A. The entire MCC shall go through a quality inspection before shipment, verifying the equipment to the factory shop drawings. This inspection will include:

1. Physical inspection and verification of:

a. Structure including verification of all bolted connections

b. Electrical conductors, including:

(1) Bussing including verification of all bolted connections

(2) Wiring

(3) Unit compartments

2. Electrical Tests:

a. Electrical tests include:

(1) Power circuit phasing

(2) Control circuit wiring and verification of satisfactory operation of all relays and other devices

(3) Instrument transformers

(4) Meters

(5) Ground fault system

(6) Device electrical operation

b. AC dielectric tests shall be performed on the power circuit.

3. Markings/Labels, include:

a. Instructional and warning type labels

b. Underwriters Laboratory (UL)

c. Inspector's stamps

4. The manufacturer shall use integral quality control checks throughout the manufacturing process to ensure that the MCC meets operating specifications.

B. Equipment that is shipped without evidence of the required tests being performed to verify satisfactory operation will be subject to non-acceptance.

C. If the MCC cannot be placed into service reasonably soon after its receipt, store it in a clean, dry and ventilated building free from temperature extremes. Acceptable storage temperature is from 32 degrees F to 104 degrees F.

PART 3 - EXECUTION

3.01 INSTALLATION:

A. Install steel channel sills that have suitable drilled holes for mounting, aligning, and bolting each motor control center in place. Method of mounting, as indicated. Size and arrangement of sills, as recommended by motor control center manufacturer and acceptable to Engineer. Paint completed sills with two coats of aluminum paint or other acceptable corrosion-resistant finish before being set in place. Properly set and level channel sills.

B. If motor control center equipment pads are located on concrete floor slabs, furnish painted steel channel mounting sills and anchor bolts, in time for placing concrete for construction of concrete equipment pads.

C. Install items in accordance with manufacturers' printed instructions.

D. Verify all loads on the motor control center including equipment and devices provided under the other electrical and non-electrical specification sections. Provide information to motor control center manufacturer for sizing of buses, control transformers, and protective devices. Verify that cables and conduits for loads are sized for the actual equipment provide in accordance with the NEC.

E. Set motor circuit protectors and circuit breakers based on load installed.

F. Check and provide a thermal overload on each phase of a starter unit. Match overloads to motor being installed.

G. Deliver spare parts to Owner.

H. Provide conduit, wiring, and grounding interconnections.

I. Perform continuity and operational tests on circuits to demonstrate that motor control center is operationally safe and functionally correct.

J. Provide one set of manufacturer wiring diagrams marked with all changes made in the field.

3.02 TESTING:

A. Adjust and verify all settings and inputs to meters and relays.

3.03 CONTRACT CLOSEOUT:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

Page Intentionally Left Blank

SECTION 26 27 17

CONTROL PANELS

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide materials and installation of custom control panels as indicated and in compliance with Contract Documents.

1.02 REFERENCES:

A. Underwriters' Laboratories, Inc., (UL):

1. 486A: UL Standard for Safety Wire Connectors and Soldering Lugs for Use with Copper Conductors

2. 508: Electrical Industrial Control Equipment

3. 508A: Industrial Control Panels

4. 1059: Safety Terminal Blocks

1.03 SUBMITTALS:

A. Submit shop drawings and manufacturers' product data in accordance with the requirements of Section 26 05 10.

B. Submit a complete list of equipment, materials, and any details required to demonstrate that the equipment will function properly as a unit. This material shall include:

1. System configuration with single-line diagrams.

2. Detailed descriptions of equipment including weights, dimensions, installation requirements, and heat dissipations.

3. Internal panel layouts indicating spacing and dimensions.

4. Panel front layouts.

5. Catalog cuts of devices used.

6. Control schematics, ladder diagrams, and interconnection drawings.

7. Nameplates.

8. Program and programming data for the PLC and OIT including logic diagrams and screen shots of OIT graphics. Include complete data table of all PLC variables for communication with the plant main control system to facilitate comprehensive remote monitoring, control and alarming of the screw press systems.

1.04 MANUFACTURER'S SERVICES:

A. Provide services of factory-trained Service Technician, specifically trained on type of equipment specified:

1. Service Technician must be present on site for all items listed below. Person-day requirements listed are exclusive of travel time, and do not relieve Contractor of the obligation to place equipment in operation as specified.

2. Installation: Check installation and calibrate the equipment:

a. 4 person-days

3. Functional Testing: Calibrate, check alignment and perform a functional test with water. Tests to include all items specified.

a. 2 person-days

4. Performance Testing: Field performance test equipment specified.

a. 2 person-days

5. Vendor Training: Provide classroom and field operation and maintenance instruction including all materials, slides, videos, handouts and preparation to lead and teach classroom sessions.

a. 2 person-days

6. Credit to the Owner, all unused service person-days specified above, at the manufacturer’s published field service rate.

7. Any additional time required of the factory trained service technician to assist in placing the equipment in operation, or testing or to correct deficiencies in installation, equipment or material shall be provided at no additional cost to the Owner.

PART 2 - PRODUCTS

2.01 DIAGRAMS:

A. Schematic diagrams shall show the equipment serial or tag number, the Owner's drawing number, contract number, or similar identification which will indicate the particular

equipment to which the diagrams apply. Diagrams shall show all equipment in the electrical system including internal wiring of subassemblies. Diagrams of subassemblies may be furnished on separate sheets.

B. Identify each device by a unique number or number-letter combination.

C. Conductor Identification: Identify each conductor by a unique number, letter, or number-letter combination. Consecutive numbering is preferred. Conductors connected to the same terminal or tie point shall have the same identification. Where multiconductor cable is used, a color code may be used to supplement the above identification. Where color-coded multiconductor cable is used for wiring identical components, such as limit switches, the color code used shall be consistent and charted on related diagrams.

D. Provide a schematic diagram for each electrical system. The schematic diagram shall be drawn between vertical lines that represent the source of control power. Show control devices between these lines. Show actuating coils of control devices on the right-hand side. Show contacts between the coils and the left vertical line.

1. Where the internal wiring diagrams of subassemblies are furnished on separate sheets, they shall be shown as a rectangle in the schematic diagram with external points identified and cross-referenced to the separate sheets of the control circuit. Show coils and contacts internal to the subassemblies in the rectangle connected to their terminal points.

    a. Exception No. 1: Where relay and electronic circuits are mixed, diagrams may be drawn between horizontal lines that represent the source of control power.

    b. Exception No. 2: Overload relay contacts may be connected to the right of the coil (common) if the conductors between such contacts and the coils of the magnetic devices do not extend beyond the control enclosure.

2. For clarity, show control device symbols in the order in which the controls are positioned on the diagram.

3. Use a cross-referencing system in conjunction with each relay coil so that associated contacts may be readily located on the diagram. Where a relay contact appears on a sheet separate from the one on which the coil is shown, describe the purpose of the contact on the same sheet.

4. Show spare contacts.

5. Show limit, pressure, float, flow, temperature sensitive, and similar switch symbols on the schematic diagram with utilities turned off (electric power, air, gas, oil, water, lubrication, etc.) and with the equipment at its normal starting position.

6. Show contacts of multiple contact devices, e.g., selector switches, on the line of the schematic diagram where they are connected in a circuit. Indicate a mechanical connection between the multiple contacts by a dotted line or arrow. This does not apply to control relays, starters, or contactors.

7. Additional charts or diagrams may be used to indicate the position of multiple contact devices such as drum, cam, and selector switches.

8. Show the purpose or function of switches adjacent to the symbols.

9. Show the purpose or function of controls such as relays, starters, contactors, solenoids, subassemblies, and timers on the diagram adjacent to their respective symbols. Show the number of positions of solenoid valves adjacent to the valve solenoid symbol.

10. Show values of capacitors and resistors on the diagram.

11. Descriptive terms for command and status functions shall be in the present or past tense. For example, Raise Transfer-Transfer Raised; Advance Transfer-Transfer Advanced. Do not use terms such as "Transfer Up."

E. The panel front and internal layouts shall show the general physical arrangement of components on the control panel. Identify devices with the same marking as used on the schematic diagram. Spare panel space shall be dimensioned. The drawings shall include a layout of the operator's console or push-button station, but terminal numbers need not be shown.

2.02 CONTROL ENCLOSURES:

A. Design and test control enclosures in conformance with UL 508. Enclosure types shall be as follows unless noted otherwise in the drawings:

Indoor Use	NEMA Type 12
Outdoor Use	NEMA Type 4
Indoor or Outdoor Use, areas open to process flow, corrosive Area	NEMA Type 4X
Electrically Hazardous Areas	NEMA TYPE 7

B. The depth of the control enclosure or compartment shall be a minimum consistent with the maximum depth of the control devices plus the required electrical clearance. In no case shall the depth of the enclosure be less than 8 inches.

C. Provide mounting panel for mounting of interior components. Panel finish shall be white enamel.

D. Where heating from control devices results in a temperature rise which is detrimental to the contained equipment or its operation, provide louvers or forced air ventilation. Design ventilating openings to prevent the entrance of any deleterious substance. When forced air ventilation is required, the cabinets shall be pressurized. Air filters shall be of commercially available types and sizes.

E. Provide a permanent metal data pocket attached to the inside of the enclosure. If space permits, the pocket shall be at least 10 1/2 inches wide and of depth and thickness to accommodate electrical diagrams.

F. Enclosure construction shall be minimum 14 gage steel. Finish shall be white enamel inside and gray prime outside over phosphatized surface. Provide continuous hinges for enclosure doors with external screw clamps. Provide hasp and staples for padlocking.

2.03 CONTROL WIRING:

A. 120-volt control wiring shall be Type MTW, THWN, or THHN. Conductors shall not be smaller than No. 14 AWG. Ampacity shall be in accordance with the NEC.

B. Instrumentation signal cables shall be of the type used for field wiring.

2.04 MARKING:

A. Identify wire terminations with a number to correspond with the schematic diagrams. Identification tags shall be preprinted white heat-shrinkable tubing, Raychem Thermofit TMS.

B. Plainly and permanently identify control and power devices using the same identification as shown on the schematic diagrams. Show identification for devices inside the enclosure on a plate adjacent to, not on, the device.

1. Exception No. 1: Where the size or location of the devices make individual identification impractical, such as on electronic assemblies, use group identification.

2. Exception No. 2: Where panel layouts do not permit mounting identification plates adjacent to components, such as relays, place the permanent relay identification on the relay where it is plainly visible, and provide a second identification on the top of the panel wireway cover directly below the relay. Identify the wireway covers to show their proper location.

C. Identification plates for devices mounted inside and outside the control enclosure shall be one of the following:

1. Laminated phenolic for engraving stock; a minimum of 0.062 inch thick. Hold plates in place with metallic drive screws or the equivalent. Use permanent adhesives for attaching nameplates to wireway covers.

2. Noncorrodible metal; a minimum of 0.031 inch thick for engraving stock or 0.012 inch thick for embossing stock. Hold plates in place with metallic drive screws.

2.05 SUPPLY CIRCUIT DISCONNECTING MEANS:

A. Provide a supply circuit disconnects for each control panel. Disconnects shall be a circuit breaker mounted within the control enclosure operated by a variable depth flange-mounted circuit breaker operating mechanism. Provide separate disconnects for sides of hot-swap PLC cabinets, and their associated power systems.

B. This PLC supplies instrumentation located outside of the building. Provide:

1. Surge protective devices on:

a. The input side of each power supply.

b. The output side of each power supply.

c. The load side of each pair of Active Redundancy Modules.

2. Provide separate power supplies and sources to each side of the hot-swap PLC.

3. Provide Active Redundancy Modules, to equalize loading between both power systems, to supply field loads. Divide field loads into separately-supplied busses, each with selectively coordinated supplying circuit breakers and surge protection, as follows:

a. Instruments serving pumps 01-P-11110, 01-P-11130, and 01-P-11150, their ancillaries, and associated level measurement.

b. Instruments serving pumps 01-P-11220, 01-P-11240, and future pump 01-P-11260, their ancillaries, and associated level measurement.

c. Instruments common to both sides, such as common discharge valve manifold, gas detectors, and similar.

4. Ensure adequate power supplies for total peak control system load, plus at least 25% spare capacity with spare capacity persisting even if one power supply fails.

5. Diode modules are not an acceptable substitute for Active Redundancy Modules.

6. Provide internal UPS system, for each power supply, as a backup to the supplying power system, and to allow . Minimum run time of 90 minutes at full loading.

7. Provide ventilation or cooling as required to keep all items within cabinet to 90 degrees Fahrenheit or less.

2.06 PLC AND OIT EQUIPMENT:

A. All new PLC equipment shall be based on Schneider M580 family of products, and shall be programmed with Unity Pro software, latest revision.

1. Provide hot-swappable PLC system with duplicate processing. Minimum requirements for each side follow:

a. Separate I/O into different racks as:

(1) First Rack:

(a) I/O Associated with Pumps 01-P-11110, 01-P-11130, and 01-P-11150, including associated interlocks, monitors, etc.

(b) Centralized I/O for balance of SW-1

(2) Second Rack:

(a) I/O Associated with Pumps 01-P-11220, 01-P-11240, and future pump 01-P-11260, including associated interlocks, monitors, etc.

(b) Spare cards ready to replace Centralized I/O for balance of SW-1.

b. CPU: M580 BME P58 1020 or better, upgrade the processor model and memory if necessary based on the specified programming and functionality requirements.

c. Power Supply: BMX CPS3500 or better, upgrade the power supply if necessary for the installed mix of input and output cards.

d. Analog Input Cards: BMX AMI 0810, 4-20 maDC Isolated Differential type. Provide auxiliary signal isolators and/or boosters if required.

e. Analog Output Cards: BMX AMO 0410, 4-20 mADC Isolated Differential type. Provide auxiliary signal isolators and/or boosters if required.

f. Discrete Input Cards: BMX DDI 6402K, Isolated 120 VAC. Provide interposing relays if required.

g. Discrete Output Cards: BMX DDO 6402K, Isolated 120 VAC relay type. Provide interposing relays if required.

h. Rack: Select the PLC rack number of slots to accommodate required modules plus a minimum of two (2) spare slots.

i. All new processors are to be adequately sized to provide sufficient memory and processing capacity to handle the I/O, logic, communications, and data requirements typical of a modern, fully automated facility and for the defined I/O mix.

j. Communication for the PLC network is Ethernet over copper and/or Fibre.

k. Provide at least 20 percent spare I/O of each type to each panel assembly.

2. Provide all necessary racks, power supplies, cables, communication cards, and accessories. Physically separate sides of the hot-swap PLC where possible.

