate changes with all other trades.

3.04 ELECTRICAL CONNECTIONS:

A. Connect electrical wiring according to Section 26 05 20.

B. Ground equipment according to Section 26 05 26.

C. Install electrical devices furnished by manufacturer, but not factory mounted, according to NFPA 70 and NECA 1.

D. Install nameplate for each electrical connection, indicating electrical equipment designation and circuit number feeding connection.

1. Nameplate shall be laminated acrylic or melamine plastic signs as specified in Section 26 05 53.

2. Nameplate shall be laminated acrylic or melamine plastic signs as layers of black with engraved white letters at least 1/2 inch high.

3. Locate nameplate where easily visible.

3.05 CONTROL CONNECTIONS:

A. Install control and electrical power wiring to field-mounted control devices.

B. Connect control wiring according to Section 26 05 20.

3.06 STARTUP AND TESTING:

A. Provide services of factory-trained Service Technician, specifically trained on type of equipment specified:

1. Service Technician must be present on site for all items listed below. Person-day requirements listed are exclusive of travel time, and do not relieve Contractor of the obligation to place equipment in operation as specified.

2. Comply with requirements for checkout, startup, and testing in Section 01 78 25.

3. Physical Checkout and Field Testing (Functional Completion Testing): Inspect grouting, location of anchor bolts; setting, leveling, alignment, field erection; coordination of piping, electrical and miscellaneous utility connections; certify proper installation:

a. 1/2 person-day

4. Startup: Calibrate, check alignment and perform a functional test with water or process fluid. Tests to include all items specified.

a. 1/2 person-day

5. Commissioning: Field performance test equipment specified.

    a. 1 person-day

B. Engage a factory-authorized service representative to perform startup service.

1. Complete installation and startup checks according to manufacturer's written instructions.

2. Inspect for visible damage to unit casing.

3. Inspect for visible damage to compressor, coils, and fans.

4. Inspect internal insulation.

5. Verify that labels are clearly visible.

6. Verify that clearances have been provided for servicing.

7. Verify that controls are connected and operable.

8. Verify that filters are installed.

9. Clean condenser coil and inspect for construction debris.

10. Remove packing from vibration isolators.

11. Verify lubrication on fan and motor bearings.

12. Inspect fan-wheel rotation for movement in correct direction without vibration and binding.

13. Start unit according to manufacturer's written instructions.

    a. Start refrigeration system.

    b. Do not operate below recommended low-ambient temperature.

    c. Complete startup sheets and attach copy with Contractor's startup report.

14. Inspect and record performance of interlocks and protective devices; verify sequences.

15. Operate unit for an initial period as recommended or required by manufacturer.

16. Adjust and inspect high-temperature limits.

17. Inspect outdoor-air dampers for proper stroke and interlock with return-air dampers.

18. Start refrigeration system and measure and record the following when ambient is a minimum of 15 degrees F above return-air temperature:

    a. Coil leaving-air, dry- and wet-bulb temperatures.

    b. Coil entering-air, dry- and wet-bulb temperatures.

    c. Outdoor-air, dry-bulb temperature.

    d. Outdoor-air-coil, discharge-air, dry-bulb temperature.

19. Inspect controls for correct sequencing of heating, mixing dampers, refrigeration, and normal and emergency shutdown.

20. Measure and record the following minimum and maximum airflows. Plot fan volumes on fan curve.

    a. Supply-air volume

    b. Return-air volume

    c. Relief-air volume

    d. Outdoor-air intake volume

21. Simulate maximum cooling demand and inspect the following:

    a. Compressor refrigerant suction and hot-gas pressures

    b. Short circuiting of air through condenser coil or from condenser fans to outdoor-air intake

22. Verify operation of remote panel including pilot-light operation and failure modes. Inspect the following:

    a. High-temperature limit on gas-fired heat exchanger

    b. Low-temperature safety operation

    c. Filter high-pressure differential alarm

    d. Economizer to minimum outdoor-air changeover

    e. Relief-air fan operation

    f. Smoke and firestat alarms

23. After startup and performance testing and prior to Substantial Completion, replace existing filters with new filters.

3.07 FIELD QUALITY CONTROL:

A. Manufacturer's Field Service: Engage a factory-authorized service representative to test and inspect components, assemblies, and equipment installations, including connections.

B. Perform tests and inspections with the assistance of a factory-authorized service representative.

C. Tests and Inspections:

1. After installing RTUs and after electrical circuitry has been energized, test units for compliance with requirements.

2. Inspect for and remove shipping bolts, blocks, and tie-down straps.

3. Operational Test: After electrical circuitry has been energized, start units to confirm proper motor rotation and unit operation.

4. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.

D. RTU will be considered defective if it does not pass tests and inspections.

E. Prepare test and inspection reports.

3.08 TRAINING:

A. Training: Provide classroom and field operation and maintenance instruction including all materials, slides, videos, handouts and preparation to lead and teach classroom sessions.

B. Coordinate training time with the Engineer and Owner.

3.09 ADJUSTING:

A. Adjust damper linkages for proper damper operation.

B. Comply with requirements in Section 23 05 93 for air-handling system testing, adjusting, and balancing.

C. Occupancy Adjustments: When requested within 12 months from date of Substantial Completion, provide on-site assistance in adjusting system to suit actual occupied conditions. Provide up to two visits to Project during other-than-normal occupancy hours for this purpose.

3.10 CLEANING:

A. After completing system installation and testing, adjusting, and balancing RTUs and air-distribution systems, clean RTUs internally to remove foreign material and construction dirt and dust. Clean fan wheels, cabinets, dampers, coils, and filter housings, and install new, clean filters.

3.11 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

DIVISION 26

ELECTRICAL

Page Intentionally Left Blank

SECTION 26 05 10

ELECTRICAL WORK – GENERAL

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide complete and operational systems for both normal and standby electric power systems, normal and emergency lighting systems, grounding systems and other specified systems, including the installation and wiring of miscellaneous equipment and devices. Perform all work and testing as indicated and specified.

1. Provide conduit, wiring and connections for power, control, lighting, instrumentation and alarms for equipment furnished by others unless otherwise specified and indicated.

2. Provide temporary circuits, overcurrent devices, conduit and wiring, and other equipment required during construction and change-over from existing to proposed electric system. Perform work at the convenience of the Owner.

3. Provide electrical system studies including a short circuit and protective device coordination study and an arc-flash study for the electrical distribution system constructed under this contract.

4. Install all raceways and equipment to meet the seismic design criteria of Section 01 41 20. Raceways supports and equipment anchoring shall be provided as specified in the Division 26 sections which form a part of the Contract Documents.

5. The equipment enclosure classification of the plant areas are indicated on the corresponding Drawings, not limited to Electrical discipline drawings. Provide all equipment, devices and material meeting the requirements for these area classifications unless otherwise noted or specified.

6. Review the electrical underground system and the civil yard piping. Install the electrical underground system in a manner that avoids conflicts with maintenance holes, catch basins, etc. provided under other Divisions of the specifications.

1.02 REFERENCES:

A. National Fire Protection Association (NFPA):

1. 70: National Electrical Code (NEC)

2. 70E: Standard for Electrical Safety in the Workplace

B. Occupational Health and Safety Administration (OSHA):

1. 1910.7: Definition and Requirements for a Nationally Recognized Testing Laboratory

1.03 SEQUENCING AND SCHEDULING:

A. Coordinate electrical equipment installation with other building components.

B. Arrange for chases, slots and openings in the building structures during the progress of construction to allow for the electrical installation.

C. Coordinate installing required supporting devices and set sleeves in poured-in-place concrete and other structural components as they are constructed.

D. Sequence, coordinate and integrate the installation of electrical materials and equipment for efficient flow of the work.

E. Coordinate the installation of large equipment prior to closing in the building.

F. Sequencing and scheduling work at existing facilities:

1. Coordinate electrical power outages to the electrical systems and equipment with the Owner. Where duration of proposed outage cannot be allowed by the Owner, phase the work to allow the system or equipment to be re-connected to the electrical power system within the time frame allowed by the Owner or provide temporary power connections as required to maintain service to the systems or equipment. The temporary power can be from a generator or another part of the facility not affected by the outage provided there is sufficient spare capacity.

a. The above requirement includes, but is not limited to, maintaining power and signal continuity to 3 existing flow meters, as identified on site plans.

2. Coordinate power change-overs and outages with Client, and obtain advance written approval.

1.04 QUALITY ASSURANCE:

A. Provide in accordance with Section 01 45 00 and as specified.

B. Install electrical work in conformance with latest rules and requirements of National Fire Protection Association Standard No. 70 (National Electrical Code) and in accordance with requirements of State and Local Codes.

1.05 QUALIFICATIONS OF ELECTRICAL SUBCONTRACTOR:

A. The Electrical Subcontractor shall have been engaged in work of a similar nature to this contract for the past 5 years.

B. The Electrical Subcontractor shall have a minimum of five projects of equal or greater size with the type of equipment specified under this project.

1.06 SUBMITTALS:

A. Submit the following in accordance with Section 01 33 00:

1. The following defines a minimum for all Division 26 shop drawing and data submittals:

a. Submit shop drawings delineated by specification number with all information for one piece of equipment provided as one package.

b. Partial submittals will be returned without action.

c. Submit bills of material: Include a numbered list of all components, with manufacturer's name, catalog number, rating, and other identification. Place item number or similar identification on all other drawings where item appears.

d. Submittal shall include:

(1) Manufacturer’s drawings

(2) Panel layout

(3) Equipment layout

(4) Schematic diagram

(5) One line diagram

(6) Control sequence diagrams

(7) Interconnection diagrams

(8) Wiring diagrams

(9) Catalog data

(10) Acceptable wire size range for wire termination hardware.

e. Submit only completed drawings showing all local and remote devices associated with each item.

f. Mark shop drawings and data submitted showing only items applicable to specific contract.

g. Where additions and modifications are made to existing equipment, provide drawings which include both retained existing equipment and new work.

h. Submit time-current characteristic curves for all submitted protection devices such as circuit breakers and fuses.

i. Submit other documentary or descriptive information as required for each assembly to demonstrate compliance with the applicable contract documents.

2. Shop drawings and data are required for the following list:

a. Starting Equipment Data List -Submit blank list initially to verify acceptable format. Submit final list at completion of the project.

b. Short Circuit and Coordination Studies Arc-Flash Studies

c. Harmonic Analysis

d. Conduit and Fittings

e. Wire and Cable

f. Wiring Devices

g. Transformers

h. Medium Voltage Switchgear and Load Switches

i. Maintenance Holes, Handholes, and Associated Equipment and Devices

cc. Paralleling Switchgear and Accessories

dd. Generator System Master Controller and Accessories

ee. Variable Frequency Motor Controllers, including Medium Voltage

ff. VFD-Controlled Electric Motors, including Medium Voltage

gg. Field Acceptance Test Reports

hh. Record Drawings

3. Submit instruction manuals for installation, operation, and maintenance of equipment, and parts list for equipment listed below. Specifically mark standard publications forming a part of this contract. Cross out, blank out, or otherwise delete non-applicable items. Submittals which do not clearly indicate items and features provided shall be rejected.

p. 600 Volt Motor Control Centers

q. Switchboards

1.07 NAMEPLATES AND LABELING:

A. Provide nameplates and labels as specified in Section 26 05 53.

1.08 INTERFERENCE AND ERRONEOUS LOCATIONS:

A. Locations of electrical equipment, devices, outlets, and similar items, as indicated, are approximate only. Exact locations shall be determined during construction.

B. Verify in field, all data and final locations of work installed under other sections of specifications, required for placing of electrical work.

C. In case of interference with other work or erroneous locations with respect to equipment or structures, furnish all labor and materials to complete the work.

1.09 SEISMIC DESIGN REQUIREMENTS:

A. Conform to the requirements indicated on the structural drawings and as specified in Section 01 41 20 and in Division 26.

1.10 APPROVAL AND MARKING EQUIPMENT:

A. Provide only devices and materials that are listed and/or labeled by UL, wherever standards have been established by that organization. Where a UL listing is not available for equipment, submit certified test reports of a Nationally Recognized Testing Laboratory (NRTL), approved by the local inspecting authority, indicating that

equipment is in conformance with local code requirements or any other applicable requirements. Tests and inspections for approval of equipment shall be performed at no additional cost to Owner.

B. Clearly mark equipment, devices and material with name or trademark of manufacturer and rating in volts and amperes and other pertinent information on a nameplate.

1.11 EQUIPMENT SPECIFIED ELSEWHERE:

A. Certain items of control equipment and other equipment are indicated on electrical drawings for connection, but are specified in other sections pertaining to plumbing, heating, ventilating and air conditioning, mechanical process, instrumentation, etc. Such items are not furnished as part of electrical work.

PART 2 - PRODUCTS

(Not Used)

PART 3 - EXECUTION

3.01 WORK IN EXISTING STRUCTURES:

A. In general, any or all existing electrical equipment and services are to remain in operation and shall not be disturbed unless otherwise noted in these Specifications and/or on the drawings or as required for the proper execution of the work. Provide at least two workdays written advance notice to Owner of intended disruption of equipment and services, and coordinate with Owner for approval to proceed.

B. In each area of the work, disconnect and carefully remove the existing electrical equipment and devices so noted. With the exception of items indicated as having to be re-used, all such existing equipment and devices shall be disposed of as specified herein. If not required by the Owner, remove them from the premises and site. All existing electrical equipment and devices indicated as not removed or abandoned are to be maintained in operation and any circuits disturbed by the construction shall be restored.

C. Maintain existing electrical services and systems to and in the buildings throughout the project and all “down-time” shall be scheduled at least two weeks in advance with the permission of the Engineer and such scheduling shall be rigidly adhered to.

3.02 PROTECTION OF ELECTRICAL EQUIPMENT:

A. Store equipment in compliance with manufacturer’s recommendations and as specified herein.

B. Protect electrical equipment from the weather, especially from water dripping or splashing upon it, at all times during shipment, storage, and construction.

C. Do not store equipment outdoors.

D. Where equipment is installed or stored in moist areas, or unheated buildings, provide acceptable means to prevent moisture damage. Provide uniformly distributed source of heat in electrical equipment to prevent condensation and damage to electrical insulation systems.

3.03 DEFECTIVE OR DAMAGED EQUIPMENT:

A. Damaged equipment shall not be used. Equipment damaged in shipment, storage, installation or through other means shall be replaced without additional cost to the Owner.

B. All equipment showing signs of water damage shall be rejected regardless of dielectric test results.

C. All electrical equipment is considered "in storage" regardless of location until first energized. Manufacturer's recommendations for storage precautions, conditions and care shall be followed.

3.04 STARTING EQUIPMENT DATA LIST:

A. Obtain data from the equipment supplier shop drawing submittals or equipment nameplates, and prepare a complete tabulation of all motors over 1/3 hp, electric heaters over 3 kW, and starting equipment for both, to be furnished on the project. Indicate building or facility from which the motor or heater is powered in the tabulation.

1. Include in tabulation firm the following information:

a. Name and identification of equipment

b. Manufacturer

c. Horsepower or kilowatt rating

d. Voltage

e. Phase

f. Speed

g. Full load current

h. Locked rotor current or code letter

i. Type of enclosure (open drip-proof, totally enclosed, fan cooled, etc.)

j. NEMA size of starter or contactor

k. Overload heater size

l. Type of starter (full-voltage, reduced-voltage, autotransformer, etc.)

m. Breaker trip setting or fuse size

n. Voltage of starter operating coil

o. If starter is at a motor control center, list motor control center number.

2. Final acceptance of the electrical system is contingent upon submittal of the complete motor and electric heater tabulation.

3. Arrange tabulation in groups by MCC or building location.

4. Furnish six copies of the tabulation to the Engineer when a submission is made.

3.05 DRAWINGS AND SPECIFICATIONS:

A. Drawings and specifications are typical of work to be done and of the arrangement desired. Provide accessories and appurtenances which the Engineer deems functionally necessary for a complete installation, whether or not explicitly indicated or described.

3.06 RECORD DRAWINGS:

A. The Contractor shall maintain a master set of record drawings showing the changes and deviations from the contract drawings.

B. A minimum of 30 days prior to application for Final Payment, submit two sets of drawings for approval that are marked to show the as-installed equipment, devices, raceway locations and wiring. The markings on the drawings are to be neat, clean and legible.

C. Provide electric power systems as-built record drawings, including submission to Owner within 90 days of system acceptance, or as required by other parts of these Specifications, or as per paragraph above, whichever is earlier. (Per 2018IECC C408.2.5.1).

3.07 CONTRACT CLOSEOUT:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

Page Intentionally Left Blank

SECTION 26 05 13

MEDIUM VOLTAGE CABLES

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide medium voltage cables, and accessories for systems rated above 2001 volts to 15,000 volts.

1.02 REFERENCES:

E. Insulated Cable Engineers Association (ICEA):

1. S-93-639/NEMA WC74: 5-46KV Shielded Power Cable for Use in the Transmission and Distribution of Electric Energy

2. S-97-682: Utility Shielded Power Cable rated 5-46kV

3. T-25-425: Guide for Establishing Stability of Volume Resistivity for Conducting Polymeric Components of Power Cables

F. National Fire Protection Association (NFPA):

1. 70: National Electrical Code

G. Underwriters Laboratories, Inc. (UL).

1. 1072: Medium-Voltage Solid Dielectric

1.03 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Submit shop drawings and manufacturers' product data in accordance with the requirements of Section 26 05 00.

C. Test Reports:

1. Certified copies of production sampling and completed cable test reports described in Paragraph 1.04 of this Specification shall be submitted prior to shipping cable in a legible and coherent format. This data should include the X-Y plot of the partial discharge test per ICEA.

2. Test reports shall be in a legible and coherent format and reported in accordance with AEIC CS8.

D. Catalogue Data: Submit catalogue data showing physical information, specifications used for manufacturing and materials used to manufacture cable.

E. Submittal Data Shall Include:

1. Letter stating cable meets specification and the date of cable manufacture.

2. Conductor size.

3. Conductor shield materials.

4. Insulation material.

5. Insulation thickness.

6. Diameter over insulation.

7. Insulation semi-conductor thickness.

8. Jacket material.

9. Jacket thickness.

10. Diameter of cable.

11. Weight per unit length of cable.

12. Cable pulling calculations including direction of pull.

13. Proof of NRTL listing and manufacturer's cutsheet indicating material meets criteria for purposes intended.

F. Certification of the Qualifications of Medium-Voltage Cable Installers: The certification shall be accompanied by satisfactory proof of the training and experience of persons listed by the Contractor as cable installers.

1.04 QUALITY ASSURANCE:

A. Provide in accordance with Section 01 45 00 and as specified.

B. Cable furnished under this specification shall conform to the latest edition of Insulated Cable Engineers Association (ICEA S-93-639) or its successors, except as specifically modified herein.

C. The completed cable shall meet or exceed all Insulated Cable Engineer's Association (ICEA), and Association of Edison Illuminating Companies (AEIC) physical and electrical tests. Tests shall be performed and frequency of sampling shall be in accordance with the latest edition of ICEA S-93-639 except as modified herein. All tests required by this specification, AEIC and ICEA shall be performed.

D. Cable shall be manufactured and tested using good care and workmanship.

E. EPR insulated cable shall be manufactured by a dry or steam curing process.

F. The conductor shield, the insulation, and the semiconducting insulation shield extrude in a triple tandem, dual tandem, or true triple process.

G. Production sampling tests shall be in accordance with ICEA S-93-639, ICEA S-97-682, and AEIC CS8.

H. AC Voltage Tests: Each factory reel length shall withstand AC voltage tests by the manufacturer at the factory in accordance with ICEA S-93-639.

1.05 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

B. The cable shall be placed on the shipping reel with both ends of cable accessible for proof testing. Ends of cable shall be sealed with weatherproof material prior to shipment.

C. Each end of each length of cable shall be hermetically sealed and securely attached to the reel.

D. Minimum reel drum diameter shall be 14 times the overall diameter of the cable.

E. A pulling eye shall be installed by the manufacturer for each length of cable supplied for installation in ducts, manholes, and utility tunnels.

PART 2 - PRODUCTS

2.01 MANUFACTURERS:

A. Medium voltage cables as manufactured by:

1. Okonite

2. Prysmian Cables & Systems

3. Southwire

B. The cable manufacturer shall have a minimum of 10 years proven and successful experience with the manufacturing of EPR insulated cables.

C. All cable furnished shall be installed within 12 months of manufacture date. Labeling of cable shall be per NEMA and shall contain no less than the following information:

1. Name of Manufacturer

2. NEC Designation

D. Cable shall be operated at 60 Hertz, single or three phase at system voltage of 5 kV or 15 kV. Suitable installations include in conduit for wet or dry location and in open air in sunlight.

2.02 CONDUCTOR:

A. The conductor shall be Class B concentric lay stranding, uncoated copper in accordance with ASTM B3 and B8 and ICEA S-93-639 with the minimum number of wires noted below:

Conductor Size Range	Number of Strands
8 - 2	7
1 - 4/0	19
250 - 500	37
501 – 1,000	61

B. Conductor shall be free from moisture, corrosion and excessive drawing lubricant before conductor shielding is applied.

2.03 CONDUCTOR SHIELD (STRAND SCREEN):

A. The strand screen shall consist of an extruded semiconducting thermosetting compound applied over the conductor. It shall be of a material compatible with the thermal characteristics of this conductor metal and insulation, shall be uniformly and firmly bonded to the overlying insulation, and shall be free stripping from the conductor. A semiconducting tape may be applied between the conductor and the extruded conductor screen. Okonite EPR based semiconductor is an approved exception.

B. The D-C volume resistivity of the extruded conductor shield shall not exceed 1000 meter-ohms at the maximum normal operating and emergency operating temperature accordance with ICEA Publication T-25-425.

C. The extruded strand shield shall have a minimum elongation of 100 percent after an air oven test at 250 degrees F for seven days and a brittleness temperature not warmer than 14 degrees F.

D. The contact area between the insulation and conductor shield shall not exhibit projections or irregularities which extend from the cylindrical surface of the conductor shield by more than 5 mils toward the insulation or 10 mils away from the insulation.

2.04 INSULATION:

A. Insulation shall conform to ICEA S-93-639 except as modified herein and shall be the following, or a prior acceptable equivalent product:

1. The insulation shall be a high quality heat, moisture, ozone, and corona resistant high dielectric strength ethylene propylene rubber compound. It shall be contrasting in color from the extruded strand and insulation screens. It shall contain less than 5 percent polyethylene, and the ethylene content of the elastomer

shall not exceed 72.5 percent by weight of ethylene to limit susceptibility to treeing.

2. Insulation shall be for use in wet or dry locations at conductor temperatures not exceeding 220 degrees F for continuous operation, 285 degrees F emergency overload conditions, and 480 degrees F short circuit conditions.

B. The insulation shall have a minimum and maximum thickness for a 133 percent insulation level as specified in Table II below:

TABLE II

Rated Circuit Voltage (kV) Phase to Phase	Conductor Size (AWG or kcmil)	Minimum Insulation Thickness (mils)	Maximum Insulation Thickness (mils)
5	8 – 1,000	85	120
8	6 – 1,000	115	170
15	2 – 1,000	210	250

C. Insulation shall be homogeneous and free of gels or discolorations larger than 10 mils.

D. The insulation shall meet or exceed the requirements of all tests specified in ICEA S-93-639.

E. The interface between the insulation and insulation shield shall be free of contaminants larger than 4 mils. The insulation shall be free from contaminants, gels and agglomerates larger than 10 mils.

2.05 INSULATION SHIELD (INSULATION SCREEN):

A. Insulation shield shall conform to ICEA S-93-639, except as modified herein.

B. The insulation screen shall consist of an extruded, semiconducting thermosetting compound applied over and compatible with the insulation. It shall be of a material compatible with the thermal and chemical characteristics of the insulation and the overlaying metallic shield. Okonite EPR based semiconductor is an approved exception.

C. The thickness with corresponding minimum and maximum points shall be as specified in Table III:

TABLE III		
Calculated Minimum Diameter over Insulation Inches	**Insulation Shield Minimum Point Thickness, mils**	**Insulation Shield Maximum Point Thickness mils**
0 - 1.000	24	60
1.001 - 1.500	32	60
1.501 - 2.000	40	75
2.001 & Larger	40	90

D. The insulation shield shall not alter its physical or electrical properties from exposure to sunlight or the elements.

1. The extruded insulation shield shall have a minimum elongation of 100 percent after an air oven test at 250 degrees F for 7 days and a brittleness temperature not warmer than minus 22 degrees F.

E. The D-C volume resistivity of the extruded insulation shield shall not exceed 75 meter-ohms at 194 degrees F when tested in accordance with ICEA Publication T-25-425.

F. The insulation shield shall be free stripping from the insulation, and the tension necessary to remove the extruded insulation shield shall be 3 to 24 pounds at room temperature when tested in accordance with ICEA S-93-639.

G. The contact area between the insulation and insulation shield shall not exhibit projections or irregularities, which into the insulation from the insulation shield more than 5 mils and into the insulation shield from the insulation more than 7 mils.

2.06 METAL TAPE SHIELD:

A. Cable shall have a metal tape or metal tape with wire shield.

B. A copper tape with nominal thickness of 0.005 inches shall be applied directly over the insulation shield. The tape shall be of suitable width and shall lap at least 12.5 percent of its width. The tape shall be free from burrs and, where jointed, shall be made electrically continuous. (If wire shield is used, it shall be mechanically and electrically comparable).

C. Application of tape shield or wire shield shall not deform the insulation.

2.07 JACKET:

A. The jacket shall be black polyvinyl chloride compound meeting the requirements of ICEA S-93-639.

B. The average thickness of the jacket shall be not less than the values specified in the following table. The minimum thickness of the jacket at any point shall be not less than 80 percent of the specified minimum average thickness.

TABLE IV	
Calculated Diameter of Cable under Jacket, inches	**Min. Thickness of Jacket, mils**
0.700 and Smaller	55
0.701 - 1.500	70
1.501 - 2.500	100
2.501 and Larger	125

C. Linear shrinkage of the jacket shall not exceed the linear shrinkage of the insulation.

D. The jacket shall be sunlight resistant in accordance with the requirements of UL 1072.

2.08 CABLE DIMENSION:

A. Cable dimensions shall be in accordance with ICEA S-97-682

B. Diameters over insulation shall be in accordance with ICEA S-97-682.

2.09 CABLE TERMINATIONS:

A. Outdoor: See Splices and Taps paragraphs for connections below-grade.

B. Indoor: Terminations that are inside equipment or weatherproof compartments of outdoor equipment, such as transformers and switchgear.

1. Terminations of shielded power cables rated 15 kV or less shall be done with an IEEE Standard 48 Class 1 termination. It shall either be a one-piece design, where high-dielectric constant stress control is integrated within a skirted insulator made of silicone rubber, gray in color or provide for positive placement of the stress control with the installation of a stress patch. The termination shall not require heat or flame for installation. The terminations shall be 3M Brand 5630 K Series Quick Term II cold shrink Termination Kits or Raychem TFT-E-SG. Only a NEMA 2-hole, long-barrel terminal connector shall be used. The connector shall be listed for copper/aluminum applications.

2. Where connecting inside of electric motors, provide terminations per connecting equipment manufacturer requirements, including spring-tension bonding of conductor shield(s) at both ends. It is not acceptable to only bond power connection grounding features at only one end.

C. Cable terminations shall have voltage ratings of not less than 15,000 volts (ungrounded neutral). The standard withstand test voltage of the completed terminations shall conform to IEEE Standard No. 48.

2.10 SPLICES AND TAPS:

A. Unless specified otherwise, all splices and taps shall be as per items B & C below. Only where hand-made splices are called out on the contract documents shall Item D apply.

B. In manholes and maintenance holes, splices for feeders shall only be 600 Amp non-loadbreak power distribution connectors. Acceptable manufacturers are ABB/Elastimold Catalog #K655BLR or equals from 3M, Eaton/Cooper, Hubbell, or approved equal. Provide manufacturer's corresponding cable adapter and compression connector sized per phase conductor. Elastimold or Cooper insulating plug, basic insulating plug and/or connecting plug shall be required for assembly. The only acceptable tape shield adaptors are Elastimold 20MA or 3M 8460/8460 ground shield adapter kit. Cooper tape shield adapters are not to be used.

1. Splices other than those in (B), above, are prohibited.

2.11 CABLE IDENTIFICATION TAGS:

A. The cables shall have identification tags in manholes (at conduit entrances and splices) and at equipment terminations indicating feeder number and routing (Example: Routing: "To MH-36", "To 01-TR-99110A". Feeder: "F01TR99110A"). The tags shall be 1 inch polypropylene plastic (Almetek EZH9) affixed to cables with plastic or nylon ties.

B. At underground riser poles where feeders make a transition from underground to overhead, the feeder number will be 2 inch x 2 inch black letters on yellow background adhesive-backed numbers. These numbers shall be attached to an aluminum strip nailed to wood or banded to steel pole above the cable terminator bracket.

2.12 FIREPROOFING:

A. Cables in manholes shall be fireproofed with one layer of one half-lapped 3M 77 tape applied and held in place with 3M 69 tape. The fireproofing tape shall completely cover each cable and hand-taped splice from duct entrance to duct exit. All three-phase cables shall be fireproofed together ending a minimum of 6 feet from the T-splice, and then individually wrapped up to the T-splice. Extend the fireproofing 1 inch into duct. The fireproofing tape shall extend 1 inch (minimum) onto the splice/T-connector body.

PART 3 - EXECUTION

3.01 INSTALLATION:

A. All work on primary conductors shall be done only when such conductors and equipment are de-energized.

1. Written request for outages shall be submitted twenty-one (21) calendar days in advance of the outage date. This request will delineate the particular circuit or service interrupted and the approximate hours the utility shall be off.

2. The work to be performed during an interruption of electrical utilities will be preceded by all possible preparation and will be carefully coordinated to minimize the duration of the interruption and work will proceed continuously until the system is restored to normal.

3. Phasing of reconnected feeders shall be identical to the existing phasing.

B. Install and terminate primary cables in accordance with the manufacturer's approved recommendations and tools suggestions. The conductors shall be free of kinks and twists, and all bends shall be formed with smooth radius not smaller than twelve times the diameter of the cable nor smaller than the minimum radius recommended by the manufacturer, whichever is greater. All 600 amp and 200 amp terminations shall be mounted to avoid any stress on the terminations.

C. The two-hole cable connectors shall be crimped with only the manufacturer's approved tool recommendations.

D. All cables in one conduit shall be pulled in together using a suitable patented grip on the conductors with a basket weave grip over the insulation, arranged so the stress of pulling is applied to the conductor and not the insulation.

E. Use a swivel between the cable grip and pulling rope.

F. Lubricate cables with Cable lube or Minnearallac cable pulling compound or the type approved by the cable manufacturer.

G. Maximum pull tensions shall not exceed values recommended by the cable manufacturer or as specified on the drawings. Pulls shall be made in the directions shown in the submitted cable pulling calculations.

H. Install cables in manholes along wall as specified on drawing providing proper support. In manhole, route cables a minimum of 3/4 of manhole perimeter.

I. Cable shield shall be grounded with #6 bare copper to manhole ground at all terminations to provide permanent, low-resistance bond.

J. After cables have been terminated or spliced and fireproofing tape applied, each cable shall have a spiral wrap of colored 1/2-inch wide tape 3M #35 vinyl plastic applied over the fireproofing tape. Spiral wrap of colored tape shall be over the total length of cable, with maximum of 5-inch separation between spirals. The color coding is as follows:

1. 2400 volt - No Colored Tape Required

2. 4160 volt - Red Tape (3M #10224)

3. 12470 to 13,800 volt - Blue Tape (3M #10240)

K. Seal all duct runs in manholes going inside buildings with a water-tight seal.

L. Cables of the same circuit shall be identified by tags in manholes (at conduit entrances and T-splice) and entrances into equipment. Information on tags shall include: circuit number and routing (circuit number will be confirmed at the outage coordination meeting). Tags shall be installed on each cable after fireproofing (see Part 2.12).

M. Cables of the same circuit shall have the phasing identified with color tape in manhole. Phase A with one wrap, Phase B with two wraps, Phase C with three wraps.

3.02 CABLE ENDS:

A. After cutting, if cable ends are not to be terminated in same working day cut, immediately protect cable ends from damage or moisture by sealing with cable caps and silicone sealant. Provide stress relief at all terminations. Provide correct phasing of the conductors of each circuit at all terminations. Provide proper connections of tape shield or tape shield and drain wire to ground.

3.03 TEST PREPARATION:

A. Prior to energizing the cable, testing of the cable shall be performed in the presence of the Engineer.

B. Exposed ends of cable shall be prepared and cleaned prior to testing in order to minimize any leakage current.

C. Cable circuit ends must be cleaned and guarded for personnel safety during cable testing. Circuits not under test in the immediate vicinity shall be grounded.

3.04 FIELD TESTING AND RECORDS:

A. Each power cable shall first be given a full dielectric-absorption test with 5000-volt insulation-resistance test set.

1. Test shall be applied for a long enough time to fully charge the cable.

2. Readings shall be recorded every 15 seconds during the first 3 minutes of test and at 1 minute intervals thereafter.

3. Test shall continue until three equal readings, 1 minute apart, are obtained.

4. Minimum reading shall be 200 megohms at an ambient temperature of 68 degrees F.

5. Readings taken at other than 68 degrees F ambient temperatures shall be corrected accordingly.

B. Upon successful completion of the dielectric adsorption tests, the cable shall be subjected to a direct-current high-potential test for 5 minutes with test voltages applied in accordance with AEIC CS8 and IEEE Std. 400.2 for cross-linked, polyethylene-

insulated cable; and AEIC CS8 and IEEE Std. 400.2 for ethylene propylene rubber-insulated cable.

1. Leakage current readings shall be recorded every 30 seconds during the first 2 minutes and every minute thereafter for the remainder of the test.

2. When the leakage current continues to increase after the first minute, the test shall be immediately terminated and steps taken to find and correct the fault. When a second test becomes necessary, this test procedure shall be repeated.

C. Upon satisfactory completion of the high-potential test, the cable shall be given a second dielectric adsorption test as before.

D. Results of the second dielectric-adsorption test shall agree with the first test and shall indicate no evidence of permanent injury to the cable caused by the high-potential test.

E. Test data shall be recorded and shall include identification of cable and location, megohm readings versus time, leakage current readings versus time, and cable temperature versus time.

F. Final acceptance shall depend upon the satisfactory performance of the cable under test.

G. Exposed circuit ends under test require a minimum separation from all elements not subjected to a test of 1 inch per 10 kV of test potential. After testing, cables shall be grounded for a minimum of 4 times (4X) as long as the test voltage was applied during the hi-potential tests to assure complete discharge.

H. When all cable, splices and terminations have been tested and test results have been accepted by the Engineer, the cable system may be placed in service.

3.05 CONTRACT CLOSEOUT:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 26 05 20

ELECTRIC WIRES AND CABLES

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide wires and cables for complete electrical systems as indicated and specified.

1.02 REFERENCES:

A. ASTM International (ASTM):

1. B3: Soft or Annealed Copper Wire.

2. B8: Concentric-Lay-Stranded Copper Conductors, Hard, Medium-Hard, or Soft.

3. B33: Tinned Soft or Annealed Copper Wire for Electrical Purposes.

B. Insulated Cables Engineers Association, Inc. (ICEA)/National Electrical Mfg's Association (NEMA):

1. S-61-4021/WC 5: Thermoplastic Insulated Wire & Cable.

2. S-66-524/NEMA WC 7: Cross-Linked-Thermosetting-Polyethylene Insulated Wire and Cable.

3. S-68-516/WC 8: Ethylene-Propylene-Rubber-Insulated Wire & Cable.

C. National Fire Protection Association (NFPA):

1. 70: National Electrical Code (NEC).

D. Underwriters Laboratories, Inc. (UL):

1. 44: Thermoset-Insulated Wires and Cables.

2. 83: Thermoplastic-Insulated Wires and Cables.

3. 854: Service Entrance Cables.

1.03 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Submit shop drawings and manufacturer's product data in accordance with the requirements of Section 26 05 10.