B. Each new PLC panel assembly is to include constant voltage regulating transformers/conditioners suitably sized for the panel load equal to Sola Hevi-Duty MCR series and incoming power transient surge suppression equal to Sola Hevi-Duty STV100K series. Connect the surge suppressor dry contacts to a PLC input at each panel and coordinate with the control system integrator/programmer as required for these contacts to be monitored.

C. Provide all run-time licenses necessary for the operation of the new PLC and HMI installations.

D. OIT Equipment:

1. Provide a Schneider Harmony colour touchscreen OIT unit type HMIGTO5310 flush mounted in the main control panel.

2. The display shall be 10.4-inch 640 x 480 pixel TFT LCD.

3. 24 VDC power supply with internal battery backup.

4. NEMA 4X environmental protection with hazardous area rating if required.

5. Program the HMI unit with Schneider Vijeo Designer V6.1HMI programming software.

6. The HMI shall be programmed to provide for the monitoring and control of all input and output points, loops and systems through graphic display screens. Additionally, the HMI programming shall include:

a. Process parameter displays

b. Alarm management

c. Trending of key process variables

2.07 CONTROL DEVICES:

A. Provide 120 volt control circuit transformer if incoming power supply is not 120 volts. Provide 100 volt-ampere spare capacity that is in addition to the connected loads. Protect, with circuit breaker(s), one side of secondary winding and ground other side. Provide primary winding circuit breakers on both lines.

B. Provide indicator lights, selector switches, push buttons, meters, operator display etc., as required for correct operation. Mount on the front panel of the control enclosure.

C. Push buttons and selector switches shall be suitably rated for the environmental conditions and/or hazardous area rating of the panel location. Provide with quantity of contact blocks required for correct operation. Units shall be UL listed with NEMA A600 rated contacts.

D. Push buttons shall be standard size, round, flush head with momentary contacts.

E. Selector switches shall be round with standard operator.

F. Indicating lights shall be round, transformer type suitably rated for the environmental conditions and/or hazardous area rating of the panel location complete with color of lens indicated in drawings or as required and legend plate. Lamps shall be high-density LEDs**.** Indicating lights shall be push-to-test type.

G. Elapsed time meters shall be synchronous motor driven, 0 to 99,999.9-hour range, non-reset type, suitable for semiflush panel mounting. Provide General Electric Type 240, 2-1/2 inch Big Look unit; Eagle Signal HK series.

H. Variable frequency drives shall comply with Section 26 29 23.

I. Control relays shall be magnetically held and shall have convertible contacts. Control relays shall be UL listed with NEMA B300 rated contacts and coil voltage, number of poles, and pole arrangement as required for correct operation. All relays shall be of the same manufacturer. Relays shall be Allen-Bradley Bulletin 700, Westinghouse Type AR, IDEC RH Series.

J. Time delay relays shall be UL listed with contacts rated 10 ampere noninductive load, 120 volts, with coil voltage, number of poles, pole arrangement, and maximum timing adjustment as required for correct operation. Relays shall be plug-in, solid-state type with manufacturer’s standard timing adjustments.

K. Mechanically held relays shall have coil voltage, number of poles, and pole arrangement and rating as required for correct operation. Provide integral coil clearing contacts.

L. D-C power supplies shall have ratings as required by the powered equipment. Provide power supplies in a dual-redundant configuration with integral overcurrent protection.

2.08 TERMINAL BLOCKS:

A. Provide terminal blocks for incoming and outgoing control wires. Wire and mount terminal blocks so that internal and external wiring do not cross over the terminals. Do not terminate more than two conductors at each terminal connection.

B. Field wiring shall terminate on the "field side" of the terminal blocks. Do not connect internal panel wiring to the "field side" of the terminal blocks. Do not connect field wiring to the "panel side" of the terminal blocks.

C. Terminal blocks shall be modular, rail mounted, rated at 20 amperes, 600 volts capable of terminating wire sizes No. 12 through No. 24 AWG and constructed of polyamide thermoplastic. Terminal blocks shall be UL listed in accordance with UL 486A and UL 1059. Current-carrying parts shall be copper or brass electroplated with tin/lead. Terminal connection shall be a screw clamp pressure plate connection, designed such that the clamping screw does not clamp the screw directly to the wire.

1. Provide larger terminals for system power where required per Instrument Loop Diagrams (ILD) / Specification 40 61 13 / Specification 40 61 13b, or where required for larger size of marshalled power conductors.

2. Provide separate terminals for each project and future pump power sources. Protect each of these terminals separately with circuit breakers, and assure upstream selective coordination.

D. Provide symmetrical steel assembly rails, end brackets, jumper bars, and other accessories as required for a complete terminal block assembly.

E. Consecutively number terminal blocks from top to bottom with preprinted marking tags. Tags shall be white polyamide and hot printed with black symbols so that the print is permanent.

2.09 WIRING METHODS:

A. Panel wiring shall be neatly contained in panel wireways, including incoming and outgoing field control wiring. Panelways shall be white or light gray colored, restricted slot design, with matching snap-on covers. Provide panelways with mounting holes and nylon "push" rivets for mounting. Panelways material shall be PVC or noryl.

B. Provide minimum 2 inches of clearance between panelway and wire terminations to allow for clear viewing of wire identification marking.

C. Tie wiring run to control devices on the front door together at short intervals and secure to the inside front door with adhesive mounts. Mounts shall be adjustable releasable-clamp type for wire bundles 0.69 inch in diameter or smaller or releasable nylon cable ties for bundles larger than 0.69 inch in diameter. Attach mounts to front panel with adhesive.

2.10 FACTORY TESTS:

A. Inspect and test control panel for correct operation and inspect for thermal performance/hotspots. Test each circuit for continuity, short circuits, and fault grounds.

2.11 SPARES:

A. Provide spares, in wall-mounted hinged cabinet, for the following. Label cabinet "PLC SPARES":

1. Circuit breakers, at least 2 of each type.

2. Terminal blocks, at least 2 of each type.

3. Fused Terminal blocks, at least 2 of each type.

4. SPD, at least one of each rail-mounted type.

PART 3 - EXECUTION

3.01 FIELD TESTS:

A. Test control panel with field wiring connected. Set adjustable set points and time delays for proper operation of equipment. Check operation of control panel and field devices to verify correct operation. Perform required adjustments for correct operation.

B. Cooperate with the owners control system integrator to establish reliable Ethernet communications between the screw press PLC control system and the main plant SCADA control system. Test and verify that all of the PLC remote monitoring and control variables are functioning correctly and properly scaled at the main plant SCADA.

C. Use infrared thermography to confirm internal equipment temperatures are 90 degrees Fahrenheit or less under loading conditions during commissioning process. Improve cooling system until all components operate at 90 degrees or less. Submittal review will not include review for thermal performance and performance is the responsibility of the Contractor.

3.02 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

Page Intentionally Left Blank

SECTION 26 27 26

WIRING DEVICES

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide field test, and place in operating condition, wiring devices as indicated and specified.

1.02 REFERENCES:

A. Federal Specifications (FS):

1. W-C-596-F: Plug, Electrical Connector, Receptacle, Electrical.

2. W-S-896-F: (1P-2P-3W) Switch, Toggle, Single Unit with wall plates.

B. National Electrical Manufacturers Association (NEMA):

1. WD 1: General Requirements for Wiring Devices

2. WD 6: Wiring Devices – Dimensional Requirements

C. National Fire Protection Association (NFPA):

1. 70: National Electrical Code (NEC).

D. Underwriters' Laboratories, Inc. (UL):

1. 20: General Use Snap Switches.

1.03 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Submit shop drawings and manufacturer's product data in accordance with requirements of Section 26 05 10.

PART 2 - PRODUCTS

2.01 MANUFACTURER'S COMPLIANCE:

A. Manufacturer’s acceptance contingent upon products compliance with specifications.

B. Provide all devices with UL label.

2.02 MANUFACTURERS:

A. Allen-Bradley Co.

B. Appleton Electric Co.

C. Cooper Wiring Devices.

D. Eaton Cutler-Hammer, Inc.

E. Crouse-Hinds Co.

F. Hubbell Electrical Products.

G. Pass & Seymour, Legrand.

H. OZ Gedney.

I. Nelson Electric.

2.03 MATERIALS AND COMPONENTS:

A. Wall Switches:

1. Provide alternating current, general-use, snap switches, in flush device boxes or on outlet box covers, totally enclosed in composition case, with insulated mounting yoke and sidewired, binding screw-type terminals. Single-pole, 2-pole, 3-way, or 4-way switches rated 20 amperes at 120/277 volts a.c. Switch to meet Fed. Spec. W-S-896-F and UL-20.

2. Switches for controlling lighting:

a. Cooper Wiring Device Cat. No. 2221, 2222, 2223, or 2224

b. Hubbell Cat. No. 1221, 1222, 1223 or 1224

c. Bryant Electric Cat. No. 4901, 4902, 4903 or 4904

d. Pass & Seymour, Cat. No. 20AC1, 20AC2, 20AC3 or 20AC4

3. Provide pilot type lighting for switches controlling lights in seldom frequented locations.

B. Watertight/Weatherproof Switches:

1. Provide watertight switches consisting of flush mounting switches in NEMA Type 4 gasketed cast metal boxes. Switch operable through shaft in matching cast metal cover, twenty-ampere, 120/277-volt switch enclosures:

a. Crouse-Hinds Type MC or MCC.

b. Appleton Cat. No. WDM 175 and WVG1

c. OZ Gedney Cat. No. WSP and WCT120

C. Explosionproof Switches:

1. Provide explosionproof switches consisting of flush mounting switches in cast metal boxes meeting requirements for NEMA Type 7D enclosure approved for use in NEC Class I, Group D, Division 1, atmosphere. Switch operable through shaft in matching cast metal cover. 20-ampere, 120/277-volt switch assemblies:

a. Crouse-Hinds Type EFS

b. Appleton Electric Type EFS

c. Nelson Electric Cat. No. SCAD

D. Flush Receptacles:

1. Provide 20-ampere, 125-volt flush receptacles constructed in flush device boxes, and of grounding type in composition case with insulated mounting yoke, side-wired, binding screw-type terminals. Receptacles to conform to Fed. Spec. W-C-596-F.

2. Duplex Receptacles:

a. Cooper Wiring Devices Cat. No. 5362

b. Hubbell Cat. No. 5362

c. Bryant Electric Cat. No. 5362

d. Pass & Seymour Cat. No. 5342

3. Duplex GFCI Type Receptacles:

a. Harvey Hubbell, Inc. Cat. No. CR5352

b. Cooper Wiring Devices Cat. No. GF20

c. Leviton Manufacturing Company Cat. No. 6899

4. Single Receptacles:

a. Cooper Wiring Devices Cat No. 5361

b. Hubbell Cat. No. 5361

c. Pass & Seymour Cat. No. 5351

E. Special Receptacles:

1. Provide weatherproof devices with weatherproof while in use covers where located in damp or wet locations. S-1.

a. Provide in corrosive areas (NEMA 4X) provide NEMA 4X listed and identified weatherproof while in-use covers, as required to comply with 2020 NEC 406.9(B)..

2. Provide watertight, gasketed cast-metal enclosures with covers in areas subject to hose-down, meeting requirements, and either standard single or duplex type:

a. Appleton Electric Cat. No. AEE3382 and AEP3361, Style 2

b. Crouse-Hinds Cat. No. ARRH33 and APJ3385, Style 2

3. Provide receptacles with matching plug or cord cap designed to meet NEMA 4 requirements when plug, cord and receptacle are assembled.

4. Provide explosion proof 20-ampere receptacles, of the delayed action type, preventing contact from being broken until arc has been extinguished. Receptacles with angle covers and spring-closed flaps:

a. Crouse-Hinds Type CPS

b. Appleton Electric Type CPS

5. Furnish one explosion proof plug for each three receptacles, with minimum of one. Plugs to match receptacles and from same manufacturer.

6. Provide welding receptacles whereby plug ground contact makes contact with receptacle ground contact before current carrying contacts engage, and when withdrawing plug, ground contact remains engaged until after current carrying ground contacts disengage. Provide ampere rating as indicated on the drawings.

F. Outlet Boxes and Enclosures:

1. Provide outlet boxes and enclosures conforming to Section 26 05 33 and enclosure schedule on the drawings unless otherwise indicated.

G. Device Plates:

1. Provide device plates suitable for type of outlet boxes and enclosures used. Plates for flush-mounting by device manufacturer. Plates for surface-mounting boxes by either device manufacturer or box manufacturer.

2. Provide flush device plates of high corrosion resistant, Type 302 stainless steel.

3. Provide flush device plates of material and finish indicated, in certain designated areas.

PART 3 - EXECUTION

3.01 GENERAL:

A. Perform all work in accordance with the NEC.

3.02 CONNECTION:

A. Securely and rigidly attach wiring devices in accordance with regulating agency, and as indicated, avoiding interference with other equipment.

B. Securely fasten nameplates using screws, bolts, or rivets and centered under or on the device, unless otherwise indicated.

3.03 GROUNDING:

A. Ground all devices in accordance with NEC.

B. Ground switches and their metal plates through switch mounting yoke, outlet box, and raceway system.

C. Ground flush receptacles and their metal plates through positive ground connection to outlet box and grounding system. Maintain ground to each receptacle by spring-loaded grounding contact to mounting screw, or by grounding jumper, both making positive connection to outlet box and grounding system at all times.

D. Ground explosion proof receptacles and plugs by making contact between the metal shells, and also by using a grounding pin to make contact before power contacts are made.

3.04 LABELING:

A. All wall plates to be engraved with the panelboard alpha-numeric identifier and circuit breaker number.

1. Characters to be 5/16 inch in size and black in color.

2. All engravings to match panelboard typed circuit breaker directories.

3.05 CONTRACT CLOSEOUT:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 26 28 16

ENCLOSED SWITCHES AND CIRCUIT BREAKERS

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide enclosed switches and circuit breakers as indicated and in compliance with Contract Documents.

1. Non-fusible switches

2. Molded-case circuit breakers (MCCBs)

3. Molded-case switches

4. Enclosures

1. 250: Enclosures for Electrical Equipment (1000 Volts Maximum)

2. FU1: Low Voltage Cartridge Fuses

3. KS1: Heavy Duty Enclosed and Dead-Front Switches (600 Volts Maximum)

D. National Fire Protection Association (NFPA):

1. 70: National Electrical Code.

E. Underwriters' Laboratories, Inc. (UL):

1. 50: Standard for Safety Enclosures for Electrical Equipment, Non-Environmental Considerations

2. 98: Standard for Safety Enclosed and Dead-Front Switches

3. 489: Standard for Safety Molded-Case Circuit Breakers, Molded-Case Switches and Circuit-Breaker Enclosures

1.03 DEFINITIONS:

A. NC: Normally closed

B. NO: Normally open

C. SPDT: Single pole, double throw

1.04 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Product Data: For each type of enclosed switch, circuit breaker, accessory, and component indicated. Include nameplate ratings, dimensioned elevations, sections, weights, and manufacturers' technical data on features, performance, electrical characteristics, ratings, accessories, and finishes.