1.04 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

B. Deliver wire and cables in full reels protected against injury. Deliver reels with factory attached UL approved tags showing the manufacturers name and the type of insulation, size, and length of wire in each coil or reel.

C. Accept wire and cable on site in manufacturer's packaging. Inspect for damage.

D. Store and protect in accordance with manufacturer's instructions.

E. Protect from weather. Provide adequate ventilation to prevent condensation.

1.05 DESIGN CRITERIA:

A. Wire for lighting, single phase circuits shall be Type XHHW or THWN-THHN.

B. Wire for three phase circuits shall be Type XHHW.

C. Service conductors are not anticipated. Contact Engineer for clarification if required.

D. Single conductor wire for control, indication and metering shall be Type THWN-THHN No. 12 or 14 AWG, stranded.

E. Multi-conductor control cable shall be used for the underground system and shall be No. 12 or 14 AWG, stranded with overall jacket.

F. Wire for process instrumentation shall be twisted shielded pairs No. 16 AWG, stranded with overall jacket, unless noted otherwise. Reference Instrumentation Loop Diagrams for additional requirements.

G. Ground wires shall be Type THW, green. Bare ground wires shall be soft drawn copper, 98 percent conductivity.

H. Wire for power circuits installed in duct banks shall be type RHW.

PART 2 - PRODUCTS

2.01 MANUFACTURERS:

A. 600V Cable:

1. Okonite.

2. Southwire.

3. American Insulated Wire.

B. Control and Metering Wire:

1. Belden Wire and Cable.

2. Alpha Wire.

3. Coleman Cable.

C. Cable Fireproofing Tape:

1. MAC Products, Inc.

2. 3M Electrical Products.

2.02 MATERIALS AND COMPONENTS:

A. Furnish copper conductors. Material and stranding of conductors to conform to ASTM B3, ASTM B33, and to ASTM B8, for the appropriate class.

B. Uncoated, soft or annealed copper wire conforming to ASTM B3.

C. Superseding the following paragraphs, where connecting between a Variable Frequency Motor Controller (VFMC) and a motor, unless a suitable filter is required and provided, then provide multi-conductor cable, with:

1. 2kV-insulation system.

2. Identification for use on the load side of a VFMC or VFD

3. XHHW or other polyethylene insulation over phase conductors

4. 3-conductor parallel symmetric equipment grounding conductors

5. Overall foil shield

6. Overall insulated jacket, with cable ratings for the intended purpose.

7. Acceptable manufacturers are Belden, Southwire, and General Cable, and pre-approved equals.

8. Include cable manufacturer's recommended VFD termination kit that maintains contstant spring tension against the overall shield, at both ends of the cable.

D. Wires and Cables for Maximum 600-Volt Power Circuits: Where used in lighting or receptacle branch circuits provide No. 12 AWG gauge and No. 10 AWG gauge as solid conductor. Provide other wire with Class C stranding. Provide No. 6 AWG gauge and larger with Class B stranding. Provide wires and cable conforming to UL 83.

E. Wires and Cables for Maximum 600-Volt Power Circuits: For No. 8 AWG gauge and smaller provide type THWN/THHN or RHW, except for three-phase circuits which shall be XHHW-2 per Paragraph 1.05.B.

F. Wires and Cables for Control, Indicating, Metering, or Alarm Circuits: Single and multi-conductor control cable, copper conductors, Class B or C stranding. Insulation; 600-volt polyethylene, polyvinylchloride, or EPR. Continuous rating of 90C dry and 75C wet. Color coding conforming to Table K-2, ICEA/NEMA S-61-4021/WC 5.

G. Shielded Cable for Instrumentation Wiring: 7-strand copper conductors, size No. 16 AWG. Insulate conductors individually with color coded polyethylene or polyvinylchloride. Twist pairs with varying lay (if more than one pair) and cover with cable tape and copper or aluminum coated Mylar shielding tape and tinned copper drain wire. Jacket: Polyvinylchloride.

H. Cables: Rated 600 volts and 90 degrees C, using ampere rating of 75 degrees C if so limited by equipment terminal temperature ratings.

I. Category 6 Cable: Reference Section 27 15 13 for requirements.

PART 3 - EXECUTION

3.01 GENERAL:

A. Perform work in accordance with the National Electrical Code.

B. Provide power cable identification as follows:

System Voltage	Neutral	Phase A	Phase B	Phase C
208/120V	White	Black	Red	Blue
240/120V	White	Black	Red	None
480/277V	Gray	Brown	Orange	Yellow

C. Use green to identify insulated ground conductors.

NOTE: Colored insulation, tapes or sleeves may be used to provide color coding where permitted by the NEC. Insulated ground conductors must have green covering.

D. Permanently post means of identification of grounded and ungrounded conductors for each nominal voltage system at each panelboard and motor control center.

E. In power and multiconductor cables manufactured without a grounding conductor identify one of the multi-conductors as the equipment grounding conductor at each cable end and at every point where the conductors are accessible.

3.02 INSTALLATION OF WIRING:

A. Unless otherwise indicated, use no conductor smaller than No. 12 AWG for power, No. 14 AWG for control, and No. 16 AWG for shielded applications.

B. Install conductors continuous from outlet to outlet and make no splices except within outlet or junction boxes.

C. Install cable in underground raceway system without splices. There shall be no splices between connection points unless otherwise indicated.

D. Draw all conductors contained within a single conduit at the same time.

E. Apply wire pulling compound to conductors being drawn through conduits. Use pulling compound, Minerallac No. 100, Y-er-Eas, Yellow 77, High Performance Polywater Cable Lubricant.

F. Use no cable bend with radius of less than eight times its diameter.

G. Wires and cables installed without prior submittal review are subject to removal at no additional expense.

H. Where cable is furnished with an overall shield:

1. Power applications – Bond shield to equipment ground bus at both ends of the system.

2. Signal applications, such as 4-20mA analog, thermocouple extension wire, and Current Transformer (CT) wire – Bond shield to equipment ground bus at central equipment, and not at the end termination equipment, unless otherwise noted. Clip and tape shield to avoid creation of inadvertent ground loops, unless otherwise noted. See Process Specifications and Drawings for additional requirements.

3.03 CONDUCTOR IDENTIFICATION:

A. Label each wire at both termination points. Carry individual conductor or circuit identification throughout, with circuit numbers or other identification clearly stamped on terminal boards and printed on directory cards in distribution cabinets and panelboards. Also label every cable in each maintenance hole. Provide imprinted or engraved stainless steel label where lableling inside maintenance holes.

B. Identify each wire in junction boxes, cabinets, and terminal boxes where total number of control, indicating, and metering wires is three or more and no terminal board is provided, including all power wire. Where no termination is made use a plastic-coated, self-adhesive, wire marker and where termination is made use a, plastic, pre-printed sleeve wire marker.

C. In cases similar to above where terminal boards are provided for the control, indicating, and metering wires, identify all wires including motor leads and other power wires too large for connection to terminal boards, by sleeve wire markers as specified above.

D. In maintenance holes and handholes, identify each power wire by laminated plastic tag located so it is easily seen. Control wires to be bundled and marked as listed in conduit and wire schedule.

3.04 CONNECTORS, TERMINAL LUGS AND BOARDS:

A. For wiring of circuits consisting of No. 10 or No. 12 AWG solid wires, such as for lighting branch circuits, use self-insulated pressure type connectors for all splices or joints.

B. Terminate all wires connected to terminal boards, terminal blocks, or to other similar terminals by means of ring or tongue, nylon self-insulated, tin-plated copper pressure terminals.

C. Terminal boards shall be 600 volts and rated for 125 percent of the ampacity of the connected circuit. They shall have screw terminals, with white marking strips for wire identification, of the 4-, 6-, 8-, or 12-pole type, as necessary.

D. Wire connections for which terminals are not supplied, for example, at solenoids or motor terminal junction boxes:

1. 10 AWG and smaller: Use self-insulated pressure-type connectors.

2. 8 AWG and larger: Use insulated, mechanical type with set screw or follower bearing directly on the wire. Split bolt connectors are not acceptable.

E. Clearly and permanently mark terminal strips with ink or indelible pencil. Mark each wire consistently throughout entire system, using notation of wires given on manufacturer's wiring diagrams wherever possible.

3.05 FIELD TESTING:

A. Submit results of all cable tests on forms indicating cable size, voltage, and date with name of tester and witness.

3.06 CONTRACT CLOSEOUT:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 26 05 26

GROUNDING AND BONDING FOR ELECTRICAL SYSTEMS

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide a single, complete, integrated grounding system, including conductors, raceways, and connections, indicated and specified, and in accordance with the National Electrical Code Article 250 and the National Electrical Safety Code.

B. Include grounding of switchgear, substations, motor control centers, electric equipment enclosures etc., outdoor substations, transformers, switch structures, etc.; ground grid systems with ground rod and water pipe connections; structural steel, and lightning protection system.

C. Include grounding conductors completely inter-connecting water supply pipe, ground rods, ground grid, substation, switchgear and motor control center ground buses, other distribution equipment, and other groundable equipment.

1.02 REFERENCES:

A. American National Standards Institute (ANSI)/Institute of Electrical and Electronics Engineers (IEEE):

1. ANSI/IEEE C2: National Electrical Safety Code.

B. ASTM International (ASTM):

2. B8: Standard Specification for Concentric-Lay-Stranded Copper Conductors, Hard, Medium-Hard, or Soft.

3. B33: Standard Specification for Tinned Soft or Annealed Copper Wire for Electrical Purposes.

C. Institute of Electrical and Electronics Engineers (IEEE):

1. Standard 81: Guide for Measuring Earth Resistivity, Ground Impedance, and Earth Surface Potential of a Ground System.

D. National Fire Protection Association (NFPA):

1. 70: National Electrical Code

2. 780: Lightning Protection Code

E. Underwriters Laboratories (UL):

1. 467: Standard for Grounding and Bonding Equipment.

1.03 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00:

B. Submit shop drawings and manufacturers' product data in accordance with requirements of Section 26 05 10.

C. Submit catalog and dimensional data for the following:

1. Ground rods

2. Conductors

3. Exothermic welding

4. Connecting hardware

D. Submit grounding system test results.

PART 2 - PRODUCTS

2.01 MANUFACTURER'S COMPLIANCE:

A. Manufacturer's acceptance contingent upon products' compliance with the specifications.

2.02 MANUFACTURERS:

A. Ground Rods:

1. ERICO Products Inc.

2. Galvan Electrical Products

3. Nehring Electrical Works

B. Conductors:

1. Southwire

2. General Cable

3. Republic Wire

C. Exothermic Welding:

1. ERICO Products, Inc.

2. American Brass Mfg. Co.

3. Orgo-Thermit, Inc.

D. Connecting Hardware:

1. American Brass Mfg. Co.

2. Thomas and Betts

3. Anderson Electric Corp.

2.03 MATERIALS AND COMPONENTS:

A. Conductors:

1. Provide copper grounding conductors bare or insulated, sized as indicated. When not indicated on the drawing provide in accordance with the NEC. Provide protection of conductors in locations where physical damage would result from direct exposure.

2. Ground and bond wires for substations, main panels and distribution points, and ground rod connections shall be annealed bare copper conforming to ASTM B3, stranded, with 98 percent conductivity.

3. Equipment ground conductors run with circuit conductors and grounding electrode conductor shall be 600 volt with green insulation, unless noted otherwise on the Contract documents.

4. Unless noted otherwise, all conductors No. 8 AWG and larger shall be stranded, Class B in accordance with ASTM B8.

a. Uninsulated conductors shall be bare copper in accordance with ASTM B3, tinned in accordance with ASTM B33.

b. Use tinned-coated in corrosive environments including when buried in earth or embedded in concrete.

B. Ground Bus:

1. Provide a 4 by 1/4 inch copper bar complete with bolted type connectors as indicated.

2. Bus bar shall have 18 pre-drilled holes, two standoff insulators, two stainless steel mounting brackets and four stainless steel assembly bolts and lock washer.

C. Connectors and Fasteners:

1. Provide ground clamps which are UL listed for use on copper or brass pipes.

2. Provide ground clamps, for use on iron pipes, of galvanized or malleable iron, or of standard noncorrosive material for use on iron pipes.

3. Provide ground clamps, for use on pipes, with rigid metal base providing good contact by proper seating on the pipe. Do not use strap type clamps.

D. Ground Rods:

1. Ground rods shall conform to the requirements of NFPA 70 and UL Standard 467.

2. Ground rods shall be copper-clad steel rods not less than 3/4 inch in diameter and not less than 10 feet long per section.

3. Ground rods shall be clean and smooth with the following characteristics:

a. Cone-shaped point on the first section.

b. Die-stamped near the top with the name or trademark of the manufacturer and the length of the rod in millimeters or feet.

PART 3 - EXECUTION

3.01 EXOTHERMIC WELDING:

A. Welding shall be by the exothermic process.

B. Within the welding procedure, include the proper mold and powder charge and conform to the manufacturer's recommendations.

C. Welding processes shall be the exothermic fusion type that will make a connection without corroding or loosening.

D. The welding process shall join all strands and not cause the parts to be damaged or weakened.

E. Completed connection or joint shall be equal or larger in size than the conductors joined and have the same current-carrying capacity as the largest conductor.

F. Paint buried ground connection with a bitumastic paint.

3.02 INSTALLATION OF GROUNDING CONDUCTORS:

A. Install grounding conductors so that they will not be exposed to physical damage. Install connections firm and tight. Arrange conductors and connectors so no strain on connections.

B. Run grounding conductors associated with direct burial cables in common trenches above cables except as indicated otherwise.

C. Bury equipment grounding conductors 30 inches deep. Bring loops or taps up for connection to equipment or other items to be grounded.

D. Where raceways are used to contain and protect grounding conductors, install in accordance with Sections 26 05 33 and Section 26 05 43.

E. Where bare grounding conductors are contained within metallic raceways, bond ends of raceways to conductors.

F. Install loop type, low impedance, grounding system interconnecting all components so at least two grounding connections are provided for each major item of electrical equipment. Ensure that severing of any single grounding conductor in this system does not remove grounding protection on any major item. Locate loop conductor at least 36 inches below finished grade, or at least 2 inches below depth of frozen soil observed during excavation, whichever is deeper.

G. Bond steel columns, steel arches, and other vertical/near-vertical structural steel to both lighting protection system and to the ground ring, near the top and bottom of the steel vertical.

H. Connect structural steel to the external perimeter loop of grounding conductors installed around all sides of building foundation. Connect to each vertical column by loop or tap. Connect two opposite points on external loop to two different points on grounding system.

I. Buried and concealed ground connections shall use exothermic welding.

J. Make accessible connections to structural members by exothermic welding process or by bolted connector. Connections to equipment or ground bus by bolted connectors.

3.03 INSTALLATION OF GROUND RODS:

A. Install ground rods in maintenance holes in accordance with requirements specified under the section Underground Distribution Systems. Connect each grounding conductor entering a maintenance hole to ground rod by exothermic weld.

B. Install ground rods where indicated. Install the top of the rod 12 inch below the ground surface.

C. Make connection to overall grounding system as indicated.

D. Ensure that final resistance of interconnected ground system is 5 ohms or less. Measure ground resistance in normally dry conditions, and not less than 48 hours after rainfall.

3.04 EQUIPMENT GROUNDING:

A. Ground each piece of electrical equipment by means of a grounding conductor installed in raceway feeding that piece of equipment. Grounding conductors installed in conduit with insulated conductors to be furnished with green, 600 volt insulation. Ground conductors are in addition to and not to be considered as the neutral wire of the system.

B. Connect power transformer cases and neutrals to grounding system. Connect neutral ground connection at transformer terminal. Provide two separate, independent, diagonally opposite, connections for power transformers so removal of one connection will not impair continuity of other.

C. Connect two separate ground connections from ground grid to ground bus of switchgear assemblies, motor control centers, switchboards and all outdoor substation and transformer equipment. Ensure that each connection for item of equipment is from different section of ground grid.

D. Connect a grounding conductor between panelboard and grounding system. Where a grounding bar is furnished with panelboard, connect grounding conductor to bar.

E. Conduits entering metal enclosures shall utilize bonding type locknuts and grounding bushings. Locknuts that gouge into the metal enclosures are not acceptable.

F. Where conduits are not effectively grounded by firm contact with a grounded enclosure, apply grounding bushings on at least one end of conduit run. Conduit connections shall be wrench tight.

G. Connect grounding conductors from equipment in area where ground bus is required to ground bus. Connect ground bus to grounding system. Mount ground bus on 600 volt pedestal insulators.

H. Connect lightning arresters to ground system by suitable conductors. Where lightning arresters are furnished with electrical equipment and grounding connections are not inherently provided, ensure that suitable separate grounding conductor connects lightning arresters with system ground.

I. Ground transformers, lightning arresters, insulators and other appurtenances, installed on timber or metal structure. Run grounding conductors between structure and ground rods. Protect grounding conductor by molding applied for at least 8 feet above ground, with both molding and conductor stapled. Install ground rod where indicated and driven until top of rod is 1 foot below ground.

J. Connect individual ground rods to the grounding loop using the direct burial grounding cable (ground ring).

K. Bond individual cable tray sections with bonding jumpers.

3.05 SIGNAL GROUNDING:

A. Ground signal surge protection and shields of twisted, shielded cable using a signal bonding conductor. The signal bonding conductor shall be a continuous path from the instrument surge protection or shield to the grounding electrode conductor. The signal bonding conductor shall be isolated from the equipment grounding conductor for its entire path.

B. Where convenient, several signal bonding conductors may be combined, providing that all the following conditions are met:

1. The combined signal bonding conductor shall have the equivalent cross section of the conductors that it was combined from or three times the cross section of the largest conductor that it was combined from, whichever is less.

2. The combined signal bonding conductor shall be isolated from the equipment grounding conductor.

3. Where two signal bonding conductors are combined use a three port insulated splice.

4. Where three or more signal bonding conductors are combined, use a copper bus mounted on 600 volt insulators. Attach each conductor to the bus using an insulated ring tongue lug and screw terminal.

C. Isolate shields at non-bonded end to avoid current flowing from point-to-point over the shield from stray currents commonly present is the equipment grounding system.

3.06 FIELD TESTING:

A. Test grounding systems for ground resistance. Total resistance from any point on the ground network to the building counterpoise must not exceed 50 milliohms.

B. Ground resistance and counterpoise tests must be made during dry weather and no sooner than 48 hours after rainfall. Conditions of soil and weather shall be documented on test forms.

C. Conduct tests using the ratio method that measures the ratio of the resistance to earth of an auxiliary test electrode to the series resistance of the electrode under test and a second auxiliary electrode. Perform measurements in accordance with IEEE Standard 81.

D. Indicating instrument must be self-contained and include a direct-current generator, synchronized current and potential reversers, crossed-current and potential coils, direct-

reading ohmmeter, series resistors, and range-selector switch. Calibrate direct-reading ohmmeter for ranges of 0 to 20 ohms and 0 to 200 ohms.

E. Place auxiliary grounding electrodes in accordance with instrument manufacturer's recommendations but not less than 50 feet apart, in accordance with IEEE Standard 81.

F. Perform continuity test on all power receptacles to ensure that the ground terminals are properly grounded to the facility ground system.

G. Furnish copies of test reports on ground system.

3.07 CONTRACT CLOSEOUT:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 26 05 29

HANGERS AND SUPPORTS FOR ELECTRICAL SYSTEMS

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide supports from building structure for electrical items by means of hangers, supports, anchors, sleeves, inserts, seals, and associated fastenings.

1.02 REFERENCES:

A. ASTM International (ASTM):

1. A123: Standard Specification for Zinc (Hot-Dip Galvanized) Coatings on Iron and Steel Products.

2. A653: Standard Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process.

3. A924: Standard Specification for General Requirements for Steel Sheet, Metallic-Coated by the Hot-Dip Process.

4. E84: Standard Test Method for Surface Burning Characteristics of Building Materials.

5. E119: Standard Method for Fire Tests of Building Construction and Materials.

B. FM Global (FM):

1. Approval Guide, A Guide to Equipment, Materials & Services Approved By Factory Mutual Research For Property Conservation.

C. National Fire Protection Association (NFPA):

1. 70: National Electrical Code (NEC).

D. Underwriters Laboratories, (UL): Applicable listings.

1. FRD: Fire Resistance Directory.

2. 263: Fire Tests of Building Construction and Materials.

3. 723: Test for Surface Burning Characteristics of Building Materials.

4. 1479: Fire Tests of Through-Penetration Firestops.

1.03 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Submit shop drawings and manufacturers' product data in accordance with the requirements of Section 26 05 10.

PART 2 - PRODUCTS

2.01 MATERIALS:

A. Steel or malleable iron.

B. Aluminum where indicated.

C. Stainless steel where indicated.

2.02 COATINGS:

A. Protect steel and malleable iron supports, support hardware, and fasteners with zinc coating.

B. Provide products identified for both use in sunlight and use outdoors.

C. Use PVC coating where indicated on Drawings.

2.03 MANUFACTURED SUPPORTING DEVICES:

A. Raceway Supports: Clevis hangers, riser clamps, conduit straps, threaded C-clamps with retainers, ceiling trapeze hangers, wall brackets, and spring steel clamps.

B. Fasteners: Types, materials, and construction features as follows:

1. Expansion Anchors: Carbon steel wedge or sleeve type. Anchors containing lead are not acceptable.

2. Toggle Bolts: All steel springhead type.

3. Powder-Driven Threaded Studs: Heat-treated steel, designed specifically for intended service.

4. Nuts, Washers, and Bolts: Stainless steel.

C. Conduit Sealing Bushings: Factory-fabricated watertight conduit sealing bushing assemblies suitable for sealing around conduit passing through concrete floors and walls. Construct seals with steel sleeve, malleable iron body, neoprene sealing grommets or rings, metal pressure rings, pressure clamps, and cap screws.

D. U-Channel Systems: Channels, with 9/16 inch diameter holes, at minimum of 8 inch on center, in top surface. Provide fittings and accessories that mate and match with U-channel and are of same manufacturer.

2.04 U-CHANNEL SYSTEMS:

A. Manufacturers, Stainless Steel/Galvanized Steel Channel.

1. Unistrut Corp.

2. Power-Strut.

3. B-Line Systems, Inc.

B. Manufacturers, Fiberglass Channel.

1. Omnistrut, Champion Fiberglass.

2. Durostrut, Enduro Composite Systems.

3. Struttech, Entrum Industries.

C. Provide Type 316 stainless steel channel or fiberglass channel with corresponding accessories.

D. Channels, with 9/16 inch diameter holes, at minimum of 8 inch on center, in top surface.

E. Provide fittings and accessories that mate and match with U-channel and are of same manufacture.

F. Provide hot-dipped galvanized after fabrication for steel channel and accessories.

G. Provide channel of the proper material to match equipment classifications.

2.05 FIRE RESISTANT JOINT SEALERS:

A. Manufacturers:

1. “Dow Corning Fire Stop Foam;” Dow Corning Corp.

2. “Pensil 851;” General Electric Co.

B. Two part, foamed-in-place, silicone sealant formulated for use in through penetration fire stopping around cables, conduit, pipes, and duct penetrations through fire-rated walls and floors.

C. Sealants and accessories shall have fire-resistance ratings indicated, as established by testing identical assemblies in accordance with ASTM E814, by Underwriters’

Laboratories, Inc., or other testing and inspection agency acceptable to authorities having jurisdiction.

PART 3 - EXECUTION

3.01 INSTALLATION:

A. Install supporting devices to fasten electrical components securely and permanently in accordance with NEC requirements.

B. Coordinate with structural system and with other electrical installation.

C. Raceway Supports: Comply with NEC and following requirements:

1. Conform to manufacturer's recommendations for selection and installation of supports.

2. Strength of each support shall be adequate to carry present and future load multiplied by safety factor of at least 4. Where this determination results in safety allowance of less than 200 pounds, provide additional strength until there is minimum of 200 pounds safety allowance in strength of each support.

3. Install individual and multiple (trapeze) raceway hangers and riser clamps as necessary to support raceways. Provide U-bolts, clamps, attachments, and other hardware necessary for hanger assembly and for securing hanger rods and conduits.

4. Support parallel runs of horizontal raceways together on trapeze-type hangers.

5. Support individual horizontal raceways by separate pipe hangers. Spring steel fasteners may be used in lieu of hangers only for 1-inch and smaller raceways serving lighting and receptacle branch circuits above suspended ceilings only. For hanger rods with spring steel fasteners, use 1/4-inch diameter or larger threaded steel. Use spring steel fasteners that are specifically designed for supporting single conduits or tubing.

6. In vertical runs, arrange support so load produced by weight of raceway and enclosed conductors is carried entirely by conduit supports with no weight load on raceway terminals.

D. Vertical Conductor Supports: Install simultaneously with installation of conductors.

E. Sleeves: Install in concrete slabs and walls and other fire-rated floors and walls for raceways and cable installations. For sleeves through fire rated wall or floor construction, apply UL listed firestopping sealant in gaps between sleeves and enclosed conduits and cables.

F. Conduit Seals: Install seals for conduit penetrations of slabs below grade and exterior walls below grade and where indicated. Tighten sleeve seal screws until sealing grommets have expanded to form watertight seal.

G. Conduit extending through roof shall pass through ceiling box at roof line.

1. Provide 14 gage minimum copper box complete with watertight soldered seams and flanged to serve as pitch pocket for each conduit.

2. Install conduit and pitch pocket in advance of roofing work.

H. Fastening: Unless otherwise indicated, fasten electrical items and their supporting hardware securely to building structure, including but not limited to conduits, raceways, cables, cable trays, busways, cabinets, panelboards, transformers, boxes, disconnect switches, and control components in accordance with following:

1. Fasten by means of wood screws or screw type nails on wood, toggle bolts on hollow masonry units, concrete inserts or expansion bolts on concrete or solid masonry, and machine screws, welded threaded studs, or spring tension clamps on steel. Threaded studs driven by powder charge and provided with lock washers and nuts may be used instead of expansion bolts and machine or wood screws. Do not weld conduit, pipe straps, or items other than threaded studs to steel structures. In partitions of light steel construction, use sheet metal screws. (Applies to Early Work Package 2 only.)

2. Fasten by means of toggle bolts on hollow masonry units, concrete inserts or expansion bolts on concrete or solid masonry, and machine screws, welded threaded studs, or spring tension clamps on steel. Threaded studs driven by powder charge and provided with lock washers and nuts may be used instead of expansion bolts and machine or wood screws. Do not weld conduit, pipe straps, or items other than threaded studs to steel structures. In partitions of light steel construction, use sheet metal screws.

3. Holes cut in concrete shall not cut main reinforcing bars. Fill holes that are not used.

4. Load applied to any fastener shall not exceed 25 percent of proof test load. Use vibration and shock resistant fasteners for attachments to concrete slabs.

3.02 CHANNELS:

A. Support electrical components as required to produce same structural safety factors as specified for raceway supports.

B. Install metal U-channel racks for mounting cabinets, panelboards, disconnects, control enclosures, pull boxes, junction boxes, transformers, and other devices.

C. Install Type 316 stainless steel for mounting of electrical equipment in outdoor areas and on below grade, outside building and structure walls.

D. Install galvanized steel channels for interior building mounting of electrical equipment except for those locations listed above and unless otherwise indicated.

E. Install fiberglass channel in chemical areas with NEMA 4X enclosures.

3.03 CONTRACT CLOSEOUT:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 26 05 33

RACEWAY AND BOXES FOR ELECTRICAL SYSTEMS

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide complete raceway systems, with matching accessories, fittings, boxes, and other hardware, as indicated and specified. When non-metallic raceway systems are specified, provide green insulated grounding conductor sized per National Electrical Code (NEC) requirements.

B. All raceway runs are indicated diagrammatically to outline general routing of raceway. Unless specifically identified for installation in concrete walls or slabs, raceways shall be run exposed with raceway supporting systems. Avoid interfering with pipes, ducts, structural members, or other equipment. Any installation deviations from the contract requirements shall be corrected at no cost to Owner.

C. Provide raceway systems in accordance with the following:

1. In precedence to the following, provide rigid aluminum conduit for all instrumentation and controls raceways, except for those in duct banks, or otherwise identified in plans and details. For other conduits:

a. In non-corrosive areas that are either NEMA 12 or NEMA 1 areas, use EMT (above lay-in ceilings or in stud walls) or galvanized rigid steel raceway systems (exposed or subject to damage).

b. In NEMA 4 areas, and where subject to wetting or wash down, use PVC Coated RMC or galvanized rigid steel conduit. Use copper-free aluminum RMC conduit where indicated on plans.

c. In areas subject to corrosion, or areas otherwise identified for NEMA4X construction, use PVC coated galvanized rigid steel or rigid aluminum conduit.

d. In exterior building applications, use galvanized rigid steel conduit.

e. Inside concrete slabs or walls, use PVC Schedule 40 raceway systems. Except use PVC-coated Steel RMC where identified in plans and details, and for elbows and stubs through concrete.

f. Review Architectural schedules for additional data regarding the corrosiveness of an area, and additional requirements.

D. All raceway systems shall be installed in accordance with the criteria described in this section. Any proposed deviations from these requirements shall be submitted to the Engineer in writing for review and disposition.

1. Use Type 304 stainless steel support systems for exterior application and in NEMA 4 and NEMA 4X areas.

2. All NEMA 1 and NEMA 12 areas shall use hot dipped galvanized steel support systems.

E. Rigid aluminum conduit and boxes can be used in place of PVC coated rigid steel in outdoor NEMA4 and similar areas. Install per manufacturer's requirements. Not allowed in direct contact with concrete. Rigid aluminum conduit is prohibited in underground locations.

F. All raceways shall be supported to NEC requirements and to meet all applicable seismic criteria. Raceways 2 inch outside diameter or greater shall be independently supported in a manner to meet the criteria to resist failure during earthquake events. All hardware supports shall be specifically designed for the magnitude of the earthquake event as defined in Section 26 05 10.

1.02 REFERENCES:

D. Underwriter's Laboratories, Inc. (UL):

1. 1: Electrical Flexible Metal Conduit

2. 6: Rigid Metal Electrical Conduit

3. 6A: Rigid Aluminum Conduit.

4. 94: UL Standard for Safety Tests for Flammability of Plastic Materials for Parts in Devices and Appliances

5. 360: Electrical Liquid-Tight Flexible Steel

6. 651: Schedule 40 and 80 PVC Conduit

7. 797: Electrical Metallic Tubing

8. 1242: Intermediate Metal Conduit

9. 1684: UL Standard for Safety Reinforced Thermosetting Resin Conduit (RTRC) and Fittings

1.03 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Submit shop drawings and manufacturers' product data in accordance with the requirements of Section 26 05 10.

C. Submit shop drawings for review in advance of contruction with labels of feeders to be included within the conduit.

1.04 QUALITY ASSURANCE:

A. Provide in accordance with Section 01 45 00 and as specified.

B. Items provided under this section shall be listed and labeled by UL or other Nationally Recognized Testing laboratory (NRTL).

1. Term “NRTL” shall be as defined in OSHA Regulation 1910.7.

2. Terms “listed” and “labeled” shall be as defined in NFPA 70, National Electrical Code, Article 100.

C. Regulatory requirements:

1. National Electrical Code (NEC): Components and installation shall comply with National Fire Protection Association (NFPA) 70.

1.05 SEISMIC DESIGN REQUIREMENTS:

A. Conform to the requirements specified in Section 01 41 20.

B. It shall be the responsibility of manufacturer and supplier along with the Electrical Contractor to conform to the seismic design requirements for this project and for the work of this specification section.

C. Install supports for raceway systems greater than 2 inches in diameter to meet the seismic requirements indicated and specified.

PART 2 - PRODUCTS

2.01 MANUFACTURERS:

A. Electrical Metallic Tubing (EMT):

1. Triangle/PWC, Inc.
2. Perma-Cote Industries
3. Republic Steel Corporation.
4. Robroy Industries.
5. Allied Tube and Conduit.

B. Rigid Metal Conduit and polyvinylchloride-coated (PVC-coated) rigid steel conduit .

1. Triangle/PWC, Inc.
2. Perma-Cote Industries.
3. Republic Steel Corporation.
4. Robroy Industries.
5. Allied Tube and Conduit / Atcore Calbond
6. (Fittings) ABB / Thomas And Betts Ocal

C. Rigid Aluminum Conduit:

1. Allied Tube and Conduit
2. Wheatland

D. Polyvinylchloride (PVC) Conduit:

1. Triangle/PWC, Inc.
2. Robroy Industries.
3. Carlon Electrical Sciences, Inc.

E. Flexible Conduit:

1. American Flexible Conduit Company.
2. Anamet, Inc.

3. Electri-Flex Company.

4. International Metal Hose Company.

F. Boxes and Fittings:

1. O.Z./Gedney Company.

2. Crouse-Hinds Electrical Construction Materials.

3. Appleton Electric Company.

G. Fiberglass-Reinforced Polyester Boxes:

1. Crouse-Hinds Electrical Construction Materials.

2. Fibox.

3. Hoffman Engineering Company.

4. Vynckier Enclosure Systems.

H. Support Systems:

1. Michigan Hanger Co., (O-Strut).

2. Thomas & Betts (Superstrut).

3. Unistrut Corp.

2.02 MATERIALS AND COMPONENTS:

A. Electrical Metallic Tubing:

1. Provide electrical metallic tubing conforming to NEMA Standard FB-1 and UL-797.

2. Fittings and Conduit Bodies: NEMA FB-1 as recommended by the conduit manufacturer.

3. Provide EMT with rain-tight couplings where:

a. Appropriate per Code

b. Where in the same room as pumping or process equipment.

c. Where circuit is supplying or supplied by Uninterruptable Power Supply units.

B. Rigid Metal Conduit, including PVC-Coated:

1. Provide galvanized rigid metal conduit, each with a coupling on one end and thread protector on other end.

2. Hot-dip galvanize rigid steel conduit over entire length, along interior and exterior surfaces, including threads. Conduit shall conform to UL 6.

3. Provide PVC-Coated conduit where indicated, and where:

   a. Providing a conduit stub from within a slab/foundation or under a slab/foundation.

   b. Where bending upwards into a conduit stub, or where changing direction by more than 22.5 degrees in any direction.

C. Where within 2 feet of a deflection jointFlexible-Metal Conduit:

1. Provide flexible-metal conduit for use in dry areas and match fittings, size, and material to rigid conduit to which it is connected. Flexible-metal conduit shall conform to UL 1.

2. Provide liquid-tight flexible-metal conduit for use in damp areas consisting of flexible-metal conduit, with liquid-tight, sunlight-resistant jacket extruded over the conduit. Provide stainless steel, braided flexible conduit in NEMA 4X, corrosive areas. On larger than 1-1/4 inch, furnish separate external ground wire. Liquid-Tight flexible-metal conduit shall conform to UL 360.

D. Polyvinylchloride (PVC) Conduit:

1. Provide PVC conduit, Schedule 40 and Schedule 80 conforming to NEMA Standard TC-2 and UL-651.

2. Fittings and Conduit Bodies: NEMA TC 3 as recommended by the conduit manufacturer.

E. Boxes:

1. In NEMA and NEMA 12 areas, provide standard, sheet-metal, outlet and junction boxes constructed of code-gauge, galvanized sheet steel. Size each box as required by the NEC.

2. Provide boxes containing fixture studs for hanging fixtures. Use concrete-tight boxes for installation in concrete. Do not use shallow boxes unless building construction is such that it is impossible to use standard-depth boxes.

3. Provide outlet boxes and fittings for hazardous locations conforming to UL 886 for class, group, and division indicated.

4. Provide cast boxes with covers or device plates suitable for the area classification. Provide same fittings in PVC-coated format where subject to corrosion. Use cover screws of stainless steel or high brass for iron boxes. Provide seal-offs in accordance with NEC Chapter 5, even if not explicitly required on plans. Review plans and details for additional requirements. Coordinate conduit routing for instrumentation and controls per the plans and schedules of all project disciplines. Review Typical Instrument Wiring Schedule for additional requirements.