1. Enclosure types and details for types other than NEMA 250, Type 1.

2. Current and voltage ratings.

3. Short-circuit current ratings (interrupting and withstand, as appropriate).

4. Include evidence of a nationally recognized testing laboratory (NRTL) listing for series rating of installed devices.

5. Detail features, characteristics, ratings, and factory settings of individual overcurrent protective devices, accessories, and auxiliary components.

6. Include time-current coordination curves (average melt) for each type and rating of overcurrent protective device; include selectable ranges for each type of overcurrent protective device. Provide in PDF electronic format.

C. Shop Drawings: For enclosed switches and circuit breakers.

1. Include plans, elevations, sections, details, and attachments to other work.

2. Include wiring diagrams for power, signal, and control wiring.

D. Informational Submittals:

1. Qualification Data: For qualified testing agency.

2. Seismic Qualification Data: Certificates, for enclosed switches and circuit breakers, accessories, and components, from manufacturer.

   a. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.

   b. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.

   c. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.

3. Field quality-control reports.

E. Closeout Submittals:

1. Operation and Maintenance Data: For enclosed switches and circuit breakers to include in emergency, operation, and maintenance manuals.

   a. In addition to items specified in Section 01 78 23, include the following:

      (1) Manufacturer's written instructions for testing and adjusting enclosed switches and circuit breakers.

      (2) Time-current coordination curves (average melt) for each type and rating of overcurrent protective device; include selectable ranges for each type of overcurrent protective device. Provide in PDF and SKM electronic format.

1.05 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.06 SPARE PARTS:

A. Comply with the requirements specified in Section 01 61 00.

1.07 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

B. Testing Agency Qualifications: Accredited by NETA.

1. Testing Agency's Field Supervisor: Currently certified by NETA to supervise on-site testing.

1.08 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

1.09 PROJECT/SITE CONDITIONS:

A. Environmental Limitations: Rate equipment for continuous operation under the following conditions unless otherwise indicated:

1. Ambient Temperature: Not less than minus 22 degrees F and not exceeding 104 degrees F.

2. Altitude: Not exceeding 4500 feet.

1.10 WARRANTY:

A. Comply with the requirements specified in Section 01 78 26.

B. Manufacturer's Warranty: Manufacturer and Installer agree to repair or replace components that fail in materials or workmanship within specified warranty period.

1. Warranty Period: One year(s) from date of Substantial Completion.

1.11 AREA DESIGNATIONS:

A. General: For purposes of delineating electrical enclosure and installation requirements, certain areas are classified as defined below. Electrical installations within these areas shall conform to the indicated code requirements for the area indicated.

1. General Purpose Locations: Work installed in areas which are not otherwise specifically classified shall be "General Purpose." Enclosures shall comply with the requirements of these Specifications and shall be NEMA Type 1.

2. Outdoor Locations: In outdoor locations, raceway shall be rigid galvanized steel conduit; entrances shall be threaded; and fittings shall have gasketed covers. Fittings and conduit shall be drained. Threaded fastening hardware shall be stainless steel. Mounting brackets shall be galvanized. Attachments or welded assemblies shall be galvanized after fabrication. Instruments and control cabinets, panels, switchboards and motor control centers shall be "Weatherproof NEMA Type 4X." Enclosures shall be mounted 1/4-inch from walls to provide an air space unless specifically shown otherwise.

3. Damp Location: Locations which are indoors and 2 feet below grade elevation or which are indicated as damp locations on the Drawings shall have electrical installations which conform to the requirements for outdoor locations; except, that the air space from walls may be less than 1/4-inch and enclosures shall be NEMA Type 4. "Damp locations" shall include pipe galleries, tunnels, and basements.

Rooms housing liquid handling equipment are also classified as damp locations regardless of grade elevation.

4. Splash Locations: Areas indicated as "splash-proof" locations shall have electrical installations as described for "outdoor locations"; except, that NEMA Type 4X stainless steel enclosures shall be provided for instruments and controls, panels, switchboards, and motor control centers.

5. Corrosive Locations: Areas indicated as "corrosive" locations shall have stainless steel threaded hardware; electrical hardware, fittings, and raceway systems shall be rigid aluminum installed per manufacturer's requirements. Enclosures shall be NEMA Type 4X of fiberglass and reinforced polyester or equal. Corrosive locations include chemical feeder and chemical storage rooms, sodium hypochlorite storage areas, reservoir access, valve structures, and outdoor areas within 10 feet of chemical storage tanks and areas within 10 feet of inlet channels.

6. Hazardous Locations: NEC "Hazardous (Classified) Locations" shall be as indicated and shall comply with NFPA 820 and NEC 500.

PART 2 - PRODUCTS

2.01 PERFORMANCE REQUIREMENTS:

A. Seismic Performance: Enclosed switches and circuit breakers shall withstand the effects of earthquake motions determined according to ASCE/SEI 7.

1. The term "withstand" means "the unit will remain in place without separation of any parts from the device when subjected to the seismic forces specified and the unit will be fully operational after the seismic event."

2.02 GENERAL REQUIREMENTS:

A. Source Limitations: Obtain enclosed switches and circuit breakers, overcurrent protective devices, components, and accessories, within same product category, from single manufacturer.

B. Product Selection for Restricted Space: Drawings indicate maximum dimensions for enclosed switches and circuit breakers, including clearances between enclosures, and adjacent surfaces and other items. Comply with indicated maximum dimensions.

C. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by an NRTL, and marked for intended location and application.

D. Comply with NFPA 70.

2.03 NON-FUSIBLE SWITCHES:

A. Manufacturers:

1. Eaton

2. ABB

3. Schneider Electric

4. Siemens Industry, Inc.

B. Type GD, General Duty, Three Pole, Single Throw, 240-V ac, 600 A and Smaller: UL 98 and NEMA KS 1, horsepower rated, lockable handle with capability to accept two padlocks, and interlocked with cover in closed position.

C. Type HD, Heavy Duty, Three Pole, Single Throw, 600-V ac, 1200 A and Smaller: UL 98 and NEMA KS 1, horsepower rated, lockable handle with capability to accept three padlocks, and interlocked with cover in closed position.

D. Accessories:

1. Equipment Ground Kit: Internally mounted and labeled for copper and aluminum ground conductors.

2. Neutral Kit: Internally mounted; insulated, capable of being grounded and bonded; labeled for copper and aluminum neutral conductors.

3. Auxiliary Contact Kit: Two NO/NC (Form "C") auxiliary contact(s), arranged to activate before switch blades open. Contact rating - 120-V ac.

4. Hookstick Handle: Allows use of a hookstick to operate the handle.

5. Lugs: Mechanical type, suitable for number, size, and conductor material.

6. Service-Rated Switches: Labeled for use as service equipment.

2.04 MOLDED-CASE CIRCUIT BREAKERS:

A. Manufacturers:

1. Eaton

2. ABB

3. Schneider Electric

4. Siemens Industry, Inc.

B. Circuit breakers shall be constructed using glass-reinforced insulating material. Current carrying components shall be completely isolated from the handle and the accessory mounting area.

C. Circuit breakers shall have a toggle operating mechanism with common tripping of all poles, which provides quick-make, quick-break contact action. The circuit-breaker handle shall be over center, be trip free, and reside in a tripped position between on and off to provide local trip indication. Circuit-breaker escutcheon shall be clearly marked on and off in addition to providing international I/O markings. Equip circuit breaker with a push-to-trip button, located on the face of the circuit breaker to mechanically operate the circuit-breaker tripping mechanism for maintenance and testing purposes.

D. The maximum ampere rating and UL, IEC, or other certification standards with applicable voltage systems and corresponding interrupting ratings shall be clearly marked on face of circuit breaker. Circuit breakers shall be 100 percent rated.

E. MCCBs shall be equipped with a device for locking in the isolated position.

F. Lugs shall be suitable for 167 degrees F rated wire, sized according to the 167 degrees F temperature rating in NFPA 70.

G. Standard: Comply with UL 489 with interrupting capacity to comply with available fault currents.

H. Thermal-Magnetic Circuit Breakers: Inverse time-current thermal element for low-level overloads and instantaneous magnetic trip element for short circuits. Adjustable magnetic trip setting for circuit-breaker frame sizes 250 A and larger.

I. Adjustable, Instantaneous-Trip Circuit Breakers: Magnetic trip element with front-mounted, field-adjustable trip setting.

J. Current-Limiting Circuit Breakers: Frame sizes 400 A and smaller, and let-through ratings less than NEMA FU 1, RK-5.

K. Features and Accessories:

1. Standard frame sizes, trip ratings, and number of poles.

2. Lugs: Mechanical type, suitable for number, size, trip ratings, and conductor material.

3. Application Listing: Appropriate for application; Type SWD for switching fluorescent lighting loads; Type HID for feeding fluorescent and high-intensity discharge lighting circuits.

4. Auxiliary Contacts: Two SPDT switches with "a" and "b" contacts; "a" contacts mimic circuit-breaker contacts, "b" contacts operate in reverse of circuit-breaker contacts.

2.05 ENCLOSURES:

A. Enclosed Switches and Circuit Breakers: UL 489, NEMA KS 1, NEMA 250, and UL 50, to comply with environmental conditions at installed location.

B. Enclosure Finish: The enclosure shall be finished with, gray baked enamel paint, electrodeposited on cleaned, phosphatized galvannealed steel (NEMA 250 Types 12), a brush finish on Type 304 stainless steel (NEMA 250 Type 4-4X stainless steel),as indicated on the drawings or suitable for location of equipment.

C. Conduit Entry: NEMA 250 Types 4, 4X, and 12 enclosures shall contain no knockouts.

D. Operating Mechanism: The circuit-breaker operating handle shall be directly operable through the front cover of the enclosure (NEMA 250 Type 1), or directly operable through the dead front trim of the enclosure (NEMA 250 Type 12. The cover interlock mechanism shall have an externally operated override. The override shall not permanently disable the interlock mechanism, which shall return to the locked position once the override is released. The tool used to override the cover interlock mechanism shall not be required to enter the enclosure in order to override the interlock.

E. Enclosures designated as NEMA 250 Type 4, 4X stainless steel, 12, or 12K shall have a dual cover interlock mechanism to prevent unintentional opening of the enclosure cover when the circuit breaker is ON and to prevent turning the circuit breaker ON when the enclosure cover is open.

PART 3 - EXECUTION

3.01 EXAMINATION:

A. Examine elements and surfaces to receive enclosed switches and circuit breakers for compliance with installation tolerances and other conditions affecting performance of the Work.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

1. Commencement of work shall indicate Installer's acceptance of the areas and conditions as satisfactory.

3.02 ENCLOSURE ENVIRONMENTAL RATING APPLICATIONS:

A. Enclosed Switches and Circuit Breakers: Provide enclosures at installed locations with the following environmental ratings.

1. Indoor, Dry and Clean Locations: NEMA 250, Type 1

2. Outdoor Locations: NEMA 250, Type 4X

3. Wash-Down Areas: NEMA 250, Type 4X stainless steel.

4. Other Wet or Damp, Indoor Locations: NEMA 250, Type 4.

5. Indoor Locations Subject to Dust, Falling Dirt, and Dripping Noncorrosive Liquids: NEMA 250, Type 12.

3.03 INSTALLATION:

A. Coordinate layout and installation of switches, circuit breakers, and components with equipment served and adjacent surfaces. Maintain required workspace clearances and required clearances for equipment access doors and panels.

B. Install individual wall-mounted switches and circuit breakers with tops at uniform height unless otherwise indicated.

C. Comply with mounting and anchoring requirements specified in Section 26 05 50.

D. Temporary Lifting Provisions: Remove temporary lifting of eyes, channels, and brackets and temporary blocking of moving parts from enclosures and components.

E. Install fuses in fusible devices.

F. Comply with NFPA 70 and NECA 1.

3.04 IDENTIFICATION:

A. Comply with requirements in Section 26 05 53.

1. Identify field-installed conductors, interconnecting wiring, and components; provide warning signs.

2. Label each enclosure with engraved metal or laminated-plastic nameplate.

3.05 FIELD QUALITY CONTROL:

A. Testing Agency: Owner will engage a qualified testing agency to perform tests and inspections.

B. Testing Agency: Engage a qualified testing agency to perform tests and inspections.

C. Manufacturer's Field Service: Engage a factory-authorized service representative to test and inspect components, assemblies, and equipment installations, including connections.

D. Perform tests and inspections.

E. Tests and Inspections for Switches:

1. Visual and Mechanical Inspection:

a. Inspect physical and mechanical condition.

b. Inspect anchorage, alignment, grounding, and clearances.

c. Verify that the unit is clean.

d. Verify blade alignment, blade penetration, travel stops, and mechanical operation.

e. Inspect bolted electrical connections for high resistance using one of the two following methods:

(1) Use a low-resistance ohmmeter.

(a) Compare bolted connection resistance values to values of similar connections. Investigate values that deviate from those of similar bolted connections by more than 50 percent of the lowest value.

(2) Verify tightness of accessible bolted electrical connections by calibrated torque-wrench method in accordance with manufacturer's published data or NETA ATS Table 100.12.

(a) Bolt-torque levels shall be in accordance with manufacturer's published data. In the absence of manufacturer's published data, use NETA ATS Table 100.12.

f. Verify that operation and sequencing of interlocking systems is as described in the Specifications and shown on the Drawings.

g. Verify correct phase barrier installation.

h. Verify lubrication of moving current-carrying parts and moving and sliding surfaces.

2. Electrical Tests:

a. Perform resistance measurements through bolted connections with a low-resistance ohmmeter. Compare bolted connection resistance values to values of similar connections. Investigate values that deviate from adjacent poles or similar switches by more than 50 percent of the lowest value.

b. Perform insulation-resistance tests for one minute on each pole, phase-to-phase and phase-to-ground with switch closed, and across each open pole. Apply voltage in accordance with manufacturer's published data. In the

absence of manufacturer's published data, use Table 100.1 from the NETA ATS. Investigate values of insulation resistance less than those published in Table 100.1 or as recommended in manufacturer's published data.

F. Tests and Inspections for Molded Case Circuit Breakers:

1. Visual and Mechanical Inspection:

a. Verify that equipment nameplate data are as described in the Specifications and shown on the Drawings.

b. Inspect physical and mechanical condition.

c. Inspect anchorage, alignment, grounding, and clearances.

d. Verify that the unit is clean.

e. Operate the circuit breaker to ensure smooth operation.

f. Inspect bolted electrical connections for high resistance using one of the two following methods:

(1) Use a low-resistance ohmmeter.