5. Provide polyvinylchloride boxes for use as junction boxes and provide high impact strength fiberglass-reinforced polyester boxes for use as device boxes, pull boxes, and terminal boxes for use with polyvinylchloride conduit. Size each box as required by the NEC.

F. Fittings:

1. Provide cast-iron fittings of malleable iron or a mixture of gray iron and cast steel.

2. Provide suitable expansion fittings where conduits cross expansion joints, and above where conduit stubs from below-grade to above-grade.. Equip these fittings with grounding straps, clamps, and copper bonding jumpers. Provide fittings with minimum of 8 inches of axial expansion or contraction.

3. Provide suitable PVC-Coated deflection joints where between 0 and 2 feet outside of structural foundation, with additional as identified in Specifications or in Plans; Salient features include:

a. Identified as corrosion-resistant.

b. Minimum tolerable axial expansion or contraction of up to 3/4”.

c. Minimum tolerable angular misalignment of the axes of the coupled conduit runs in any direction to 30°.

d. Minimum tolerable parallel misalignment of the axes of coupled conduit runs in any direction to 3/4”.

e. Provide PVC-coated joint where located below-grade.

f. Provide PVC-coated adapter to convert from PVC to PVC-coated joint where connecting to PVC below-grade.

4. Also provide PVC-Coated suitable deflection joints where conduit approaches duct bank.

G. PVC-Coating is to be factory-applied. Ensure patching and installation compounds and methods are strictly as recommended by the PVC-coated raceway / fitting manufacturer.

H. Provide fittings and conduits from a single manufacturer.

PART 3 - EXECUTION

3.01 INSTALLATION:

A. Perform all work in accordance with the NEC.

B. Use no conduit less than 3/4-inch in diameter, unless otherwise indicated.

C. Install raceways, boxes, enclosures, and cabinets as indicated, according to manufacturer's printed instructions.

3.02 SEISMIC RESTRAINTS:

A. For conduits and other raceways installed in open areas, not adjacent to and secured to structural elements, and 2 inch outside diameter or greater, support such raceways using seismic restraints rated for the applicable project earthquake criteria.

B. Methods of Restraining Raceways:

1. Utilize threaded rod with rod stiffeners and transverse channel braces at approximately 45 degrees angle, at 15 feet on center, maximum, and on one side of rod support.

2. Utilize longitudinal bracing with channel braces at 30 feet on center, maximum.

3. Strap raceways directly to transverse channel braces, using pipe strap with both ends of strap bolted into the channel brace.

4. Do not rigidly brace raceways to different parts of a building that may respond differently during an earthquake. Seismic restraints shall not limit expansion and contraction of the raceway support system.

5. Provide flexible connections for conduits 2 inch outside diameter or greater than when terminating to fixed equipment to prevent loss of raceway integrity in the event of an earthquake.

3.03 INSTALLATION OF FITTINGS:

A. Install expansion fittings wherever conduits cross structural expansion joints and where indicated on Plans. Keep the fittings in line with conduit, and install with regard to temperature so that full working range of expansion is available.

B. Do not install fittings to replace elbows and pull boxes, unless space or other problems make use of fittings necessary. Use oversize fittings whenever large cable is installed, in order to maintain proper bending radius.

C. Terminate ends of all floor conduits installed for future use with couplings and readily removable plugs set flush with finished floor surface. Cap spare wall conduits at wall where they enter building.

D. Equip ends of all conduits with conduit fittings. Fit conduits terminating at motor control center or power distribution equipment, or in box above or below, with grounding type bushings, or solidly ground by locknuts or other acceptable fittings. Connect each grounding bushing to ground bus by a bare or green-covered copper wire. Do not use ground wire smaller than 12 AWG. Install ground wire larger than 12 AWG when required by NEC. Where conduits terminate in unprotected areas or where bonding is required over expansion joint, flexible conduit or equivalent; use ground wires 6 AWG. copper or larger.

E. Terminate conduits entering gasketed sheet-metal boxes or gasketed sheet-metal equipment enclosures with gasketed hubs.

F. Terminate conduits entering non-gasketed sheet-metal boxes or enclosures with double locknuts and insulated bushings, or with acceptable equivalent.

G. Join raceways with fittings listed for the purpose. Make joints tight. Use raceway fittings compatible with raceway and suitable for use and location. For intermediate steel conduit, use threaded rigid steel conduit fittings, except as otherwise indicated.

1. Make raceway terminations tight. Use bonding bushings or wedges at connections subject to vibration. Use bonding jumpers where joints cannot be made tight.

2. Use insulating bushings to protect conductors.

3. Tighten set screws of threadless fittings with suitable tool.

H. Install PVC-coated fittings with tools and methods as required by the manufacturer. Conduits underneath the IPS building require additional scruitiny and inspection, including photographs of final work, assuring complete coating was made, so as to maximize the life of the electrical system underneath the IPS foundation.

3.04 INSTALLATION OF RACEWAYS:

A. Install exposed raceways parallel or at right angles to walls and ceiling beams. Make all changes in directions with listed bends, elbows, and pull boxes. Space parallel runs uniformly throughout. Secure in place by hangers and fasteners. Ground raceways by connection to properly grounded enclosures, bonding, or other means, to obtain permanent low resistance path to ground throughout installation. Ensure that raceway sections in single run and in parallel runs are of same type and finish.

1. Run parallel or banked raceways together, on common supports where practical.

2. Install raceways level and square and at proper elevations. Provide minimum 7 feet headroom. Locate so as to avoid tripping near walkways or other pathway obstructions.

B. Support raceways concealed above suspended ceilings from slab above ceiling in same manner as exposed raceways. Do not support raceways from ceiling supports.

C. Provide cast-in-place inserts in concrete to support all runs, unless otherwise permitted. Use stainless steel sleeve type concrete anchors for installing boxes, and conduit supports. Provide Type 316 stainless steel nut, bolts, and washers, for use with concrete anchors.

D. Support conduits by hangers or pipe straps spaced according to NEC, but in no case more than 10 feet on centers.

E. Comply with NECA 102 for aluminum conduits.

F. Provide hot-dipped galvanized supports for galvanized conduit.

G. Stub-Up Connections: Extend conduits through concrete floor for connection to freestanding equipment with an adjustable top or coupling threaded inside for plugs, and set flush with the finished floor. Extend conductors to equipment with rigid steel conduit. Flexible metal conduit may be used 6 inches above the floor, provide stanchions as required to secure and support per Code. Where equipment connections are not made under this Contract, terminate ends of floor conduits installed for future use with couplings and readily removable plugs 8 inch above finished floor surface. Cap spare wall conduits at wall entrance to building.

H. Do not use dissimilar metals in conjunction with each other. Use an insulation between adjoining surfaces so as to eliminate direct contact and any resultant electrolysis. Maintain electrical continuity of system. Use bituminous impregnated felt, heavy bituminous coatings, nonmetallic separators or washers, or other acceptable materials as insulation.

I. Install fittings to match raceway being used.

J. Install expansion fittings wherever conduits cross structural expansion joints at connections between buildings. Keep fittings in line with conduit, and install with regard to temperature so that full working range of expansion is available.

K. Provide separate raceways for all low voltage instrumentation raceways (50 volts and below) from control and power raceways.

L. Terminations: Where raceways are terminated with locknuts and bushings, align the raceway to enter squarely, and install the locknuts with dished part against the box; use two locknuts, one inside and one outside the box.

M. Where terminating in threaded hubs, screw the raceway or fitting tight into the hub so the end bears against the wire protection shoulder. Where chase nipples are used, align the raceway so the coupling is square to the box, and tighten the chase nipple so no threads are exposed.

N. Install pull wires in all empty raceways. Use 14 AWG zinc-coated steel or monofilament plastic line having not less than 200 pound tensile strength. Leave not less than 12 inches of slack at each end of the pull wire.

O. Keep raceways at least 6 inches away from parallel runs of flues and steam or hot water pipes. Install horizontal raceway runs above water and steam piping.

P. Complete raceway installation before beginning conductor installation.

Q. Use temporary closures to prevent foreign matter from entering raceway.

R. Protect stub-ups from damage where conduits rise through floor slabs. Arrange so curved portion of bends is not visible above the finished slab.

S. Where metal conduits rise through floor slabs in wet areas, coat conduits for a distance of 6 inches above and below slab grade with brush coat of waterproof bituminous cement.

T. Install PVC-coated conduit with tools and methods as required by the manufacturer. Conduits underneath the IPS building require additional scruitiny and inspection, including photographs of final work, assuring complete coating was made, so as to maximize the life of the electrical system underneath the IPS foundation.

U. Identify raceways with engraved or imprinted stainless steel labels that include feeder desigations of enclosed feeders. Where enclosing circuits without a feeder name, then provide supplying panel abbreviation and circuit numbers.

3.05 BENDS:

A. Make all bends carefully to prevent distortion of circular cross section. Field bend conduit shall have an inside radius of not less than nine diameters.

B. Where bends of less than nine diameters are necessary, use standard factory elbows. Size conduit to permit cable-bending radius within the factory elbow of at least eight times cable diameter.

C. Allow no conduit greater than 50 feet to have more than two 90 degree bends or equivalent thereof between pulling points. For conduits less than 50 feet in length, allow only three 90 degree bends between pulling points.

3.06 CUTTING, THREADING AND CONNECTING:

A. Make all field cuts in conduits squarely, file cut ends, ream to remove rough edges and thread in accordance with NEC. No running thread permitted. Make all connections mechanically strong and tight, and with acceptable connectors. Where conduit surface coating is damaged or removed in the cutting, threading or reaming process, restore the surface to its original condition.

3.07 CONDUIT CLEANING:

A. Clean all conduit carefully before and after installation, ream ends free of burrs, and free inside surfaces from all imperfections likely to injure cable.

B. After installation of each complete new conduit run, snake the run with band to which is attached a tube cleaner with cylindrical mandrel of a diameter not less than 85 percent of nominal diameter of conduit. Remove and replace all conduit through which mandrel will not pass.

C. Use a sponge with steel brush to clean steel conduit and use a sponge with nylon brush to clean PVC conduits.

D. After cleaning, protect ends of all conduit with standard caps to prevent entrance of water, concrete, debris, or other foreign substance.

3.08 CONDUIT DRAINAGE:

A. Where practicable, pitch conduit to drain to outlet boxes, or install so as to avoid trapping moisture. Where dips are unavoidable in exposed conduits, install fitting with drain hole at low point.

3.09 INSTALLATION OF BOXES:

A. Unless otherwise indicated, install sheet metal boxes only in dry, accessible locations. Install cast-metal boxes in exterior concrete or masonry walls, in floor slabs, in basements, all other below grade locations and elsewhere as indicated. Cast metal boxes shall be used (unless otherwise indicated) where vapor-tight fixtures are required, for all surface mounting of wall switches and receptacles and for all outdoor use. Install pull boxes for motor control centers and large ceiling hung boxes where indicated.

B. Install boxes in conformance with all the requirements of NEC. Install boxes designed for type of construction involved. Support boxes in same manner as required for conduit. Size boxes to provide bending radius for wire or cable of at least eight times diameter or in accordance with NEC, whichever is larger.

C. Center all outlets in panels, or spaces and adjust to structural finish. Where specific locations are not indicated, locate outlets with respect to equipment served.

D. Place all outlet boxes, junction boxes and pull boxes, in accessible locations when they are installed above or behind plastered ceilings, furred spaces, or suspended ceilings. Install access panels of suitable size. Mark all access panels for all boxes so panels can be readily located in future. Mark, using metal tabs or plastic buttons which cannot mark ceilings or walls, appropriate for type of construction being used.

E. Assemble cast-metal boxes with threaded conduit hubs in such manner that conduit connections and gasketed covers are watertight. Close all unused threaded openings with pipe plugs and compound.

F. Provide cast boxes with covers and device plates suitable for the area classification. Install screws of stainless steel or high brass for iron boxes.

3.10 FLEXIBLE CONNECTIONS TO MOTORS AND EQUIPMENT:

A. At all motors and electrically operated equipment to which conduit connections are made, install with a complete connection between end of conduit and terminal box of motor or other equipment.

B. Install the conduits in locations permitting direct connection to motors.

C. Make connections between rigid raceway and motor or equipment subject to vibration and adjustment using flexible conduit. Make each connection with at least one quarter bend so that no vibration can be transmitted beyond flexible connection. Provide stanchion or other support as required to secure non-vibrating end of the flexible conduit per Code.

D. Install flexible metal conduit, fittings, and accessories in dry areas in accordance with requirements of NEC.

E. Install liquid-tight flexible metal conduit in damp and corrosive areas. Locate conduit to reduce the possibility of damage to the exterior coating. Use fittings that screw into flexible conduit and provide gaskets.

F. Use maximum of 6 feet of flexible conduit for recessed and semi-recessed lighting fixtures and; for equipment subject to vibration, noise transmission, or movement; and for all motors. Use liquid tight flexible conduit in wet or damp locations. Install liquid-tight flexible metal conduit in areas subject to wetting due to fire protection sprinklers or broken or ruptured water line. Locate conduit to reduce the possibility of damage to the exterior flexible conduit jacket. Use fittings that screw into flexible conduit and provide gaskets. Install separate ground conductor across flexible connections.

3.11 PROTECTION:

A. Provide protection and install in accordance with manufacturer printed instructions. The conduit and raceway equipment manufacturers, to ensure that coatings, finishes, and enclosures are without damage or deterioration at completion of project.

1. Repair damage to galvanized finishes with zinc-rich paint recommended by manufacturer.

2. Repair damage to PVC or paint finishes with matching touch-up coating recommended by the manufacturer.

3.12 FINAL SYSTEM ACCEPTANCE:

A. Upon completion of installation of system, including outlet fittings and devices, inspect exposed finish. Remove burrs, dirt, and construction debris and repair damaged finish, including chips, scratches, and abrasions and at no additional cost to the Owner.

B. Label all raceways and boxes in accordance with the requirements of Section 26 05 10.

3.13 CONTRACT CLOSEOUT:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 26 05 43

UNDERGROUND DUCTS AND RACEWAYS FOR ELECTRICAL SYSTEMS

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide complete underground distribution system as indicated and specified.

B. Conform to lines, grades, elevations, and dimensions. Resolve interferences with other underground conduit, piping or equipment, either new or existing with the Engineer. Match components suitable for proper installation.

C. Provide red-dyed concrete encasement of duct system where indicated. Include forms and reinforcing in installation. Perform work in accordance with Section 26 05 10.

D. Provide maintenance holes (MHs) and handholes (HHs) complete with ground rods, windows, ladders, frames, covers, cable racks, supports, pulling irons, and other inserts. Use reinforced concrete. Perform work in accordance with Section 26 05 10.

E. Provide Schedule 40 polyvinylchloride (PVC) conduit or HDPE conduit for power and control circuits (as indicated on drawings or specified herein) and furnish and install rigid galvanized steel conduits for instrumentation, communication and fire circuits.

F. Specification in Division 01, 02, and 03 are incorporated by reference, especially the following sections. Note that mid-execution coordination is required to accommodate existing conditions. Sections of particular importance to existing utilities include:

1. 01 31 13, "Coordination"

2. 02 10 20, "Protecting Existing Underground Utilities"

1.02 REFERENCES:

A. National Fire Protection Association (NFPA):

1. 70: National Electrical Code (NEC)

1.03 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Submit shop drawings and manufacturers' product data in accordance with requirements of Section 26 05 10.

C. Provide "Record" drawings.

PART 2 - PRODUCTS

2.01 MANUFACTURER'S COMPLIANCE:

A. Manufacturer's acceptance contingent upon products' compliance with specifications.

2.02 MANUFACTURERS:

A. Polyvinylchloride (PVC) Conduit:

1. Specified in Section 26 05 33

B. High Density Polyethylene (HDPE) Conduit is not an acceptable duct conduit material.

C. Rigid Steel Conduit, Galvanized:

1. Specified in Section 26 05 33

D. Rigid Steel Conduit, Galvanized, including portion PVC-Coated:

1. Specified in Section 26 05 33

E. Rigid Steel Conduit, Aluminum:

1. Specified in Section 26 05 33

F. Fiber, Conduit, Type I is not an acceptable duct conduit material.

G. Maintenance Hole Waterproofing Material:

1. Heavy Duty Black, No. 46-449, by Tnemec Company, Inc., No. Kansas City MO

2. Hi-Build Bituminous Coating, No. 64-J-5, by Valspar Corporation, Baltimore, MD

3. Bitumastic Super Service Black, by Kop-Coat, Inc., Pittsburg, PA

2.03 MATERIALS AND COMPONENTS:

A. Conduit Spacers: Furnish conduit spacers made of plastic to maintain spacing between conduits.

B. Concrete: Minimum compressive strength, 3,000 psi.

C. Hot-dipped galvanized steel conduit used underground to be painted with bituminous paint.

D. PVC-Coated galvanized steel conduit where indicated in plans and details.

E. PVC-Coated galvanized steel condit deflection joints where indicated in plans and details.

F. Maintenance Hole Frames and Covers:

1. Heavy duty gray cast iron

2. Conform to details indicated on the drawings and as specified

3. Provide machine-finished seat

4. Mark "ELECTRICAL-15kV", "ELECTRICAL-5kV", “Comunications”, or “Electrical-480V” on cover of maintenance hole as appropriate for system.

2.04 PROVISIONS FOR TRACING IN THE PUBLIC WAY

A. Provide 3-terminal Switchable tracing accesspoint, CopperHead Lite Duty SnakePit, or equal, within an HS-20-rated round 12-inch-diameter meter box with steel lid (box to be at least 12 inches tall.) Provide integral ground rod with accesspoint. Install per manufacturer instructions. Color lid for fiber optic as orange, lid for power as red. Maintain at least 24 inches of slack below accesspoint for maintenance over lifetime of system.

B. Provide detectable tape centered above duct bank, with color and text to match utility marked. Provide insulated #14 detectable tape, minimum.

PART 3 - EXECUTION

3.01 INSTALLATION OF CONDUITS:

A. Requirements shown on drawings and plans take precedence over Specification requirements for buried conduits and ductbanks.

B. Lay conduits, indicated to be direct buried in the ground, in trench on 3 inch bed of sand and cover with an equivalent 3 inch bed of sand. Ensure that no rocks come in contact with conduit during backfilling. Dig trenches to depth and location indicated.

C. Provide minimum separation for groups of power and control conduits of 7.5 inches center-to-center for conduits with conductors rated 2.4kV and above. Provide minimum spacing between outer diameter of conduits of at least 3 inches for conduits of all volage levels, both vertically and horizontally. Build ductbank layer by layer, backfill and compact each layer (for direct buried applications) to provide support for next layer.

D. Separate power and control ducts from instrument ducts by a minimum of 12 inches, and ductbanks by 12 inches minimum, concrete-to-concrete.

E. Backfill ductbank in layers and tamp or "puddle" as directed by the CM. Provide yellow ductbank marker tapes, reading "Caution - Electrical Lines Below", over entire length of ductline. Locate tapes 12 inches below grade. Provide a tape for every 12 inches of width of ductline.

F. Install conduit, indicated to be encased in concrete with spacers and reinforcing, as specified and as indicated. Rigid galvanized steel conduits to be painted with bituminous paint.

G. Install conduit runs following routing on drawing and running in straight lines. Where deviation from a straight line becomes necessary, install bends of radius which allow for rodding and installation of cable.

H. Accomplish changes in direction of runs exceeding total of 10 degrees, either vertical or horizontal, by long sweep bends having minimum radius of curvature of 25 feet Manufactured bends can be used at ends of short runs of 100 feet or less, with less than 270 degrees of bends, and then only at or close to the end of run. Provide long sweep bends made up of one or more curved or straight sections and/or combinations thereof. Install manufactured bends with minimum radius of 36 inch where larger radius cannot be used. Provide lubrication and/or cable feeding into conduit as required

I. Lay ductlines to minimum slope of 3 inches per 100 feet and slope to maintenance holes and handholes, as indicated. Ductlines are to slope away from buildings.

J. Install spacers at intervals of approximately 4 feet and stagger between tiers of ducts to provide not less than 12 inches of longitudinal separation. Install base spacers to provide at least 3 inches between bottom of trench and underside of bottom conduits. Completely fill space with concrete. Firmly wire conduits and spacers together before concrete is placed.

K. Ductbanks are to be formed, unless trench conditions allow for neat placement of concrete with specified clearances.

L. Prior to placing of concrete, remove all dirt, sand, and any other debris from between conduits and from trench bottoms. Hold conduits in place to prevent floating or accidental movement.

M. Stagger joints in conduits at least 6 inches. Do not allow couplings to rest on bottom of trench. Install couplings for plastic conduit in accordance with manufacturer's recommendations.

N. Install concrete encasements so minimum clearance of 12 inches from concrete to parallel pipes, lines, structures, etc., is maintained. Where ducts cross, minimum clearance of 6 inches is required. Do not allow the top of concrete to be less than 30 inches below finished grade or paving. Submit special conditions which may require lesser clearances or special conditions which may require greater than 30 inches depth to Engineer for acceptance.

O. Where a connection is made to existing ductline, bond or dowel concrete encasement to existing encasement. Use waterstop between ductpours and between maintenance holes or buildings and ductwork as indicated.

P. Do not use power-driven vibrators for spading of concrete around ducts.

Q. Roll and grade backfill, and restore surface to condition equal to the site finish grade, or as otherwise indicated.

R. Locate ductbank markers at ends of all ductbanks except at maintenance holes or handholes, at approximately every 200 feet along duct run, and at each change in direction of duct run. Place markers approximately on ductbank. Install markers 6 inches square or round section by 3 feet long made of Class B concrete. Imprint the letter "D" or cast it on top of the marker. Install top of duct markers flush in paved areas, protruding no more 2-inches above finished grade in unpaved areas. In finished lawns, allow marker to protrude 1/2-inch.

S. Keep conduits clean of concrete, dirt, and other substances during the course of construction. After the ductlines have been completed, pull a standard flexible mandrel not less than 12 inches long, having a diameter approximately 1/4-inch less than the inside diameter of the conduit, through each conduit, after which pull a brush with stiff bristles through each conduit to make certain that no particles of earth, sand, or gravel have been left in the line. Replace conduit runs that do not allow the passage of the mandrel at no additional cost to the Owner. Pneumatic rodding may be used to draw in the lead wire. Install in spare conduits a pull wire or rope, and plug and seal spare conduits after cleaning.

T. Reference Specification 26 05 33, Plans and Details for fittings and conduit requirements in at end of ductbanks, bends, stubs, deflection and/or expansion fittings, and additional requirements.

3.02 MAINTENANCE HOLES AND HANDHOLES:

A. Construct maintenance holes and handholes of cast-in-place 3,000 psi red-dyed concrete, as indicated.

B. Install maintenance holes with cable racks, hooks, insulators, and other features, as indicated.

C. Place a 12 inch crushed-stone base under each maintenance hole and handhole. See plans for additional requirements.

D. Construct cast-in-place maintenance holes and handholes with forms, complete with centering cores and molds, to conform to shape, form, line, and grade required and maintain sufficiently rigid to prevent deformation under load. Make all joints leakproof and arrange horizontally or vertically. Place forms on successive units for continuous

surfaces and fit to accurate alignment, assuring a smooth completed surface, free from irregularities.

E. At convenient point close to wall, drive a ground rod into earth as indicated. Extend ground rod approximately 6 inches above finished maintenance hole floor. After completion of maintenance hole or handhole, connect 6 foot length of No. 4 bare copper ground wire to ground rod and coil it within maintenance hole or handhole for connection to steel supports and cover.

F. Size, space, and place reinforcing bars as indicated and as specified.

G. Set maintenance hole and handhole frames to the required grade, in full bed of concrete mortar to make watertight connection.

H. Install tops of maintenance hole and handhole covers in unpaved areas approximately 1/2-inch above finished grade, and in paved areas install flush with finished surface of paving.

I. Install galvanized corrosion-resistant channel support, with continuous slot and required fittings designed for concrete encasement.

J. Install inserts in the maintenance holes as indicated.

K. Install two cable pulling irons in wall opposite each ductbank entrance into maintenance hole, one 6 inch above floor and one 6 inch below the roof of maintenance hole. Where indicated on drawings, install additional features such as openings in maintenance hole walls for future conduit entrances. Seal future entrances with required courses of brick.

L. Where ductlines enter maintenance holes, terminate conduits in end bells. Terminate steel conduit entering maintenance holes and handholes in grounding bushing.

3.03 PROVISIONS FOR TRACING IN THE PUBLIC WAY

A. Locate tracing accesspoint at the southernmost extent of the public way, located 1 foot outside of the fence that bounds the public way, and 5 feet north of every maintenance hole.

B. Provide connection to separate terminals from tracing wire.

C. Bond ground terminal of tracing access point to embedded ground rod.

D. Ensure conductivity of tracing wire from terminal boxes prior to burial.

E. Install top of tracing accesspoint 2” below cover, and centered within, valve box.

F. Install tracing accesspoint in accordance with manufacturer instructions.

G. Install valve box in accordance with manufacturer instructions, and locate flush with grade.

3.04 MAINTENANCE HOLEAND HANDHOLE WATERPROOFING:

A. Apply two coats of bituminous waterproofing material to exterior surfaces of maintenance holes and handholes. Apply by brush or spray, in accordance with manufacturer's printed instructions. Allow time between coats to permit drying to bitumastic manufacturer’s recommendations for the purpose.

1. Two coats applied with a minimum dry film thickness of 12 to 14 mils per coat.

3.05 RECORD DRAWINGS OF UNDERGROUND WORK:

A. Furnish one set of marked copies of contract drawings, showing exact routing and depths of all underground conduit, duct handholes and maintenance holes. Furnish scaled plot plans, showing principal outline of buildings and structures. Reference conduits, ducts, and maintenance holes, and all bends deviating from straight line, dimensionally from fixed objects or structures.

3.06 CONTRACT CLOSEOUT:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

Page Intentionally Left Blank

SECTION 26 05 50

SEISMIC CONTROLS FOR ELECTRICAL SYSTEMS

PART 1 - GENERAL

1.01 DESCRIPTION:

A. This section describes the requirements for furnishing and installing seismic restraint devices for electrical equipment as indicated and in compliance with Contract Documents.

1.02 REFERENCES:

A. American Society of Civil Engineers (ASCE):

1. 7: Minimum Design Loads for Buildings and Other Structures - Includes Supplement No. 1

1.03 SUBMITTALS:

A. Submit the following shop drawings and submittal data in accordance with Section 01 33 00.

B. Reference Specification 01 41 20, Seismic and Wind Requirements, for additional requirements, which are incorporated into these requirements by reference.

C. Submit shop drawings and manufacturers' product data in accordance with the requirements of Section 26 05 00 and specific directives within Specifications Division 26.

D. Submit shop drawings in accordance with the General Provisions, Conditions and Section 01 33 00.

E. Delegated Design Submittals: Provide seismic-resistant installation with design and written certification from Professional Engineer licensed in the State of Utah stating that supports systems and anchorage for equipment have been designed according to the requirements of:

1. Section 1613 of the Building Code of Utah

2. Section 1613 of the International Building Code (IBC)

3. Salt Lake City specific codes and ordinances

4. ASCE/SEI 7, including design and construction to resist the effects of earthquake motions in accordance with Chapters 11, 12, 13, 15, 17 and 18 of ASCE/SEI 7, as applicable.

5. In accordance with Specification 01 41 20.

F. Provide "Delegated Design Submittals" including associated installation for the following:

1. Every structure, and portion thereof, including nonstructural components that are permanently attached to structures and their supports and attachments

2. This includes, but is not limited to permanently affixing all switchgear, conduits, electrical enclosures, control enclosures, pullboxes, battery cabinets, and all other items identified by the National Electrical Code to be secured.

G. Submit calculations stamped by a Professional Engineer licensed in the State of Utah for support systems (including raceways) and anchorage for wind, seismic, and all other pertinent loads.

H. At a minimum, seismic design shall be the most resilient of the following:

1. As required in the Structural Contract Documents.

2. Design Ground Motions shall be determined on a site-specific basis and not by use of a zip code. For specific acceleration values for a particular project please go to the Applied Technology Council to use their free "ATC Hazards by Location" tool: https://hazards.atcouncil.org/, or an approved equivalent that is acceptable to the Salt Lake City Authority Having Jurisdiction.

3. Seismic Design Category is site specific (per Section 1613.2.5 of the IBC).

I. Submit equipment anchoring methods. Include anchoring locations, anchor types, and minimum anchor embedment depths. Anchors shall have ICC-approved anchorage values.

PART 2 - PRODUCTS

2.01 SEISMIC DESIGN OF EQUIPMENT:

A. Equipment fabricated or assembled at manufacturers' premises shall be designed and constructed in such a manner that all portions, elements, subassemblies, and/or parts of said equipment and the equipment as a whole, including their attachments, shall have the capability of withstanding seismic forces specified under "Seismic Anchoring and Restraints" below.

B. Construction in an outside state, prior to shipment to site, does not relieve the Contractor of providing a Utah-compliant installation, with review and certification of a Utah-licensed Professional Engineer.

2.02 SEISMIC ANCHORING AND RESTRAINTS:

A. Equipment Anchors: Electrical equipment shall be securely anchored. Anchoring shall have the capability of withstanding seismic forces per Sections 13.3 and 13.4 of ASCE 7. Use Ip = 1.5, Site Class E.

B. Raceway Supports:

1. Seismically support raceway (conduit, cable tray, busway, etc.) of 2.5-inch inside diameter and larger and suspend 12 inches or more from the top of the raceway to the bottom of the support for the hanger. Raceway supports shall have the capability of withstanding seismic forces per Sections 13.3 and 13.4 of ASCE 7. Use Ip = 1.5, Site Class E.

2. Provide Kin-Line seismic bracing system, Midland Ross superstrut seismic restraint system, Cooper B-Line Seismic Bracing System, or equal. Install per manufacturer's requirements.

PART 3 - EXECUTION

3.01 EQUIPMENT AND RACEWAYS:

A. Install equipment anchors and raceway supports in accordance with the final shop drawing and manufacturer's recommendations. Properly torque all bolts to the required values.

3.02 CONTRACT CLOSEOUT:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

Page Intentionally Left Blank

SECTION 26 05 53

ELECTRICAL IDENTIFICATION

PART 1 - GENERAL

1.01 SUMMARY:

A. Section Includes:

1. Identification of electrical materials, equipment, and installations.

1.02 REFERENCES

A. American Society of Mechanical Engineers (ASME):

1. A13.1: Scheme for the Identification of Piping Systems

B. Institute of Electrical and Electronics Engineers (IEEE):

1. ANSI/IEEE C2: National Electrical Safety Code.

C. National Fire Protection Association (NFPA):

1. 70: National Electrical Code (NEC).

1.03 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

1. Submit shop drawings and manufacturers' product data in accordance with the requirements of Section 26 05 10.

B. Product Data:

C. Submit for each type of product specified.

D. Samples: Submit for each color, lettering style, and or graphic representation required for identification materials; samples of labels and signs.

E. Miscellaneous: Schedule of identification nomenclature to be used for identification signs and labels.

1.04 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

PART 2 - PRODUCTS

2.01 RACEWAY AND CABLE LABELS:

A. Manufacturer's Standard Products: Where more than one type is listed for specified application, selection is Installer's option, but provide single type for each application category. Use colors prescribed by ASME A13.1, NFPA 70, or as specified elsewhere.

B. Components and installation shall comply with NFPA 70.

C. Conform to ASME A13.1, Table 3, for minimum size of letters for legend and minimum length of color field for each raceway or cable size.

1. Color: Black legend on orange field.

2. Legend: Indicates voltage.

D. Adhesive Labels: Preprinted, flexible, self-adhesive vinyl. Legend is over-laminated with clear, wear and chemical resistant coating.

E. Pre-tensioned, Wraparound Plastic Sleeves: Flexible, preprinted, color coded, acrylic bands sized to suit diameter of line it identifies and arranged to stay in place by pre-tensioned gripping action when placed in position.

F. Colored Adhesive Tape: Self-adhesive vinyl tape not less than 3 mils thick by 1 to 2 inch wide.

G. Underground Line Warning Tape: Permanent, bright colored, continuous printed, vinyl tape with following features:

1. Size: Not less than 6 inch wide by 4 mils thick.

2. Compounded for permanent direct burial service.

3. Embedded continuous metallic strip or core.

4. Printed Legend: Indicates type of underground line.

H. Tape Markers: Vinyl or vinyl cloth, self-adhesive, wraparound type with preprinted numbers and letters.

I. Aluminum, Wraparound Marker Bands: Bands cut from 0.014 inch thick aluminum sheet, with stamped or embossed legend, and fitted with slots or ears for permanently securing around wire or cable jacket or around groups of conductors.

J. Plasticized Card Stock Tags: Vinyl cloth with preprinted and field printed legends. Orange background, except as otherwise indicated, with eyelet for fastener.

K. Aluminum Faced Card Stock Tags: Wear resistant, 18 point minimum card stock faced on both sides with embossable aluminum sheet, 0.002 inch thick, laminated with moisture resistant acrylic adhesive, and punched for fastener. Preprinted legends suit each application.

L. Brass or Aluminum Tags: Metal tags with stamped legend, punched for fastener. Dimensions: 2 by 2 inch by 0.05 inch.

2.02 FUSED EQUIPMENT LABELS

A. Provide UV-resistant engraved plastic or stainless steel label on equipment exterior. Provide label with 3/8-inch height text. If plastic, coloration is black legend on orange field.

B. Record fuse make and model for replacement fuses on label legend. Append "PER ARC FLASH / COORDINATION STUDY". Match fuse make and model to fuse determining Arc Flash boundaries and PPE in the required Electrical System Studies. Reference Specification 26 05 70, Electrical System Studies, and its deliverables for additional information.

2.03 ENGRAVED NAMEPLATES AND SIGNS:

A. Conform with Specification 22 05 53 requirements for Warning Signs and Labels, except:

1. Do not rivet nor screw into explosion-proof enclosures/equipment. Where labelling explosion-proof equipment, submit proposed adhesive and adhesion technique. Alternately, submit proposed material and technique to use stainless steel hardware to permanently affix labels to equipment, in accordance with explosion-proof enclosure/equipment manufacturer's instructions. Adhere labels to equipment with approved method.

2. Alternate Fasteners for Plastic Laminated and Metal Signs: Self tapping stainless steel screws or No. 10/32 stainless steel machine screws with nuts, flat washers and lock washers. (Or per Specification 22 05 53.)

B. Manufacturer's Standard Products: Where more than one type is listed for specified application, selection is Installer's option, but provide single type for each application category. Use colors prescribed by ASME A13.1, NFPA 70, or as specified elsewhere.

C. Engraving stock, melamine plastic laminate, 1/16-inch minimum thick for signs up to 20 square inches, 1/8 inch thick for larger sizes.

D. Exterior signs are to be Metal Backed, Butyrate Signs: Wear resistant, non-fading, preprinted, cellulose acetate butyrate signs with 0.0396 inch, galvanized steel backing, with colors, legend, and size appropriate to application. 1/4-inch grommets in corners for mounting.

2.04 MISCELLANEOUS IDENTIFICATION PRODUCTS:

A. Cable Ties: Fungus-inert, self-extinguishing, 1 piece, self-locking, Type 6/6 nylon cable ties with following features:

1. Minimum Width: 3/16-inch.

2. Tensile Strength: 50 pound minimum.

3. Temperature Range: -40 to 185 degrees F.

4. Color: As indicated where used for color coding.

B. Paint: Alkyd-urethane enamel. Primer as recommended by enamel manufacturer.

PART 3 - EXECUTION

3.01 INSTALLATION:

A. Install identification devices according to manufacturer's written instructions.

B. Install labels where indicated and at locations for best convenience of viewing without interference with operation and maintenance of equipment.

C. Lettering, Colors, and Graphics: Coordinate names, abbreviations, colors, and or designations used for electrical identification with corresponding designations used in Contract Documents or required by codes and standards. Use consistent designations throughout Project.

D. Sequence of Work: Where identification is to be applied to surfaces that require finish, install identification after completion of finish work.