(a) Compare bolted connection resistance values to values of similar connections. Investigate values that deviate from those of similar bolted connections by more than 50 percent of the lowest value.

(2) Verify tightness of accessible bolted electrical connections by calibrated torque-wrench method in accordance with manufacturer's published data or NETA ATS Table 100.12.

(a) Bolt-torque levels shall be in accordance with manufacturer's published data. In the absence of manufacturer's published data, use NETA ATS Table 100.12.

g. Inspect operating mechanism, contacts, and chutes in unsealed units.

h. Perform adjustments for final protective device settings in accordance with the coordination study.

2. Electrical Tests:

a. Perform resistance measurements through bolted connections with a low-resistance ohmmeter. Compare bolted connection resistance values to values of similar connections. Investigate values that deviate from adjacent poles or similar switches by more than 50 percent of the lowest value.

b. Perform insulation-resistance tests for one minute on each pole, phase-to-phase and phase-to-ground with circuit breaker closed, and across each open pole. Apply voltage in accordance with manufacturer's published data. In the absence of manufacturer's published data, use Table 100.1 from the NETA ATS. Investigate values of insulation resistance less than those published in Table 100.1 or as recommended in manufacturer's published data.

c. Perform a contact/pole resistance test. Drop values shall not exceed the high level of the manufacturer's published data. If manufacturer's published data are not available, investigate values that deviate from adjacent poles or similar switches by more than 50 percent of the lowest value.

d. Perform insulation resistance tests on all control wiring with respect to ground. Applied potential shall be 500-V dc for 300-V rated cable and 1000-V dc for 600-V rated cable. Test duration shall be one minute. For units with solid state components, follow manufacturer's recommendation. Insulation resistance values shall be no less than two megohms.

e. Determine the following by primary current injection (if applicable):

(1) Long-time pickup and delay. Pickup values shall be as specified. Trip characteristics shall not exceed manufacturer's published time-current characteristic tolerance band, including adjustment factors.

(2) Short-time pickup and delay. Short-time pickup values shall be as specified. Trip characteristics shall not exceed manufacturer's published time-current characteristic tolerance band, including adjustment factors.

(3) Instantaneous pickup. Instantaneous pickup values shall be as specified and within manufacturer's published tolerances.

f. Test functionality of the trip unit by means of primary current injection. Pickup values and trip characteristics shall be as specified and within manufacturer's published tolerances.

g. Verify operation of charging mechanism. Investigate units that do not function as designed.

3. Correct malfunctioning units on-site, where possible, and retest to demonstrate compliance; otherwise, replace with new units and retest.

4. Perform the following infrared scan tests and inspections and prepare reports:

a. Initial Infrared Scanning: After Substantial Completion, but not more than 60 days after Final Acceptance, perform an infrared scan of each enclosed

switch and circuit breaker. Remove front panels so joints and connections are accessible to portable scanner.

b. Follow-up Infrared Scanning: Perform an additional follow-up infrared scan of each enclosed switch and circuit breaker 11 months after date of Substantial Completion.

c. Instruments and Equipment: Use an infrared scanning device designed to measure temperature or to detect significant deviations from normal values. Provide calibration record for device.

5. Test and adjust controls, remote monitoring, and safeties. Replace damaged and malfunctioning controls and equipment.

G. Enclosed switches and circuit breakers will be considered defective if they do not pass tests and inspections.

H. Prepare test and inspection reports.

1. Test procedures used.

2. Include identification of each enclosed switch and circuit breaker tested and describe test results.

3. List deficiencies detected, remedial action taken, and observations after remedial action.

3.06 ADJUSTING:

A. Adjust moving parts and operable components to function smoothly and lubricate as recommended by manufacturer.

B. Set field-adjustable circuit-breaker trip ranges as specified in Section 26 05 70.

3.07 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

Page Intentionally Left Blank

SECTION 26 29 13

ENCLOSED CONTROLLERS

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide AC motor control devices rated 600 volts and less that are supplied as enclosed units as indicated and in compliance with Contract Documents.

1.02 REFERENCES:

A. National Electrical Manufacturers Association (NEMA):

1. 250: Enclosures for Electrical Equipment (1000 Volts Maximum)

2. AB 1: Molded-Case Circuit Breakers, Molded Case Switches, and Circuit-Breaker Enclosures

3. ICS 2: Industrial Control and Systems Controllers, Contactors, and Overload Relays Rated 600 Volts

4. KS 1: Enclosed and Miscellaneous Distribution Equipment Switches (600 Volts Maximum)

5. MG 1: Motors and Generators

B. International Electrical Testing Association (NETA):

1. ATS: Acceptance Testing Specifications for Electrical Power Distribution Equipment and Systems

C. National Fire Protection Association (NFPA):

1. 70: National Electrical Code (NEC)

1.03 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Shop Drawings: Submit shop drawings and manufacturers' product data in accordance with the requirements of Section 26 05 00.

C. For each controller center specified in this Section. Include dimensioned plans, elevations, and component lists. Show ratings, including short-time and short-circuit ratings.

1. Schedule of features, characteristics, ratings, and factory settings of individual units.

2. Wiring Diagrams: Interconnecting wiring diagrams pertinent to class and type specified for and schematic diagram of each type of controller unit indicated.

D. Product Data: Include dimensions, ratings, and data on features and components.

E. Test Results: Certified reports of field tests and observations.

F. Operation and Maintenance Data (O&M): Maintenance data for motor controllers.

G. Miscellaneous:

1. Load-Current and Overload-Relay Heater List: Compile after motors have been installed and arrange to demonstrate that selection of heaters suits actual motor nameplate full-load currents.

H. Acceptance of equipment specified in this section is contingent upon acceptance of coordination study specified in Section 26 05 73.

1.04 QUALITY ASSURANCE:

A. Provide in accordance with Section 01 45 00 and as specified.

B. Manufacturer Qualifications: Maintain, within 200 miles of Project site, service center capable of providing training, parts, and emergency maintenance and repairs.

C. Source Limitations: Obtain similar motor-control devices through one source from single manufacturer.

D. Items provided under this section shall be listed or labeled by UL or other Nationally Recognized Testing Laboratory (NRTL).

1. Term “NRTL” shall be as defined in OSHA Regulation 1910.7.

2. Terms “listed” and “labeled” shall be as defined in National Electrical Code, Article 100.

E. Regulatory Requirements:

1. National Electrical Code (NEC): Components and installation shall comply with National Fire Protection Association (NFPA) 70.

1.05 COORDINATION:

A. Coordinate features of controllers and accessory devices with pilot devices and control circuits to which they connect.

B. Coordinate features, accessories, and functions of each motor controller with ratings and characteristics of supply circuit, motor, required control sequence, and duty cycle of motor and load.

1.06 EXTRA MATERIALS:

A. Furnish extra materials described below that match products installed, are packaged with protective covering for storage, and are identified with labels describing contents.

1. Spare Fuses and Incandescent Indicating Lamps: Furnish 1 spare for every 5 installed units, but not less than 1 set of 3 of each kind.

PART 2 - PRODUCTS

2.01 MANUFACTURERS:

A. Allen-Bradley Co.

B. Eaton, Cutler-Hammer Inc.

C. General Electric Company

D. Siemens Energy & Automation, Inc.

E. Square D Company

2.02 COORDINATION STUDY:

A. Where coordination study specified in Section 26 05 73 recommends changes in types, classes, features or ratings of equipment or devices from those indicated, make written request for instruction. Obtain instructions from Engineer before ordering equipment or devices recommended to be changed.

2.03 ENCLOSURE:

A. Meet environmental conditions of installed location.

1. Provide NEMA-250 Type 1 enclosure in electrical equipment rooms and NEMA-250 Type 12 enclosure for other indoor switches locations unless otherwise indicated.

2. Provide NEMA-250 Type 4X for outdoor and wet location switches with watertight hubs and stainless steel Type 304 enclosure.

3. Provide NEMA-250 Type 7 enclosure for Class 1 hazardous classified location. Provide gaskets for outdoor and wet locations. Heavy cast aluminum enclosure.

2.04 MANUAL MOTOR SWITCHES:

A. Description: NEMA ICS 2, general purpose Class A with toggle action (no overload element).

2.05 MANUAL MOTOR CONTROLLERS:

A. Description: NEMA ICS 2, general purpose, Class A with toggle action and overload element.

2.06 MAGNETIC MOTOR CONTROLLERS:

A. Description: NEMA ICS 2, Class A, full voltage, non-reversing, across line, unless otherwise indicated.

B. Control Circuit: 120 V; obtained from integral control power transformer, unless otherwise indicated. Include control power transformer with adequate capacity to operate connected pilot, indicating and control devices, plus 100 percent spare capacity.

C. Combination Controller: Factory-assembled combination controller and disconnect switch with or without overcurrent protection as indicated.

1. Fusible Disconnecting Means: NEMA KS 1, heavy-duty, fusible switch with rejection-type fuse clips rated for fuses indicated. Select and size fuses to provide Type 2 protection according to IEC 947-4-1, as certified by Nationally Recognized Testing Laboratory.

2. Non-fusible Disconnect: NEMA KS 1, heavy-duty, non-fusible switch.

3. Circuit-Breaker Disconnect: NEMA AB 1, motor-circuit protector with field-adjustable short-circuit trip coordinated with motor locked-rotor amperes.

D. Overload Relay:

1. Electronic solid state type with inverse-time-current characteristic, phase loss and phase unbalance protection for size 2 and larger.

2. Provide NEMA Class 20 heaters or sensors in each phase matched to nameplate full load current of specific motor to which connected with appropriate adjustment for duty cycle.

3. Enhanced Protection Overload Relay: Provide overload relays with NEMA Class 10 or better tripping characteristics for submersible equipment or where indicated. Select to protect motor against voltage unbalance and single phasing.

E. When power factor correction capacitors are indicated provide termination lugs on line side of overload relays.

F. Time Delay Restart Relays: Solid-state sensing circuit with isolated output contacts for hard-wired connection.

1. Provide in starter enclosure for Size 2 and larger starters.

2. Delay initial motor start.

3. Delay motor restart due to starter dropout caused by undervoltage or starter coil circuit interruption for maintained control circuits.

4. Adjustable on delay from 0.15 to 30.0 sec set at 10.0 sec.

5. Connect control relay in motor starter coil circuit.

6. Coordinate control relay section with motor starter to cause motor starter to drop out at voltage slightly higher than dropout voltage of starter and have dropout time slightly faster than motor starter to ensure if motor starter drops out, relay will drop out.

G. Solid-State, Reduced-Voltage Controller: NEMA ICS 2, suitable for use with standard NEMA MG 1, Design B, polyphase, medium induction motors.

1. Adjustable acceleration rate control uses voltage or current ramp, and adjustable starting torque control has up to 500 percent current limitation for 20 sec.

2. Surge suppressor in solid-state power circuits provides 3 phase protection against damage from supply voltage surges 10 percent or more above nominal line voltage.

3. LED indicators show motor and control status, including following conditions:

a. Control power available

b. Controller on

c. Overload trip

d. Loss of phase

e. Shorted silicon-controlled rectifier

4. Motor running contactor operates automatically when full voltage is applied to motor.

2.07 VARIABLE-FREQUENCY CONTROLLERS:

A. Refer to section 26 29 23 for drive requirements.

2.08 ENCLOSURES:

A. Description: Flush or surface-mounted cabinets. NEMA 250, Type 1, unless otherwise indicated to meet environmental conditions at installed location.

1. Wet or Damp Indoor and Outdoor Locations: NEMA 250, Type 4X, stainless steel.

2. Hazardous Areas Indicated on Drawings: NEMA 250, Type 7C.

2.09 ACCESSORIES:

A. Provide devices when indicated. Factory install in controller enclosure, where indicated.

B. Push-Button Stations, Pilot Lights, and Selector Switches: NEMA ICS 2, heavy-duty type.

C. Stop and Lockout Push-Button Station: Momentary-break push-button station with factory-applied hasp arranged so padlock can be used to lock push button in depressed position with control circuit open.

D. Control Relays: Auxiliary and adjustable time-delay relays.

E. Elapsed Time Meters: Heavy duty with digital readout in hrs.

F. Factory mounted with Nationally Recognized Testing Laboratory listed and labeled mounting device.

PART 3 - EXECUTION

3.01 APPLICATIONS:

A. Select features of each motor controller to coordinate with ratings and characteristics of supply circuit and motor; required control sequence; duty cycle of motor, drive, and load; and configuration of pilot device and control circuit affecting controller functions.

B. Hand-Off-Automatic Selector Switches: In covers of manual and magnetic controllers of motors started and stopped by automatic controls or interlocks with other equipment where indicated.

3.02 INSTALLATION:

A. Install independently mounted motor-control devices according to manufacturer's written instructions.

B. Location: Locate controllers within sight of motors controlled, unless otherwise indicated.

C. For control equipment at walls, bolt units to wall or mount on lightweight structural-steel channels bolted to wall. For controllers not at walls, provide freestanding racks conforming to Section 26 05 29.

D. Install freestanding equipment on concrete housekeeping bases conforming to Section 03 30 00.

3.03 IDENTIFICATION:

A. Identify motor-control components and control wiring according to Section 26 05 53.

3.04 CONNECTIONS:

A. Tighten connectors, terminals, bus joints, and mountings. Tighten field-connected connectors and terminals, including screws and bolts, according to manufacturer's published torque-tightening values. Where manufacturer's torque values are not indicated, use those specified in UL 486A-486B.

3.05 COORDINATION STUDY:

A. Where coordination study specified in Section 26 05 73 recommends changes in types, classes, features of ratings of equipment or devices from those indicated, make written request for instructions. Obtain instructions from Engineer before ordering equipment or devices recommended to be changed.

3.06 FIELD QUALITY CONTROL:

A. Manufacturer's Field Services:

1. Supplier's or manufacturer's representative for equipment specified herein shall be present at jobsite or classroom designated by Owner for minimum person-days indicated, travel time excluded, for assistance during plant construction, plant startup, and training of Owner's personnel for plant operation. Include:

a. 2 person-day for Installation Services

b. 2 person-day for Instructional Services

2. Supplier or manufacturer shall direct services to system and equipment operation, maintenance, troubleshooting, and equipment and system-related areas other than wastewater treatment process.

3. Manufacturer's Field Services: Provide services of factory-authorized service representative to supervise field assembly and connection of components, including pretesting and adjustment of solid-state controllers.

B. Testing:

1. Reports: Notify Engineer in writing indicating defective materials and workmanship and unsatisfactory test results. Include records of repairs and adjustments made.

2. On completing installation of system, perform following tests.

a. Test insulation resistance of conducting parts of motor control components; and of connecting supply, feeder, and control circuits. For devices containing solid-state components, use test equipment and methods recommended by manufacturer.

b. Make continuity tests of circuits.

c. Review updating of final system configuration and parameters where they supplement or differ from those indicated in original Contract Documents.

d. Review manufacturer's written instructions for installation and testing of motor control devices.

3. Visual and Mechanical Inspection: Include following inspections and related work.

a. Motor Control Device Ratings and Settings: Verify ratings and settings as installed are appropriate for final loads and final system arrangement and parameters. Recommend final protective device ratings and settings where differences found. Use accepted revised ratings or settings to make final system adjustments.

b. Inspect for defects and physical damage and nameplate compliance with Drawings.

c. Exercise and perform operational tests of mechanical components and other operable devices in accordance with manufacturer's written instructions.

d. Check tightness of electrical connections of devices with calibrated torque wrench. Use manufacturer's recommended torque values.

e. Clean devices using manufacturer's approved methods and materials.

f. Verify proper fuse types and ratings in fusible devices.

4. Electrical Tests: Perform following in accordance with manufacturer's written instructions.

a. Insulation resistance test of motor control devices conducting parts to extent permitted by manufacturer's written instructions. Insulation resistance less than 100 megohms not acceptable.

b. Make adjustments for final settings of adjustable trip devices.

c. Test auxiliary protective features such as loss of phase, phase unbalance, and undervoltage to verify operation.

d. Check for improper voltages at terminals in controllers having external control wiring when controller disconnect opened. Voltage over 30 V unacceptable.

5. Correct deficiencies and retest motor control devices. Verify by system tests that specified requirements are met.

C. Retesting:

1. Correct deficiencies identified by tests and completely retest equipment.

2. Verify by system test that total system meets specification requirements.

3.07 ADJUSTING:

A. Time Delay Restart Relay:

1. Adjust control relay to cause motor starter to drop out at voltage slightly higher than dropout voltage of starter and have dropout time slightly faster than motor starter to ensure if motor starter drops out, relay will drop out.

B. Perform short-circuit analysis and coordination study. Set field-adjustable pick-up and time-sensitivity ranges accordingly.

3.08 CLEANING:

A. Remove paint splatters and other spots, dirt, and debris. Touch up scratches and mars of finish to match original finish. Clean devices internally, using methods and materials recommended by manufacturer.

3.09 CONTRACT CLOSEOUT:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 26 29 23

VARIABLE FREQUENCY MOTOR CONTROLLERS

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Reference Specification 26 29 23.1 for requirements for Variable Frequency Motor Controllers (Also referred to a Variable Frequency Drives, or VFD), where operating on systems of 1kV and higher.

B. Provide complete Variable Frequency Drive (VFD) units and appurtenances including drive reactors, DC chokes, harmonic filters, enclosures, and certain auxiliary items, as indicated and as specified, to provide a complete operating system.

C. Coordinate Variable frequency drive unit sizing by the driven equipment manufacturer (pump, fan, etc.) supplier. Furnish drives from a single manufacturer to minimize maintenance costs for the site. Installation of the units shall be the responsibility of the General Contractor. All conduit and wire installations associated with each VFD shall be provided under Division 26.

D. VFD units shall be manufacturer's standard technology and in production for a minimum of 2 years.

E. Provide control system operation, input and control signals, status signals and devices in accordance with Section 40 61 13.

F. Provide VFD output filter or reactor, when cable length between VFD and motor is greater than 100 feet, to insure motor terminals do not experience overvoltage condition as defined by NEMA Standard MG-1. Except – output filter may be omitted where motor is identified for inverter duty, contains shaft grounding kit, is supplied by cables identified for use on the load side of the inverter, and otherwise meets motor specification requirements for motors supplied by an inverter.

G. Provide front-end harmonic mitigation of the VFD unit to reduce line-side harmonics to 5 percent current total harmonic distortion and less than 3 percent current distortion on each harmonic at their immediate upstream distribution bus as verified by calculation and testing. Harmonic current distortion to be in accordance with Table 26 29 23-1. This bus shall be referred to as the point of common coupling (PCC). For drives smaller than 50HP, use of a 5% reactor is acceptable.

H. Drive supplier shall coordinate with plant control system integrator to setup communication networks, addresses, and data point addresses to facilitate control system programming.

1.03 SEISMIC DESIGN REQUIREMENTS:

A. Conform to the requirements indicated on the structural drawings and as specified in Section 01 41 20.

B. It shall be the responsibility of manufacturer and supplier along with the Electrical Contractor to conform to the seismic design requirements for this project and for the work of this specification section.

1.04 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Submit shop drawings and manufacturers' product data in accordance with the requirements of Section 26 05 10.

C. Complete list of equipment and materials, including manufacturer's descriptive and technical literature, catalog cuts, and installation instructions for all major components.

D. Complete wiring and schematic diagrams for the equipment furnished. Each wiring diagram shall be legible and not reduced from the original design drafted format. Provide a list of equipment on each wiring diagram for which it is applicable.

E. Panel layout and front view drawings.

F. Time versus current curves for protection devices.

G. Data sheets for all devices provided as part of the assembly.

H. All other details required to demonstrate that system has been coordinated and will properly function as a unit.

I. Provide data to verify that drives can be used for motor lead lengths up to 100 feet without output filters. Include information from the VFD manufacturer or output filter or reactor manufacturer (if required) stating that the motor terminal voltage limitations as defined by NEMA Standard MG 1, Part 31 are met. For VFDs located more than a cable length of 100 feet from the motor load, provide drawings which include information demonstrating that an output filter or reactor is included within the VFD.

J. Provide enclosure drawings and details showing all dimensions and construction details.

K. Harmonic Analysis Report: Provide harmonic analysis report. Report to be accepted by Engineer prior to release of drives for fabrication.

    1. Submit voltage THD frequency scan of each type of VFD supplied for use in field testing.

L. Submit information relative to location and expertise of local service office and personnel.

M. Submit a Statement of Compliance indicating conformance to the Seismic Requirements specified. Certificate shall be signed and sealed by a Professional Structural Engineer holding current registration in the state for work of this project.

N. For informational purposes only, provide installation and anchoring details to meet earthquake requirements as specified and indicated on structural drawings.

O. For informational purposes only, submit manufacturer's printed installation instructions.

P. Spare Parts Data: Submit a list of spare parts for the equipment specified.

Q. Operating and Maintenance Instruction Manuals:

1. Furnish:

a. Operating instruction manuals outlining step-by-step procedures required for system startup and operation.

b. Manufacturer's name, model number, service manual parts list.

c. Brief description of equipment and basic operating features.

d. Maintenance instruction manuals outlining maintenance procedures.

e. Troubleshooting guide listing possible breakdown and repairs.

f. Point-to-point connection wiring diagram for the system.

g. Performance Test Reports: Upon completion of installed system, submit in booklet form all shop and field tests performed to prove compliance with specified performance criteria.

R. Submit Pump, Motor, and VFD Statement of Compliance Coordinate Certificate from firm ensuring all three elements will operate together. Refer to Section 01 33 00 for form and fill out complete.

1.05 QUALITY ASSURANCE:

A. Provide in accordance with Section 01 45 00 and as specified.

B. Provide variable frequency drives in accordance with UL 508A, supplement SB, and Article 409 of the National Electrical Code (NEC). All VFD units shall be provided with a UL label.

C. Ensure that conduit size and wire quantity, size, and type are suitable for the equipment supplied. Coordinate all design information with the Electrical Contractor. Review the proper installation of each type of VFD unit with the equipment supplier prior to installation.

1. Services of Service Engineer, specifically trained on type of equipment specified. Person-day requirements listed exclusive of travel time.

a. Assist in location of devices, methods of mounting, field erection, etc.

2 person-days

b. Functional Completion Testing:

2 person-days

c. Startup:

1 person-day

d. Commissioning:

1 person-day

e. At the end of start-up service provide for a maximum of six members of the owners staff at the facility site to receive training from the startup/testing service Engineer.

1 person-day

f. Service-inspections during first year of operation, for use at Owner's request, and exclusive of repair, malfunction or other trouble-shooting service calls:

3 person-days

g. Person-day is defined as one 8-hour day, excluding travel time.

1.06 DELIVERY, STORAGE AND HANDLING:

A. Provide in accordance with APWA Section 01 66 00 and as specified.

B. Shipping:

1. Ship equipment and materials, except where partial disassembly is required by transportation regulations or for protection, complete with identification and quantity of items.

2. Pack spare parts in containers bearing labels clearly designating contents and pieces of equipment for which intended.

3. Deliver spare parts after installation but as specified before start-up of drives. Deliver to Owner after completion of work.

C. Storage:

1. Inspect and inventory items upon delivery to site.

2. Store and safeguard equipment, material and spare parts.

a. If the equipment cannot be placed into service after its receipt, store in a closed building or structure, in a clean, dry and ventilated area free from temperature, dirt and moisture extremes. Acceptable storage temperatures are from 32 degrees F to 104 degrees F with temporary heaters provided within enclosures to prevent condensation. Provide heavy plastic envelope

directly over motor control center to protect against dust, dirt, and moisture. Provide lifting angles outside of envelope.

1.07 WARRANTY AND SERVICE:

A. Provide in accordance with Section 01 78 36 and as specified.

B. Guarantee components, parts, and assemblies supplied by manufacturer against defects in materials and workmanship for a period of 24 months after turning the equipment over to the Owner, and in this time period include onsite, parts and labor warranty. All labor to be performed by local factory trained service engineers.

C. Ensure that equipment manufacturer has local branch office staff with trained, full-time employees who are capable of performing testing, inspecting, repair, and maintenance services.

PART 2 - PRODUCTS

2.01 MANUFACTURERS:

A. Manufacturer shall have at least five years commercial experience in the manufacture, operation and servicing of equipment of type, size, quality, performance, and reliability equal to that specified.

B. Variable Frequency Drive Units:

1. ABB Drives

2. Eaton Corporation, Electric Drives Division

3. Schneider Electric / Square D Company

4. Siemens Inc.

5. Toshiba Industrial

C. VFD Input Filters and Output Filters/Reactors:

1. Trans-Coil, Inc.

2. MTE Corporation

3. Power Quality International

2.02 HARMONIC ANALYSIS:

A. Each VFD unit shall be designed such that there is less than 5 percent current total harmonic distortion at the PCC. Current distortion at the PCC will be in accordance with Table 26 29 23-1. For the purpose of the analysis, it will be assumed that the facility transformer feeding the electrical system is at a moderately (70 percent) loaded condition.

Table 26 29 23-1
Maximum Harmonic Current
Distortion In Percent Il

Odd Harmonic

Ratio	5 to 9	11 to 15	17 to 21	23 to 33	35 +	TDD
Less than 20	4.0	2.0	1.5	0.6	0.3	5.0
20 to 50	7.0	3.5	2.5	1.0	0.5	8.0
50 to 100	10.0	4.5	4.0	1.5	0.7	12.0
100 to 1000	12.0	5.5	5.0	2.0	1.0	15.0
1000 +	15.0	7.0	6.0	2.5	1.4	20.0

Notes:
1. Even harmonics are limited to 25 percent of odd harmonics.
2. DC offset distortions not allowed.
3. Ratio = Isc/IL where:
   Isc = Maximum short circuit current at PCC.
   IL = Maximum demand load current at PCC (fundamental frequency component)

B. Provide all harmonic related data to the independent engineering firm identified in Section 26 05 70.

C. For each VFD unit, provide a harmonic analysis study at the point of connection to the immediate upstream distribution bus (PCC), based on pre-submittal data.

Each VFD unit shall be designed such that there is less than 5 percent voltage total harmonic distortion and less than 3 percent voltage distortion on each harmonic at the PCC. Current distortion to be within the limits of Table 26 29 23-1. For the purpose of the analysis, it will be assumed that the electrical system is at a lightly loaded condition, 50 percent load. If the VFD loads exceed 50 percent system loading, assume system is loaded at VFD full load ratings.

1. At each PCC, where more than one type or size VFD unit is to be connected, provide the following:

   a. Contractor shall have the supplier of the largest drive (in Hp) provide a harmonic study for each point of common coupling based on pre-submittal information

2. The Contractor shall supply the following pre-submittal information to the largest VFD supplier to complete the harmonics study.

   a. Full load fundamental current for each variable frequency drive unit.

   b. Harmonic currents on per unit basis of full load fundamental for each VFD unit.

   c. Available fault current information from the electric utility and upstream transformer data.

   d. Distribution transformer sizes and impedances, if any.

   e. VFD input line reactor and/or isolation transformer sizes and impedances from the utility source to the VFD units.

   f. Conductor information between transformer secondary or generator terminals to the distribution buses and VFDs.

   g. Generator kW, impedance, subtransient reactance generator constants for the condition when the electrical system is powered from the generator.

3. The results of the harmonics study shall verify that the levels of total harmonic voltage at each point of common coupling are less than 5 percent and that the voltage distortion on each harmonic is less than 3 percent. In addition, harmonic currents at the PCC will be within the limits of Table 26 29 23-1. The study shall separately consider each VFD distribution bus as points of common connection (PCCs). The study shall specify additional equipment required (e.g., filters) at each harmonic where harmonic reduction is required to insure compliance.

D. The study shall consider the following conditions:

1. The electrical system shall be powered by the electric utility, case 1, or solely by local generation, Case 2.

2. The study shall include an explanation of all assumptions, sources of data, methodologies and formulas used in the study and a summary of the study results.

3. The Contractor shall supply all equipment required as a result of the final accepted harmonics study to comply with the requirements of Paragraph 1.01.F.

2.03 PROVISIONS:

A. Service Conditions:

1. Ambient Temperature Range: 0 degrees C to 40 degrees C

2. Operational Humidity: Up to 90 percent non-condensing

3. Environment: As indicated on enclosure schedule

4. Altitude: Below 4,500 feet above sea level

5. Input Power:

   a. Nominal Voltage: 480 volts (plus 10 percent or minus 10 percent), 3-phase, 3 wire

   b. Nominal Frequency: 60 Hertz (plus or minus 2 Hertz)

   c. Service provided from feeder breaker on distribution bus

6. Performance:

   a. Program drive to operate within motor's allowable turndown.

   b. Provide drive capable of catching a spinning motor.

   c. Provide programming in drive to allow motor to spin down upon loss of power prior to re-starting motor, not to exceed 30 seconds. When starting, provide catching sequence in case motor is still in motion.