E. Self-Adhesive Identification Products: Clean surfaces of dust, loose material, and oily films before applying.

F. Install painted identification as follows:

1. Clean surfaces of dust, loose material, and oily films before painting.

2. Prime Surfaces: For galvanized metal, use single component, acrylic vehicle coating formulated for galvanized surfaces. For concrete masonry units, use heavy duty, acrylic resin block filler. For concrete surfaces, use clear, alkali resistant, alkyd binder type sealer.

3. Apply 1 intermediate and 1 finish coat of silicone alkyd enamel.

4. Apply primer and finish materials according to manufacturer's instructions.

G. Identify Paths of Underground Electrical Lines: During trench backfilling, for exterior underground power, control, signal, and communications lines, install continuous underground plastic line marker located directly above line at 6 to 8 inch below finished grade. Where multiple lines installed in common trench or concrete envelope do not exceed an overall width of 16 inch, use single line marker.

1. Install line marker for underground wiring, both direct buried and in raceway.

H. Color Code Conductors: Secondary service, feeder, and branch circuit conductors throughout secondary electrical system.

1. Field applied, color coding methods may be used in lieu of factory coded wire for sizes larger than 10 AWG.

a. Colored, pressure sensitive plastic tape in half lapped turns for distance of 6 inch from terminal points and in boxes where splices or taps are made. Apply last 2 turns of tape with no tension to prevent possible unwinding. Use 1 inch wide tape in colors as specified. Adjust tape bands to avoid obscuring cable identification markings.

b. Colored cable ties applied in groups of 3 ties of specified color to each wire at each terminal or splice point starting 3 inch from terminal and spaced 3 inch apart. Apply with special tool or pliers, tighten to snug fit, and cut off excess length.

2. Reference Specification 26 05 20, Electric Wires and Cables, for power cable identification coloring.

I. Power Circuit Identification: Use metal tags or aluminum wraparound marker bands for cables, feeders, and power circuits in vaults, pull boxes, junction boxes, maintenance holes, and switchboard rooms.

1. Legend: 1/4-inch steel letter and number stamping or embossing with legend corresponding to indicated circuit designations.

2. Fasten tags with nylon cable ties; fasten bands using integral ears.

J. Apply identification to conductors as follows:

1. Conductors to Be Extended in Future: Indicate source and circuit numbers.

2. Multiple Power or Lighting Circuits in Same Enclosure: Identify each conductor with source, voltage, circuit number, and phase. Use color coding for voltage and phase indication of secondary circuit.

K. Apply warning, caution, and instruction signs and stencils as follows:

1. Install warning, caution, and instruction signs where indicated or required to ensure safe operation and maintenance of electrical systems and of items to which they connect. Install engraved, plastic laminated instruction signs with accepted legend where instructions or explanations are needed for system or equipment operation. Install butyrate signs with metal backing for outdoor items.

2. Emergency Operating Signs: Install engraved laminate signs with white legend on red background with minimum 3/8-inch high lettering for emergency instructions on power transfer, load shedding, and or emergency operations.

L. Install identification as follows:

a. Panelboards, electrical cabinets, and enclosures.

b. Electrical substations.

c. Contactors.

d. Control devices.

e. Transformers.

2. Apply designation labels of engraved plastic laminate for disconnect switches, breakers, push buttons, pilot lights, motor control centers, and similar items for power distribution and control components above, except panelboards and alarm/signal components where labeling is specified elsewhere. For panelboards, provide framed, typed circuit schedules with explicit description and identification of items controlled by each individual breaker.

3.02 CONTRACT CLOSEOUT:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 26 05 70

ELECTRICAL SYSTEM STUDIES

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide electrical system studies as indicated and in compliance with Contract Documents, and as follows.

1. Provide a short circuit, protective device coordination and arc-flash study for the electrical distribution system constructed under this contract. The study shall consider the electrical utility system upstream protective devices down to circuits that neither exceed 250 Volts nor exceed protection of 30 Amperes. The study shall include calculations used to verify the short circuit ratings of the electrical distribution equipment to be provided under this contract and to identify the required settings of associated protective devices.

a. Provide a report summarizing the coordination study including: one-line of system, relay and breaker setting tabulation, relay, circuit breaker, and fuse protective device coordination and short circuit calculation, all prepared by an independent specialty firm. Device calibration and settings are to be based on the results of this coordination study, and based on manufacturer Time Coordination Curves for each overcurrent protective device provided.

B. Provide a complete electrical system voltage and current harmonics analysis study of the electrical system from the main distribution bus to each Variable Frequency Drive (VFD) distribution bus or point of common coupling (PCC). The study shall consider the harmonic contribution of all VFDs on the electrical system.

C. The Contractor shall employ the services of a specialty firm, subject to review, with the specified demonstrated capability for calibrating and setting protective devices as specified herein.

D. Changes and additions of equipment characteristics based on the actual equipment supplied may be suggested by the results of the short circuit and protective device coordination studies. Submit suggested changes and additions as a part of the study. Field settings of devices, adjustments, and minor modifications to equipment that are required to accomplish conformance with the accepted short circuit and protective device coordination studies shall be provided at no additional cost.

1. 70E: Standard for Electrical Safety Requirements for Employee Workplaces

1.03 SUBMITTALS:

A. Submit the following in accordance with Section 01 33 00.

1. Qualifications of specialty testing and/or study firm, as specified.

2. Short circuit and protective device coordination study for review and acceptance, concurrent with the preliminary shop drawing submission for the main electrical distribution system equipment and overcurrent protective devices. Submit an initial study for comment and a final study, with all electronic files, at the completion of the project.

a. The study shall be performed using the latest edition of one of the following commercial software program.

(1) SKM PowerTools

(2) EasyPower

(3) EDSA Paladin

b. The study shall consider the effects of motor contribution during fault conditions, at various buses in the system.

(1) Consider both all-on and all-off motor scenarios.

(2) Consider available fault current from sources shown on the P&ID, including, but not limited to the generator system. Assume up to two engine generator units not running in at least one motors-off scenario.

c. Consider both the maximum and minimum available fault current from the supplying feeders, and actual impedance of the 13,800V-supplying transformer at the main plant. This includes maximum and minimum expected motor contribution from motors within the plant.

d. Include the following elements within the study:

e. Cable sizes

f. Cable lengths

g. Raceway types and associated impedances.

h. Field-Verified information, such as existing transformer impedances to be provided by the Contractor.

i. The maximum fault contribution at the incoming source(s) shall be documented via correspondence from the authority maintaining the main plant electrical system.

j. Transformer inrush points and damage curves shall be plotted on coordination curves, based on actual manufacturer data, not per approximations

k. Obtain from the engine generator supplier, reactance values, protective device type and data and generator decrement curves. Include all engine generator / alternator information as an appendix to these Electrical System Studies.

l. Plot on common 8.5”x11” drawings, single line diagrams and the curves for each protective device to verify proper selectivity and protection for all components of the system for both the normal utility and standby generator source. Label each device uniquely. Do not show more than 5 overcurrent protective devices in Time-Current Curves unless showing relationship between main breaker and load-side breakers within a single piece of electrical equipment.

m. Identify recommended settings for all devices.

n. Devices which do not provide full selectivity and coordination are not to be used as a recommended device in the study.

o. Submittals of electrical distribution equipment affected by the study are not to be submitted until successful review of this study. Submittal or procurement of equipment prior to review or prior to resolution of all review comments is at the Contractor’s risk, and increased costs due to premature ordering are the responsibility of the Contractor.

3. This study shall consider starting when the system is powered from the main plant while on utility feed, and from the standby generator sources.

4. Voltage and current total harmonic analysis study at points of common coupling with the main plant and main distribution buses for all facility supply modes. (i.e. “Plant Feed A”, “Plant Feed B”, “Backup Generators”)

5. After review of coordination study, the Contractor shall set all devices based on the study.

6. After review of the Arc Flash study, the Contractor shall apply Arc Flash Labels based on the study.

7. After review of the Arc Flash study, the Contractor shall apply fused equipment labels based on the study.

1.04 QUALIFICATIONS OF SPECIALTY FIRM:

A. Submit evidence of the following:

1. Firm's Experience:

a. Specialty firm shall have been in the business of the type of work specified, for at least the past five years.

b. The firm shall have a minimum of five projects of equal or greater size, service, and the type of equipment specified.

c. At least the following information must be submitted:

(1) The number of years the firm has been in the business of performing coordination studies.

(2) Summary of five previously performed studies including:

(a) A brief description of each study.

(b) Name of owner of installation on which study was performed with address, telephone number, and contact person.

(c) Date of study.

(3) List of projects and contact persons for which protective device settings were performed.

(4) Any other information indicating the firm's experience, ability to perform the work, and business status.

B. The work identified in this specification is to be conducted by, or supervised by, a Utah-license Professional Engineer specializing in Electrical Power systems. The final approved Electrical Systems Study is to bear the supervising Utah-licensed Professional Engineer's stamp.

PART 2 - PRODUCTS

(Not Used)

PART 3 - EXECUTION

3.01 SHORT CIRCUIT STUDY:

A. Perform a short circuit study in accordance with ANSI Standard C37.010 to verify the adequacy and correct application of circuit protective devices and other electrical system components.

B. The study shall address the case when the system is being powered from the utility source as well as from the on-site generating facilities. Minimum and maximum possible fault conditions shall be covered in the study.

C. Include the fault contribution of all motors. Horsepower shown in the Contract Documents may be used to calculate fault contribution of motors. In the short circuit study regenerative VFDs shall be replaced by conductors of the same size as the branch circuit conductors.

D. Calculate short-circuit momentary duties and interrupting duties on the basis of an assumed bolted 3-phase short circuit at each bus. The short circuit tabulations shall include X/R ratios, asymmetry factors, kVA and symmetrical fault-current. Where ground fault protection is specified, provide a ground fault current study for the same system areas, including the associated zero sequence impedance diagram. Include in tabulation form, fault impedance, X/R ratios, asymmetry factors, motor contribution, short circuit kVA, and symmetrical and asymmetrical fault currents.

E. The studies shall include representation of the site power system, the base quantities selected, impedance source data, calculation methods and tabulations, one-line diagrams, conclusions and recommendations.

3.02 PROTECTIVE DEVICE COORDINATION STUDY:

A. Provide a protective device time current coordination study with coordination plots of current limiting devices, plus tabulated data, including ratings and settings selected. In the study, balance shall be achieved between the competing objectives of protection and continuity of service (with emphasis on continuity of service) for the system specified, taking into account the basic factors of sensitivity, selectivity and speed.

B. Provide separate plots for utility and generator operation as applicable. Show maximum and minimum fault values in each case. Multiple power sources shown in one plot is not acceptable.

C. Each primary protective device required for a delta-to-wye-connected transformer shall be selected so the characteristic or operating band is within the transformer parameters. Separate low voltage circuit breakers from each other and the associated primary protective device, by a 16 percent current margin for coordination and protection in the event of line-to-line faults. Separate protective relays by a 0.4 second time margin, or larger, as required to assure fault-side protective devices have an opportunity to open and clear before tripping upstream device(s). The protective device characteristics or operating bands shall be terminated to reflect the actual symmetrical and asymmetrical fault-currents sensed by the device. Provide the coordination plots for 3 phase and phase-to-ground faults on a system basis. Include all devices down to largest branch circuit feeder circuit breaker. Include all adjustable setting ground fault protective devices.

D. Identify discrepancies in the conclusions and recommendations of the report. Upon resolution of discrepancies and recommendation, update all associated analyses and revise the affected studies.

E. The coordination plots shall graphically indicate the coordination proposed for the several systems centered on full scale log forms. The coordination plots shall include complete titles, representative one-line diagrams and legends, associated upstream power system relays, fuse or system characteristics, significant motor starting characteristics, significant generator characteristics, complete parameters for power, and substation transformers, complete operating bands for low voltage circuit breaker trip devices, fuses, and the associated system load protective devices. The coordination plots shall define the types of protective devices selected, together with the proposed coil taps, time-dial settings and pick-up settings required. The short-time region shall indicate the relay instantaneous elements, the magnetizing inrush, and ANSI transformer damage curves, the low voltage circuit breaker and instantaneous trip devices, fuse manufacturing tolerance bands, and significant symmetrical and asymmetrical fault-currents.

F. The thermal limit of all feeder cables to each bus and large motors, where applicable in the study, shall be shown.

G. No more than six devices shall be shown on one coordination plot. Of these six curves, two (the largest upstream device and the smallest downstream device) shall repeat curves shown on other coordination plots in order to provide cross reference. Give each unique protective device curve in the study a study-unique number or letter identifier to permit cross reference between plots. Do not use identifier letters or numbers more than once.

H. Each primary protective device required for delta-wye connected transformer shall be selected so that the characteristic or operating band is within the transformer parameters,

which, where feasible, shall include a parameter equivalent to 58 percent of the ANSI withstand point to assure protection for secondary line-to-ground faults. Prioritize coordination and designed system capacity over protection for secondary line-to-ground faults.

I. Include a detailed description of each protective device identifying its type, function, manufacturer, and time-current characteristics. Tabulate recommended device tap, time dial, pickup, instantaneous, and time delay settings. Include C.T. ratio, burden and all other calculations required for the determination of settings.

3.03 MOTOR STARTING/RUNNING STUDY:

A. Provide a motor starting study for all large electric motors and drives over 15 Hp in size to determine voltage dip or power inrush limitations at selected locations due to starting of motors. Define minimum system voltages and compare to standard equipment voltage capabilities.

B. Provide a complete independent set of current-time characteristic curves for all motors 100 hp and above indicating coordination between the protective relays and the thermal characteristics of the motor.

C. Obtain from the motor supplier the necessary information to perform the study. Certified curves for “Safe Time vs. Current at 100 percent Voltage” and “Accelerating Time vs. Current at 100 percent Voltage” are absolutely necessary and shall become part of the final report.

D. Provide recommended settings for all motor protective devices supplied under this contract.

3.04 HARMONIC ANALYSIS STUDY:

A. Provide a voltage and current total harmonic distortion analysis for the distribution system from the main distribution bus to each VFD distribution bus point of supply at the main plant switchboard (08-SWGR-99100A / 08-SWGR-99100B).

B. Obtain harmonic analyses and characteristics for each VFD, reactor and/or filters to be supplied for each drive from the Contractor.

C. Perform a system analyses to demonstrate not more than 5 percent THD voltage and current distortion at all distribution buses identified in the study.

D. Where THD is greater than 5 percent, provide recommendations to reduce distortion at one or more VFD units by the addition of filters and/or reactors.

E. The harmonics analysis shall be performed assuming the system transformers are 70 percent loaded.

3.05 ARC FLASH HAZARD ANALYSIS:

A. Perform arc flash hazard analysis for the following items:

1. Switchgear.

2. Switchboards.

3. Panelboards.

4. Control panels with voltage over 50 volts.

5. Motor control centers.

6. Transformers of 15kVA and larger

7. Motor Controllers

8. Disconnect switches and safety switches protected at 30 amps and above, or operating at over 600 volts.

B. Methods of performing analysis:

1. Provide calculations per IEEE 1584-2018, or latest version officially published by IEEE.

a. If the conditions fall within the IEEE 1584-2018 parameters use the IEEE 1584-2018 calculations based on actual OCPD curves and settings.

b. If the conditions do not fall within the IEEE 1584-2018 parameters, use the Lee method.

C. Label each item for which the calculations were performed with the following information:

1. Information required by 2021 NFPA 70E, 130.5(H)(2).

2. Arc Flash Boundary.

3. Limited approach boundary.

4. Restricted approach boundary.

5. Calculated Incident Energy in cal/cm^2.

6. Caption “WARNING - PERSONAL PROTECTIVE EQUIPMENT IS REQUIRED WITHIN ARC FLASH BOUNDARY!”

3.06 FIELD TESTING:

A. Provide in accordance with Section 01 78 25 and as specified.

B. Integrate results of this study with functional testing of the contract electrical equipment in accordance with Section 26 05 10.

3.07 CONTRACT CLOSEOUT:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

Page Intentionally Left Blank

SECTION 26 05 90

ELECTRICAL CONTROLS AND MISCELLANEOUS ELECTRICAL EQUIPMENT

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide and connect the electrical control equipment and miscellaneous electrical equipment, including such instruments and devices indicated and specified. Device enclosures for electrical equipment as indicated and specified.

B. Control panel enclosures and devices specified herein are provided under those specification sections which invoke this section for control panel requirements or as indicated on electrical drawings.

1.02 REFERENCES:

A. ASTM International (ASTM):

1. D178: Standard Specification for Rubber Insulating Matting

D. Underwriter's Laboratories, Inc. (UL):

1. 467: Standard for Grounding and Bonding Equipment

2. 486A: UL Standard for Safety Wire Connectors and Soldering Lugs for Use with Copper Conductors

3. 486B: UL Standard for Safety Wire Connectors for Use with Aluminum Conductors

4. 489: Standard for Molded-Case Circuit Breakers, Molded-Case Switches and Circuit-Breaker Enclosures.

5. 823: Standard for Safety Electric Heaters for Use in Hazardous (Classified) Locations.

1.03 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Submit shop drawings and manufacturers' product data in accordance with the requirements of Section 26 05 10.

C. Wiring diagrams to show control interface points provided with other equipment.

D. Shop drawings to include:

1. Outline drawings with elevations

2. Equipment arrangement drawings

3. Anchor bolt location drawings

4. Electrical schematics and wiring diagrams

5. Electrical fuse/circuit breaker characteristic

6. Equipment performance curves and data

7. Bill of installation/assembly materials

8. Equipment weights

9. Completed manufacturer’s data sheets

10. Sustainable design submittals

1.04 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.05 SPARE PARTS:

A. Comply with the requirements specified in Section 01 61 00.

1.06 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

1.07 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

PART 2 - PRODUCTS

2.01 MANUFACTURERS FOR ELECTRICAL DISTRIBUTION EQUIPMENT:

A. Siemens

B. General Electric Company

C. Eaton/Cutler-Hammer

D. Square D Company

E. Appleton Electric Company

F. Crouse-Hinds Company

G. O-Z/Gedney

H. ABB

2.02 SAFETY DISCONNECT SWITCHES:

A. Provide heavy duty type, safety switches, with external operating handles, 3 PST, rated 600 volt, 60 Hertz with ampere rating as indicated, and having provisions for padlocking.

B. Provide fuses for safety switches as indicated.

C. Heavy duty safety switches to be UL listed, File E 2875 and 154828, and meet or exceed NEMA Standard KS1.

D. Provide auxiliary electrical interlocks for motor heaters or other motor control circuits, including auto-transformer starter, starter control where indicated.

2.03 CONDUIT AND WIRING:

A. Provide conduit and wiring necessary to make connections between instrument panels, consoles, cabinets and external equipment and devices.

2.04 PUSHBUTTON AND SELECTOR SWITCH STATIONS:

A. Provide HAND-OFF-AUTO switches, push buttons, tumbler switches and other accessory devices as necessary for the control of motors and other electrical equipment or devices.

B. Provide pushbutton and selector switch stations designed for heavy-duty service and with momentary or maintaining contacts as indicated or as necessary for starting and stopping of equipment with 10 amp contact ratings.

C. Provide heavy duty switches and pushbuttons, Square D Company, Class 9001. Indicating lights to be led cluster type.

D. At stations provide nameplates with white letters on black background.

E. Provide safety lockout station with position indication located near motor to prevent application of current. Where pumps are located on lower levels than driving motors, furnish safety lockout station near each pump or other item of equipment.

F. Rate explosion-proof stations for the Group, Division and Class as indicated.

G. Provide galvanized cast iron enclosures for NEMA Type 4 watertight stations.

H. Provide fiberglass reinforced polyester NEMA Type 4X enclosures for stations located in highly corrosive areas. Provide gaskets and Type 316 stainless steel screws, to prevent entry of chemicals.

2.05 WALL MOUNTED COMBINATION STARTERS:

A. Unless otherwise indicated, provide each combination starter with motor circuit protector and full voltage magnetic starter. Provide starters in an enclosure that meets the requirements of the enclosure schedule. Provide motor circuit protectors and starters as specified in Section 26 24 19.

2.06 WALL MOUNTED CIRCUIT BREAKERS:

A. Provide manually operated circuit breakers, ambient compensated, providing thermal magnetic inverse time limit overload and instantaneous short circuit protection. Provide overload protection on all poles; trip settings as indicated.

B. Provide circuit breakers as specified under Section 26 24 19.

C. Provide circuit breakers housed in NEMA type enclosure indicated, having external operating handles with provisions for padlocking.

2.07 CONTROL PANELS AND ELECTRICAL ENCLOSURES:

A. Manufacturers:

1. McKinstry Incorporated

2. Hoffman, Inc.

3. Hammond Manufacturing

B. Provide control panels for motors and other equipment, as indicated. Ensure that dimensions, NEMA rating, construction and mounting of equipment are as indicated.

C. Provide enclosures with back panels constructed of at least 14 gage steel and provided with terminal blocks for connection of external wiring. Provide door and body stiffeners in panels over 36 inches in length. NEMA 4 and NEMA 4X panels to be provided with hand operated quick disconnects of stainless steel material.

D. Provide UL listed and NEMA rated pushbuttons, indicator lights and switches of heavy duty, oil tight types. Provide relays of industrial types, with 120 volt, 60 Hertz operating coils, and contacts rated for intended service. Power from fused control power transformers.

E. Provide nameplates for each panel and each device on panel. Nameplates of laminated plastic material, at least 3/32-inch thick, and with white letters on a black background.

F. Secure nameplates with self-tapping, Type 316 stainless steel metal screws.

G. Terminal Blocks:

1. Provide terminal blocks rated for 600 volts with screw type terminals

2. Terminal blocks to be one piece with full barriers

3. Provide General Electric EB-25 terminal blocks or equal

H. Provide print pocket on inside of enclosure and include record drawings for Owner's use.

I. Where 480 volts AC and 120 volts AC are required within the same enclosure, install components to insure separation of wiring for the panel voltage circuits.

J. Enclosures and panels located outdoors shall be provided with heaters and thermostats. Enclosures less than 24 inch high shall be provided with strip heaters and encapsulated leads. Enclosures 24 inch high and larger shall be provided with forced air heaters with thermostats as manufactured by Hoffman. Thermostats shall be provided with a range of 40 degrees F to at least 60 degrees F.

K. Enclosures 24 inch or larger shall be provided with light fixtures, light switch and 20 amp GFI protected receptacle. Light fixtures shall be UL listed for wet locations and provided with glass globe, metal guard and 100 watt incandescent lamp.

L. Where visual strobe or warning lamps are required, provide heavy duty beacon, Edwards Signal Catalogue No. 93.

M. Where audible horn alarms are required, provide Edwards Signal 870P.

N. Where equipment and devices are to be installed in hazardous locations, provide equipment and components suitable for the environment.

O. Where intrinsically safe wiring is required within the panels, the following requirements shall be met:

1. Within enclosures, conductors or intrinsically safe (IS) circuits shall be separated at least two inches from conductors of any non-intrinsically safe circuit. Within the enclosure the conductors shall be secured.

2. Intrinsically safe wiring shall not be routed in the same conduit as non-IS wiring.

3. Terminals in panels with IS wiring shall be identified in a manner that will prevent unintentional interference with the control circuits during testing and servicing.

P. All indicating lamps to be LED cluster type.

2.08 RUBBER MATS:

A. Rubber mats are not required.

2.09 CONTACTORS AND RELAYS:

A. Provide mechanically held, heavy duty type contactors (relays) for lighting control, rated 30 amps, 600 volts, with number of poles as indicated.

B. Provide contactor in the required NEMA enclosure suitable for wall mounting. Provide circuit breaker or fuse protection on each ungrounded pole. Provide contactor similar to Square D Company, Class 8903, Type LX.

C. Provide control power transformer with primary and secondary fuse protection. Control power to be 120 volts, single phase.

D. Provide timing relays by Allen Bradley, Series 700.

E. Provide industrial grade relays, NEMA rated, Square D Company, Class 8501.

PART 3 - EXECUTION

3.01 WIRING OF MISCELLANEOUS DEVICES:

A. Make electrical connections required for recording and indicating instruments, and miscellaneous devices. Provide electrical supplies to metering, instrumentation, control, and alarm systems. Provide dedicated fuse and power from switchgear battery system where supplying such devices associated with protective devices within a switchgear. Provide surge protection for battery power system where CTs or other protective devices are located outside of the building that encloses the switchgear.

B. Connect HAND-OFF-AUTO switches, safety switches, tumbler switches, and other accessory devices as indicated or necessary for control of motors and other electrical equipment or devices.

C. Install conduit and wiring and make electrical connections between all instrument panels, consoles, cabinets, and external equipment and devices.

3.02 WIRING OF EQUIPMENT FURNISHED UNDER OTHER SECTIONS:

A. As specified in Section 26 05 00, install conduit, wiring, and connections for equipment and devices furnished under other Sections of specifications, and as indicated.

B. Unless otherwise indicated, control equipment, relays, control wiring, conduit, and connections for control of heating, ventilating, and air conditioning systems are provided as specified in Division 23. Refer to mechanical specifications and drawings for locations of pressure-operated control switches, float switches, butterfly valves, solenoid operated valves, sump pumps, metering instruments, control panels, alarm actuating contacts, indicating lamps, limit switches, and other devices requiring wiring or interconnections with equipment supplied under Electrical Sections of these specifications.

3.03 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

ELECTRICAL SYSTEM DEMONSTRATIONS

PART 1 - GENERAL

1.01 SUMMARY:

A. Demonstrate proper operation of electrical systems and equipment in presence of Engineer.

1.02 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Demonstration log

PART 2 - PRODUCTS

(Not Used)

PART 3 - EXECUTION

3.01 PERFORMANCE:

A. Demonstrations:

1. Each piece of equipment

2. Each integrated system

B. Demonstration Log:

1. Keep log of individual demonstrations

2. Data:

a. Date and time of demonstration

b. Owner's representative

c. Equipment or system demonstrated

d. Result of demonstration.

(1) Success or fail

(2) If failure, description of failure

(3) Corrective action taken

(4) New demonstration result

3.02 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 26 08 13

FIELD INSPECTION AND ACCEPTANCE TESTS

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Perform electrical system tests to demonstrate that each component of each system is in proper working order and in accordance with applicable codes, manufacturer's instructions, drawings and specifications. Tests are in addition to, and no substitution for, factory tests of individual equipment.

1. Perform insulation and ground resistance tests before operating tests.

2. Determine proper rotation of motors before permanent connections are made.

3. Perform tests at first overcurrent protective device after a separately-derived source to assure no neutral-to-ground faults nor no line-to-ground faults. Do not energize system before performing this test in a witnessed condition, with no faults identified.

4. All of these tests shall be witnessed by the Owner and/or the Owner’s Engineer, or their representatives, at the Owner’s option. Repeat this test as requested by Owner’s or Engineer’s representative.

B. Testing shall be performed to:

1. Provide initial acceptance tests and recorded data that can be used as a bench mark for future routine maintenance and troubleshooting by facility operating staff.

2. Ensure a successful start-up with a minimum of last minute interruptions and problems.

3. Determine the suitability of the equipment and systems for energization and placing into operating service.

4. Provide assurance that each system component is not only installed satisfactorily but performs, and will continue to perform, its function in the system with reasonable reliability throughout the life of the facility.

C. Provide all supervision and labor, materials, tools, test instruments or other equipment or services and expenses required to test, adjust, set, calibrate, functionally and operationally check all work and components of the various electrical systems and circuitry throughout the installation. Provide sufficient personnel to assist in any

additional checks they may require for acceptance, start-up, run-in and placing the equipment and systems into continuous service.

D. The Contractor shall engage the services of a competent nationally recognized independent electrical equipment testing firm to perform specified field inspections, tests, and adjustments firm. The testing firm shall not be a subsidiary, division, nor department of either the installing Contractor or the manufacturer of the equipment materials or systems being inspected and tested. The testing firm shall be a fully accredited member of the International Electrical Testing Association, Incorporated (NETA), or an approved equal, and have the specialized experience and skill in the supervision and performance of all inspection and testing specified herein.

E. The testing firm shall perform the specified activities prior to the start-up and completion of the work identified in the Contract Documents.

F. The tests and inspections performed shall in no way relieve the Contractor of the responsibility for the performance of the tests, check outs, and inspections specified under other sections of the specification during construction.

G. The listings and descriptions of the tests, and checks described herein shall not be considered as complete and all inclusive. Additional normal standard construction (and sometimes repetitive) checks and tests may be necessary throughout the job, prior to final acceptance by the Owner.

H. Pay all costs for tests including expenses incident to retests occasioned by defects and failures of equipment to meet specifications.

1. Replace wiring and equipment found defective, or failing to meet specified requirements, without charge, unless written acceptance for repair is given by Engineer.

2. Unless otherwise specified, the Owner will supply electric power necessary for tests.

1.02 REFERENCES:

A. All inspections and tests shall be in accordance with the following applicable codes and standards latest revisions except as provided otherwise herein.

1. All Standard, Special and Supplemental Conditions of the Contract

B. All inspections and tests shall utilize the following references:

1. Project Design Specifications

2. Project Design Drawings

3. Project Electrical System Studies

4. Manufacturer's instruction manuals applicable to each particular apparatus

1.03 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

1. Submit test plans and test data in accordance with the requirements of Section 26 05 10.

2. Submit evidence of NETA membership, or an approved equal, experience and staff qualifications of the independent testing firm.

3. Submit in 3-ring notebook, test plans for each system and piece of equipment to be inspected and tested. Provide sample test data sheets with blanks identified where test data will be recorded, test instrument identification, calibration date, and blanks provided to identify the person performing the test and the person witnessing the test.

4. Submit test results.

1.04 SCHEDULING:

A. The Contractor shall be responsible for the preparation of proposed procedures and schedules for all inspections, tests, settings and calibrations specified or otherwise required prior to or during the check out for start-up and acceptance of all the electrical components, equipment and systems. This work shall be coordinated and to be compatible with both the work of other crafts and the project schedule. The above must be organized and submitted with all proposed testing and check out forms. The procedures shall provide specific instructions for the checking and testing of each component in addition to the system functional checks. Tests and inspections shall be scheduled as the job progresses and may require repetition in greater detail at a later stage of construction. All procedures submitted shall include job safety rules proposed.

B. Equipment shall be inspected and tested to determine its condition. See other applicable sections of the specifications and contract documents for required checks and responsibilities.

C. At any stage of construction and when observed, any electrical equipment or system determined to be damaged, faulty, or requiring repairs shall be reported to the Engineer. Corrective action may require prior approval.

D. Prior to check out and testing for start-up, ensure that all equipment and wiring is properly and permanently identified with nameplates and other identification as specified elsewhere. Check and tighten all terminals and connection points, remove all shipping blocks and hardware, thoroughly clean all equipment, repair all damaged or scratched finishes, inspect for broken and missing parts and review and collect manufacturer's drawings and instructions for submittal to the Engineer. Make routine checks and tests as the job progresses and as necessary to insure that all wiring and equipment is properly installed and wired.

E. All testing and checkout work shall be performed with fully qualified personnel skilled in the particular tests being conducted. This is essential for obtaining and properly evaluating data while the tests are in progress and for insuring that important facts and questionable data are reported.

F. All inspections, tests, and calibrations shall be reported in writing on forms submitted for review under Submittals. The recorded data form shall have the signatures of the persons conducting the tests and authorized witnesses. The forms shall be designed to serve as the test and inspection checklist for inspection requirements. "As-found" and "as-left" test data shall be recorded and reported in writing.

G. The sequence of all tests and checks shall be such that the equipment can be energized immediately after the completion of the applicable tests.

H. When applicable electrical tests and inspections specified herein, or otherwise required are completed and results reported and reviewed then the Contractor may consider that portion of the electrical equipment system or installation electrically complete. The Contractor shall then affix appropriate dated completion and calibration labels to the tested equipment. The Contractor shall notify the Engineer and Owner of electrical completion. If the Engineer or Owner finds completed work unacceptable, the Contractor will be notified in writing of the unfinished or deficient work which shall be corrected by the Contractor. The Contractor shall notify the Engineer in writing when all exceptions have been corrected. If later in-service operation or further testing determines problems attributable to the Contractor, these shall be corrected by the Contractor or suitable arrangements shall be made to suit operating circumstances.

PART 2 - PRODUCTS

2.01 TESTING EQUIPMENT:

A. Calibration:

1. Furnish all material, test equipment, and power sources required for testing, calibrating and check out. All calibration and setting checks by the independent testing laboratory shall be performed with laboratory calibrated test instruments of appropriate accuracy. This test equipment shall have calibrations traceable to the National Bureau of Standards. Testing laboratory dated calibration labels shall be visible on all test equipment. Calibrations over 6 months old will not be acceptable on field test instruments. The accuracy of all test instruments shall be at least twice that of the accuracy of the equipment, device, relay or meter under test. All testing instruments shall be checked to insure satisfactory operation prior to proceeding with the tests. Serial and model numbers of the instruments used shall be recorded on the test forms.

2. Make necessary openings in circuits for testing instruments and place and connect all instruments, equipment, and devices, necessary for the tests. Upon completion of tests, remove instruments and instrument connections and restore all circuits to permanent condition.

2.02 TESTING:

A. Coordination:

1. Coordinate activities, and cooperate with others on project, to ensure that systems are energized when required, loads applied, and other requirements of Section are carried out on timely, coordinated basis.

2. Conduct tests in presence of Engineer unless waived by the Engineer. Notify Engineer seven calendar days or more in advance when any test to be performed, and do not start tests without Engineer's permission.

3. Other Sections of specifications require services of one or more manufacturer's representatives, to ensure that equipment supplied has been installed properly and adjusted to proper working order. Advise representative of all applicable tests in this section, so that work will be coordinated, and tests combined where feasible.

4. It is important that equipment warranties or guarantees not be voided by testing and checkout work. The checks and tests to normally be supplemental to and compatible with the manufacturer's installation instruction leaflets and literature. Where deviations are apparent, the manufacturer's review shall be obtained prior to testing. Reasonable cooperation shall be extended to permit witnessing by the manufacturer's representative if so requested. Where any questionable repairs, modifications, significant adjustments, tests or checks are to be made, the Contractor shall contact the Engineer to determine if the work should be performed by or with the manufacturer's representative.

B. Preparation:

1. Make up no high and/or medium-voltage connections at service entrance, transformers, substations, motors, medium voltage motor control centers, switchgear and generator permanently until correct phase rotation of all equipment is determined. Install and insulate these connections temporarily, if necessary, while determining proper rotation. Make permanent connections after proper rotation has been established and subsequent to completion of insulation resistance and dielectric tests.

PART 3 - EXECUTION

3.01 INSULATION TESTS OF EQUIPMENT, CABLE, AND CIRCUITS:

A. General:

1. Perform DC insulation tests of the type specified on electrical equipment, apparatus and cables under any one or more of the conditions described as follows: At the time equipment such as motors, generators, transformers, power circuit

breakers and switches, switchgear, motor control centers, bus duct, and similar electrical equipment is:

a. Delivered to the site for care, storage, and/or installation,

b. Prior to energization and/or placing into service and acceptance by the Owner,

c. When damage to the insulation is suspected or known to exist,

d. After repairs or modifications to the equipment affecting the insulation,

e. Routinely as necessary to determine or evaluate the condition of the insulation, especially moisture conditions, to determine the need for drying, cleaning or other maintenance work or protection,

f. Where lightning or other surge conditions are known to have existed on the circuit.

2. Insulation tests are required to be performed by the testing firm at various stages of construction. The equipment, cable and systems that require testing, the maximum test voltages, and the type tests required shall be in accordance with the applicable paragraphs of NETA, or an approved equal.

3. List each circuit and measured resistance as test data.

4. Maintain record of all insulation resistance values. Identify conductor, or equipment, date that value was taken and resistance value. Arrange information in suitable neat tabular form and submit to Engineer.

3.02 SPECIFIC TESTS AND INSPECTIONS BY THE CONTRACTOR:

A. General:

1. The following specific items of work shall be performed by the Contractor. The list is not all inclusive, nor does it define how the tests and checks are to be made. Refer to applicable sections of NETA, or an approved equal, and equipment specifications for additional details. The equipment and cable shall be deenergized and isolated as necessary to perform the tests.

2. The engagement of the independent testing firm in no way relieves the Contractor of the responsibility for, or diminishes the importance of, performance tests, checkouts, and inspections during the various stages of construction. The specific work of the independent test firm is defined in Paragraph 3.03.

3. The Contractor shall perform all tests and inspections as defined in the other sections of this specification. Tests and inspections required by these sections are not necessarily repeated under specific equipment in Paragraph 3.02.

4. All equipment received for the job and for which the Contractor is responsible to be stored and cared for per the manufacturer's instructions. It is the Contractor's responsibility to obtain such information even where the instructions are not shipped with the equipment.

5. The Contractor shall assist the independent test laboratory in performing its work.

B. Equipment Test and Inspection During Construction and Prior to Acceptance Testing:

1. Motors (5 Hp and larger):

a. At the time of motor receipt, each motor shall be visually inspected for any physical damage and the motor meggered as described in Paragraph 1.e below.

b. All voltage motors shall be provided with adequate heating during storage. See Paragraph 3.01 for additional insulation tests for all motors of different voltages.

c. Before energizing any machine, visually inspect for serviceability. Check manufacturer's instruction manual for correct lubrication and ventilation. Verify that proper alignment has been performed. Check nameplate for electrical power requirements.

d. Test run all motors preferably uncoupled or unloaded, before placing into regular service. A check on the motor for rotation, speed, current and temperature rise to be made and results recorded. The proper color codes for phase identifications to be maintained. This may require lead swaps at the motor for proper rotation. A motor phase rotation meter shall be used prior to connection at motor to prevent later swaps.

e. Complete visual inspection and electrical tests (including optionally listed tests) per NETA ATS Section 7.15.1, (or the equivalent standard from an approved equal).

2. Medium Voltage Switchgear, Medium Voltage Motor Controllers and Medium Voltage Switches:

a. At the time of equipment receipt, the exterior shall be visually checked for any damage and the interior checked for damaged or loose components with special attention to insulators.

b. Prior to connecting cable leads to the equipment, internal bus bars and power connection shall be megger tested. If moisture is a problem, the equipment may have to be dried out before going into service. If the insulation resistance between conductors and ground reads below 50 megohms with the

fuses or current breakers removed, moisture, dirt or other contaminants may be a problem.

c. Cable phasing and identification to be checked prior to connecting cable leads.

d. Check to insure proper fuse sizes and settings of overload elements or relays in control centers.

e. Physically and functionally check all control circuits and devices and key, mechanical, and/or electrical interlock system. Alignment of circuit breaker elements or motor controllers with fixed connections in cubicles to be checked for ease of insertion and withdrawal.

f. Motor controllers, medium voltage switches, and disconnects shall be checked for proper fuse sizes and types and the information recorded and properly reported on the forms.

g. Check all bolted bus joints and all other power and control terminal connections. Calibrated torque wrench methods in accordance with manufacturer's instructions to be used on bus connections or where needed.

h. Complete inspection and electrical tests requirements per NETA ATS, (or the equivalent standard from an approved equal):

(1) Section 7.1: Metal Enclosed Switchgear and Switchboard Assemblies

(2) Section 7.5: Switches

(3) Section 7.6: Circuit Breakers

(4) Section 7.19: Surge Arresters

(5) Section 7.10: Instrument Transformers

(6) Section 7.11: Metering Devices

3. Grounding Systems:

a. All grounding loops and major equipment grounds shall be tested to remote earth or directly referenced to an extremely low resistance (approximately 1 ohm) reference ground bench mark. Visual inspection of all systems, raceway and equipment grounds shall be made to determine the adequacy and integrity of the grounding. All ground testing results shall be properly recorded, witnessed, and submitted.

b. Ground tests shall be performed in accordance with NETA ATS, Section 8.13 using a J. G. Biddle Company low resistance, Null balance type, ground testing with ‘ohmmeter with test lead compensation in place. (Or the equivalent standard from an approved equal.) The test instrument shall be the type which compensates for potential and current rod resistances.

c. Test each ground rod and submit tabulation of results to Engineer. Include identification of electrode, date of reading and ground resistance value in results.

d. Test each entire grounding system for continuity of connections and for resistance. Ensure that ground resistance of conduits, equipment cases, and supporting frames does not vary appreciably from that of system as whole and does not exceed 5 Ohms.

e. Where ground test results indicate the need for additional grounding conductors or rods that are not indicated on drawings or specified, additional grounding provisions shall be initiated to obtain the acceptable values. The Contractor shall be responsible for the proper installation of the grounding shown on drawings or specified and for the correction of improper installations as determined by inspections and tests.

4. Power Transformers:

a. At the time of equipment receipt, the exterior to be visually checked for any damage or any defects.

b. Perform complete inspection and electrical tests in accordance with NETA ATS, Section 7.2. (Or the equivalent standard from an approved equal).

5. Low Voltage Switchgear: Refer to NETA ATS, Section 7.2. (Or the equivalent standard from an approved equal). Perform all applicable tests and checks as described in NETA ATS, Section 7.2. (Or the equivalent standard from an approved equal).

6. Protective Relays and Metering:

a. Prior to final check out as described in Paragraph 3.03, visually inspect and correct, where appropriate, all relays, meters, wiring and related circuitry for tightness of connections, physical damage, compliance with specifications and Vendor data, mechanical condition, freedom of movement, and presence of or possibility of moisture, dust, or other contaminants.

b. Clean, check, and pre-set all protective relays. Final calibration and adjustment, etc., shall be by the independent testing firm. Refer to Paragraph 3.03.

c. Complete inspection and electrical tests per NETA ATS, Section 7.9. (Or the equivalent standard from an approved equal).

7. Low Voltage Motor Control Centers:

a. At the time of equipment receipt, the motor control centers shall be visually checked for any damage.

b. Perform inspection checks and electrical tests in accordance with NETA ATS, Section 7.16.2. (Or the equivalent standard from an approved equal).

C. Bus Ducts:

1. At time of equipment receipt, the exterior and bus work shall be visually inspected for any damage.

2. Perform inspection checks and electrical tests in accordance with NETA ATS, Section 7.4. (Or the equivalent standard from an approved equal).

D. Distribution Transformers:

1. All 480 volt primary, air-cooled, transformers shall be given an insulation test, by means of a megger, after connections with the primary cables are complete. The supply cable shall be meggered with the primary winding and to the open-air circuit breaker. Secondary leads may be meggered with the secondary windings to the open load breakers.

2. Continuity and correctness of connections of all windings, and ratings shall be checked.

3. Perform inspection checks, and electrical tests in accordance with NETA ATS, Section 7.2.3. (Or the equivalent standard from an approved equal).

E. Wire and Cable:

1. Before energizing, the continuity and insulation resistance of every circuit external to equipment shall be measured with a megger from each wire to all others and ground and test results recorded on forms. Tests shall normally be conducted at voltages 500 volts or lower. High potential testing will normally be performed by the independent testing laboratory as described in Paragraph 3.03.

2. Insulation resistance measurements shall be taken of the following: (Refer to Paragraph 3.01 for additional information.)

a. Motor Feeders: With motors disconnected, measure and record insulation resistance from load side of contactors or circuit breakers. Repeat this test after motors are connected and just before energizing at lower voltage as limited by the maximum test voltage for the motor.

b. Motor Control Circuits (600 Volts): With push buttons and overcurrent devices connected, measure and record insulation resistance from phase to ground only. It will be necessary to lift the neutral ground on the control transformers to perform this test. Also, isolate any control elements that should not be meggered.

c. Lighting Panel Feeders And Distribution Panel Feeders: Measure and record insulation resistance with circuit breakers, lighting transformers and panelboards connected, but with lighting branch circuit breakers or switches open.

d. Lighting Branch Circuits: Measure and record insulation resistance after all lampholders, receptacles, fixtures, etc., are connected but before lamping.

e. Feeder Circuits: Measure and record insulation resistance with connections to circuit breakers made up but with breakers open and loads not connected.

3. All cables and wires shall be checked for proper identification numbering and/or color coding.

F. Overhead Conduit Systems:

1. The overhead conduit system shall be checked for proper installation by using the following check list: (This list not to be considered all-inclusive but as a guide for inspection).

a. Conduits are supported on appropriate independent supports (i.e., not on process piping, pipe ways, or piping hangers).

b. Exposed conduits are run in a neat workmanlike manner, parallel or perpendicular to structural members.

c. Conduits are routed as far away from possible fire hazards and heat sources as practical.

d. Conduits are supported at the required intervals.

e. Pull boxes and fittings are installed so that covers are easily removable. Verify that all covers are installed and tightly bolted with gaskets provided where needed.

f. Number of bends in the conduit does not exceed 270 degrees without a pull box installed.

g. Circular cross sectional area is uniform at conduit bends. Single bends do not exceed 90 degrees.

h. Conduits are terminated in threaded hubs or bushings to prevent damage to wire.

i. Conduits joints have joint compound of the type specified and are tight and conduit ends are properly reamed and threaded not to engage less than 5 threads.

j. Pull fittings are of adequate size such that cable can be installed and replaced at a later date without the bending radius of the cable being less than code or manufacturer's requirements.

k. Seal fittings and/or sealing compound is installed at moisture barriers to prevent entry of moisture into equipment and/or where shown on plans.

l. Drains and conduit seals are installed on vertical conduit runs entering devices, equipment, and enclosures to prevent entrance of moisture.

m. Flexible conduit is installed at motors and other equipment as specified or required. Verify that all cabling and conduit runs are properly identified at each end.

G. Underground Conduit Systems:

1. Underground conduit systems shall be inspected and checked for compliance with standard practices, plans and specifications as the job progresses.

2. Upon construction completion of the underground conduit banks or runs and prior to backfill, the routing and the elevation and depth below grade shall be checked and any deviations from plans and/or specification to be recorded and in addition noted on record drawings.

H. Relay Panels, Operator and Instrument Control Panels, Communications Systems, Static Equipment, Programmable Controllers, Micro-Processors, Battery Systems and Other Miscellaneous Equipment:

1. Upon receipt of equipment, each item shall be inspected for damage, loose or missing parts.

2. Upon completion of equipment installation, all equipment and their control devices shall be visually and functionally tested for tightness of connections and for proper operation. In the case of battery systems, static inverters and the like, manufacturer's recommended test and installation manuals shall be reviewed and complied with. In the case of operator, instrument, and relay panels and cabinets or devices used solely for control, each circuit, where possible, shall be functionally tested for proper operation and conformance with drawings. Where functional testing is deemed undesirable by the Owner's Representative from a safety or plant operational standpoint, then continuity and terminal connection

verification checks will be adequate. The Contractor shall insure that instruments and associated components cannot be energized until instructed by the Owner's Representative. For functional, operational, and calibration checks of instrument loops, refer to the instrument installation specifications.

3. Panelboard electrical checks shall be as included in the Wire and Cable section of this specification, Paragraph 3.02.E. Panelboards to be checked for proper circuit identification on the door schedule.

I. Sealing of Openings: The Contractor shall inspect the entire job with the Engineer to insure that all openings are properly sealed as specified elsewhere.

J. Record Drawings: The Contractor shall maintain a master set or record drawings that show changes and any other deviations from the base drawing. The markups shall be made as the changes are done. At the conclusions of the job, these master record drawings shall be complete and delivered to the Owner's Representative for forwarding to the design group.

3.03 SPECIFIC TESTS AND INSPECTIONS BY THE INDEPENDENT TESTING FIRM:

A. The following specific items of work shall be performed by the independent testing firm, (see Paragraph 1.01.D.) The list is not all inclusive, nor does it define how the tests and checks are to be made. It is merely to define the minimum and type of tests that are required. For additional and supplementary requirements, refer to Paragraph 1.02.

B. Protective Relays and Metering:

1. Check, clean, set, calibrate and adjust all protective relays. Settings will be provided by the Contractor and reviewed by the Engineer prior to setting. Determine pickups, timing, seal-in and target operations. Check several points on the curves.

2. Check, calibrate and adjust all meters.

3. Visually inspect and correct where appropriate, all relays, meters, wiring and related circuitry for physical damage, shipping blocks, compliance with specification and vendor data, mechanical condition, freedom of movement, and presence or possibility of moisture, dust, or other contaminants.

4. Insulation resistance tests shall be made on this circuitry only where recommended by the manufacturer.

5. Simulated fault or other conditions at current transformers and voltage transformers, or initiating contacts shall be made where appropriate or necessary to assure the protective device function or characteristic and operation in the circuitry. Functional tests in the circuitry to verify tripping and operation shall be made in virtually all cases.

6. At the conclusion of tests and after placing into operating service under load conditions, measure and record all currents, voltages and phase angles at the terminals of all protective relays in medium and low voltage switchgear. Verify that all shorts are removed from current transformers where appropriate.

C. Medium Voltage Switchgear:

1. Check, set, calibrate and adjust all relays and meters as previously specified in Paragraph B.2, Protective Relays and Metering, and in addition, all power circuit breakers.

2. Perform DC insulation over-potential proof tests on medium voltage components of the system such as bus and breakers. This shall normally be done with the manufacturer's representative present. Lower voltage megger insulation tests to always precede the application of the proof test voltages to determine suitability for application of the higher voltages. Maximum test voltages to be as specified elsewhere. Breaker tests shall be performed with the breaker open and also closed.

3. Inspect switchgear and breaker for physical damage, tightness of connections, contact resistance, mechanical conditions, anchorage and alignment, shipping blocks, freedom of movement and operation, cleanliness and other installation and maintenance checks called for in manufacturer's instructions.

4. Bolted bus joints shall be inspected and tested by calibrated torque wrench methods in accordance with manufacturer's instructions.

5. Functionally and operationally test all devices, equipment and circuitry.

6. Physically and functionally check all key, electrical, mechanical or other interlock systems.

7. A ratio and polarity test shall be made of all current transformers (CTs) and potential transformers (PTs). Remove any CT shorts at the units or on terminal blocks. Perform complete wire tracing and continuity checks of all CT and PT wiring within the gear. Relaying and synchronizing circuits shall be given special attention to assure proper connections, phasing and operations.

D. Low Voltage Switchgear:

1. Perform all tests, calibration settings, inspections and adjustments as described under Paragraph C, Medium Voltage Switchgear. The DC over-potential proof tests shall be performed with a Biddle instrument at the maximum voltage specified elsewhere for 480 volt equipment.

E. Low Voltage Motor Control Centers:

1. No work by the independent testing firm is required on low voltage (600 volts and less) motor controls.

F. Molded Case Breakers:

1. No testing or checks of molded case circuit breakers is required by the independent testing firm.

G. Thermographic (Infrared) Surveys:

1. After the equipment has been placed in service, infrared surveys shall be performed on all designated electrical system apparatus specified below. The survey shall be performed with all apparatus energized and under full or normal load conditions. The survey shall include all connections and joints. Access covers and doors shall be removed or opened from all apparatus for the purpose of the survey. The survey shall consist of an on-site inspection performed by competent field engineering personnel using portable, imaging-display infrared camera equipment to locate and recommend corrective measures for overheated electrical connections, splices, taps, conductors and other abnormally hot items of apparatus, or portions thereof, that are a part of the designated apparatus.

2. The infrared survey documentation shall include a survey summary as well as detailed inspection reports containing photographic records of significant problems found, problem cause(s), required corrective action(s) and recommendations as to how promptly corrective action(s) should be taken.

3. The infrared camera equipment used shall be of the fully portable, image display type with photographic camera attached unit, and be capable of measuring apparatus temperatures with an accuracy of plus or minus 0.25 degrees C. at 30 degree object temperature. The testing firm and its assigned field engineer shall be regularly engaged in this type of work, to have prior experience in the use of the infrared camera equipment for this kind of application and to also be experienced in the normal inspection and test, of the electrical apparatus to be surveyed.

H. Electrical system apparatus to be surveyed to include:

1. Medium 15 kV, 5 kV, and low 480 voltage switchgear and breakers and disconnects and low voltage (480 volt) motor controls.

2. Small service transformers, and power transformers.

3. Power distribution panels and centers.

4. Variable speed AC drive controls and equipment.

5. Lightning arresters.

6. Rotating equipment.

3.04 LOSS OF AC POWER TEST:

A. After the satisfactory completion of all electrical system testing, perform a loss of AC power test. The main circuit breaker at the facility shall be placed in the "OPEN" position by the Contractor using all required safety and personal protective equipment in accordance with NFPA 70E.

B. During this test the representatives from the following organizations shall be present:

1. Contractor

2. Division 40 SCADA System Supplier

3. Main Electrical Distribution Equipment Supplier

4. Variable Frequency Drive Equipment Supplier

5. Engineer

C. The test shall verify that all electrical equipment in the system can withstand the loss of utility AC power. Under standby generator power, all automatically started equipment shall be witnessed to start and accept load without tripping offline or initiating false alarms.

D. The test shall be performed with the facility operated at near or full load.

E. All alarms associated with the loss of utility power and startup of the standby generator system shall be recorded.

1. Any nuisance type alarms associated with microprocessor faults or troubles shall be investigated and action taken to prevent reoccurrence.

2. When all nuisance type alarms have been resolved, the test shall be repeated to verify acceptable operation of the facility electrical system upon loss of utility power.

3.05 CONTRACT CLOSEOUT:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

Page Intentionally Left Blank

SECTION 26 09 29

LIGHTING CONTROL SYSTEMS

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide, test, and place into operating condition a complete and fully functional hard-wired, low-voltage relay lighting control system.

B. Area lighting control shall include:

1. Occupancy sensors with manual bypass capabilities.

2. Timing control.

3. Photo-electric controls.

C. The lighting control system shall include networked wiring and components, and shall be digitally linked to the Building Automation and Control System specified in Division 40.

1.02 REFERENCES:

A. Government Electronics and Information Technology Association (EIA):

1. 709.1: Control Network Protocol Specification

B. Federal Communications Commission (FCC):

1. Standard for Radio Frequency Equipment

C. National Electrical Manufacturers Association (NEMA):

1. 250: Enclosures for Electrical Equipment (1000 volts maximum)

D. National Fire Protection Association (NFPA):

1. 70: National Electrical Code (NEC)

E. Underwriters Laboratories Inc. (UL):

1. 50: Enclosures for Electrical Equipment

2. 67: Panelboards

3. 508: Electrical Industrial Control Equipment

4. 916: Energy Management Equipment

1.03 SYSTEM DESCRIPTION:

A. Provide networked lighting control system consisting of components manufactured by single source.

B. Provide networked lighting control system consisting of:

1. Multiple relay panels linked over network wiring using open protocol for communications.

2. Multiple relay panels linked over network wiring using open protocol for communications, and be fully compliant with EIA 709.1

3. Relay panels and programmable switches connected together by networked wiring system extending from panel locations with single communications bus to allow switches to communicate with panels.

4. System connected to single time clock mounted in interior of relay panel.

5. Lighting system control to be interconnected with occupancy sensors, timers and photo-electric devices.

1.04 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Submit shop drawings and manufacturer's product data, brochures including wiring diagrams in accordance with Section 26 05 10.

C. Wiring diagrams to show control interface points provided with other equipment.

D. Shop drawings to include:

1. Outline drawings with elevations.

2. Equipment arrangement drawings and control device data sheets and descriptions.

3. Anchor bolt location drawings.

4. Electrical schematics and wiring diagrams specific to this project. Generic system drawings shall be rejected.

5. Electrical fuse/circuit breaker characteristic.

6. Equipment performance curves and data.

7. Bill of installation/assembly materials.

8. Equipment weights.

9. Completed manufacturer's data sheets.

E. Delegated Design Submittals: For each device, equipment or appurtenance provide written certification from Professional Engineer licensed in the State of Utah stating that supports systems, anchorage and equipment have been designed according to the requirements of Section 1613 of the building codes of Utah, Salt Lake City and ASCE/SEI 7, and in accordance with Specifications 01 41 20 and 26 05 50. Submit calculations stamped by a Professional Engineer licensed in the State of Utah for support systems and anchorage for wind, seismic, and all other pertinent loads.

F. Additional Delegated Design: Provide design and layout drawings for sensing and control systems, as adjusted for specific lighting control hardware intended for provision. For low voltage keypads, submit proposed keypad layout for review and approval.

G. Spare Parts Data: After acceptance of the list of shop drawings, and not later than six months prior to the estimated date of substantial completion, furnish copies of spare parts data for each different item of materials and equipment specified. The data shall include a complete list of parts and supplies with current unit prices and source of supply, a list of supplies that are either normally furnished at no extra cost with the purchase of the equipment, or specified to be furnished in accordance with paragraph Special Tools and Spare Parts and a list of additional items recommended by the manufacturer to assure efficient operation for a period of 120 days.

1.05 OPERATION AND MAINTENANCE DATA:

A. Operation and maintenance manuals shall be specific to equipment purchased and crossing out of non-applicable items is not acceptable.

B. Comply with requirements of Section 01 78 23.

C. Operating and Maintenance Instruction Manuals:

1. At end of project, submit operating instruction manuals as specified in Section 01 78 23, outlining the step-by-step procedures required for system startup and operation. The instructions shall include the manufacturer's name, model number, service manual parts list and brief description of all equipment and their basic operating features. (Per 2018IECC C303.3, C408.2.5.2)

2. Maintenance instructions manuals outlining maintenance procedures shall be furnished. The manual shall include:

a. A troubleshooting guide listing possible breakdown and repairs

b. A simplified connection wiring diagram for the system as installed.

c. Provision of the names, addresses, and telephone numbers of service organizations that provide technical assistance and carry stock of repair parts for the system to be furnished. (Per 2018IECC C408.1.1)

d. Luminaire and Lighting Control System(s) specifications, programming procedures and means of illustrating to owner how building, equipment and systems are intended to be installed, maintained, and operated. (Per 2018IECC C408.1.1)

3. Performance Test Reports: Upon completion of the installed system submit in booklet form field tests performed to prove compliance with the specified performance criteria. Each test report shall indicate the final position of controls.

1.06 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

B. Standard Products: Material and equipment shall be the latest standard products of a single manufacturer regularly engaged in the manufacture of the product for 5 years as a minimum.

C. Services of Manufacturer's Representative as stated in Section 01 45 00 and as specified herein.

1.07 DELIVERY, STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

B. Equipment placed into storage shall be protected from the weather, humidity and temperature variations, dirt, dust, and other contaminants.

1.08 SEISMIC DESIGN REQUIRMENTS:

A. Conform to the requirements indicated on the structural drawings and as specified in Section 01 41 20.

B. It shall be the responsibility of the manufacturer and supplier along with the Electrical Contractor to conform to the seismic design requirements for this project and for the work of this specification section.

1.09 SPARE PARTS:

A. Comply with the requirements specified in Section 01 61 00.

B. Provide a list of recommended spare parts for the first year of operation and for the first five years of operation, including a price list and location of the nearest facility from which all spare parts can be obtained.

PART 2 - PRODUCTS

2.01 MANUFACTURERS:

A. nLight, Acuity Brands Lighting Controls

B. General Electric Company, Total Lighting Control (TLC) Level 2, Networked.

C. Leviton Company, Lighting Controls.

2.02 WATT STOPPER, LIGHTING INTEGRATOR CONTROL SYSTEMS.GENERAL:

A. The Low Voltage Lighting Control System shall consist of relay panels and intelligent switches and/or photocells, timers and occupancy sensors connected together by a dataline, as well as all associated wiring.

B. The system shall include a DIN rail mounted time clock, photosensor control module and/or other low voltage control devices. These devices shall be totally compatible with the manual operation of the soft wired switches.

C. Requirements for the system installation are indicated elsewhere in the specifications for work including, but not limited to, raceways and electrical boxes and fitting required for installation of control equipment and wiring.

D. It is acceptable for luminaire switching and dimming controllers to be located on-board luminaire, with datalines installed per manufacturer instructions. Such data lines shall be enclosed in conduit. Where manufacturer's hardware does not provide means for conduit connection and system voltage is 30V or less, terminate conduit within 8 inches of the device and provide bushings at the ends of conduit, and seal interior end of conduit around dataline cable(s) with silicone caulk.

E. IECC 2018 Conformance – Provide a system conforming with the 2018 version of the International Energy Conservation Code (2018IECC), even if a specific requirement is not addressed in this specification.

2.03 RELAY PANELS:

A. Modular Relay Panels shall be UL listed and consist of the following:

1. NEMA 1 enclosure that can accept an interior sized to accept up to 24 control relays.

2. Power Supply: Transformer assembly with low voltage secondary wired transformers each with an individual secondary.

3. Transformers shall include internal over current protection with automatic reset and metal oxide varistor protection against power line spikes. Voltage rating at primary connection shall be as shown on the drawings.

4. Cover: Surface with captive screws in a hinged, lockable configuration. A wiring schedule directory card shall be affixed to the inside surface of the cover.

5. Interior: Bracket and intelligence board backplane with pre-mounted relays. Interiors shall be provided with the required installed and tested relays. Provide 20 percent space relays in each panel.

B. Panels shall be provided with an integral DIN rail mounting bar for installation of system components. Terminals shall be included in the interior to accept a dataline for the connection of soft wired dataline switches to the system, or to allow a dataline to be run between multiple panels for network communications between the panels.

C. Panels shall be provided with individual ON/OFF switches for both panel and dataline power.

D. Eight channels shall be provided in each interior regardless of size, each with an associated pushbutton to toggle the channel ON/OFF, and a terminal block for a separate dry contact input.

E. Any number of relays in the panel shall be able to be assigned to each channel, with overlapping allowed. Channels shall be set up via “Soft wiring”, i.e. no hand held programmer or keypad is required. Systems that require programmers or keypads, or that change relay states during set up are not acceptable.

F. Each channel pushbutton shall be provided with LED status indication - RED shall indicate that all of the relays within the channel group are ON; NO LED shall indicate that all of the relays within the group are OFF, and GREEN shall indicate the channel’s relays are in a MIXED status.

G. The system shall accept future functionality upgrades without removal of the panel.

H. Features:

1. Relays shall be momentary-pulsed mechanically latching contactors rated at 20 amps, 120 to 277 volts AC. They shall attach to the interior of the panel by a single plug-in connector.

2. Adjacent to each relay shall be an individual override button and an LED to indicate state.

3. Captive screw terminations shall be provided for all wiring connections.

4. Each channel shall also have an associated 1 amp, 30 volts DC isolated contact which may be used for status feedback or pilot light control.

5. The Relay Panel shall use an EEPROM to record the channel soft wiring assignments and the current status of all relays, thus insuring a 40-year backup of information in the event of a power failure. Systems that require a chargeable battery with less than 10 year's life shall not be allowed.

6. The unit shall provide LED status indication of the power supply status. Access to 24 volts AC and 24V rectified power for accessory devices shall be provided within the panel.

7. The panel interior shall use relays with pilot contacts to provide individual relay feedback to other control systems. Also, terminal blocks will be located next to each relay to allow standard low voltage switching devices to control the relay state.

   a. Devices can be either 2 or 3-wire, maintained or momentary inputs.

   b. The system shall also accept a 2-wire toggling input.

8. The system shall comply with the LonMark® lighting controller profile and provide capability for network binding to LonMark compliant building automation system components without the use of dry contacts, gateways, protocol converters or additional systems devices.

2.04 NETWORK DATALINE:

A. The intelligence in multiple panels shall be linked over a single dataline that uses the open Echelon/LonTalk™ protocol for communications, and be fully LonMark and LNS (LonWorks Network Services) compliant.

B. The dataline shall provide a highly reliable communications bus for transferring control and status between the relay panels.

C. The dataline shall be self-powering at each relay panel and not require any ancillary equipment to function properly.

D. The dataline, in addition to linking together multiple relay panels, shall be capable of extension and provide a single communications bus to allow soft wired dataline switches to communicate with the panels.

E. The dataline shall be able to connect to a single soft wired dataline time clock mounted in the interior of a relay panel or a separate enclosure at another location.

F. Features:

1. Dataline shall be 18/4 twisted conductor with shield meeting Class 2P NEC code requirements. The dataline can be run in a loop, serial, or star configuration.

2. System maximum length limit for all dataline wire in the system shall be not less than 1,500 feet. System maximum number of devices (panels/switch modules/tieclocks) limit on a dataline shall be not less than 127.

2.05 SOFTWIRED DATALINE SWITCHES:

A. To allow individual overrides, dataline switches shall be terminated to each panel 4 wire "Local Dataline". Switches shall be available in either single, dual, quad, or octal (1 button, 2 button, 4 button, or 8 button) designs. The single, dual, and quad devices mount in a standard single gang box, while the octal version mounts in a two gang box.

B. Each button in a switch module can be individually programmed. Programming is done by a "Softwiring Sequence" rather than with a handheld keypad or laptop. Each button can be assigned to any one of the following four functions:

1. Control any individual relay in any single panel.

2. Control any group of relays in any single panel

3. Control any of the eight channels (A-H) in a single panel.

4. Control the same channel letter (A-H) in any chosen group of panels in the system.

C. For applications that require pattern switching, any button can perform its function using an "ON/OFF/Not Controlled" pattern of relays instead of the normal All ON/All OFF.

D. Features:

1. Switches shall have a non-breakable Lexan body and a matching wallplate.

2. Each switch module shall use a bi-color LED pilot light for the individual buttons to indicate status of the controlled relay or group of relays. LED indications are Red for All ON, Green for Mixed State (some relays in the group ON and others OFF), and No LED for All OFF.

3. Switches shall be provided with a locator light to allow standard 3/8-inch tape to used for labeling the controlled loads.

4. The dual, quad, and octal switches shall all include a single master button that will override all relays controlled by the individual buttons OFF, or Restore them to their original state. Each switch unit's master button function can be configured to perform a "Master On/Off", "OFF Only", or "Disabled" function if desired.

5. Dip switches on the back of the module shall allow switch units to be designated for “Cleaning Crew” Control. This prevents the switch from turning off the occupant’s lights accidentally.

6. Each switch module shall be available with a locking control. Once a key is inserted, the individual buttons will function for five minutes.

2.06 SOFTWIRED TIME CLOCK:

A. Provide a soft wired time clock on the dataline.

B. From any plug-in point on the dataline, the time clock shall be used to:

1. Schedule any of the 8 channel groups (A-H) in the relay panel network.

2. Schedule program soft wired dataline switches. Schedules shall be defined using “Occupied vs. Unoccupied” times to simplify data entry.

C. The time clock shall include user-selectable intelligent scenarios to handle standard lighting control functions for each channel independently. Selectable scenarios shall include:

1. Scheduled ON / Scheduled OFF.

2. Manual ON / Scheduled OFF

3. Astronomical ON / Astronomical OFF (with optional offset)

4. Astronomical ON / Scheduled OFF (with optional offset)

D. Where required, each channel shall be assigned a standard time delay from 1-256 minutes. During “Occupied” hours, the time delays do not take effect. During “Unoccupied” hours, the time delays will ensure that overridden lights are automatically turned off.

E. Each channel can be assigned an automatic “blinking” of the lights before they are turned off to allow occupants the opportunity to enter an override without being put in the dark. The time interval between the blink warn and “off” operation shall be user configurable between 1 and 15 minutes.

F. Features:

1. The time clock will provide a clear 9-line, 22-character per line display and a simple user interface.

2. A single button can be used to bring up a context sensitive help screen to assist the user.

2.07 SOFTWARE:

A. Provide programming of the system parameters.

B. The system shall allow any user-definable feature (schedules, relay groups, switch assignments) to be field modified without the need for configuration software or systems integration expertise.

C. In addition to hardwired channel inputs, the system shall provide for integration to system components including, but not limited to, photocell controllers, HVAC controllers, security, access and fire safety systems without the use of dry contact, gateways or protocol converters.

PART 3 - EXECUTION

3.01 INSTALLATION:

A. Install lighting control system as indicated on the drawings, in accordance with the manufacturer's diagrams and printed instructions, except where otherwise indicated.

1. Wiring: Wiring for systems shall be installed in conduit. Reuse existing fire alarm conduit system where applicable; otherwise, provide conduit as specified in Section 26 05 33. Enclosures shall comply with the requirements of UL 864. Enclosures having doors over 48 inches in height shall be provided with a three-point catch and lock; all other doors shall contain a cabinet type cylinder lock. Inserts shall be blind fastened so that no screws show on the panel front.

2. Sensors and control devices shall be installed in accordance with manufacturer's printed instructions.

3. Provide complete wiring and conduit between all equipment. Devices shall be mounted upon UL listed boxes. Wiring splices and transposing or changing of colors will not be permitted.

3.02 FIELD TESTING:

A. Test lighting systems to ensure proper calibration, adjustment, programming, and operation. (2018IECC C408.3)

B. Furnish instruments and personnel required for the tests. Tests shall be conducted for the following:

1. Verify that the system is free of grounds or open circuits. Wiring runs shall be tested for continuity, short circuits and grounds before system is energized.

2. Verify that all switches and sensors are functioning as specified.

C. System tests to be performed under the supervision of a qualified manufacturer's representative.

D. Perform all tests to verify the correction of defects found in the initial testing. If testing identifies system modifications are required to accomplish the required operation, perform work at no additional cost to the Owner and retest the system.

3.03 TRAINING:

A. Training: Provide classroom and field operation and maintenance instruction including all materials, slides, videos, handouts and preparation to lead and teach classroom sessions.

1. 1 person-day per building panel

B. Coordinate training time with the Engineer and Owner.

C. Furnish training as follows:

1. Training in the system operation including manual control of output functions from the system control panel.

2. Training in the testing of the system.

3.04 STARTUP AND TESTING:

A. Provide services of factory-trained Service Technician, specifically trained on type of equipment specified:

1. Service Technician must be present on site for all items listed below. Person-day requirements listed are exclusive of travel time, and do not relieve Contractor of the obligation to place equipment in operation as specified.

2. Installation: Inspect field erection per building:

a. 1 person-day

3. Functional Testing: Perform a functional test. Tests to include all items specified.

a. 1 person-day

4. Testing: Field performance test equipment specified.

a. 1 person-day

5. Vendor Training: Provide classroom and field operation and maintenance instruction including all materials, slides, videos, handouts and preparation to lead and teach classroom sessions.

   a. 1 person-day per building

6. Credit to the Owner, all unused service person-days specified above, at the manufacturer's published field service rate.

7. Any additional time required of the factory trained service technician to assist in placing the equipment in operation or testing or to correct deficiencies in installation, equipment or material shall be provided at no additional cost to the Owner.

3.05 RECORD DRAWINGS:

A. Provide final record drawings of the system showing all panels, relays, sensors and control devices. Include with overall electric power systems as-built drawings, including submission to Owner within 90 days of system acceptance, or as required by other parts of these Specifications, whichever is earlier. (Per 2018IECC C408.2.5.1).

B. Provide panel schedules.

C. Record system wiring diagrams to be provided.

3.06 CONTRACT CLOSEOUT:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 26 12 19

PAD-MOUNTED TRANSFORMERS

PART 1 - GENERAL

1.01 DESCRIPTION:

A. This section describes materials, installation, and testing of outdoor pad-mounted transformers.

1.02 REFERENCES:

A. American National Standards Institute, (ANSI):

F. Occupational Safety & Health Act (OSHA):

1. Regulation 1910.7

1.03 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Submit shop drawings and manufacturers' product data in accordance with the requirements of Section 26 05 10.

C. Submit shop drawings giving equipment dimensions, anchoring information, and weights for each rating shown in the drawings and giving ratings of transformers, switches, fuses, and breakers. Provide data on pressure-relief valves, oil sampling valves, gauges, and separable connectors.

D. Submit catalog cuts for transformer pads.

E. Factory Tests: Furnish manufacturer’s certified standard test reports for the transformer ratings shown in the drawings and for the tests specified herein.

F. Instruction Manuals: Furnish manufacturer's installation and maintenance manuals on the transformers and accessories.

1.04 QUALITY ASSURANCE:

A. Manufacturer Qualifications: Single source manufacturer regularly engaged in manufacturing pad-mounted transformers complying with requirements of these Specifications and experienced with at least 5 projects of similar size and scope

B. Product Selection for Restricted Space: Drawings indicate size, profiles, and dimensions for pad-mounted transformer equipment including clearances between pad-mounted transformers and adjacent surfaces and items, and are based on manufacturer’s preliminary information.

C. Items provided under this section shall be listed or labeled by UL or other Nationally Recognized Testing Laboratory (NRTL).