B. Drive System: 0-500 HP Units, 480V, 3-phase.

1. General:

   a. Furnish solid state variable frequency, microprocessor type with Pulse Width Modulated (PWM) output wave form converter. The VFD shall employ a full wave rectifier to prevent input line notching, a DC bus choke, DC bus capacitors and Insulated Gate Bipolar Transistors (IGBT) as the output switching device to convert nominal 480 volts, 3 phase, 60 Hertz, 3 wire input power into adjustable-frequency 3 wire system at 0 to 480 volts, 3 phase, 0 to 60 Hertz output power. Provide output speed control of required motor under variable torque load or constant torque as required by the driven equipment.

   b. Motor control circuits shall be wired in accordance with the requirements specified herein or indicated on the Drawings. Where not indicated, the control circuits shall be standard two-wire "start-stop" and the Contractor shall furnish wiring accordingly. Controls shall be designed to allow for automatic re-start when power is returned after a system outage, unless otherwise directed.

   c. Variable frequency drive manufacturer shall be responsible for the successful application and operation of the entire drive and control system serving the motor and driven equipment. This includes the responsibility for obtaining all loads, torque, speed and performance requirements from the

respective sources and integrating these into a variable frequency drive system that fulfills the requirements of this Specification.

d. The Contractor and variable frequency drive system manufacturer are cautioned regarding the review and compliance with the total Contract Documents. Typical examples are circuit breakers, motor circuit protectors, magnetic starters, relays, timers, control and instrumentation products, pilot devices including pushbuttons, selector switches and pilot lights, enclosures, conduit, disconnect switches, terminal boxes, and other equipment.

e. Provide VFD control which ensures accurate zero to full load torque control at low frequencies, including zero speed, with torque repeatability accuracy of 2 percent or better and torque response time less than 20 ms.

f. Provide on drive, a disconnecting device and fixed diode input rectifier (for a constant power factor).

g. The drive unit shall be of modular design to provide for ease and speed of maintenance.

2. For units rated 50 Hp or less, provide 6 pulse drive with 5 percent impedance input line reactor.

a. Provide trap filters for the drive unit meeting the requirements of the harmonic study under Paragraph 2.02. Filters shall be provided with contactors and controlled by the VFD to remove them from the line when the drive is not operating. Contactors shall be provided with spare contacts for remote alarm and to energize status lamp at VFD enclosure.

3. For units rated 50 and 120 Hp, provide VFD with the following type three phase PWM rectifier section: 18 pules or higher supply-side transformer, or Low-Harmonic Active Front End . Provide multiple secondary integral transformer within enclosure at input bridge to provide appropriate phase shift.

a. Where supplying harmonic mitigation transformer, then as a minimum the transformer shall provide for the cancellation of the 5th, 7th, 17th, 19th, positive and negative sequence harmonic currents at the primary connection.

b. Where supplying harmonic mitigation transformer, the transformer shall reduce voltage and current distortion on the primary side and voltage distortion on the secondary side.

c. Provide active front end technology to meet harmonic content requirements already articulated in this Section.

d. The design shall be optimized for harmonic rich and high neutral current environment.

e. Provide a primary to secondary phase shift by use of multiple secondaries.

4. For VFD units rated 125 horsepower or higher, provide active converter low harmonic drives.

   a. Control high order harmonics with line filtering.

   b. Direct torque control (DTC) AC to AC converter with IGBT technology.

   c. Operational modes of scalar or V/Hertz operation.

   d. AC line reactor and DC choke shall be provided to reduce input harmonic content, and provide protection from power line transients.

5. All components of the drive shall be designed and sized for the abnormal condition of continuous operation of the driven equipment specified herein at loads up to 15 percent above rated full load.

6. RMS harmonic output of the drive not to provide more than 5 percent increase in motor heating over similar operation of the motor with zero harmonics in the current.

7. The unit shall withstand drive output terminal line-to-line and line-to-ground short circuits without component failure during start-up and during operation. Drive to safely shutdown until short is cleared.

8. NEMA type cabinet for each drive unit, as indicated on drawings and enclosure schedule. NEMA 4 and NEMA 4X enclosures to be provided with stainless steel hand operated quick disconnect devices and interior cooling systems. Provide hinged acrylic door with gasketing on front of door for each access to keypad controls.

9. For inverter rated squirrel cage motors, per NEMA Standard MG-1, Part 31.40.4.2, the following limit values at the motor terminals are to be observed:

   a. For motors with base rating voltage less than or equal to 600 volts, the peak instantaneous voltage must be limited to 1600 volts or less, with a voltage rise time greater than or equal to 0.1 micro-seconds.

10. The VFD manufacturer shall guarantee that the required voltage limits will be met with the motor installed up to 300 cable feet from the VFD drive unit. If the VFD manufacturer is not able to guarantee that the above voltage limits will be met, provide a drive output filter or reactor, appropriately rated, located within the VFD enclosure and near the VFD output terminals, which shall ensure that the limitations listed above are maintained. A device located at the motor terminals is not acceptable.

11. When controlling for non-inverter rated squirrel cage motors, provide output filters to limit peak voltage at the motor terminal to less than 1000 V, increase voltage rise time and reduce common mode current.

12. VFD shall be capable of full rated output when powered by incoming voltage with Total Harmonic Distortion (THD) in excess of 10 percent.

13. Furnish series choke and capacitors on dc bus to reduce ripple in rectifier output and to reduce harmonic distortion reflected into incoming power feeders.

14. Properly size enclosure to dissipate heat generated by VFD within limits of specified service conditions.

    a. Provide NEMA enclosure type as indicated on drawings.

    b. Provide integral fans or cooling systems as required by the application.

    c. NEMA 4 and 4X type enclosures to use hand-operated locking devices for door closing hardware.

    d. Circuit breaker interlock to be able to be bypassed via lever on front door surface.

    e. NEMA 1 and 12 type enclosures to have keypad controls located on exterior of enclosure.

    f. Provide visual alarm indicator on cabinet door.

    g. Fans shall be located to allow quick removal and replacement without disassembly of drive components.

2.04 PERFORMANCE CHARACTERISTICS:

A. Output amps: 110 percent of rated, continuous.

B. Current limit: Range 0 to 130 percent for constant torque applications, 0 to 110 percent for variable torque applications, for 1 minute minimum.

C. Acceleration time to top speed, 1-300 seconds, minimum, adjustable

D. Deceleration time from top speed, 1-300 seconds, minimum, adjustable

E. Frequency stability: plus or minus 0.5 percent (at 25 degrees C, +10 degrees C) after reaching operating temperature.

F. Output voltage: Proportional to frequency with low speed boost.

G. Combined drive/and filtering efficiency, defined as motor shaft kW divided by VFD input kW, shall meet the following minimum requirements at the specified operating points:

1. 97 percent at 60 Hertz VFD output and 100 percent load

2. 92 percent at 50 Hertz VFD output and 60 percent load

H. VFD fundamental power factor shall be 0.98 or higher at all speeds and loads.

I. The VFD shall be capable of sustaining continued operation with a 30 percent dip in nominal line voltage. Output speed may decline only if current limit rating of the VFD is exceeded.

J. Losses to be utilized in drive system efficiency calculation shall include the input line reactor, phase shifting transformer and, harmonic trap filter with capacitors. Auxiliary controls such as internal VFD control boards and cooling fans shall be included in all loss calculations.

2.05 DRIVE PROTECTION:

A. General:

1. Fault detection and trip circuits shall protect VFD and connected motor against line voltage transients, single-phase, power line overvoltage and undervoltage, output overvoltage and overcurrent, and VFD overtemperature.

a. The VFD shall employ three current limit circuits to provide trip free operation.

b. The slow current regulation limit circuit shall be adjustable to a minimum 125 percent of the VFD's variable torque current rating.

c. The rapid current regulation limit shall be adjustable to a minimum 170 percent of the VFD's variable torque current rating.

d. The current switch off limit shall be fixed at a minimum 225 percent of the VFD's variable torque current rating.

2. Internal Protection: Minimum circuitry as follows:

a. Current limiting, fast acting, semiconductor input fuses for protection of internal power semiconductors

b. Instantaneous output overcurrent trip maximum: 200 percent

c. DC bus and control circuit transformer fusing

d. Grounded control chassis

e. Under and over voltage trip, 3 phases

f. Motor overload protection, with solid state relays

g. Circuit breaker, with door interlocked handle. Provide means to allow entry into panel where required by authorized personnel. Circuit breaker to be rated 65,000 AIC minimum.

h. Fault reset push button

i. Line to ground faults

j. Input metal oxide varistor and input line reactor for transient protection

k. VFD overtemperature

3. Troubleshooting: Diagnostic aids to indicate cause of fault; used to assist in troubleshooting circuit problems. Isolated Form C contacts for remote indication of alarms to include the following:

   a. Over/under voltage indication

   b. Overcurrent trip indication

   c. DC bus charged indication

   d. Fault detection indication

   e. Recycle start indication (to indicate that the unit tried to pick up load for three previous tries and failed)

4. Provide power loss ride through capability which will allow the logic to maintain control due to load inertia without faulting.

5. Provide a programmable automatic restart function which will provide a minimum with time delays between restarts of 3 restarts following a fault condition other than a ground fault, short circuit, internal fault, or user programmable fault condition. Restart type to be programmable for time delay or coasting motor restart.

6. For drives units rated 200 hp or more, provide uninterruptable power supply (UPS) to power control circuits and prevent inadvertent trip due to voltage sag conditions.

   a. The UPS shall be installed within the drive enclosure.

b. The battery backup time of the UPS shall be a minimum of 5 minutes or as recommended by the VFD manufacturer.

c. UPS shall be American Power Conversion Smart-UPS 1400 X LT by MGE or Eaton Powerware.

d. Power source for this UPS and associated control power shall be derived within the VFD enclosure from the same master power source.

2.06 CONTROL INTERFACE:

A. Provide variable frequency drive unit with appropriate power circuitry and auxiliary contacts for energizing and controlling the following devices associated with the motor, if required:

1. Space heaters

2. Solenoid valves

3. Remote indication of motor start and stop (isolated contacts)

B. Minimum Control Features:

1. LOCAL/REMOTE selection of Start/Stop control.

2. LOCAL/REMOTE selection of Speed control.

3. Accept a grounded, isolated, 4-20 mA input remote speed control signal from an external device.

4. Provide a 4-20 mA output signal proportion to VFD output frequency for remote speed indication.

C. Control Devices:

1. Provide operating, monitoring or alarm indicating devices, door mounted, with minimum as follows:

a. Drive System Disconnect Operator.

b. System control selector switch (RUN/OFF/REMOTE) (When in RUN position drive will run). Control switch shall be oil-tight, 30 mm units.

c. System speed control selector switch (LOCAL/REMOTE) (When in LOCAL position, speed controlled by manual speed potentiometer). Control switch shall be oil tight, 30 mm units.

d. Manual keypad controls to set speed in manual mode.

e. Speed indicating meter in percent speed to indicate speed of the converter powered motor.

f. Run time meter, mechanical type, round, UL Certified, non-reset type, with register to indicate hours and tenths of hours up to 99,999.9 hours.

g. Alarm and status lights. Provide LED cluster type, heavy duty, 30 mm oil tight units.

2. Control circuits shall be isolated from power circuits.

a. Unit to accept a 4-20 mA DC speed control signal from an isolated, ungrounded transmitter with unit in remote mode and from local door-mounted micro-processor type keypad with unit in local mode.

b. The input 4-20 mA signal to be optically isolated from the drive run control circuit.

c. Furnish door-mounted switch on the enclosure for local/remote mode.

d. Keypad controls to have adjustable minimum speed setting of 10 to 80 percent of full speed and maximum speed setting of 50 to 100 percent of full speed. The total speed setting to follow a linear time ramp, adjustable from 1-300 seconds for acceleration and deceleration control.

D. Provide a Ethernet network card/port and interface modules to allow serial communications on an Ethernet network.

1. Interface connection cable shall utilize a RJ-45 connector.

2. Network to allow a selection of standard and custom register values to communicate drive parameters, including:

a. Drive fault

b. Overload

c. Trip

d. Loss of control power

e. Speed

f. Power (kW)

g. Amps (Phase A, B and C)

h. Voltage (Phase A-B, B-C, C-A)

3. Provide all components and drive programming to allow network interface with control system. Provide data mapping information to control system integrator to facilitate plant system programming.

2.07 SHOP TESTING:

A. Provide in accordance with Section 01 45 00.

B. Provide a factory performance test for each variable frequency drive unit. The test to consist of simulating the expected load to be driven. The drive to operate the actual motor load through the expected speed ranges. Test length to be a minimum of two hours.

C. Provide a factory burn-in test for 24 hours minimum and a control and alarm test on each drive unit by simulating each control signal and each alarm function to verify proper and correct drive unit action.

D. Provide typical prototype factory test data for short circuit testing of each type of drive supplied. Data to verify that each drive can be started into a line-to-line fault and line-to-ground fault on the drive terminals. Each drive can be operating at full load and be subjected to a line-to-line fault and line-to-ground fault on the drive terminals. All phases (A, B & C) to be included in test data.

E. Provide certified documentation of all tests performed.

F. Provide above stated tests in addition to routine factory tests.

G. Owner to have option to witness all factory tests. Notify Owner two weeks before all tests.

2.08 SPARE PARTS:

A. Provide in accordance with Section 01 78 23 and as specified.

B. Provide one spare board or card, three diodes, for each horsepower size drive. Spares will be color-coded or otherwise keyed to their original counterpart such that improper installation of spare cards is impossible. In addition to the cards, the manufacturer shall provide three spares for all expendable items such as pilot lamps, power fuses, and control fuses. Provide one spare keypad for every three VFD of the same model.

PART 3 - EXECUTION

3.01 INSPECTION:

A. Examine VFD location for satisfactory preparation. Check conduits and raceway location for connection to units.

B. Visually inspect delivered unit(s) and accessories for conformance with specification and drawings.

C. Verify availability of appropriate pacing signal.

D. Maintain variable frequency drive in upright position at all times.

E. Protect variable frequency drive against damage. Store drive in clean, dry environment with temperature and humidity within range as specified by drive manufacturer. Energize space heaters during storage as recommended by manufacturer.

3.02 INSTALLATION:

A. Erect, install, and start-up equipment.

B. The VFDs shall be installed as shown on the drawings, in accordance with the manufacturer's installation instructions, and accepted shop drawings.

C. Install VFDs to allow complete door swing required for component removal. This is specifically required where a VFD is set in the corner of a room.

D. Factory-trained service personnel, other than sales representatives, shall supervise field installation, inspect, make final adjustments and operational checks, make functional checks of spare parts, and prepare a final report for record purposes. Adjust control and instrument equipment until this equipment has been field tested.

3.03 RUBBER MATS:

A. Rubber mats are not required.

3.04 FIELD TESTING:

A. Provide in accordance with Section 01 45 00.

B. Perform testing checkout, and start-up for variable frequency drive equipment under technical direction of manufacturer's service engineer. Under no circumstances energize any portion of the drive system without authorization from manufacturer's technical representative.