1. Terms “NRTL” shall be as defined in OSHA Regulation 1910.7.

2. Terms “listed” and “labeled” shall be as defined in National Electrical Code, Article 100.

D. Regulatory Requirements:

1. National Electrical Code (NEC): Components and installation shall comply with National Fire Protection Association (NFPA) 70.

E. ANSI/IEEE Compliance: Comply with applicable requirements of ANSI/IEEE standards, including IEEE C2.

1.05 DELIVERY, STORAGE, AND HANDLING:

A. Coordinate delivery of pad-mounted transformers in shipping splits to allow movement into designated space.

B. Handle pad-mounted transformers components in accordance with manufacturer's instructions. Use factory installed lifting provisions.

1.06 SEQUENCING AND SCHEDULING:

A. Coordinate size and location of concrete bases and pads. Cast anchor bolt inserts into pad.

1.07 MAINTENANCE:

A. Extra Materials:

1. Furnish extra materials matching products installed as described below, packaged with protective covering for storage, and identified with labels clearly describing contents.

2. Touch-Up Paint: 3 half-pint containers of paint matching enclosure exterior finish.

3. Contact Lubricant: 1 container.

PART 2 - PRODUCTS

2.01 MANUFACTURERS:

A. Eaton Cooper Power Series

B. Cooper Power Systems

C. ABB

D. General Electric

E. SIEMENS

2.02 TRANSFORMER:

A. General: Liquid-filled, pad-mounted transformer, complying with IEEE C57.12.26 and C57.12.28, with primary gang-operated 4-position V-blade load break disconnect switch(es), tap changer, fuse provisions, secondary terminals in separate compartments,

and accessories in a weather-resistant, tamper-proof enclosure. Isolate and interlock high- and low-voltage compartments. Doors shall be provided with padlockable three-point latch and pentahead bolt. Winding material for pad-mounted transformers can be either aluminum or copper.

B. Transformers shall comply with the 2016 Department of Energy (DOE) Efficiency Standards for Distribution Transformers, especially CFR title 10 Chapter II Part 431 (in Appendix A of Subpart K 2016)

C. Enclosure: Enclosure base shall have a 4 mil thick tar-mastic undercoat.

D. Transformer: Unit shall be dead front, 3-phase, two winding, 60 Hertz, 65 degrees C riseand elevation 4,500 feet above sea level. Self-cooled kVA ratings shall be as noted in the drawings. High voltage shall be as indicated on the drawings with two 2-1/2 percent taps above and below normal. BIL shall be 95 kV. Low voltage shall be as indicated in the drawings. Provide Envirotemp FR3 or equal insulating liquid per requirements of transformer's manufacturer and FM Global Standard 3990. Insulating liquid shall contain less than 1-ppm PCB chemicals.

E. Percent Impedance Voltage: Provide the following impedances subject to a plus or minus 7.5 percent impedance variation, unless noted otherwise on single line diagram(s):

kVA	Percent IZ
150 and smaller	2.0
225	3.5
300	4.0
500	4.0
750 and larger	5.75

F. Primary Compartment: Provide the following equipment as a minimum:

1. Dead-front construction.

2. Loop-feed construction.

3. Three dead-front elbow-type metal oxide varister (kV rating based on equipment voltage level) lightning arresters where shown in the drawings.

4. Load-break switch.

5. Draw-out dry well mounted current-limiting fuses.

6. Medium-voltage bushing inserts and bushings for separable elbow connectors conforming to IEEE 386 and rated for 15 kV or 5 kV based on application, 95 or 30 kV BIL, 600 amperes continuous, 20,000-ampere rms symmetrical for a time

duration of 0.17 second. Provide a parking stand for each elbow connector. Equip connector with steel-reinforced hook-stick eye, grounding eye, test point, and arc-quenching material.

7. Insulated means for locating up to two primary-side Current Transformers, configured as shown on plans, and as required for a complete functioning system.

8. Primary side Current Transformer(s), oriented and configured as shown on plans, and as required for a complete functioning system.

G. Low-Voltage Compartment: Provide the following equipment as a minimum:

1. Secondary low-voltage bushings with spade terminals designed for copper conductors.

2. Liquid level gauge, dial type with low level alarm contacts.

3. Thermometer, dial type with high temperature alarm contacts.

4. Oil filling connection.

5. Drainage and oil sample valves.

6. Neutral ground strap, removable.

7. Corrosion-resistant nameplate and connection diagram in conformance with IEEE C57.12.26 except that the number of gallons of coolant shall be shown.

8. Transformer case grounding pad.

9. Circuit breakers as indicated in the drawings.

10. Non-PCB and UL label.

11. Insulate conductors for systems where low voltage side is greater than 600V line-to-line.

12. Secondary side Current Transformer(s), oriented and configured as shown on plans, and as required for a complete functioning system.

13. Integrated sensors, including:

a. Cover mounted pressure relief device with alarm contacts.

b. Dial-type thermometer with alarm contacts.

c. Pressure vacuum gauge with contacts and bleeder.

2.03 LIQUID LEVEL GAUGE WITH CONTACTSFACTORY FINISH:

A. Provide with a factory-applied, corrosion-resistant finish which shall withstand 3,000 hours of exposure to the salt spray test specified in ASTM B117 without loss of paint or release of adhesion of paint primer coat to the metal surface in excess of 1/16 inch from the scribed test mark. Finish color shall be ANSI Z55.1 No. 61 light gray.

B. Cut edges or otherwise damaged surfaces of galvanized steel shall be coated with a zinc-rich paint conforming to Section 09 99 00, System No. 55.

2.04 TRANSFORMER PADS:

A. Provide cast-in-place concrete transformer pads sized per transformer manufacturer requirements and details as indicated on the drawings. Provide reinforcement for parkway (non-traffic) loading.

B. Provide precast concrete slab box, where indicated, consisting of transformer pad and precast concrete box below, sized per the drawings. Box shall have reinforcement for H-20 traffic bridge loading. Provide hot-dipped galvanized steel parkway covers for access openings.

2.05 FACTORY TEST:

A. Perform the following factory tests:

1. Routine factory tests, IEEE C57.12.00 Section 8.1.

2. ANSI full wave impulse test, observed by oscilloscope.

3. ANSI reduced full wave, chopped wave impulse test with oscillograph record.

4. Complete ANSI temperature tests.

PART 3 - EXECUTION

3.01 INSTALLATION:

A. Install pad-mounted transformer in conformance to the manufacturer's mounting instructions including securing it to the concrete slab by at least four anchor bolts.

3.02 GROUNDING:

A. Pad-mounted transformer shall have all noncurrent-carrying metal parts connected to a solid earth ground electrode.

3.03 SIGNS:

A. Install "DANGER--HIGH VOLTAGE--KEEP OUT" signs with tamper-proof stainless steel screws on each accessible side of pad-mounted transformers.

3.04 FIELD TESTS:

A. After the installation has been completed, conduct an operating test demonstrating that all equipment devices operate in accordance with the requirements of the drawings and specifications.

B. Operating Test: Energize the transformer and adjust the output voltage to the specified value. Further readjust tap settings, if necessary, after the facility being served is in normal operation.

3.05 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

B. Adjusting: Adjust primary taps so secondary voltage is above and within 2 percent of rated voltage.

END OF SECTION

Page Intentionally Left Blank

SECTION 26 13 13

MEDIUM VOLTAGE CIRCUIT BREAKER SWITCHGEAR

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide a 4,160 Volt-class, 250 MVA nominal 3-phase class, metal-clad drawout switchgear assembly complete with circuit breakers, transformers, relays, meters, and accessories as indicated and in compliance with Contract Documents.

B. Section 26 13 13 appies to 01-SWGR-99100A and 01-SWGR-99100B, the 4.76KV switchgear inside 0104 IPS Electrical Buidling, where the switchgear shall be indoor rated per IEEE C37.20.2, part 7.17 "Indoor MC switchgear, access, and ventilation."

C. Section 26 13 13 also applies to 01-SWGR-99110, the generator paralleling switchgear at 0105 IPS Standby Power & Fuel Storage. Provide enclosure that is outdoor rated per IEEE C37.20.2, part 7.18 b) "Outdoor MC switchgear, access, and ventilation, with aisle" and also meeting the requirements of Section 26 13 13, 2.02.B.14 Walk-in Enclosure for Generator Paralleling Switchgear. The Contractor shall furnish and install, where indicated on the drawings, a complete standby power generation and load management power distribution and control system.

1. The Standby Power System consists of the following as applicable:

a. Generator sets

b. Generator Control Switchgear (with associated monitoring and distribution equipment)

c. Generator Paralleling Digital Master Controller

d. Generator Paralleling Remote I/O Cabinet (In the IPS Electrical Building)

e. Battery System(s)

f. Networking System(s)

g. Generator Neutral Grounding equipment

2. The Standby Power System Supplier (EPSS) shall be an authorized service provider for all components of the Standby Power System (EPS). In order to assure maximum equipment uptime and best service response to the owner, the Standby Power System Supplier shall be an factory-authorized dealer with

complete EPS parts and service available on a 24 hour emergency basis within a 100 mile radius of the project site.

3. The Generator Control Switchgear shall be by the same manufacturer as the generator sets and furnished with the generator sets by the (EPSS) as a total system.

4. The Standby Power Systems Supplier must be capable of servicing the Generator Paralleling Switchgear and the Generator sets, and be able to supply replacement parts for both factory supplied equipment. Proof for technicians capable of serving both roles within the EPSS organization is required. A single point of contact on behalf of multiple manufacturers does not meet the requirement.

1.03 SUBMITTALS

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Submit shop drawings and manufacturers product data in accordance with the requirements of Section 26 05 10.

C. Submit a system protection device coordination study prepared by the switchgear manufacturer.

1.04 QUALITY ASSURANCE:

A. Manufacturer Qualifications: Single source manufacturer regularly engaged in manufacturing and assembling substations complying with requirements of these Specifications and experienced with at least 5 projects of similar size and scope. Single source manufacturer is responsible for assembled substation.

B. Product Selection for Restricted Space: Drawings indicate size, profiles, and dimensions for unit substation equipment including clearances between unit substations and adjacent surfaces and items, and are based on manufacturer's preliminary information.

C. Items provided under this section shall be listed or labeled by UL or other Nationally Recognized Testing Laboratory (NRTL).

1. Terms "NRTL" shall be as defined in OSHA Regulation 1910.7.

2. Terms "listed" and "labeled" shall be as defined in National Electrical Code, Article 100.

D. Regulatory Requirements:

1. National Electrical Code (NEC): Components and installation shall comply with National Fire Protection Association (NFPA) 70.

E. ANSI/IEEE Compliance: Comply with applicable requirements of ANSI/IEEE standards, including IEEE C2 and C57.12.80.

F. Provide classroom training and field operation and maintenance instruction including all materials, slides, videos, handouts and preparation to lead and teach classroom sessions per Section 01 78 24.

1.05 DELIVERY, STORAGE, AND HANDLING:

A. Store protected from weather and so condensation will not form on or in substation components. Provide temporary heaters in accordance with manufacturer's recommendations to prevent condensation.

B. Handle substation components in accordance with manufacturer's instructions. Use factory installed lifting provisions.

1.06 SEQUENCING AND SCHEDULING:

A. Coordinate size and location of concrete bases and pads. Cast anchor bolt inserts into pad.

1.07 MAINTENANCE:

A. Extra Materials:

1. Furnish extra materials matching products installed as described below, packaged with protective covering for storage, and identified with labels clearly describing contents.

2. Two spare fuses of each size and type.

3. One complete set of indicating lamps for number provided on switchgear.

PART 2 - PRODUCTS

2.01 MANUFACTURERS:

A. Siemens.

B. General Electric Co.

C. ABB.

D. Eaton.

E. Schneider Electric.

F. Powell Industries

2.02 MATERIALS:

A. Mounting Sills:

1. Furnish steel channel sills with suitable drilled holes for mounting, aligning, and bolting switchgear in place. Method of mounting as indicated. Size and arrangement of sills as recommended by switchgear manufacturer. Paint completed sills with two coats of aluminum paint or other acceptable corrosion-resistant finish before being set in place. Set and level channel sills.

2. If switchgear equipment pads are to be located on concrete floor slabs, furnish painted steel channel mounting sills and anchor bolts, including location instructions, to General Contractor for setting in place during construction of concrete equipment pads.

3. Furnish painted steel channel mounting sills and anchor bolts, including location instructions, to General Contractor for setting in place during construction of switchgear equipment pad.

B. Housing and Construction:

1. Housing: Rigid, self-supporting, structural steel units welded throughout. Assembled unit consists of basic metal-clad switchgear units assembled together to form continuous unit. Mount potential transformers with current-limiting fuses in separate compartments and provide with hinged doors for easy access. Housing compartments: Steel constructed of suitable thickness and in manner that when bolted together in proper positions, each circuit is isolated from adjacent circuits. Switchgear assembly shall conform to ANSI Standard C37.20.

2. Where necessary provide screened openings for ventilation.

3. Furnish doors for front section to provide for installation and removal of circuit breaker removable elements. Doors: Smooth surfaces, steel sheets. Hinges: Concealed removable pin type.

4. Equip doors with one lock-type handle which will take padlock to prevent opening. Hole size for accommodating padlock: 1/2-inch diameter.

5. Furnish additional fasteners on each door in closed position to prevent distortion when subjected to forces resulting from breaker opening under load or from short circuit conditions. Provide fasteners with knob 2 inch minimum diameter or handle located on outside of doors.

6. Equip doors with combination swing limit and latch to hold door in open position. Swing limit device limits opened position of door to prevent damage to adjacent switchgear metal surfaces, instruments, and devices.

7. Door shall be prevented from being opened with the circuit breaker energized in the closed position. Circuit breaker must be tripped and de-energized before door can be opened.

8. Provide removal panels for rear access to breaker cubicles and for ease in terminating bottom entry of power feeder cables.

9. Fit potential transformer compartments with doors or removable panels equipped with provisions for padlocking.

10. Power cables enter switchgear from above or below as indicated.

11. Provide bare copper ground bus not less than 2 inch by 1/4-inch extending entire length of switchgear, secured to each unit. Provide terminals for connection to grounding system which are suitable for accepting NEMA compression two-hole bolted type lugs.

12. All structural bolts, nuts and washers: Cadmium-plated steel or other suitable corrosion-resistant finish.

13. Complete structure shall be factory assembled and tested. After complete assembly, test each standard unit for operation under service conditions by impressing primary current and voltage on instrument transformers to assure accuracy of wiring, correctness of control and relay circuits, and functioning of equipment.

14. Walk-in Enclosure for Generator Paralleling Switchgear:

    a. As indicated on the drawings, provide an outdoor, weatherproof, protected walk in enclosure, fabricated and coordinated with the switchgear to form an integral enclosure.

    b. The entire length of the aisle shall be wide enough to permit removal of a circuit breaker, including width required for equipment on opposing wall, as required.

    c. Adequate space shall be provided for convenient installation, operation and maintenance of the batteries and battery charger. The aisle area shall be not less than shown on the drawings.

        (1) Reference Section 26 33 23, “Central Battery Equipment” for external battery requirements, adjacent to 01-SWGR-99100.

(2) Provide battery system within building or enclosure housing 01-SWGR-99110. Provide battery system generally conforming to Section 26 33 23, except adjusted if written approvals by Engineer of Record are approved as required to allow manufacturer-standard equipment that substantially meets the same performance.

d. The entire space under the enclosure shall be provided with a cement pad adequately reinforced. The walk-in enclosure shall include a floor sufficient to allow the circuit breakers to be interchanged and serviced without causing the floor to deflect. The entire floor shall be approximately 4 inches above grade level.

e. The roof of the enclosure shall slope to allow for adequate run off of moisture. Provide Utah-licensed PE certification of seismic resilience and capability to support snow load requirements, as per local municipality.

f. The entire area between the floor and foundation, including feeder conduits, shall be enclosed by structural steel or steel sheets.

g. The enclosure shall include proper ventilation suitable for the ambient site conditions required.

h. Enclosure Personnel Doors:

(1) Locate a door wide enough to allow a circuit breaker to pass at each end enclosure.

(2) The pre-hung doors shall be safety type, steel with concealed or semi-concealed hinges for attachment. The pre-hung door frames are to be welded to the equipment structure.

(3) Provide the doors with UL Listed panic hardware on the inside and handle on the exterior. A latch bolt controlled by a key cylinder shall lock the door from the outside.

i. Enclosure Rear Doors:

(1) Provide suitable weatherproof type doors on the rear of the switchgear enclosure for each termination access. Attach the doors to the enclosure with a with surface mounted strap type hinges. Each door includes three point latches with stainless steel pad-lockable type handles.

(2) The doors shall be capable of a swing of 180 degrees (nominal).

j. Cubicle Heaters:

(1) Install an electric strip heater within each circuit breaker cubicle and cable termination compartment to limit excessive humidity during adverse weather conditions. Thermostat shall be set and marked with manufacturer's recommended setting.

(2) Heater and associated control wiring shall be pre-wired at the factory. Properly fuse the wiring and protect to prevent terminal overheating.

k. Lighting:

(1) Exterior mounted LED lighting with photocell mounted above the two entrance doors. Battery backup lighting fixtures mounted inside the enclosure to meet code egress requirements.

(2) Provide ceiling mounted, LED fixtures over the front aisle, with fixtures parallel to the switchgear sufficient for operation and maintenance.

(3) Fixtures shall be securely mounted.

(4) Install a 3-way switch at each enclosure entrance to control the lighting. Provide 4-way switch(es) as appropriate if there are more than 2 entrances.

l. Receptacles: Provide heavy duty duplex ground fault current interrupter (GFI) receptacle. located at the personnel door entrance. Do not provide exterior convenience receptacles.

15. Inspection Windows; Provide inspection windows for inspection of components exposed to medium voltage, such as fuses, cable terminations, circuit breaker, and so forth, as recommended by the manufacturer, and/or as available as standard options. Provide windows and/or covers as required to maintain the overall rating of the enclosure. Provide same for components operating at 10 amps or above.

C. Control Panels:

1. Unit front doors: Hinged steel panel of suitable thickness for mounting instruments, relays and control equipment. Provide panels with handle and suitable mechanical latch to hold panels securely in closed position.

D. Circuit Breakers:

1. Circuit breakers 250 MVA, rated 1200 amperes (or as indicated on the drawings), 4,760 volts nominal, with momentary rating of 23 kA amperes symmetrical. Circuit breakers of equal rating: Completely interchangeable.

2. Circuit breakers: Stored-energy type for operation on 120 volt DC source. Circuit breakers may be vacuum interrupter type or air-magnetic. Mechanically and electrically trip free and electrically operated by means of stored-energy mechanism, normally charged by universal motor, but which can be charged by manual handle for emergency operation. Air-magnetic circuit breaker equipped with three independent arc chutes, complete with blowout coils. Interposing relays provided in control circuits, where required, for remote control of circuit breakers. Time for energizing trip coil until circuit breaker is interrupted at 25 to 100 percent of interrupting rating, not more than 5 cycles.

E. Disconnecting Devices:

1. Equip breakers with main and control circuit disconnecting devices to make circuit breaker a removable element. Locate and securely mount disconnecting devices to maintain alignment. Main contacts and supports guaranteed not to distort or fail under mechanical and thermal stresses due to full load and short circuit duties specified for circuit breaker ratings.

2. Provide automatically closing shutters to cover openings for main contacts in order to prevent accidental contact with live parts when circuit breaker is withdrawn from its operating position. Shutters shall be closed when breaker is in test position and fits tightly to exclude rodents.

F. Drawout Mechanism:

1. Circuit breakers: Drawout type. Each unit having self-contained manually operated device for withdrawing the circuit breaker from its operating position. Breaker only removed or replaced by using manual operating device. Suitable guide rails and stops furnished for aligning unit in proper position when inserting or withdrawing removable element.

G. Auxiliary Apparatus Compartments:

1. Provide auxiliary compartments, matching rest of structure, as indicated. Furnish compartments with hinged front enclosures similar to those furnished with basic metal-clad units and with insulated buses and connections where necessary.

H. Bus Bars, Connections and Supports:

1. Provide bus bars and connections with all necessary supports, insulation and clamps. Where connections are made, silver plated bars to provide proper contact surfaces for carrying full load current.

2. Power buses designed for not less than 1,200 amperes capacity through entire length of bus without exceeding maximum temperature of 54 degrees F above ambient of 104 degrees F.

3. Power buses extend entire length of switchgear and securely fastened to each unit.

4. Main bus connections and branch taps by high-pressure bolted joints and copper bar with silver plated surfaces.

5. Entire bus structure braced and secured in place to withstand forces caused by 250 MVA short circuit conditions. Main bus and branch taps insulated, in addition to bus support insulators.

I. Wiring:

1. Furnish units completely wired, including cleats and terminal blocks. Switchgear wiring made with standard switchgear wire with fire-resisting braid. Use no wire smaller than No. 14 AWG. Wiring on instrument panels with flexible connections to terminal blocks. Wiring in accordance with latest rules of National Electrical Code (NEC).

2. Clamp type terminal lugs for main terminals. Size of cable for individual units as indicated.

J. Instrument Transformers:

1. Instrument transformers of dry type. Instrument transformers conforming to ANSI Standard C57.13. Current transformers with 5-ampere secondaries for relaying and metering. Current transformers with thermal and mechanical ratings at least equal to those of circuit breakers.

2. Potential transformers of drawout type with voltage ratio as indicated on drawings. Normal rating of 400 Volt-Amperes and capable of carrying 1,000-volt amperes continuously with temperature rise not exceeding 55 degrees C ambient. Provide with primary current-limiting fuses.

K. Control Power Transformers:

1. Control power transformers: Rating of 4,160-120 volts, single-phase, 3-wire, 60 Hertz, with kVA rating as required by switchgear. Primary fuses for the control power transformer mounted on disconnecting or drawout fuse mounts. Secondary fuses also provided.

L. Instruments, Relays, and Control Components:

1. Instruments and relays semi-flush mounted with glass covers and dusttight gaskets. Alternating current instruments and relays suitable for operation on 5 ampere current transformer secondary circuits, 120-volt potential transformers and at frequency of 60 Hertz.

2. Instruments, relays and meters accurately calibrated and adjusted before shipment. Instrument, relays and meters not injuriously affected by short-circuit currents as specified elsewhere in this specification. Accuracy of 1 percent.

3. In general, indicating instruments are 4-1/2-inch rectangular type, 250 degree scales and white with black markings. Provide moving elements with accessible zero adjustments external to case.

4. Inspect instruments, relays and meters for satisfactory operation and, if necessary, adjust after installation.

5. Control switches: Rotary type with positive means for maintaining contact. Silver-to-silver contacts provided with easily removable protective covers.

6. Protective relays: Rectangular semi-flush drawout type with built-in testing facilities. Relays and relay systems shall conform to IEEE C37.90.

7. Test blocks for both current and potential, small wiring, and terminal blocks.

M. Indicating Lights:

1. Indicating lights of low current type rated at 24 volts, with resistors suitable for operation over maximum range specified for control voltage. Lamps easily removed and replaced from front of panel. Red and green indicating lights showing closed and open position of the breakers, respectively, and amber lights indicating automatic trip of breakers.

N. Fuses:

1. Provide necessary fuses, including two spare fuses of each size and type.

O. Nameplates:

1. Furnish engraved nameplates of laminated plastic with white lettering on a black background for all panels, control switches, instruments, and like.

P. Provisions for Heating and Lighting:

1. Equip cubicles with (1) built-in strip heaters with ON-OFF switch and wiring, (2) lamp receptacles with suitable lamps for general lighting both front and rear of compartments, and (3) convenience outlets with proper protective devices.

Q. Painting:

1. Coat front and rear of all metal panels and interior and exteriors of all metal structures with rust-resisting priming coat after properly sanding and chemically cleaning surfaces.

2. Coat interior surfaces of switchgear with one finishing coat of light gray quick lacquer or synthetic enamel. Exterior surfaces given two finish coats of ANSI Z55.1 No. 61 gray.

R. Accessory Equipment:

1. Furnish one complete set of manufacturer's standard metal-clad accessories for operation and inspection of switchgear as follows:

   a. Test plugs for drawout relays and test blocks.

   b. Inspection and test cabinet including control pushbutton, control relay secondary coupler and wiring complete for electrical operation of circuit breaker when removed from stationary structure.

   c. Transfer truck.

   d. Removable Breaker Lifting Device

2. Control Wiring and Device/Terminal Blocks:

   a. Utilize minimum 14 AWG type SIS cable for control wiring.

   b. High flexible stranding shall wire shall be used in resrtrricted spaces or across hinged sections.

   c. No more than two wires shall be connected to any one terminal on any device or terminal block

   d. Terminal blocks shall be suitable for ring tongue connectors.

   e. Twenty percent (20 percent) spare terminals shall be provided on any terminal block segment.

3. Meet seismic requirements indicated in Section 01 41 20 for the site such that equipment is operational after an event.

S. Circuit Boards – General Requirement:

1. Provide manufacturer’s conformal coating options for all circuit boards where this option is available. This includes, but is not limited to, processor, protective relay, network switch, Modbus/TCP gateway, power electronics, and HMI interface components.

2.03 UNIT EQUIPMENT:

A. Equipment to be provided for each unit, as follows (exact quantities of equipment for each compartment shall be the responsibility of the Contractor):

1. Pending final single line diagrams.

2. Equipment, components, devices, relays, meters, etc. shall be supplied and electrically interconnected (pre-wired) to the extent possible as applicable to the switchgear in accordance with the following drawings and as required by the Contract Documents, especially:

a. Supplying Substation Single Line Diagrams: 0100-E602 and 0100-E603

b. IPS Switchgear Meter and Relay Diagrams: 0100-E604 and E-605

2.04 IPS STANDBY SWITCHGEAR METER AND RELAY DIAGRAMS: 0100-E606 AND E-607SOURCE QUALITY CONTROL:

A. Test at the factory in accordance with IEEE C37.20.1 and NEMA, including operating and high potential tests.

B. Test breakers in accordance with IEEE C37.09 and ANSI/IEEE C37.20.2.

C. Test breakers in a switchgear cell of the basic design in which the breaker will be used.

1. Include continuous current test.

2. Include momentary current test.

3. Include BIL test.

PART 3 - EXECUTION

3.01 INSTALLATION:

A. Install in accordance with IEEE C37.20.1.

B. Install switchgear on level structural steel channels accurately embedded in the floor per the manufacturer’s instructions.

C. Install switchgear plumb and level and with each section aligned properly.

D. Make electrical connections between equipment sections using connectors furnished by manufacturer.

E. Install engraved plastic nameplates in accordance with Section 26 05 53.

F. Ground and bond switchgear in accordance with Section 26 05 26.

G. Bond duct banks with cables that route to switchgear to switchgear's grounding electrode system.

H. Bond surge arrester and neutrals directly to the switchgear enclosure and then to the grounding electrode system with bare copper conductors, sized as shown.

I. Complete switchgear grounding and lightning arrester connections prior to making any other electrical connections.

3.02 FIELD QUALITY CONTROL:

A. Energize the space heaters as soon as each switchgear is delivered to the site. Obtain power for the heaters from the temporary power and lighting system until they can be energized from the source shown.

B. Furnish the services of a representative of the manufacturer of the switchgear to check the installation before it is energized. Submit to Engineer, 3 copies of a signed statement from manufacturer's representative and addressed to Owner that the equipment has been properly installed and is in good working order. Include:

1. Operation of each circuit breaker.

2. All circuit breaker trip functions.

3. Control power transfer system.

C. Test in accordance with the latest standards of ANSI and NEMA.

D. Inspect completed installation for physical damage, proper alignment, anchorage, and grounding.

E. Check tightness of accessible bolted bus joints using calibrated torque wrench.

F. Measure insulation resistance of each bus section phase to phase and phase to ground for one minute each, at test voltage of 1000 volts; minimum acceptable value for insulation resistance is 2 megohms.

G. Perform power frequency withstand testing in accordance with IEEE C37.09.

H. Physically test key interlock systems to insure proper function.

I. Inspection and test in accordance with NETA ATS, except Section 4. (Or equivalent tests from an approved equal.)

J. Perform inspections and tests listed in NETA ATS, Section 7.6. (Or equivalent tests from an approved equal.)

K. Use IR inspection windows to record baseline thermography of the system and to identify and resolve any hotspots during commissioning process. Provide electronic written summary with photos from all IR windows. Ensure all relevant components are viewable from these windows.

3.03 ADJUSTING:

A. Adjust all operating mechanisms for free mechanical movement.

B. Tighten bolted bus connections in accordance with manufacturer's instructions after placing switchgear.

C. Adjust protective relays in accordance with recommendations of the Short Circuit Analysis and Protective Device Coordination Study of Section 26 05 70 and as directed by the Engineer.

3.04 CONTRACT CLOSEOUT:

A. Provide in accordance with Section 01 77 00.

B. Furnish complete, clear, and concise instructions for installation, operation, and care of equipment.

END OF SECTION

Page Intentionally Left Blank

SECTION 26 13 13S

MEDIUM VOLTAGE CIRCUIT BREAKER SWITCHGEAR – SOO SUPPLEMENT

PART 1 - GENERAL

1.01 DESCRIPTION:

A. This supplement includes the Sequence of Operations for the Medium-Voltage Switchgear identified for paralleling standby Medium-Voltage (MV) Generator Sets to MV Distribution and Sources, including but not limited to paralleling with the normal-power MV Sources.

B. This Sequence of Operations (SOO) describes the integration requirements for a system with:

1. Main-Tie-Main power sources from an off-site normal power source,

2. Various demand loads,

3. Up to 3 generators feeding a common generator bus:

a. This generator switchgear bus is spatially separated from the switchgear providing power to load breakers on tie-separated busses.

b. Protective relays and breakers are specified at both ends.

c. The load busses are normally energized and separated from the common generator bus by an emergency tie breaker. The common generator bus is normally de-energized.

d. At Contractor's preference, either of the following breakers can be used for synching or paralleling the generators to the normal power system, or vice-versa:

(1) The generator-supplied breaker on the load-feeding switchgear

(2) The load switchgear-feeding breaker on the generator paralleling switchgear.

4. Reference Single Line Diagrams and Plan Drawings for additional information and requirements.

1.02 DEFINITIONS:

A. Determine definition of words and abbreviations in this Section:

1. As defined within this specification.

2. "Utility Power" and "Utility" are simplifications to describe medium voltage normal-power feeds from utility-supplied switchgear at the main Salt Lake City Water Reclamation Facility, which may or may not include paralleled or dedicated generator power. It is noted the "Utility" feed to this facility's switchgear is a subfeed from a Rocky Mountain Power (RMP)-supplied and generator-backed switchgear.

3. As defined by other specifications within Division 26.

4. As defined by other Specifications within this project.

5. As defined in Relevant NFPA or other AHJ-adopted Codes.

6. As defined in IEEE technical documents.

1.03 KEY PARAMETERS

1. Power ramping while paralleled shall not exceed 100kW-per-second, whether loading or unloading, except where system faults require emergency shut-down. Under fault conditions, protective devices shall open and shut down power to the fault in accordance with protective relaying coordination requirements.

2. Provide study as required in other Sections, as required to ensure scope of any such shutdown is minimized, and maximum backup power remains available. Provide alarm signal for SCADA integration of any such fault, including information to determine nature and scope of fault for the HMI operator.

3. Delegated design – it is the Contractor's responsibility to assure that system stability is such that power will not reverse-feed to the normal-power sources during transition. This implies a stability study and generator governance as required to parallel without backfeeding, while also continuing to provide acceptable power quality, including both voltage range and frequency.

B. Back-feeding provisions:

1. Under normal conditions, load balance generators as required to ensure any contribution back to utility power source lasts for less than $1/10^{th}$ of a second. This includes when restoring power to normal.

2. Provide manual override such that power can be back-fed to the utility source when needed, such that the source breaker becomes a load breaker in emergency conditions, and this Backfeeding Mode is both set and reset at the generator

paralleling system master control panel. Include cancellable warning for SCADA operator before engaging, to ensure the main plant power is disconnected from RMP before enabling this feature, and to consider disabling this feature before returning to RMP power.

C. Provide instrumentation and monitoring of utility breaker and tie breakers as required to determine utility status and to monitor and control relevant breakers for both parallel supply in islanding operation and paralleling operation with the utility.

D. Provide adjustable user-prioritizable control of load breakers to determine which breakers should open in the event of an overload. Default setting is to open the spare circuit breakers, then the off-site power source breakers, then individual VFDs, starting at 6, and decreasing to 1, and then the 480V loads.

E. Provide interface to SCADA system. Provide, at a minimum Modbus TCP registers as required for:

1. Status of utility availability, including both utility-side voltage and utility-side frequency.

2. Status of each breaker between utility and generators.

3. Indication of values monitored at each transducer within distribution switchgear.

4. Indication of values monitored at each transducer within generator-paralleling switchgear.

5. Determination of both magnitude and direction of power flow through utility breaker.

1.04 FUNCTIONAL SEQUENCE OF OPERATIONS

A. Automatic / Standby Mode, With Normal Power in Steady-State:

1. The utility main breaker is closed serving utility power to the load bus.

2. The synchronizing emergency tie breaker 52MZ is open.

3. The generator main breakers 52G11, 52G21, and 52G31 are open.

4. Generator paralleling gear main breaker 52MZP is closed.

5. The automation is standing by to act in response to a utility failure. Utility failures occur when protective relays open, or when voltage or frequency is outside of bounds.

6. Failures in supplies to only 52MX or 52MY cause breaker(s) associated with failure to open, and remaining breaker to close, following synch check / delay.

B. Emergency Mode; Transition Upon Normal Power Failure:

1. Utility Failure at both supplying breakers 52MX and 52MY.

2. Utility protective relaying and/or transducer senses utility voltage or frequency out of tolerance.

3. The utility main breaker is opened.

4. A run request is sent to the generator plant. (This is left to contractor means/methods, and is to be transparent to the SCADA operator.)

5. The first generator up to voltage and frequency is closed to the generator paralleling switchgear bus.

6. The emergency tie breaker, 52MZ, is closed at the load-supplying switchgear to energize loads.

7. The remaining generators are synchronized and paralleled to the bus as they come up to voltage and frequency.

8. The system is now in Emergency Mode.

C. Utility Restoration and Exit from Emergency Mode:

1. Utility protective relaying and/or transducer senses utility voltage and frequency within tolerance.

2. Following an adjustable time delay (which can be abbreviated by the operator, default value of 30 minutes) to assure that the utility power source is stable, the generator plant is synchronized and paralleled to the utility source by closing the utility main breaker.

3. The paralleling control system immediately starts unloading one generator as required to avoid reverse-feeding the utility grid, while not unloading faster than 100kW/s.

4. The generator plant is soft ramp unloaded until the utility source is nominally serving the entire system load.

5. The emergency tie breaker, 52MZ, is opened.

6. The generator breakers 52G11, 52G21, and 52G31 are opened.

7. The generators are allowed to run for their programmed cool down period, then shut down.

8. The system is now back in Automatic/Standby Mode.

D. Storm Mode, Similar to Emergency Mode, but Manually-Controlled:

1. Entry

a. The operator places the Master Mode Selector Switch into the Transfer to Emergency position. - A soft button on the Human-Machine Interface (HMI) touchscreen is an acceptable substitute.

b. A run request is sent to the generator plant. (This is left to contractor means/methods, and is to be transparent to the SCADA operator.)

c. The first generator up to voltage and frequency is closed to the generator bus.

d. The remaining generators are synchronized and paralleled to the bus as they come up to voltage and frequency.

e. The generator plant is synchronized and paralleled to the utility source by closing the emergency tie breaker. Generator governors are controlled such that there is zero energy contribution to the bus.

f. The generator plant is ramp loaded, at 100kVA/sec until it is serving nominally the entire load on the bus and the utility main breaker is opened.

g. The system is now in Storm Mode.