C. Field Tests:

1. Test each drive over the total speed range that it will be required to operate through for the load being driven for a minimum of two hours. Determine for each drive, motor, and load combination the following at minimum speed, maximum speed, and at 1/3 and 2/3 points between the minimum and maximum speeds:

a. Input power (kW), voltage, current and RMS power factor on the line side of the drive isolation device.

b. Output to the driven load in kilowatts.

c. For each drive, measure the harmonic voltage distortion and harmonic current distortion for each harmonic at the main distribution bus for maximum and minimum load conditions.

d. Measure the total harmonic voltage distortion and total harmonic current distortion at each PCC for maximum and minimum load conditions.

2. Test each drive by using the actual control signal for remote and local operation.

3. Test each drive's alarm functions.

4. Perform all tests in the presence of the Owner's representative.

5. Perform the above test in addition to the manufacturer's normal field tests.

6. Submit final test report with summary comparing field test data with harmonic analysis design calculated values for each drive.

7. Testing determined not in compliance with Contract documents shall be repeated by the Contractor at no additional cost to the Owner.

3.05 CONTRACT CLOSEOUT:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

Page Intentionally Left Blank

SECTION 26 29 23.1

MEDIUM VOLTAGE VARIABLE FREQUENCY DRIVE

PART 1 - GENERAL

1.01 DESCRIPTION:

A. This specification and related Contract documents define the minimum requirements for design, manufacture, inspection and testing of medium voltage variable frequency drive (VFD) assembly for IPS Electrical Building facility.

B. The VFD shall be capable of continuous operation in an average ambient temperature between 0°F and 104°F at an elevation of 4500 feet above MSL without derating.

C. Delegated design includes programming of protection relay and incorporation of field protection features.

1.03 SUBMITTALS:

A. For Review/Approval

1. Master drawing index

2. General arrangement drawings with outline dimensions, including locations of all components and devices

3. One-line diagram

4. Wiring/Schematic diagram

5. Nameplate schedule

6. Component list

7. Conduit entry/exit locations

8. Assembly ratings

9. Cable terminal sizes

10. Product data sheets, including full harmonic spectrum data and heat loss data

11. Installation information including anchorage provisions

12. Recommended spare parts

13. Auxiliary load list (fans, control power, etc.)

B. Final Documentation

1. Certified as-built drawings for items listed in paragraph 1.3 A, incorporating all changes made during the manufacturing process

2. Certified production test reports

1.04 QUALITY ASSURANCE:

A. Every variable frequency drive system shall meet the performance, protection, safety, testing, and certification criteria of this specification. This system may include incoming harmonic filter, VFD converter/DC link/inverter, and output filter.

B. The VFD assembly shall be completely factory pre-wired, assembled, and then tested as a complete package by the VFD manufacturer, before delivery, to assure a properly coordinated, fully integrated drive system.

C. Items provided shall be listed or labeled by UL or other Nationally Recognized Testing Laboratory (NRTL).

D. Terms “NRTL” shall be as defined in OSHA Regulation 1910.7.

E. Terms “listed” and “labeled” shall be as defined in National Electrical Code, Article 100.

F. The manufacturer of the VFD assembly shall be the manufacturer of the major components within the assembly.

G. The VFD shall be manufactured by the VFD supplier at its own facility which is certified in accordance with ISO Standard 9001.

1.05 DELIVERY, STORAGE AND HANDLING:

A. Equipment shall be handled and stored in accordance with manufacturer’s instructions. One (1) copy of these instructions shall be included with the equipment at time of shipment.

B. VFD shall be suitable for skidding in place on rollers using jacks to raise and lower the groups.

1.06 OPERATION AND MAINTENANCE MANUALS:

A. Equipment operation and maintenance manuals shall be provided with each assembly shipped and shall include instruction leaflets and instruction bulletins for the complete assembly and each major component.

PART 2 - PRODUCTS

2.01 MANUFACTURERS:

A. The VFD manufacturer shall be able to demonstrate at least 15 years of experience in manufacturing VFDs at medium voltage and their capability to provide parts and service

support. A user's list of similar design equipment, complete with contact names and telephone numbers, shall be furnished upon request.

2.02 DESIGN REQUIREMENTS:

A. The VFD described in this specification shall be designed for operation on a 4.16 kV, three-phase, three wire, solidly grounded, 60-Hertz system.

B. The VFD shall be based on applicable standards and in accordance with this specification and drawings

C. The VFD application will be for induction type motor.

D. The VFD shall have a direct-to-drive technology (integral AC line reactor) which allows connection without the requirement of an isolation transformer.

E. The VFD shall have Active Front End (AFE) rectifier for input harmonic mitigation.

F. Inverter design shall have a pulse width modulated (PWM) configuration, with smoothing technologies to avoid reflected wave phenomena and to reduce total harmonic distortion, as measured by current, to less that 5%.

G. Inverter is to be sized for elevation, potential ambient temperatures, and for actual motor power factor or 67% power factor, whichever results in the maximum VFD current rating.

H. Provide on-board processor with programming as required to take over control of pump and to maintain wetwell level as an individual motor controller upon loss of PLC or upon loss of PLC communications.

I. Provide suitable I/O, both analog and discrete, to monitor discharge valves, vibration sensor, level sensors, and similar, as identified in the 40 61 96 Process Control Description.

1. Not limiting the above, the Instrument Loop Diagram (ILD) sheets require two performance modes:

    a. Control of VFD by SCADA.

    b. Control of VFD transferred to level switch control, as signaled by an external dry contact, note key constraint that VFD must be able to change motor speed based on which level switch is high during this mode. Alternately, provide microcontroller as specified later in this Section. Processing requirements to fulfill both control modes is the responsibility of the Medium Voltage Variable Frequency Drive provider, not the Plant Integrator.

J. Provide manufacturer's conformal coating options for all circuit boards where this option is available. This includes, but is not limited to, processor, protective relay, network switch, Modbus/TCP gateway, power electronics, and HMI interface.

2.03 PERFORMANCE:

A. Operating Envelope

1. The VFD shall be capable of producing a variable AC voltage/frequency output to provide continuous operation over the normal system 20-100% speed range.

2. The VFD must be capable of operation at 1/10 speed to facilitate checkout and maintenance of the driven equipment.

3. As a commissioning and troubleshooting feature, the VFD power circuit shall be capable of operating without a motor connected to the VFD output.

4. One-minute overload capability (1 minute every 10 minutes) shall be provided consistent with the application requirements defined in this specification. Overload shall be at least 115% of the full load.

B. Input Voltage Tolerance

1. The VFD shall have input voltage tolerance of ±10% of nominal voltage.

C. Input Frequency

1. The VFD shall have input frequency ±5% at 60 Hz.

D. Input Power Factor

1. The VFD shall maintain greater than 0.95 power factor at all speeds and loads.

E. System Efficiency

1. The VFD efficiency shall be above 95% at all speed and loads.

F. Speed Regulation

1. The VFD speed regulation shall be 0.5% without encoder feedback.

G. Input Harmonics

1. VFDs shall comply with the latest edition of IEEE 519 for total harmonic current distortion, calculation and measurement, and meet the above distortion limits without causing the VFD to operate at a leading input power factor from 30% to 100% of rated speed.

2. Voltage Harmonics: individual or simultaneous operation of the VFDs shall not add more than 3% total harmonic voltage distortion while operating.

3. Total harmonic current distortion limits for each individual VFD shall not exceed 5% as calculated and measured at the point of common coupling, defined as the input connection of each VFD.

H. Motor Compatibility

1. The VFD must provide motor overload protection in any operating condition.

2. The VFD must include top-level contactor to shut down internal power components upon system fault.

3. The VFD output waveform shall be suitable for operating a squirrel cage induction motor without de-rating or requiring additional service factor. To ensure that there are no problems with motor heating, VFD output current waveform, as measured at the motor, shall be inherently sinusoidal at all speeds, with a total harmonic current distortion not exceeding 3% referenced to the full load output current fundamental between 10% and 100% speed.

4. The VFD shall inherently protect motor from high voltage □v/□t stress, independent of cable length to motor. VFD shall not require non-standard insulation systems or insulation ratings above the VFD output voltage rating.

I. Metering

1. Power quality metering shall be inherent to the VFD system to continuously monitor and display input and output power quality. This will allow easy customer verification of power quality and efficiency for the VFD system.

2. As a minimum, the following door mounted digital indications with a resolution of at least ±0.01% and an accuracy of 1%, shall be supplied:

a. Input/output Voltage

b. Input/output Current

c. kW Output

d. Power Factor

2.04 AVAILABILITY:

A. Firing Signals

1. All internal firing signals and other communications with power components, such as status and diagnostic signals, must meet noise immunity and safety requirements as defined by the applicable standards referenced in Section 1.2.

B. Failed Power Electronic Device

1. If any power switching device in both the converter and inverter sections and/or switching device control circuitry fails, the VFD shall initiate a process trip and the VFD shall annunciate and identify the specific location of the failed device.

C. Power Interrupt Ride-Through

1. The VFD system must be capable of continuous operation in the event of a power loss of a minimum of 5 cycles. Beyond this, the VFD must shut down until a user-adjustable time delay has expired, generally as required for motor to spin down.

2. VFD to be capable of catching a spinning motor, for conditions when shut down timer may not be adequate for motor to completely stop.

3. The VFD system must be capable of automatically restarting in the event of a momentary loss of power. The VFD system shall be configured to automatically restart without user intervention, but also provide the user with the choice of automatically restarting or not. A safety device (hard key or password) must be available to allow enabling, disabling, and setting changes to this feature only by authorized personnel. The user shall be able to selectively apply this feature and can set the allowable restart time applicable to some (but not necessarily all) conditions as determined by the user to be appropriate for the specific application.

D. Power Sag Ride-Through

1. The VFD system shall be capable of maintaining continuous operation with a 35% voltage sag on the input power line. Such operation shall be maintained if medium voltage is absent (or below 65%). If enabled, the control shall monitor the motor flux (both magnitude and phase) as it decays based on the motor open circuit time constant. If the drive is restarted and the motor flux is still above 4% of rated, the drive shall re-magnetize the motor and follow the speed ramp without any delay.

E. Auto-Restart Capability

1. The VFD system must be capable of automatically restarting in the event of a process or drive trip if input MV is present. The VFD system shall provide the user with the choice of automatically restarting or not. The user shall be able to selectively apply this feature to some (but not necessarily all) conditions as determined by the user to be appropriate for the specific application. This option shall be hard-key or password protected to avoid unwanted changes by unauthorized personnel.

F. Ground Faults

1. In the event of an input or output ground fault, the VFD shall be capable of annunciating the ground fault condition, safely operating, and by user selection, either trip or continue operation.

2. The VFD shall be capable of detecting output ground fault of 10mA to ensure personal safety. The manufacturer shall provide a valid type test to show that protection and detection works as described.

2.05 SERVICEABILITY/MAINTAINABILITY:

A. Front Access

1. The VFD system should be designed for front access only. VFD manufacturer shall state in their proposal if rear or side access is required. An explanation of reason and specified distance for any required rear or side access shall be given.

B. Voltage Isolation

1. All low voltage components, circuits, and wiring shall be separated with physical barriers from any sources of medium voltage.

C. Mean Time to Repair (MTTR)

1. In the event of a power electronic failure, removal and replacement should take an average of 20 minutes, after capacitors have discharged and safe working conditions have been established.

2.06 PROTECTIVE DEVICES:

A. Drive Protection

1. The VFD shall have built-in short-circuit detection and protection. Software shall include protective functions which detect abnormal conditions due to an internal power circuit sub-component failure(s). And as such, VFD will fault if abnormal conditions are present. Protective functions shall include:

a. Excessive Input Reactive Current Detection (One Cycle Protection)

b. Excessive Drive Losses Protection

2. The VFD shall be protected from VFD overtemperature.

3. The VFD system shall include distribution class surge arrestors to protect the converter and its input transformer against voltage surges.

4. The VFD system shall include power fuses on the input to the converter devices to protect from any potentially harmful fault currents.

5. The VFD system shall be protected from damage due to the following:

    a. Single-phase fault or 3-phase short circuit on VFD system output terminals.

    b. Power device failure to commutate/switch due to severe overload or other conditions.

    c. Loss of input power due to opening of VFD input disconnect device or utility power failure during VFD operation.

    d. Loss of one phase of input power.

6. The VFD shall be able to withstand the following fault conditions without damage to the power circuit components:

    a. Failure to connect a motor to the VFD output.

    b. VFD output open circuit that may occur during operation.

    c. VFD input or output ground fault.

    d. VFD input or output single-phase

B. Motor Protection

1. VFD shall be equipped with motor protection relay for RTD thermal protection. RTD module/cards shall have 10 RTD inputs minimum and shall be compatible with three-wire RTD types.

2. The motor protection relay shall be able to communicate via Modbus TCP/IP using Ethernet switch.

C. Motor Protective Relay:

1. Provide VFD-native protection or SEL-710-5 relay with option cards, as required to:

    a. Monitor overcurrent and time-overccurent parameters to the motor.

    b. To protect the motor from thermal overload, with both mathematical modelling and with 10 RTD option card.

    c. To process Discrete Inputs as required for interlock monitoring and Discrete Outputs to interlock / shutdown drive.

d. Provide Dual Ethernet 10/100 ports, with ModbusTCP protocol as required for SCADA monitoring of Vibration protection system and each RTD.

e. Where relay is provided, incorporate relay into door control of VFD, but ensure VFD dimensions do not exceed those shown in electrical plans.

2. Provide small form factor ethernet switch to route data between VFD processor and protective relay.

3. Provide integral Zelio microcontroller with analog expansion card as required to provide float control mode, unless all required functions are native within the VFD, or are accommodated by manufacturer's standard options. Include programming to accommodate float and PLC control modes within scope of provision for this microprocessor.

2.07 CONTROL INTERFACE:

A. The VFD shall have the availability to do the following control signals, indications, and alarms via ethernet:

1. VFD in Remote

2. VFD Running

3. VFD Warning

4. VFD Fault

5. Motor bearing RTD Alarm

6. Motor winding RTD Alarm

7. Speed indication

8. Current indication

9. Voltage indication

10. Real Power (kW) indication

11. Power indication

12. Remote Start

13. Remote Stop

14. Remote Fault Reset

15. Speed Control

B. The VFD shall be provided with integrated control provisions to operate or trip an incoming power disconnect device.

C. The VFD shall be provided with means to shut down the motor when remote Emergency Stop (E-Stop) signal is sent to the VFD.

2.08 DIAGNOSTICS AND FAULT RECORDING:

A. The VFD shall include a comprehensive microprocessor based digital diagnostic system which monitors its own control functions and displays faults and operating conditions.