2. Exit from Storm Mode

a. The operator removes the Master Mode Selector Switch from Transfer to Emergency position and returns it to the Auto position. - A soft button on the Human-Machine Interface (HMI) touchscreen is an acceptable substitute.

b. Following an adjustable time delay (which can be abbreviated by the operator), the generator plant is synchronized and paralleled to the utility source by closing the utility main breaker, either 52MX or 52MY, as previously supplying, or as selected by Operator.

c. The generator plant is ramp unloaded, at the same rate as loaded, until the utility source is nominally serving the entire system load.

d. The 52Z emergency tie breaker is opened.

e. The generator breakers are opened.

f. The generators are allowed to run for their programmed cool down period.

g. The system is now back in Automatic/Standby Mode.

E. No Load Test Mode

1. Entry

a. The No Load Test Switch is placed in the ON position. A soft button on the Human-Machine Interface (HMI) touchscreen is an acceptable substitute.

b. All available generators are started.

c. The first generator up to voltage and frequency is closed to the bus.

d. The remaining generators are synchronized and paralleled to the generator paralleling switchgear bus as they come up to voltage and frequency.

e. The system is now in No Load Test Mode.

2. Exit

a. The No Load Test Switch is placed in the OFF position. A soft button on the Human-Machine Interface (HMI) touchscreen is an acceptable substitute.

b. All generator breakers are opened.

c. The generators are allowed to run for their programmed cool down period.

d. The system is now back in Automatic/Standby Mode.

F. Utility Fail Test Mode

1. The Utility Fail Test Mode is understood to be manually conducted by Operators causing the 52MX and/or 52MY breaker(s) to open, simulating a real loss of power.

G. Load Add/Shed Control

1. Load control is to be through the SCADA system. Provide, at a minimum read-only Modbus TCP registers as required for:

a. For Plant SCADA systems to energize loads sequentially upon outage. Ensure backup power system will not close breakers opened for reasons other than load shedding. Track breakers opened for load shedding, and re-close them within 2 minutes of opening, and where opened for more than 2 minutes, provide alarms for operator intervention. The intent of this requirement is to avoid unanticipated closing of circuit breakers. Also provide immediate alarm at SCADA console of any breakers opened for load shedding, and identify the system will attempt to re-close within 2 minutes of opening, or manual re-closing will be required.

b. Provide pollable registers as required to continuously determine:

(1) The number of generators online.

(2) The system voltage.

(3) The system frequency.

(4) Individual generator output kW.

(5) Individual generator output kVA.

2. Coordinate with SCADA provider for HMI reset feature when system trips out for undervoltage or under-frequency beyond acceptable setpoints for scale and time.

3. It is not an acceptable alternative to directly control load-supplying breakers.

H. Generator Demand Priority Control

1. The System Controls shall include a Generator Demand Priority Control function to automatically match the on-line generator capacity to the loads to avoid unnecessary operation of all the generators when the loads are low.

2. The following controls shall be provided for each generator:

a. User-adjustable Generator Priority Selector

b. Status indicator for the Generator Priority Selected

c. Status indicator for generator On-line or Off-line

3. The Generator Demand Priority Control shall have the following controls:

a. Generator Demand Priority Control Switch (On/Off) - A soft button on the Human-Machine Interface (HMI) touchscreen is an acceptable substitute.

b. User-adjustable Generator Remove % (as a function of a single generator capacity)

c. User-adjustable Generator Remove Delay

d. User-adjustable Generator Add % (as a function of a single generator capacity)

e. User-adjustable Generator Add Delay

4. Upon entrance into Emergency or Storm modes, all generators shall be started and paralleled to the bus. After the Remove Time Delay, generators shall be removed from the bus as a function of the generator percentage loading by the user selected

Generator Remove time delay. Generators shall be removed from the bus in descending priority. Should the generator percentage loading increase to the user selected Generator Add limits for the user selected Add Delay, the next generator will be started, synchronized and paralleled to the bus. Generators shall be added to the bus in ascending priority order. Should the generator plant ever reach 95% loading, the next priority generator shall be started and added to the bus with no time delay.

I. On-Line Paralleled Load Testing

1. Continuous performance – Throughout this test mode, provide background monitoring of the system such that full emergency power will kick in if normal power systems are lost, with all generators available, not just the generator undergoing a load test while paralleled to the grid.

2. Entrance:

   a. The SCADA system provides signal for appropriate Engine Generator to come on-line for load testing. (Provide such signal handling for each generator unit, including start-mode, percent loading, and as otherwise required to implement this mode.)

   b. Specified generator begins idle.

   c. Synchronizing systems govern generator set and wait for synch between the generator bus and the load bus, and synch the generator set. Breakers close as applicable, depending on number of generators operating in this configuration.

   d. Generator increases loading to 80%, or to percentage of loading determined by SCADA operator HMI, with hard system lock-outs to between 0-100%, with additional lockouts to ensure overload duration does not exceed manufacturer limitations. Ensure all lock-outs account for generator deration for elevation above sea level.

   e. Automatically decrease load whenever required to avoid reverse-feeding power to the utility through the utility main breaker. Continuously limit generator output to ensure at least 500kVA of power is drawn into the plant at all times during load testing, as required to assure no grid contribution, with respect to the accuracy of the CT units within the switchgear. Provide SCADA integration for HMI alert message for this condition.

   f. Generator load is modulated as adjusted at SCADA HMI.

3. Exit:

   a. Operator Signals to discontinue operation

b. Generator decreases load contribution to 0%.

c. Generator breaker opens.

d. If last generator breaker has opened, then open generator system paralleling main breaker.

e. Generator idles as required for system cooling and safe shut-down.

f. Generator shuts down at timeframe per manufacturer recommendations. Delay to be 5 minutes if not stated by manufacturer or if ambiguous.

4. In the event of a utility failure during a Load Bank Test:

a. The remaining generators are synchronized and paralleled to the bus as they come up to voltage and frequency.

b. The system is now in Emergency Mode.

SECTION 26 20 00

ELECTRIC MOTORS

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Low voltage electric motors and accessories, furnished under other Sections, and which are a part of equipment assemblies shall be in conformance with the requirements specified in this Section, unless otherwise noted. This section includes performance, and descriptive type specifications.

B. Medium voltage electric motors and accessories are specified by this Specification Section and per Section 43 21 00.34, “Vertical Wet Pit Solids Handling Pumps And Appurtenances”. Referenence Section 42 21 00.34 for additional requirements.

C. Unless otherwise specified or approved, all electric motors furnished and installed by the Contractor shall conform to the requirements specified herein.

1. Motors connected to a Variable Frequency Motor Controller shall be inverter duty rated in accordance with the requirements of NEMA MG-1.

2. Motors rated 1 hp or greater shall be premium efficient type per NEMA MG-1.

1.02 REFERENCES:

1.03 SUBMITTALS:

A. Shop drawings: Submit the following in accordance with Section 01 33 00.

B. Submit shop drawings and manufacturers' product data in accordance with the requirements of Section 26 05 00.

1. Descriptive literature and motor characteristics.

2. Shop drawings and descriptive data to include:

a. Complete list of all motors to be furnished.

b. Outlines, dimensions, weights, and wiring diagrams.

c. Location of main and accessories boxes with size of conduit entrance.

d. Efficiency and power factor at 1/2, 3/4 and full load.

e. Bearing design data and grease requirements.

f. Nameplate data

g. Shop test report

h. Field acceptance test report

i. Strip heaters KW and voltage ratings

j. Power factor correction capacitors, where required.

k. Built in overload protection device where applicable.

l. Starting restrictions, acceleration time-current curve of motor starting load (100 hp and larger).

m. Thermal damage curve and allowable stall time, full voltage (100 hp and larger).

n. Thermal monitoring and protective devices.

o. Vibration Sensors and Vibration Sensor Monitors.

3. Submit Pump, Motor and VFD Coordination Certificate. Refer to Section 01 33 00 for form.

1.04 QUALITY ASSURANCE:

A. Provide in accordance with Section 01 45 00 and as specified.

B. Motors to comply with the latest reference standards listed below.

1. National Electrical Code (NEC)

2. Underwriters Laboratories, Inc. (UL)

3. National Electric Manufacturer's Association (NEMA).

   a. MG-1: Motors and Generators

4. Anti-Friction Bearing Manufacturer's Association, Inc. (AFBMA)

5. American National Standard Institute (ANSI)

6. Institute of Electrical and Electronics Engineers (IEEE).

   a. 112: Test Procedures for Polyphase Induction Motors and Generators

   b. 1349: IEEE Guide for the Application of Electric Motors in Class 1, Division 2 Hazardous (Classified) Locations

C. Routine tests shall be performed on representative motors, and shall include the information described on NEMA MG1-12.54 Report of Test Form for Routine Tests on Induction Motors. Efficiency shall be determined in accordance with IEEE Publication No. 112, Method B. Power factor shall be measured on representative motors.

1.05 DELIVERY, STORAGE AND HANDLING

A. Provide in accordance with APWA Section 01 66 00 and as specified.

B. Shipping:

1. Ship motors assembled to driven equipment complete except where partial disassembly is required by transportation regulations or for protection of components.

2. Pack spare parts in containers bearing labels clearly designating contents and pieces of equipment for which intended.

3. Deliver spare parts at same time as pertaining materials. Delivery to Owner after completion of work.

C. Receiving and Storage:

1. Inspect and inventory items upon delivery to site.

2. Store and safeguard equipment and material in heated storage facility as recommended by equipment manufacturer and required by APWA Section 01 66 00.

3. Protect motors from moisture at all times.

4. Protect motors from exposure to elements for which they are not designed. Install and energize temporary electrical service to motors with space heaters.

5. Unless protected by manufacturer's packing, upon delivery, carefully wrap each motor in three layers of 8-mil-minimum polyethylene. Secure the wrap with adhesive tape. For base-mounted motors, wrap the entire assembly.

D. Prolonged Storage:

1. For extended outdoor storage, remove motors from equipment and store separately.

2. If storage is anticipated to be longer than two months, store in accordance with the manufacturer instructions including the following additional steps.

3. Maintain motor space heaters energized.

4. Fill the oil reservoirs of motors with sleeve bearings to the proper level with the specified oil.

5. Motors with anti-friction bearings to receive an initial change of grease and then be re-greased every six months.

6. Remove the motor shaft braces and the rotate motor shaft every two weeks. Replace the shaft braces prior to relocation to the installation site. Under no circumstances should the motor be lifted without the braces in place.

7. Provide vapor phase corrosion inhibitor pad (emitter) inside the wrapping.

PART 2 - PRODUCTS

2.01 MOTOR MANUFACTURERS:

A. Motors rated below 1kV:

1. General Electric Company

2. Reliance Electric

3. U.S. Motors

B. Motors rated above 1kV:

C. Toshiba.

D. U.S. Motors.

E. Weg Motors.

F. E Motors.

G. National Oilwell (previously Louis-Allis).

2.02 CONTINENTAL ELECTRIC MOTORS.ELECTRIC MOTOR RATINGS:

A. Voltage Ratings:

1. Unless otherwise specified, motors with ratings of 3/4 to 350 hp shall be rated 460 volt (nameplate rating), 3-phase, 60 Hertz; motors of 1/2 hp or less to be rated 115 volt, single-phase, 60 Hertz.

2. High voltage motors, if indicated on drawings, shall be as specified in associated equipment Specification Section and per this Specification Section.

B. The following specific motor requirements shall be in the equipment specifications:

1. RPM

2. Motor enclosure type

2.03 MOTOR DESIGN REQUIREMENTS:

A. Motor heaters shall be supplied on all medium voltage motors and on motors installed outdoors or in unheated areas. Heaters shall be of the cartridge or flexible wrap around type installed within the motor enclosure adjacent to core iron. Heaters shall be rated for 120 volt, single phase with wattage as required. The heater wattage and voltage shall be embossed on the motor nameplate.

B. Unless otherwise specified or permitted all electric motors furnished and installed by the Contractor shall conform to the requirements hereinafter set forth.

C. Motors connected to variable frequency motor controller shall be inverter duty rated.

D. Every motor shall be of sufficient capacity to operate the driven equipment under all load and operating conditions without exceeding its rated nameplate current or power or its specified temperature limit at rated voltage. Each motor shall develop ample torque for its required service throughout its acceleration range at a voltage 10 percent below nameplate rating. Where indicated on the electrical drawings to be operated on a reduced voltage starter, the motor shall develop ample torque under the conditions imposed by the reduced voltage starting method.

E. The motor shall have sufficient capacity to operate the driven equipment as given in the equipment detail specifications. The motor shall not be required to deliver more than its rated nameplate horsepower, at unity (1.0) service factor, under any condition of mechanical or hydraulic loading.

F. The motor shall be suitable for rated horsepower and full service factor operation at 4,500 feet elevation above sea level.

G. Type of Motors:

1. All motors shall be NEMA Design B or of a type having starting characteristics and ruggedness as may be necessary under the actual conditions of operation and, unless otherwise specified, shall be suitable for full-voltage starting.

H. Insulation:

1. Reference later within this specification for requirements for insulation of shaft bearings for motors supplied by variable frequency motor controllers.

2. All motors shall have Class B or Class F insulation with temperature rise by resistance at full load rating of a Class B insulation in accordance with NEMA Standards for Motors and Generators, NEMA MG1, and based on a maximum ambient temperature of 40 degrees C unless otherwise specified.

3. Insulation systems shall be manufacturer's premium grade, resistant to attack by moisture, acids, alkalies and mechanical or thermal shock for 480 volt motors. Provide 80 degrees C, Class B rise or better by resistance at 100 percent load and provide a Class F insulation system, suitable for an ambient temperature motor operation of 0 to 40 degrees C at no more than 4,500 feet above sea level for inverter duty motors. This temperature rise shall be met when motors are operated and controlled with the VFD(s). The motor insulation system shall have full capability to handle the common mode voltage conditions imposed by the VFD.

4. Motors for outdoor service shall have vacuum/pressure impregnated epoxy insulation for moisture resistance.

5. Insulation for inverter duty motor windings shall meet or exceed the Pulse Endurance Index for magnetic wire and shall not be injured when exposed to repeated pulse type waveforms, repetitive high voltage transients, switching frequency and rate of rise of the pulse. Class H varnish shall be used.

I. Enclosures:

1. Motors shall have a steel or cast iron frame and a cast iron or stamped steel conduit box, as specified below. Conduit box shall be split from top to bottom and shall be capable of being rotated to four positions. Synthetic rubber-like gaskets shall be provided between the frame and the conduit box and between the conduit box and its cover. Motor leads shall be sealed with a non-wicking, non-hygroscopic insulating material. A frame mounted pad with drilled and tapped hole, not less than 1/4-inch diameter, shall be provided inside the conduit box for motor frame grounding.

    a. Totally enclosed fan cooled: TEFC motors shall have a steel or cast iron frame, cast iron end brackets, cast iron conduit box, 1.15 service factor at 40 degrees C, tapped drain holes (corrosion resistant plugs for frames 286T and smaller and automatic breather/drain devices for frames 324T and larger) and upgraded insulation by additional dips and bakes to increase moisture resistance.

    b. Totally enclosed non-ventilated: TENV motors shall include the same rating and accessories as specified for TEFC motors.

    c. Explosion proof motors shall comply with all requirements of Class I, Division I, Group D, hazardous locations as defined by the NEC and with all other safety codes pertaining thereto.

J. Special Purpose Motors:

1. Chemical duty motors shall be provided with severe duty rating. Motors shall be of the corrosion resistant type conforming to motors designated by the manufacturer as Corro-Duty, Mill and Chemical, Custom Severe Duty, or similar quality designation. Severe duty motors shall have a cast iron frame, cast iron end brackets, cast iron conduit box and 1.15 service factor at 40 degrees C and tapped drain holes (corrosion resistant plug for frames 286T and smaller and automatic breather/drain devices for frames 324T and larger).

2. Hermetically sealed air conditioning units, elevators, hoists, cranes and other devices complying with special safety codes shall be furnished with motors, control equipment, accessories and safety devices for approved, safe, and efficient operation, in accordance with the manufacturer's standards and to be rated for the duty cycle as specified for the driven equipment. Minimum service factor 1.15 above 3 hp.

3. Submersible motors shall be manufacturer's standard.

4. Synchronous and wound rotor motors shall be specified elsewhere in the specifications when required.

5. Inverter duty rated: Motors for operation on variable frequency motor controller shall meet current power quality levels published in NEMA MG1. Enclosures shall be equal to those furnished for severe duty or explosion proof motors. Motor shaft and bearings shall be insulated. Internal service factor shall be 1.15 that of the nameplate. Ventilation system shall be designed for maximum heat transfer. Stator laminations shall be stagger-stacked and stamped from high grade electrical steel to minimize eddy-current losses and heat build-up caused by inverter induced harmonics. Rotors shall be configured to minimize skin-effect heating.

K. Auxiliary Devices:

1. Three phase motors shall not be provided with starting capacitors.

2. Single-phase motors requiring switching devices and auxiliary starting resistors, capacitors, or reactors shall be furnished as combination units with such auxiliaries either incorporated within the motor housings or housed in suitable enclosures mounted upon the motor frames. Each combination unit shall be mounted upon a single base and to be provided with a single conduit box.

3. Motors 200 hp or over, or where specified in other sections, shall have:

a. Winding temperature detectors that are:

(1) Factory installed

(2) Embedded

(3) Bi-metallic switch type or thermistors with relay with leads terminating in the main conduit box.

(4) Designed and prototype-tested to protect the motor against damage from overheating caused by single phasing, overload, high ambient temperature, abnormal voltage, locked rotor, frequent starts or ventilation failure.

(5) Arranged to have normally closed contacts, that open upon abnormal conditions.

(6) In quantities of not less than three detectors per motor. Provide two RTDs per phase for MV motors over 450HP, one on each side of the stator.

(7) Listed as part of overall motor assembly.

b. Bearing temperature sensors, meeting the same requirements of winding temperature sensors, except:

(1) Need not be embedded into the actual bearing.

(2) Shall allow for removal and replacement with hand tools as required to replace either sensor or bearing.

c. Vibration Sensors that are:

(1) Factory installed.

(2) Accompanied by a listed and compatible vibration sensor monitor module with appropriate time-delay features to alarm when severe vibration is encountered, and to avoid nuisance indications from vibrations not associated with machine failure. Coordinate monitor to be compatible with motor controller auxiliary power supply.

(a) In addition to the requirements listed above, for the vibration monitoring system at each IPS raw wastewater pump provide complete system with the following functions:

- One discrete output to indicate high vibration, suitable for interlocking out the VFD upon excessive vibration.
- Ethernet capability for communication of sensor values and alarms to SCADA.
- Systems compatible with local 120V power supply.
- With enclosure suitable for the location, or located within I&C cabinet, where space exists.

(3) Either:

(a) Tri-axial type for either non-sleeve bearings or for gears.

(b) Displacement-type (in/sec) for sleeve bearings.

(4) Sensor Format:

(a) Motors rated less than 1kV - Arranged to have normally closed contacts, that open upon abnormal conditions.

(b) Motors rated 1kV and higher - To match proprietary system recommendations for the application, compatible with vibration sensor monitor described earlier in this section, and completely powered/serviced by vibration sensor monitor. Provide system with compatible vibration and speed reference sensors.

(c) Coordinate with motor, pump, and/or coupling manufacturer to provide sensor manufacturer's recommended mounts, such as threaded wells, for maximum quality sensing.

(5) Listed as part of the overall motor assembly.

d. Non-Drive end insulated bearing, with additional bearing(s) as required for motors supplied by Variable Frequency Motor Controllers.

e. Shaft Grounding Kit – Identified for use in grounding the motor shaft to the frame of the motor with a lower impedance than is usually required to microweld the bearing race to the moving parts of the bearing. AEGIS™ shaft grounding kit, or approved equal.

L. General Design of Motors:

1. Motors shall comply with the latest NEMA Standards Publication No. MG1 for Motors and Generators, unless otherwise specified.

2. All polyphase non-explosion proof motors shall be designed for energy efficient operation and meet the requirements of MG1-12.53 a and b.

3. Motor windings shall be braced to withstand successfully the stresses resulting from the method of starting. The windings shall be treated thoroughly with acceptable insulating compound suitable for protection against moisture and slightly acid or alkaline conditions.

4. Bearings shall be of the self-lubricating type, designed to ensure proper alignment of rotor and shaft and to prevent leakage of lubricant.

a. Bearings for open motors shall be of the sleeve or ball type, as specified under the respective items of mechanical equipment.

b. Bearings for totally enclosed and explosionproof motors shall be of the ball type.

c. Bearing minimum L-10 fatigue life in hours at 100 percent load shall be 50,000.

d. Bearing grease shall be of the 120 degrees C thermal capability type.

5. Vertical motors shall be provided with thrust bearings adequate for all thrusts to which they can be subjected in operation.

a. For motors rated 1kV and above:

(1) Motors operated in a vertical position shall be designed for vertical operation and shall have thrust bearings with a rated B-10 life of 40,000 hours as defined by AFBMA standards. In addition, motor thrust bearings shall be capable of withstanding a momentary upthrust equal to at least 30 percent of the rated downthrust capacity and any other transient loads imposed on the bearings during starting or

shutdown. Thrust and guide bearings shall be oil lubricated and shall be continuously submerged in oil when the motor is not in use. Provide a means for visual observation of the oil level for bearings while the motor is in operation. No filtered water-cooling may be used.

6. For motors rated 1kV and above:

   a. Provide copper stator windings. Do not provide aluminum windings. Provide motors with form-wound coils and a sealed insulation system equivalent to the General Electric "Custom Polyseal" system, Westinghouse "Thermalastic Epoxy" system, or U.S. Motors "Everseal" system.

   b. Balance motors after assembly to an overall vibration amplitude of 1 mil (0.025 mm) maximum, when measured at the machine bearing housing.

   c. Provide motor Motor Enclosure and Speed per Process Pump Schedule, or as scheduled in driven equipment specification.

   d. Perform the following nonwitnessed tests at the factory, conforming with NEMA MG1:

      (1) No load current and speed.

      (2) Locked rotor current.

      (3) High potential tests.

      (4) Winding resistance.

      (5) Full load heat run with temperature rise measured by resistance method.

      (6) Percent slip.

      (7) Efficiency at full, 3/4, and 1/2 loads.

      (8) Power factor at full, 3/4, 1/2, and no load.

      (9) Starting torque.

      (10) Locked rotor current test and determination of pullout torque as calculated from locked test.

7. Vertical motors of the open type shall be provided with drip hoods of acceptable shape and construction. When the drip hood is too heavy to be easily removed, provision to be made for access for testing.

8. All three phase two speed motors shall be of the two-winding design.

9. All three phase motors shall be provided with a 1.15 service factor.

10. Three phase motors shall be of cast iron construction including frame and end brackets.

11. Totally enclosed motors shall be provided with automatic breather and drain

12. Motor nameplates shall be stainless steel.

13. Motor Terminal Boxes and Leads:

    a. Motors shall be furnished with oversize conduit terminal boxes to provide for making and housing the connections, and with flexible leads of sufficient length to extend for a distance of not less than 4 inches beyond the face of the box. The size of cable terminals, and terminal box conduit hoses shall be as permitted by the Engineer. An acceptable type of solderless lug to be furnished. Totally enclosed and explosionproof motors to have cast-iron terminal boxes.

    b. Leads for space heaters shall be brought out into an auxiliary, cast, conduit box on the motor side opposite to the main terminal box. Auxiliary box to have 1 inch threaded conduit openings and shall be so constructed that conduit entrance may be placed at top, bottom, or either side.

    c. A grounding terminal shall be provided in the main terminal box and a bronze grounding bolt to be furnished at the conduit side of the motor frame.

14. Provide screens over openings.

15. Reference specifications for driven equipment to determine requisite motor type and housing.

M. Motor Efficiencies:

1. Three phase motors rated 1 hp and larger shall be of the premium efficiency, “Design E”, type per Table 12.1 of NEMA MG1 Part 12. Motors shall have a NEMA Nominal Efficiency not less than the values referenced in NEMA MG1. Efficiency values shall be based on tests performed in accordance with IEEE Publication No. 112, Method B. Motors with horsepower or rpm’s not listed shall conform to comparable standards of construction and materials as those for listed motors.

N. Shop Painting:

1. Unless otherwise specified, motors shall be given a shop application of paint filler or enamel sealer, a flat coat of undercoater for enamel, and two coats of enamel or, in lieu of this treatment, other corrosion-resistant treatment customary with the manufacturer.

2. Coat per manufacturer-standard color with oil-resistant, outdoor-rated paint. Apply prime coat at the factory. Reference Section 09 90 00 for additional requirements.

O. Motor Data:

1. The Contractor shall furnish the Engineer with five certified copies of characteristic curves of each motor furnished, except 115-volt motors. Curves shall be supplied as a part of the driven equipment submittal.

P. Motor Shop Tests:

1. Motor shop tests shall be made in accordance with the IEEE Test Codes as specified in the NEMA MG1 Standards for Motors and Generators. NEMA report-of-test forms to be used in submitting test data.

2. Motor efficiency shall be determined by use of IEEE Standard 112 Test Method B, and by use of MGI-12.53 a and b.

3. For induction motors larger than 100 hp, complete tests of each motor furnished to be made and certified tests data sheets to be submitted, unless witness shop tests are required by the technical specifications pertaining to the equipment. Each motor shall be tested at rated voltage for: efficiency and power factor at 50, 75, and 100 percent of it rated horsepower; for temperature rise, torque, no-load current, starting current, full load current, and dielectric strength; and for compliance with all specified performance requirements.

4. For induction motors 5 hp, up to and including 100 hp, copies of routine tests reports of electrically duplicate motors shall be furnished.

5. For motors 3 hp or less, no test data need be furnished.

Q. Spare Parts:

1. Provide in accordance with Section 01 78 23 and as specified.

2. Furnish one spare bearing of each type for each motor size and type.

R. Capacitors for Motors:

1. All 3-phase, non-explosionproof 460 volt motors 50 hp and above (except for motors driven through variable frequency drive units) shall be provided with a capacitor of the maximum kVAR. Size recommended by the motor manufacturer and in accordance with the requirements of the NEC.

2. Capacitors shall be furnished with the motors. All capacitors to be installed and wired in accordance with the requirements of the NEC.

3. Capacitor shall be rated 600 volt, 3-phase, 60 Hertz.

4. Each capacitor unit to be enclosed in a corrosion-resistant weatherproof dusttight housing for indoor/outdoor use with threaded conduit connection. A heavy duty corrosion-resistant wall rack shall be provided with each capacitor. Discharge resistors to be included to reduce the voltage to 50 volts or less within one minute after the capacitor is disconnected from the source.

5. Capacitors shall be dry film or liquid insulated and shall be hermetically sealed in steel enclosures.

6. Each capacitor unit shall be furnished with three high interrupting capacity current limiting fuses. Fuss shall be equipped with blown-fuse indicators.

7. Capacitor enclosures shall be suitable for conduit connection and of the NEMA enclosure type required for the area as indicated on the Drawings. Covers shall be gasketed, bolt-on type.

8. Capacitors shall be UL listed.

9. Capacitors shall be by General Electric Co.; Square D Co.; Sprague.

2.04 ELECTRICAL INTERFACE:

A. All items of electrical equipment that are furnished with process, heating, ventilating, or other equipment shall conform to the requirements specified under the applicable electrical sections of the Division 26 specifications. Enclosures for electrical equipment such as switches, starters, etc., shall also conform to the requirements specified under the applicable electrical sections of the Division 26 specifications.

PART 3 - EXECUTION

3.01 INSTALLATION:

A. Verify heaters are energized on motors installed in outdoor or unheated areas.

B. After motor installation but before connection to power wiring, test motor winding insulation in accordance with the applicable Division 26 requirements.

C. After connection to power wiring, check for operating temperature, correct rotation, vibration, alignment and operating current drawn under load.

D. Submit all motor test results for review and record.

E. Adjust and test protective features as required to assure reasonable protection from thermal damage and from excess vibration. Adjustments to be minimum practical values in accordance with manufacturer instructions and as required to avoid false alarms.

3.02 CONTRACT CLOSEOUT:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

Page Intentionally Left Blank

SECTION 26 22 14

DRY-TYPE TRANSFORMERS

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide copper-wound, dry-type transformers as indicated and specified.

B. Provide transformer windings and enclosures rated for the installation location and in accordance with the requirements herein.

C. Transformers shall be “Energy Star” rated.

1.02 REFERENCES:

A. American National Standards Institute (ANSI):

1. Z55.1: Gray Finishes for Industrial Apparatus and Equipment

B. ASTM International (ASTM):

1. D635: Rate of Burning and/or Extent and Time of Burning of Self-Supporting Plastics in a Horizontal Position.

C. National Electrical Manufacturers Association (NEMA):

1. ST 20: Dry-Type Transformers for General Applications.

D. International Electrical Testing Association (NETA):

1. ATS: Acceptance Testing Specifications for Electrical Power Distribution Equipment and Systems.

E. National Fire Protection Association (NFPA):

1. 70: National Electrical Code (NEC).

F. Underwriters' Laboratories, Inc. (UL):

1. 506: Standard for Specialty Transformers.

1.03 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Submit shop drawings and manufacturers' product data in accordance with the requirements of Section 26 05 10.

C. Submit shop drawings and manufacturer's product data of the transformer. Information to include:

1. Outline drawings including dimensions.

2. Weight.

3. Ratings and tap configuration.

4. Core and coil material.

5. Insulation system description.

6. Loss data and efficiency.

7. Accessories.

8. Mounting requirements.

9. Nameplate data.

10. Testing data.

D. Submit a Certificate of Compliance indicating conformance to the Seismic Requirements specified. Certificate shall be signed and sealed by a Professional Structural Engineer holding current registration in the state for work of this project.

E. For informational purposes only, provide manufacturers printed installation instructions including anchoring details to meet earthquake requirements as specified and indicated on structural drawings.

1.04 SEISMIC DESIGN REQUIREMENTS:

A. Conform to the requirements specified in Section 01 41 20.

B. It shall be the responsibility of manufacturer and supplier along with the Electrical Contractor to conform to the seismic design requirements for this project and for the work of this specification section.

1.05 QUALITY ASSURANCE:

A. Provide in accordance with Section 01 45 00 and as specified.

1.06 DELIVERY, STORAGE AND HANDLING:

A. Provide in accordance with APWA Section 01 66 00.

B. Deliver transformers individually wrapped for protection and mounted on shipping skids.

C. Accept transformers on site. Inspect for damage.

D. Store in clean, dry space. Maintain factory wrapping or provide additional canvas or plastic cover to protect units from dirt, water, construction debris, and traffic.

E. Handle and stored in accordance with manufacturer's written instructions. Lift only with lugs provided. Handle carefully to avoid damage to transformer internal components, enclosure, and finish.

1.07 REQUIREMENTS OF REGULATORY AGENCIES:

A. Furnish transformers in accordance with NEMA ST 20 and UL 506.

B. Furnish transformers with UL listing mark.

PART 2 - PRODUCTS

2.01 MANUFACTURERS:

A. Square D Co.

B. Eaton-Cutler-Hammer Corp.

C. Siemens Inc.

D. ABB.

2.02 TRANSFORMERS:

A. In NEMA 1 and NEMA 12 designated areas, furnish general purpose, ventilated, dry-type transformers in indoor-style enclosure. On single-phase transformers and three-phase transformers above 9 KVA, provide not less than two windings per phase.

1. Temperature rise at hottest spot shall conform to NEMA Standards, and shall not bake and peel off the enclosure paint after the transformer has been placed in service.

2. Ventilation openings shall prevent accidental access to live components.

3. Thoroughly clean and paint enclosure at the factory with manufacturer's prime coat and standard finish.

B. In NEMA 4 or NEMA 4X designated areas, provide transformers with encapsulated windings and stainless steel enclosures.

C. Auto transformers shall not be used in place of general purpose dry-type transformers.

D. Furnish at least two 2-1/2 percent full capacity taps above and below nominal in high voltage winding for transformers rated above 15 kVA. Two five percent taps below rated voltage for transformers rated 15 kVA and below.

E. Furnish transformers, single-phase or three-phase, as indicated. Furnish transformers with kVA ratings as indicated.

F. Furnish three-phase transformers, Delta-Wye, Delta-Delta or Wye-Wye connected as indicated, and conforming to latest NEMA standards. Scott Tee connected transformers are not acceptable above 9 kVA.

G. Isolate core and coil from enclosure using vibration-absorbing mounts.

H. Furnish transformers with primary and secondary voltages and frequency, wye connected, as indicated for secondary windings, with neutral brought out for cable termination.

I. Furnish transformers designed for continuous operation at rated kVA with normal life expectancy as defined in NEMA ST 20.

J. For transformers rated 30 kVA or less, ensure that performance is obtained without exceeding 115 degrees C average temperature rise by resistance or 145 degrees C hot spot temperature rise in 40 degrees C maximum ambient and 30 degrees C average ambient. Do not allow maximum coil hot spot temperature to exceed 185 degrees C.

K. Furnish transformers with 220 degrees C insulation materials with proven reliability for 15 kVA transformers and above. Furnish 185 degrees C insulation on transformers below 15 kVA.

L. Transformers rated greater than 30 kVA shall be provided with low-loss 80 degrees C full load operating temperature rise rating.

M. Furnish transformers made of flame retardant materials that will not support combustion as defined in ASTM D635.

N. Furnish core mounting frames and enclosures of welded and bolted construction with mechanical rigidity and strength to withstand shipping, erection and short circuit stresses.

1. Cores shall be grain oriented, non-aging, and silicon steel.

2. Coils shall be continuous windings without splices except for tapes.

3. Coil loss and core loss shall be minimum for efficient operation.

4. Primary and secondary tap connections shall be razed or pressure type.

5. Coil windings shall have end fillers or tie downs for maximum strength.

O. Transformers located in areas where fire protection system sprinklers are located shall be provided with NEMA 2 rated enclosure to protect transformer from water falling at an angle of 75 degrees from the vertical.

P. Furnish transformers designed to meet UL thermal overload test of 200 percent of rated current for one half hour.

Q. Furnish transformers not to exceed the 65 degrees C rise established by UL as safe limit for maximum surface enclosure temperature.

R. Furnish transformers with sound level not exceeding:

Average Sound Level in dB

kVA	NEMA ST 20
0-09	40
10-50	45
51-150	50
151-300	55
301-500	60

S. Install transformers with sound levels greater than 50 dB on resilient vibration isolating mounts to prevent amplification of sound. Transformers rated 15 kVA and larger to be provided with rubber washer anti-vibration pads and molded neoprene assemblies to isolate noise from the transformer to the mounting surface.

2.03 SHOP TESTING:

A. Submit results of audible-sound-levels tests in accordance with NEMA ST 20 of similar size transformer.

B. Production test each unit in accordance with NEMA ST 20.

PART 3 - EXECUTION

3.01 INSTALLATION:

A. Set transformer plumb and level. Install and guard transformers as specified by latest NEC and ANSI standards, and in accordance with manufacturer's printed instructions.

B. Furnish adequate space around transformer to dispose of transformer full load losses by ventilation without creating excessive ambient temperature. Verify working clearances as required by the NEC are met.

C. Unless indicated otherwise on drawings, wall mount with suitable supports, transformers rated 15 kVA and below. Floor mount transformers rated above 15 kVA unless otherwise indicated on the drawings. In addition, all transformers located in NEMA 4 or NEMA 4X designated areas shall be wall mounted on Type 316 stainless steel channel supporting systems with Type 316 stainless steel concrete inserts, minimum 7 feet-6 inches AFF. Provide all required seismic restraints.

D. Provide lifting lugs and jacking plates on transformer enclosure.

E. Provide concrete pad for all floor mounted transformers.

F. Clean metal parts, excepting cores and core mounting frames, then rust-proof and apply heavy coating of inert primer. Paint coverplates and external metal parts with two finish coats of ANSI Z55.1 No. 61 or 49 Gray.

G. Verify mounting pads are in place to reduce noise.

H. Install grounding and bonding in accordance with the drawings and Section 26 05 26.

3.02 FIELD TESTING:

A. Inspect and test in accordance with NETA ATS, except Section 4.

B. Perform inspections and tests listed in NETA ATS, Section 7.2.1.

3.03 CONTRACT CLOSEOUT:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 26 23 15

NEUTRAL GROUNDING RESISTOR

PART 1 - GENERAL

1.01 DESCRIPTION:

A. This section includes materials and installation of neutral grounding resistors for resistance grounding of power distribution systems as indicated and in compliance with Contract Documents.