B. Fault log data storage memory shall be stored in non-volatile memory or be supported by a UPS sized to provide a minimum of 48-hour data retention.

C. A "fault log" shall record, store, display, and print upon demand, the following for the 256 most recent events:

1. VFD mode (Local/Remote)

2. Date and time of day

3. Type of fault

4. Reset mode (Local/Remote)

D. A "historic log" shall record, store, display, and print upon demand, the following control variables at an adjustable time interval for the 50 intervals immediately preceding a fault trip and 100 intervals following such trip:

1. VFD mode (local/remote/inhibited/tripped/etc.)

2. Speed demand

3. VFD output frequency

4. Demand (output) amps

5. Feedback (motor) amps

6. VFD output volts

7. Type of fault

8. Drive inhibit (On/Off)

9. The fault log record shall be accessible via an ethernet port, as well as, line by line on the keypad display

E. The VFD system shall be provided with the capability for remote diagnostics via ethernet link.

2.09 PROGRAMMING AND COMMUNIATIONS:

A. User Input/Keypad

1. The door of each power unit shall include manual speed device, a mode selector marked “Local/Remote”, a “POWER ON” light, a VFD “FAULT” light, a VFD “RUNNING” light, start pushbutton, stop pushbutton, and reset pushbutton.

2. A door-mounted keypad with integral digital LCD display shall be furnished, capable of controlling the VFD and setting drive parameters. The display must present all diagnostic message and parameter values in standard engineering units when accessed, without the use of codes. The keypad shall allow the operator to enter exact numerical settings in standard engineering units. A plain language (English) user menu (rather than codes) shall be provided in software as a guide to parameter setting. This device shall be fully compliant with applicable Norms related to enclosures.

3. Drive parameters shall be factory set in non-volatile EEPROM registers and re-settable in the field through the keypad. A minimum of 6 levels of password security shall be available to protect drive parameters from unauthorized personnel. The EEPROM stored drive variables must be able to be transferred for programming of new or spare boards.

4. The VFD system shall have the user selectable option of programming up to 3 speed avoidance bands. This gives the user the ability to block out and prevent operation at any undesirable speed, such as one that may be coincident with a mechanical resonance condition. The loss of the keypad or display shall be annunciated as a fault but shall not result in a VFD trip.

B. Serial Communication/Protocols/Modem or Cable

1. The VFD shall be capable of digital communication for setup of parameters, fault diagnostics, trending, and diagnostic log downloading.

2. The VFD shall be provided with ethernet switch(es) to communicate with the facility PLC network.

2.10 MATERIALS AND CONSTRUCTION:

A. The VFD shall be capable of continuous operation in an average ambient temperature between 4°F and 102°F at an elevation of 4400 feet above MSL without derating.

B. The VFD shall be sized to accommodate the continuous current ratings and shall be braced for a minimum symmetrical incoming fault current of 40 kA.

C. Cooling System

1. The VFD shall be forced air-cooled and shall be provided with fan redundancy and automatic switchover in the event of a fan failure for enhanced reliability. If a fan fails, the system must automatically switch to the alternate fan and generate an alarm to notify operator of initial fan system failure. During normal operation, the system must periodically cycle between the redundant fan systems to prevent drying out of bearings, seals, etc.

D. Enclosure

1. The VFD enclosure shall be NEMA Type 1A gasketed, ventilated and rigidly constructed.

2. Ventilated enclosure shall have cleanable filter media covering all air inlets and shall be front replaceable without exposing maintenance personnel to any of the power components.

3. Cabinet and doors shall be heavy gauge formed or structural steel for sturdy construction for dimensional integrity to assure long-term fit and function.

4. Enclosures must be designed to avoid harmonic and inductive heating effects.

5. Finish shall be manufacturer's standard.

6. Enclosure doors shall be hinged and shall be complete with keyed safety interlocks. It shall not be possible for the doors to be opened while the VFD is energized (this requirement is not applicable to the low voltage control cabinet doors).

E. Wiring and Terminal Blocks:

1. Control and indication wiring shall be #14 AWG, current transformer wiring shall be #10 AWG, and potential transformer wiring shall be #12 AWG. Internal power wiring shall be a minimum #12 AWG.

2. All control wiring shall be UL listed and have a VW-1 flame rating.

3. Terminal blocks used for external connections of control and signal circuits shall be provided.

4. Terminals shall be provided for terminating the shields of each shielded cable, immediately adjacent to the signal conductors.

5. Screw type terminal blocks shall be provided for all control wiring. No more than two wires shall be connected to one terminal block point.

6. No more than one wire shall be on any terminal lug, including jumper wires. A minimum of 20 percent spare terminal points shall be provided. Adequate space shall be provided on both sides of the terminal block for connecting wires and for wire markers.

7. Terminal blocks shall be provided with marker strips attached to terminal blocks, not to the covers. Wires numbers shall be marked on these marker strips by engraving or by using indelible ink.

8. All internal interconnecting wiring crossing a shipping split shall be labeled, coiled, and secured for field termination. Sufficient length of wire shall be provided to enable direct connection to the appropriate section, without the need for intermediate terminal blocks or splices.

9. Where wiring passes metal edges or through holes, suitable guards and grommets shall be provided to prevent cutting or scratching insulation.

F. Interlocks

1. Mechanical key interlocks shall be provided on all MV hinged doors.

2. Interlocking shall be fully coordinated to prevent access to all high voltage compartments when line power is applied to the VFD system.

3. Interlocks must be mechanical to provide positive lock-out prevention and safety.

G. Control Power

1. Control voltage shall be 120V AC supplied internally from an integral UPS furnished with VFD, with power supplied from UPS-backed panelboard. Label VFD with indication enclosure is supplied from more than one source, and identify locations required for disconnection.

H. Control Devices and Indicating Lights

1. LED type indicating light shall be provided for each VFD.

2. Each control device, relay, indicating lights, etc. will operate at 120V AC.

I. Nameplates:

1. Permanent engraved lamacoid nameplates with black lettering on a white background for all panels, relays, control switches, instruments and devices, including transformers, circuit breaker, and compartments shall be provided.

2. Safety signs and labels shall be in accordance with ANSI Z535.4.

3. Equipment and terminal blocks within the compartment shall be suitably identified.

4. Nameplates shall be mounted with self-tapping stainless screws.

5. A stainless steel nameplate showing manufacturer's name, type and identification number, year of manufacture, continuous current rating, interrupting rating in amperes, and maximum voltage rating shall be provided.

PART 3 - EXECUTION

3.01 FACTORY TESTING:

A. Standard factory tests and production tests shall be performed on each VFD.

B. The manufacturer shall provide three (3) certified copies of factory test reports.

3.02 INSTALLATION:

A. The Contractor shall install all equipment per the manufacturer's recommendations and contract drawings.

B. All necessary hardware to secure the assembly in place shall be provided by the Contractor.

3.03 FIELD ADJUSTMENTS:

A. The relays shall be set in the field by the Contractor in accordance with settings designated by the engineer.

3.04 RELAY INTEGRATION:

A. Delegated design - Program relay to avoid motor operating in conditions that could damage it, as defined by damage curve of motor, RTD sensors, and vibration protection system.

B. Program mathematical model for motor per relay manufacturer instructions.

C. Program appropriate responses to interlock VFD per field interlock devices and permissives.

D. Program option card, if provided, as required to determine sensor values, and to provide user-adjustable warning threshold for SCADA and shutdown parameters for VFD, including notification of SCADA.

E. Program pass-through from ModbusRTU to ModbusTCP protocol for features required by these Contract Documents.

F. Install relay into VFD control cabinet. Separate instrumentation conduits from other electronics.

3.05 FIELD INSPECTION AND TESTING:

A. Upon delivery, the VFD shall be inspected for physical defects and conformance to this specification.

B. Provide testing of system both in PLC and in no-PLC Autonomous Operation Mode.

END OF SECTION

SECTION 26 32 13

ENGINE GENERATORS

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide and test ready for operation, diesel engine-generator set complete with appurtenances, as indicated and specified.

B. The unit shall be provided in an outdoor, weather proof, sound attenuated enclosure. The unit shall be provided with double-walled, sub-base fuel tank, and provisions for circulating fuel between the belly tank and the facility's fuel storage system.

C. Each unit shall have a minimum site rating of 2000 KW, 2500 KVA power rating, standby, at 80 percent lagging power factor, three-phase, 60-Hertz, 4.16kV, four-wire, alternating current generator.

D. The unit shall be arranged for automatic starting and stopping, and load transfer upon failure of the normal source of power through automatic throw over system. The engine generator set shall exhibit less than 20 percent voltage dip and less than 5 percent frequency dip during starting of the loads identified in Attachment A to this Section.

E. The engine-generator package shall be complete in all respects and shall include all equipment and controls necessary for a fully operational standby power supply system.

F. Provide fully enclosed walk-in enclosure suitable for installation on concrete pad as indicated on the drawings. Include any galvanized steel platform and steps, with railing system necessary for normal operation and to allow servicing the units from a raised platform due to the height of the sub-base fuel tank.

G. Provide, as a package system from the engine generator manufacturer, Switchgear 01-SWGR-99110, specified on plans, Single Line Diagrams, and Section 26 13 13, with Sequence of Operations as specified in Section 26 13 13S.

1.03 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00 and as specified:

B. Submit shop drawings and manufacturers' product data in accordance with the requirements of Section 26 05 10.

C. A copy of this specification section with addenda and all referenced specification sections with addenda, with each paragraph check-marked to indicate specification compliance.

1. Failure to include a copy of the marked-up specification sections will result in return of the entire submittal without further review and consideration until the marked-up specification are resubmitted with the entire package.

D. Outline equipment and enclosure drawings, equipment catalog cuts, wiring and connection diagrams and other documents required to completely describe the systems and equipment being furnished. Elevation drawings with shipping splits and estimated weights identified.

E. Identification, description and dimensions.

F. Engine-generator skid base drawings including spring vibration isolators. Drawings shall indicate size and location of anchor bolts, and conduit electrical device locations.

G. Performance specifications of all items of equipment.

H. Control panel layout drawings, dimensions, and component bill of materials. Outline drawings showing conduit entry areas and anchoring information. Description of control including operation of interface equipment.

I. Complete electrical, instrumentation, control and wiring diagrams in sufficient detail to allow installation of instrumentation and controls and electrical components.

J. Provide certificate of conformance to UL Standard 2200, Stationary Engine Generator Assemblies.

K. Attenuation curve for the silencing equipment as offered to accomplish the required silencing for this installation.

L. Information on the proposed jacket water treatment and procedures for flushing of the cooling systems.

M. Operations and Maintenance Manuals, covering all equipment furnished, annotated to reference only the specific model numbers supplied. Include parts lists and parts prices current to the date of submittal; include information relevant to part supply and ordering. Submit prior to the startup and testing of the engine/generator units. Submit in accordance with Section 01 33 00, Section 01 78 36 and as specified herein.

N. Manufacturer's certified shop test record of complete engine driven generator unit.

O. As-built drawings and material summary shall be shipped with the equipment.

P. Engine generator loading calculation, per the requirements of Attachment A to this section.

Q. Data to be provided by engine generator system supplier:

1. Submit generator loading calculations and data for engine, generator, and accessories: (for rated kW capacity).

    a. Engine Data:

        (1) Manufacturer

        (2) Model

        (3) Number and arrangement of cylinders:

            (a) RPM

            (b) Bore X stroke

            (c) Maximum power at rated RPM

            (d) BMEP at rated kW (including any parasitic loads and generator efficiency)

            (e) Piston speed, feet per minute

(f) Make and model of governor

(g) Make and model of overspeed shutdown device

b. Generator Data:

(1) Manufacturer

(2) Model

(3) Rated kVA

(4) Rated kW

(5) Voltage

(6) Temperature rise above 40 degrees C ambient. Stator by thermometer and field by resistance in degrees C.

(7) Class of insulation

(8) Generator efficiency including excitation losses at 80 percent PF:

(a) Full load

(b) Three quarters load

(c) Half load

(9) Generator subtransient reactance in ohms and Per Unit value.

c. Guaranteed maximum fuel consumption rate at generator terminals at 138,000 BTU/gallon of No. 2 diesel fuel:

(1) Full load, gallons/hour

(2) Three-quarters load, gallons/hour

(3) Half load, gallons/hour

d. Generator unit and accessories

e. Weight of complete unit, with break down by engine-generator set, base tank, and fuel.

f. Exhaust gas emissions data, maximum values at full load, 3/4 load, 1/2 load, and 1/4 load:

(1) Temperature in degrees F

(2) Flow in ACFM (mass and volume)

g. Combustion air requirement in CFM

h. Cold cranking amperes rating of engine starting batteries (CCA) at 0 degrees F.

R. Provide manufacturer's printed installation instructions including anchoring details to meet earthquake requirements as specified and indicated.

S. Performance Test Reports: Upon completion of installed system, submit in booklet form all field tests performed to prove compliance with specified performance criteria including final settings of devices.

1.04 SEISMIC REQUIREMENTS:

A. Contractor shall conform to the seismic requirements as indicated and as specified in Section 01 41 20.

B. The Contractor shall conform to the seismic design requirements for this project and for the work of this specification section.

C. Provide all equipment bases, anchorage, supports and foundations designed in accordance with the seismic requirements indicated and specified such that units will remain operational after a seismic event or conditions occur as indicated in the referenced seismic specification section.

D. Additionally, provide with the Certificate of Unit Responsibility, certification for all equipment signed by a registered structural engineer stating that computations were performed and that all components have been sized for the seismic forces specified and indicated.

1.05 QUALITY ASSURANCE:

A. Provide in accordance with Section 01 45 00 and as specified.

B. Contractor to ensure that conduit size and wire quantity, size, and type are suitable for the equipment supplied. Contractor to review the proper installation of the equipment and of each type of device with the equipment supplier prior to installation.

1.06 DELIVERY, STORAGE AND HANDLING:

A. Provide in accordance with APWA Section 01 66 00 and as specified.

B. Protect all equipment placed into storage from weather, humidity and temperature variations, dirt, dust, and other contaminants.

1.07 REGULATORY REQUIREMENTS:

A. Local State and City Air Pollution Control Laws.

B. Provide all required data and information for a Title V local air pollution control district operating permit.

C. Federal Clean Air Act (42 United States Code (U.S.C.) 7401 et. seq.)

D. Federal Air Pollution Control Regulations: 40 Code of Federal Regulations (CFR) Parts 50-99, as amended by the Federal Register.

E. Furnish to the Owner, within 15 working days of the date of any request, all documents and other information required to verify compliance with permit and applicable air pollution control laws and regulations, including EPA Tier 2 emission requirements in effect at the bid date of the project.

1.08 SPARE PARTS:

A. Comply with the requirements specified