1.02 REFERENCES:

A. American National Standards Institute (ANSI):

1. C19.3: Compressors for Process Industries

B. National Electrical Manufacturers Association (NEMA):

1. C29.3: Wet-Process Porcelain Insulators-(Spool Type)

2. ICS 1: Industrial Control and Systems: General Requirements

3. ICS 6: Standard for Industrial Controls and System Enclosures.

C. Underwriter's Laboratories, Inc. (UL):

1. 347: Medium Voltage Industrial Control Equipment.

1.03 SEISMIC DESIGN REQUIRMENTS:

A. Conform to the requirements indicated on the structural drawings and as specified in Section 01 41 20.

B. Conform to the requirements specified in Section 01 41 20 and Section 26 05 50, Seismic Controls for Electrical Systems.

C. It shall be the responsibility of manufacturer and supplier along with the Electrical Contractor to conform to the seismic design requirements for this project and for the work of this specification section.

1.04 SUBMITTALS:

A. Submit shop drawings and manufacturers' product data in accordance with the requirements of Section 01 33 00 and Section 26 05 10 “Electrical Work – General”.

B. Submit manufacturer's descriptive and technical literature and any details required to demonstrate that the equipment will function properly as a unit. This material shall include:

1. System configuration with single-line diagrams. Identify devices by location, size, and manufacturer type number.

2. Detailed descriptions of equipment including weights, dimensions, foundation requirements, installation requirements, and heat dissipation.

3. Complete dimensional plan views indicating sizes and clearances required for all equipment.

4. Interconnection and schematic diagrams for power and control wiring showing all interconnection and wiring with terminal numbers for each wire. Clearly identify contacts, terminal blocks, and wire numbers for remote devices. Show field devices and wiring on diagrams.

5. Nameplate designations.

C. Submit factory and site acceptance test procedures for review 30 days prior to tests. Include a detailed description of all tests to be performed.

D. Submit copies of certified factory test reports.

1.05 OPERATION AND MAINTENANCE MANUALS:

A. Submit operation and maintenance manuals in accordance with Section 01 78 23 “Operation and Maintenance Data”. The manuals shall describe the equipment in full and shall include the following major items:

1. Operating instructions and start-up procedures including receiving and installation requirements.

2. Maintenance instructions listing preventive and corrective maintenance procedures. Corrective maintenance procedures shall identify the most probable failures and the appropriate repairs. Reference test measurement levels to specific test points on the installed equipment.

3. Provide spare parts data for each item of material and equipment specified. The data shall include a complete list of parts and supplies, with current unit prices and source of supply. Provide a list and itemized price breakdown of spare parts recommended for stocking. The parts selected shall be those that, in the manufacturer's judgment, will be involved in the majority of maintenance difficulties encountered.

4. Control schematics, ladder diagrams, and interconnection drawings.

5. Catalog cuts and technical manuals for system components.

6. Copy of guarantees and warranties issued for the various items of equipment, showing all dates of expiration.

7. Copies of test results.

8. Final copies of shop drawings incorporating manufacturing and field changes.

1.06 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 40 00 “Quality Requirements”.

B. Ensure that conduit size and wire quantity, size, and type are suitable for the equipment supplied. Review the proper installation of each type of device with the equipment supplier prior to installation.

1.07 DELIERY, STORAGE AND HANDLING:

A. Comply with the requirements specified in Section 01 61 00, “Control of Materials”.

B. Shipping:

1. Ship equipment, and materials, except where partial disassembly is required by transportation regulations or for protection, complete with identification and quantity of items.

2. Pack spare parts in containers bearing labels clearly designating contents and pieces of equipment for which intended.

PART 2 - PRODUCTS

2.01 GENERAL:

A. Provide nameplates as specified in Section 26 05 10 “Electrical Work – General”.

B. The grounding resistor shall be manufactured by Westinghouse Electric Corporation, Bender Incorporated, or equal.

2.02 NEUTRAL GROUNDING RESISTOR:

A. Design, construct, and test the neutral grounding resistors and enclosures in accordance with the latest applicable sections of NEMA, ANSI, and UL.

B. The grounding resistor shall meet the requirements shown on relevant single line diagram(s), maximum temperature rise 135 degrees F (75 degrees C).

C. Construct resistor units of stainless steel, edge-wound type with welded connections between units. The edge-wound helix strap shall be wound around a refractory core reinforced by longitudinal stainless-steel supports. Individually support each resistor element at each end by ceramic insulators in such a manner that one end of the helix bar support is freely attached to a roller which shall permit expansion of the supporting bar when subject to high temperatures.

D. Provide resistor frames with a screen-type enclosure with openings in the side and top not to exceed 1/2-inch (13 mm). Construct of aluminum (Alloy 6061-T6) with bolted construction using steel hardware. When required, provide the enclosure with current transformer mounting and entrance bushing. Support each frame by porcelain pin and cap-type insulators. The insulators shall conform to NEMA C29.3.

E. Provide the grounding resistor and enclosure with provisions for lifting and suitable for pad mounting outdoors.

2.03 FINISH:

A. Clean chemically and treat steel surfaces to provide a bond between the primer paint and metal surfaces. Final coat shall be in accordance with manufacturer's standard paint.

2.04 FACORTY TESTS:

A. Test and inspect equipment in conformance with NEMA ICS 1-109 and ANSI C19.3. The tests shall verify the physical configuration of assembly and workmanship, the mechanical adjustments of parts and components, and the sequencing and functional operations of control systems.

B. Perform a dielectric test (Hi-pot) on circuit wiring, with appropriate connection separated to avoid equipment damage, to confirm the insulation resistance to withstand breakdown to a selected test voltage. The test method shall be as specified in NEMA ICS 1-109-21.

C. Test power cables and buses phase-to-ground for insulation breakdown resistance and circuit isolation as specified in NEMA ICS 1-109.21.

PART 3 - EXECUTION

3.01 INSTALLATION:

A. Secure neutral disconnect switchgear rigidly to floor, supporting steel, or mounting pad with anchor bolts or Phillips Drill Company concrete anchors. Provide supplemental steel, per delegated design by a Utah-License Professional Engineer, as required to mount the neutral grounding resistor as shown in the Electrical plans.

B. Connect neutral conductor to one of the poles of the switch. Do not use the other two poles. Connect the corresponding bus to the conductor connected to the grounding

resistor. Electrically interlock the switch with the corresponding generator breaker as shown in the drawings.

3.02 FIELD TESTING:

A. Test the operation of the resistor and switches to verify correct operation. Perform adjustments as required for correct operation.

3.03 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00 “Execution and Closeout Requirements”.

END OF SECTION

Page Intentionally Left Blank

SECTION 26 24 16

PANELBOARDS

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide panelboards rated 600 volts or less and 1200 amperes or less.

B. Provide with circuit breakers and cabinets complete, as indicated and specified.

1.02 REFERENCES:

A. Federal Specifications (FS):

1. QQ-S-365B: General Requirements for Silver Plating, Electro Deposited

2. W-C-375B: Automatic Circuit Breakers

3. W-P-115A: Panel, Power Distribution

B. National Electrical Manufacturers Association (NEMA):

1. 250: Enclosures for Electrical Equipment (1000 volts maximum)

2. AB 1: Molded Case Circuit Breakers

3. PB 1: Panelboards

C. National Fire Protection Association (NFPA):

1. 70: National Electrical Code (NEC)

D. Underwriter's Laboratories, Inc. (UL):

1. 50: Cabinets and Boxes

2. 67: Panelboards

3. 86A: Wire Connectors and Soldering Lugs for Use with Copper Conductors

4. 489: Circuit Breakers, Molded Case and Circuit Breaker Enclosures

1.03 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Submit shop drawings and manufacturer's product data in accordance with requirements of Section 26 05 10.

1.04 QUALITY ASSURANCE:

A. Provide in accordance with Section 01 45 00 and as specified.

B. All panelboards shall be designed, manufactured and assembled in accordance with the referenced standards.

C. Listing and Labeling: All panelboards shall be listed and labeled by Underwriter's Laboratories, Inc. (UL), or other nationally-recognized testing laboratory (NRTL).

D. Service Entrance panelboards shall be UL/NRTL-labeled as suitable for that purpose.

E. Single-source Responsibility: Provide panelboards products that are new, and from the same manufacturer for each building or job. Panelboard components shall be from the same manufacturer, or listed as an assembly thereof.

PART 2 - PRODUCTS

2.01 PANELBOARD MANUFACTURERS:

A. Manufacturers acceptable contingent upon products' compliance with the specifications:

1. Cutler-Hammer Products

2. General Electric Company

3. Siemens Corp.

4. Schneider Square D

2.02 PANELBOARDS:

A. Factory assembled deadfront type panelboards.

B. Furnish panelboards complete with branch circuit breakers and a main circuit breaker or main lugs only as indicated.

C. Furnish panelboards with full capacity separate ground bus, separate insulated neutral bus and furnish panelboards connected to a 3 phase, 4 wire service or single phase, 3-wire service as indicated.

D. Provide panelboards with the voltage, frequency and current ratings as indicated conforming to NEMA Standard PB1, Federal Specification W-P-115A. U.L. 67, and the NEC.

E. Furnish the panelboard main and neutral buses, with minimum 98 percent conductivity rectangular copper bars provided with bolted type lugs as necessary.

F. Drill buses to fit either "A", "B" or "C" Phase connectors, and ensure that connectors are inter-changeable and installed in a distributed phase sequence.

G. Prevent terminal lugs from turning per NEMA standard PB 1 and ensure they are suitable for the conductor material and size.

H. Provide main bus-bracing for each panel board adequate for 10,000 amperes symmetrical short circuit at 240 volts and 42,000 amperes symmetrical short circuit at 480 volts unless otherwise indicated.

I. Where the word “space” occurs on panel schedules, provide all necessary hardware in the space, including connection straps, mounting brackets, and filler plates so that only the addition of a future circuit breaker is required. Connection straps shall be rated a minimum of 100A in panelboards of 400A rating or less and a minimum of 225A in panelboards above 400A rating, unless otherwise noted on panel schedules.

J. Tinned buses, connectors and terminals to a minimum thickness of 0.005-in., conforming to the requirements of Federal Spec. QQ-S-365B.

K. Provide integral surge protection device (SPD) in accordance with Section 26 43 13 where indicated on the Drawings.

2.03 CIRCUIT BREAKERS:

A. Each circuit breaker shall be bolted into position in the panelboard, whether by direct bolted connection to the bus or by being bolted to the panelboard frame. Each circuit breaker shall be replaceable without disturbing adjacent units. Plug-on circuit breakers held in place only by spring force of the bus lug and the pressure of the deadfront are not acceptable.

B. Furnish frame sizes, trip settings and number of poles as indicated. Clearly and visibly mark circuit breakers with ampere trip rating. Furnish breakers meeting the requirements of F.S. W-C-375B and NEMA AB1.

C. Furnish all breakers with quick-make, quick-break, toggle mechanisms and thermal-magnetic, inverse time-limit overload and instantaneous short circuit protection on all poles, unless otherwise indicated. Automatic tripping indicated by the breaker handle assuming a clearly distinctive position from the manual ON and OFF position. Furnish breaker handle that is trip-free on overloads.

D. Do not use single pole breakers with handle ties or bails in lieu of multi-pole breakers.

E. For each panelboard, furnish quantity four handle lock devices for individual breakers to prevent the manual opening of the selected breakers. Turn devices over to Owner at completion of the project work.

F. Ensure that voltage and interrupting rating of all breakers in a panelboard is not less than voltage and short circuit rating of the panelboard main buses, as indicated. Furnish breakers suitable to operate satisfactorily at the frequency indicated.

G. Furnish ground fault interrupter (GFI) circuit breakers for certain circuits as indicated on the drawings.

H. Furnish equipment level ground fault protective (GFP) circuit breakers for heat tracing circuits as indicated on the drawings.

I. Furnish manufacturer's locking provisions for circuit breakers as indicated on the drawings.

J. Furnish single pole breakers with full module size. Do not install two pole breakers in a single module.

K. Furnish time-current characteristic curves and catalog information and data for each size of breaker furnished.

2.04 CABINETS:

A. Provide cabinets with NEMA enclosure type as indicated and without knockouts. Drill cabinets only for the exact conduit entrances and mounting bolts.

B. Finish cabinet fronts, trims and surface-mounted boxes in ANSI No. 61 or 49, light-gray enamel over a rust-inhibitive primer. Attach the fronts (exterior trims) to the boxes or interior trims, by quarter-turn, indicating trim clamps. Design cabinets for surface or flush mounting as indicated.

C. Unless otherwise specified, construct panelboard cabinets of code-gauge galvanized, sheet steel and equip with gutters of ample size for the risers and outgoing circuits. Ensure that the cabinets do not exceed 78 inch in height.

D. Trims for branch circuit panelboards shall be supplied with a hinged door over all circuit breaker handles. Doors in panelboard trims shall not uncover any live parts. Doors shall have a semi flush cylinder lock and catch assembly. Door-in-door trim shall be provided. Both hinged trim and trim door shall utilize three point latching. No tools shall be required to install or remove trim. Trim shall be equipped with a door-actuated trim locking tab. Equip locking tab with provision for a screw such that removal of trim requires a tool, at the Owner's option. Installation shall be tamper resistant with no exposed hardware on the panelboard trim.

E. Provide enclosure with the following side gutter dimensions:

1. Left side minimum 4-1/2 inch measured from inside lip of the box to the installed deadfront.

2. Right side; minimum 4-1/2 inch measured from inside lip of the box to the installed deadfront. With the door-in-door cover in place; minimum 3-1/4 inch from installed outer door hinge to the installed deadfront.

2.05 FACTORY TESTING:

A. Standard factory tests shall be performed on the equipment provided under this section. All tests shall be in accordance with the latest version of NEMA and UL standards.

PART 3 - EXECUTION

3.01 INSTALLATION:

A. Mount panelboards, plumb and rigid without distortion of the box. Mount such that the height of the top operating handle does not exceed 6 feet 7 inches from the floor.

B. Hang each door of the cabinet on semi- or fully-concealed hinges with a combination catch and lock.

C. On cabinets 48 inch high and over, install a 3 point catch assembly latching at top, bottom and approximate middle.

D. Verify all panelboard locks are keyed alike.

E. Provide typed directory card filled-out to clearly indicate the load served.

F. Door hinge to be on the side opposite escape route if applicable.

3.02 CONTRACT CLOSEOUT:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

Page Intentionally Left Blank

SECTION 26 24 19

MOTOR CONTROL CENTERS

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide motor control center, totally enclosed, free-standing, cabinet-type structure with motor starters, circuit breakers and/or fused switches and other equipment, as indicated and specified. Motor control center to operate at 480 volt, 3 phase, 3 wire, 60 Hertz.

B. Complete motor control center to be designed, assembled, wired, and tested at the point of manufacture in accordance with the latest NEMA, UL, and ANSI standards.

C. Use manufacturer's standard when data is not specified.

D. Provide Surge Protective Devices (SPD) as indicated, and as specified in Section 26 43 13.

E. Provide MCCs with Short Circuit Current Rating as shown in Single Line Diagrams, or as shown in schedules, whichever is more conservative. Provide with labels incorporating the results of the arc flash studies provided under Section 26 05 70.

F. Provide MCC line ups with means for Arc Flash energy reduction, complying with 2020 NEC Article 240.87. Provide means other than the following 240.87 options:

1. "Energy-reducing maintenance switching with local indictator", 240.97(B)(3)

2. "An Intantanous trip setting on the main breakers." , 240.97(B)(5)

3. "An instantaneous override", 240.97(B)(6)

2. 845: Standards for Motor Control Centers

3. 1008: Standard for Automatic Transfer Switches

4. 1066: Low Voltage AC and DC Power Circuit Breakers Used in Enclosures

1.03 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00:

B. Submit shop drawings and manufacturers' product data in accordance with the requirements of Section 26 05 10.

C. Complete list of equipment and materials, including manufacturer's descriptive and technical literature, catalog cuts, installation instructions.

D. Complete wiring and schematic diagrams for the equipment furnished. Each wiring diagram shall be legible and not reduced from the original design drafted format. Provide a list of equipment on each wiring diagram for which it is applicable.

E. Equipment layout.

F. Time versus current curves for protective devices.

G. Data sheets for all devices provided as part of the assembly.

H. All other details required to demonstrate that system has been coordinated and will properly function as a unit.

I. Spare Parts Data: Provide a list of recommended spare parts for the material and equipment to be provided, including current unit prices and source of supply (indicate which supplies are furnished at no extra cost with purchase of equipment) and in accordance with Section 01 78 23.

J. Operating and Maintenance Instruction Manuals:

1. Furnish:

a. Operating instruction manuals outlining step-by-step procedures required for system startup and operation and in accordance with Section 01 78 23.

b. Manufacturer's name, model number, service manual parts list.

c. Brief description of equipment and basic operating features.

d. Maintenance instruction manuals outlining maintenance procedures, for all devices, including compartment installation, circuit breakers, motor starters and fuses.

e. Troubleshooting guide listing possible breakdown and repairs.

f. Record drawing wiring diagrams for the system.

K. Performance Test Reports: Upon completion of installed system, submit in booklet form all field tests performed to prove compliance with specified performance criteria including final position of controls.

L. Load-Current and Overload-Relay Heater List: Compile after motors have been installed and arrange to demonstrate that selection of heaters suits actual motor nameplate full-load currents.

1.04 SEISMIC DESIGN REQUIREMENTS:

A. Conform to the requirements indicated on the structural drawings and as specified in Section 01 41 20.

B. Conform to the requirements specified in Section 01 41 20.

C. It shall be the responsibility of manufacturer and supplier along with the Electrical Contractor to conform to the seismic design requirements for this project and for the work of this specification section.

1.05 SPARE PARTS:

A. Furnish following spare parts for each motor control center:

1. Twelve lamps for indicating lights.

2. One coil for each size of starter furnished for each motor control center.

3. One complete set of fuses for each size furnished.

4. One set of contacts for each size of starter furnished.

5. One control transformer for each volt-ampere capacity unit furnished.

6. One remote I/O module for every 20 starters.

B. Package items in suitable containers bearing labels clearly indicating contents and equipment with which used.

1.06 QUALITY ASSURANCE:

A. Provide in accordance with Section 01 45 00 and as specified.

B. Ensure that conduit size and wire quantity, size, and type are suitable for the equipment supplied. Review the proper installation of each type of device with the equipment supplier prior to installation.

C. Provide services of factory-trained Service Technician, specifically trained on type of equipment specified:

1. Service Technician must be present on site for all items listed below. Person-day requirements listed are exclusive of travel time, and do not relieve Contractor of the obligation to place equipment in operation as specified.

2. Assist in location of devices, methods of mounting, field erection, etc.:

a. 10 person-days

3. Functional Completion Testing:

a. 10 person-days

4. Startup:

a. 15 person-days

5. Commissioning:

a. 10 person-days

6. Service-inspections during first year of operation, for use at Owner's request, and exclusive of repair, malfunction or other trouble-shooting service calls:

a. 10 person-days

7. Person-day is defined as one 8-hour day, excluding travel time.

8. Credit to the Owner, all unused service person-days specified above, at the manufacturer's published field service rate.

9. Any additional time required of the factory trained service technician to assist in placing the equipment in operation, or testing or to correct deficiencies in installation, equipment or material shall be provided at no additional cost to the Owner.

1.07 DELIVERY STORAGE AND HANDLING:

A. Provide in accordance with APWA Section 01 66 00 and as specified.

B. Shipping:

1. Ship equipment, and materials, except where partial disassembly is required by transportation regulations or for protection, complete with identification and quantity of items.

2. Pack spare parts in containers bearing labels clearly designating contents and pieces of equipment for which intended.

3. MCCs shall be separated into shipping blocks no more than three vertical sections each. Each shipping block shall include a removable lifting angle, to allow attachment by suitable lifting equipment.

4. Deliver spare parts at same time as pertaining equipment. Delivery to Owner after completion of work.

5. Channel bases:

a. For front and rear, minimum of 1-1/2 inch by 3 inch standard channel with suitable holes for mounting motor control center, and holes for grouting and flow of concrete.

b. Shipped in advance with accurate template of motor control center mounting holes or dimension layout drawing for embedding in concrete pad, floor slab, or securing to floor.

6. Attach lifting angles to main frame of structure to distribute weight equally. Deflection or distortion is cause for rejection.

7. If the equipment cannot be placed into service after its receipt, store in a closed building or structure, in a clean, dry and ventilated area free from temperature, dirt and moisture extremes. Acceptable storage temperatures are from 32 degrees F to 104 degrees F with temporary heaters provided within enclosures to prevent condensation. Provide heavy plastic envelope directly over motor control center to protect against dust, dirt, and moisture. Provide lifting angles outside of envelope.

C. Storage:

1. Inspection and inventory items upon delivery to site.

2. Store and safeguard equipment, material and spare parts.

1.08 WARRANTY AND SERVICE:

A. Provide in accordance with Section 01 78 36 and as specified.

B. Guarantee components, parts, and assemblies supplied by manufacturer against defects in materials and workmanship for a period of 12 months after acceptance or beneficial occupancy, whichever happens first.

C. Ensure that equipment manufacturer has local branch office staff with trained, full-time employees who are capable of performing testing, inspecting, repair, and maintenance services.

PART 2 - PRODUCTS

2.01 MANUFACTURERS:

A. The equipment manufacturer shall be ISO 9001 or 9002 certified.

B. Manufacturer’s acceptable contingent upon products' compliance with the specifications.

1. Eaton/Cutler-Hammer Inc.

2. General Electric Company

3. Siemens Energy & Automation, Inc.

4. Square D Company

2.02 COMPONENTS:

A. Motor control center construction: Comply with UL 845

B. Starters: Comply with the requirements of NEMA ICS 2

C. Instruments: Comply with ANSI C39.1

D. Enclosures:

1. Enclosures for motor control centers: NEMA Type 1 gasketed, unless otherwise indicated on the Contract Drawings.

2. Motor control centers: NEMA Class II-S, Type B wiring.

3. Outline dimensions of motor control centers and arrange equipment and devices as indicated.

4. The minimum depth of a motor control center is 20 inch. Arrange motor control centers for back-to-back mounting of the starter units where indicated.

5. Each MCC shall consist of one or more vertical sections of heavy gage steel bolted together to form a rigid, free-standing assembly. A removable 7 gage structural steel lifting angle shall be mounted full width of the MCC shipping block at the top. Removable 7 gage bottom channel sills shall be mounted underneath front and rear of the vertical sections extending the full width of the shipping block. Vertical sections made of welded side-frame assembly formed from a minimum of 12 gage steel. Internal reinforcement structural parts shall be of 12 and 14 gage steel to provide a strong, rigid assembly. The entire assembly shall be constructed and packaged to withstand normal stresses included in transit and during installation.

E. Buses:

1. Locate main horizontal bus at top with ampere rating as indicated. Isolate bus from both front and back compartments.

2. Neutral bus if required: Rated at full capacity.

3. Main and vertical buses: 98 percent conductivity tinned copper bars of suitable size carried on supports fabricated from an acceptable insulating material.

4. Short circuit bus bracing: As indicated.

5. Vertical buses: A minimum rating of 300 amperes for front only units, a minimum rating of 600 ampere for back-to-back units. Insulate or isolate vertical buses.

6. Provide continuous 2 inch by 1/4 inch tinned copper ground bus along length of the motor control center.

7. Contact surfaces of bar-to-bar connections and lug-to-bar connections: Silver plated.

8. Phase rotation of vertical buses: Make same when viewed from front or from either side of motor control center.

9. Bolts and other hardware: Galvanized or stainless steel or equal.

10. Provide horizontal wireways at top and bottom of each vertical section. Provide vertical wireways with wire supports for each vertical section. Interconnect all wireways.

11. Provide standard corrosion resistant fasteners for unit doors hardware which operate without special tools.

F. Barriers:

1. All power bussing and splice connections shall be isolated from the unit compartments and the wireways. The horizontal bus shall be mounted onto a glass filled polyester support assembly that braces the bus against the forces generated during a short circuit. The horizontal bus shall be isolated from the top horizontal wireway by a two-piece rigid non-conductive barrier. The barrier design shall allow qualified personnel to slide the barriers both left and right, to allow access to the bus and connections for maintenance without having to remove the barrier. Barrier sliding shall occur via an upper and lower track system.

2. The vertical bus shall be housed in a molded glass-filled polyester support that provides bus insulation and braces the bus against the forces generated during a short circuit. These supports shall have openings every 3 inch for unit stab-on connections. Each opening shall be provided with an automatic shutter to close off the stab opening. These shutters shall be attached to the structure so that when they are removed (to allow a stab connection) they are retained in the structure and are readily accessible for use should a plug-in unit be removed from the MCC.

3. Barriers shall be provided in the vertical structure and unit designs to prevent the contact of any energized bus or terminal by a pull wire routed through the conduit or wireway areas.

G. Motor Control Center Units:

1. Motor control center units: Drawout type. Units larger than NEMA Size 4 having bolt-in construction. Provide fully interchangeable removable units of same size and type.

2. Interlock disconnect devices with associated doors, to prevent closing the disconnect device with the door open unless a tool is used or a defeater device is operated.

3. Furnish disconnect devices capable of being locked in either the open or closed position.

4. Arrange each unit so that when its starter has been removed, its door may be closed to cover the opening.

5. With following features:

a. Viewing window through door of each compartment for visible disconnect inspection to verify that stabs are disconnected from bus.

b. Provide Infrared (IR) inspection window in the main circuit breaker doors, the tie circuit breaker door, and as recommended by the MCC manufacturer for maintenance personnel to periodically inspect the gear without opening doors and accesses. However, one side of the MCC may be shut down at a time for the inspection process.

H. Motor Control Center Starter Units:

1. Unless otherwise indicated, use minimum NEMA Size 1 combination starter, consisting of a circuit breaker, or motor circuit protector and magnetic starter, as indicated. Momentary and interrupting ratings of circuit breakers, motor circuit protectors, and fused disconnect switches coordinated with main bus bracing. Type of starters, i.e., full voltage, reduced voltage, reversing, non-reversing, two-speed, etc., are as indicated. Furnish magnetic starters with thermal overload protection on each phase with external manual reset.

2. Solid-State Overload Relay:

a. Provide a solid-state overload relay for protection of the motors. The relay shall be Cutler-Hammer type CEP7 from equipment manufacturer.

b. The overload relay shall provide high accuracy through the use of state-of-the-art microelectronic packaging technology. The relay shall be suitable for application with NEMA Size 1 through Size 7 motor starters.

c. The overload relay shall be modular in design, be an integral part of a family of relays to provide a choice of levels of protection, be designed to directly replace existing electromechanical overload relays, and be listed under UL Standard 508.

d. The overload relay shall have the following features:

(1) Self-powered.

(2) Class 10 or 20 fixed tripping characteristics.

(3) Manual or automatic reset 4.

(4) Phase loss protection. The relay shall trip in 2 seconds or less under phase loss condition when applied to a fully loaded motor.

(5) Visible trip indication.

(6) One normally open and one normally closed isolated auxiliary contact.

(7) Test button that operates the normally closed contact.

(8) Test trip function that trips both the normally and normally closed contacts.

(9) A current adjustment range of 3.2:1 or greater.

(10) Ambient temperature compensated.

(11) Ground fault protection. Relay shall trip at 50 percent of full load ampere setting.

(12) Jam/Stall protection. Relay shall trip at 400 percent of full load ampere setting, after inrush.

2. Verify type (single- or 2-winding) of two-speed motor being installed. Furnish type of motor starter necessary for control of motor. Furnish decelerating, time-delay relay for each two-speed starter.

3. Remote Input/Output (I/O) Modules (compatible with system specified in Section 40 67 00):

   a. Motor Control Center assemblies shall be provided with a factory assembled Remote I/O modules which are configured to provide remote control and indications from the Facility Control System (by others). Remote I/O modules shall be capable of communication with the Facility Control System using Ethernet/IP protocol.

   b. Provide Motor Control Centers with pre-wired distributed I/O wiring which originates at Remote I/O modules located within the MCC. Provide 24 VDC power supply with sufficient capacity to supply the I/O modules, communication card and relays. The power supply shall be installed in an MCC unit with a disconnect switch and overcurrent protection.

   c. Remote I/O shall be configured to provide the control and status functions depicted on the project Motor Control Diagrams and as described herein.

   d. Barriers shall be provided to separate the distributed Remote I/O wiring from power wiring.

   e. The Remote I/O cabling system shall be designed to allow separation of the MCC sections into shipping splits.

4. Provide reduced voltage solid-state type starters with thyristor (SCR) bridge consisting of at least two SCRs per phase to control the starting and stopping of industry standard motors.

   a. The soft start shall provide torque control for linear acceleration without external feedback independent of motor load or type of application.

b. The gating of the thyristors will be controlled in such a manner to ensure smooth and stable acceleration ramp.

c. The soft start shall be controlled by a microprocessor that continuously monitors the current and controls the phasing of the SCRs. Analog control algorithms shall not be allowed.

d. All soft start power ratings will utilize the same control board/module.

e. A shorting contactor shall be supplied with the soft start controller units. Protective features and deceleration control options integral to the soft start shall be available even when the shorting contactor is employed.

f. The soft start controller unit shall be designed to operate from an input voltage between minus 10 percent and plus 10 percent of nominal voltage rating.

g. The soft start controller unit shall operate from an input voltage frequency range of plus or minus 5 percent. By configuration, it shall be capable of operation at a supply line frequency that can vary by plus or minus 20 percent during steady state operation.

h. The soft start shall be capable of supplying 400 percent of rated full load current for 23 seconds at maximum ambient temperature.

i. All soft start controller unit power and control devices shall be rated heavy duty and capable of 5 evenly spaced starts per hour at 400 percent of full rated current for 25 seconds per start without tripping.

5. Furnish starter operating coils suitable for operation on 120 volt, single-phase, 60 Hertz.

6. Furnish each starter with at least one normally open and one normally closed auxiliary contact. Furnish additional normally open and/or normally closed auxiliary contacts for indicating lights, interlocking and other requirements as indicated.

7. Motor horsepower indicated on Contract Drawings may not be same as furnished, if larger motors are furnished, circuit breakers, fused switches, starters, wire and conduits of larger capacity may be necessary and, if so, furnish them at no additional cost.

8. Furnish within each starter compartment a control transformer with primary fuses and secondary fuse. Secondary voltage 120 VAC, unless otherwise indicated. Determine load of each motor control circuit including equipment and devices provided under the other specification sections and furnish control circuit transformer 2-winding, dry-type of suitable volt-ampere rating, but not less than

75 volt-amperes. Control circuit loads may consist of but not be limited to solenoid operators, motorized valves, motorized dampers, relays, motor heaters, etc.

I. Variable frequency drives (VFDs) shall be provided in MCCs where indicated. VFDs shall be in accordance with Section 26 29 23, and include 5 percent input reactors, and dV/dt output filters for cable leads to motors in excess of 100 feet of cable length. VFDs shall include network interface to provide interconnection with plant control system through remote I/O network.

J. Circuit Breakers:

1. Main and tie breakers to be low voltage power circuit breaker with auxiliary contact for alarm on open or trip condition. Circuit breakers to be provided in accordance with UL Std. 489. Provide with long time, short time, instantaneous and ground fault solid state adjustable trip units.

2. Unless otherwise indicated, furnish manually operable circuit breakers and provide thermal-magnetic, inverse-time-limit overload, and instantaneous, short-circuit protection. UL listed circuit breakers conforming to NEMA Std. AB-1 and UL Std. 489.

3. Breakers: Molded case type, rated 480 volts, 2 or 3 pole and having 100 ampere or larger frames. Minimum interrupting rating equal to bus bracing required. Furnish current limiting type, where indicated.

4. Furnish overload protection on all poles with trip settings as indicated. Breakers of 225 ampere frames and larger with interchangeable trip units and adjustable magnetic trip elements.

5. Where indicated, furnish circuit breakers with shunt trip.

6. Furnish time-current characteristic curves and other necessary information and data for each size of breaker furnished.

7. Should supplied HVAC equipment require a maximum overcurrent device less than 15 amps, provide fused disconnect-type MCC bucket instead, with fuses sized for the load.

K. Motor Circuit Protectors:

1. Motor circuit protectors being completely enclosed molded case devices with current sensing coil in each of 3 poles having adjustable magnetic trip setting by means of single knob on front. Motor circuit protector manually operable. Protector designed to meet NEC requirement concerning motor full load and locked-rotor current. Minimum interrupting rating equal to bus bracing required.

2. Where indicated, current limiters, completely enclosed in molded case, bolted to load end of motor circuit protector to provide at least 100,000 amperes symmetrical interrupting rating at 600 volts. Limiters coordinated with protector so at low level short circuit, protector interrupts circuit without limiter operation. Faults interrupted by limiter also trip the protector and open all 3 poles. Equip each limiter with an indicator to show that the limiter has interrupted a fault.

L. Contactors:

1. Contactors for electric heating and other non-motor loads: Similar to motor starters except without overload relays or heaters. NEMA size as indicated, except 30 amperes minimum rating, tungsten lamploads.

2. Contactors for lighting loads: Mechanically held. Ampere ratings as indicated, except 30 amperes minimum rating tungsten lamploads.

M. Control Devices:

1. Control relays: Heavy-duty, industrial or machine tool type with at least two normally open and two normally closed contacts. Coils 120 volts, 60 Hertz.

2. Contacts: Rated 10 amperes, 250 volt alternating current.

3. Time-delay relays: Adjustable, pneumatic type, range 2 to 60 seconds and operated on 120 volts, 60 Hertz, with at least one normally open and one normally closed timed contact.

4. Pushbuttons and instrument selector switches: Heavy-duty, oil tight units, 30 mm, rated 10 amperes continuous current at 120 volts.

5. Indicating lights: LED type, heavy-duty, oil-tight, 30 mm units with push-to-test features.

6. Control and selector switches: Rotary type with enclosed contacts. Equip each switch with rectangular escutcheon and pistol-grip handle, except handles for instrument phase selector switches equipped with round knurled or slotted handles. Switch contacts rated 10 amperes continuous, 600 volts.

N. Nameplates: Furnish each motor control center and each unit of motor control center with engraved nameplate. Nameplates of laminated sheet plastic, 1/16 inch thick, engraved to provide white letters on black background. Fasten nameplates in place with corrosion-resistant screws.

O. Instruments:

1. Instruments: Panel type, approximately 3-1/2 inch or 4-1/2 inch square as indicated, semi-flush mounted. Accurate within 1 percent of full scale. Select

scales so full load readings occur at approximately 70 percent of full scale. UL listed instruments conforming to ANSI C39.1.

2. Furnish suitable instrument transformers. Conforming to ANSI C57.13.

   a. Current transformers of window type and insulated for 600 volts.

   b. Furnish potential transformers with current limiting primary fuses.

3. Running time meters: Mechanical style, panel-mounted, round, UL Certified, non-reset type, 3-1/2 inch with register to indicate hours and tenths of hours up to 99,999.9 hours. Meters to operate on 120 volts, 60 Hertz. Provide with 3-hole bezel mount.

4. Furnish current and potential test blocks with plugs where indicated. Clearly identify current, voltage and phase for blocks and plugs.

2.03 WIRING:

A. Conductors: Copper; size as required by load, except that no control wire is smaller than 14 AWG. Use insulation that is flame retardant, and moisture and heat resistant.

B. Cables and conductors: Bundled and tie wrapped securely in wireways furnished.

C. Identify internal wiring at terminations by T&B wire markers or equivalent.

D. All spare starter auxiliary contacts to be wired to terminal blocks.

E. Terminal Blocks:

1. Rated 600 volt for power with current rating as required by loads.

2.04 FINISH:

A. Finish motor control centers with ANSI No. 61, light-gray enamel over rust-resistant undercoat.

B. Furnish instruments and control devices with standard black finish.

C. Use, mixing, application, and curing of paint on items requiring painting in accordance with paint manufacturer's written recommendations.

2.05 FACTORY TESTS:
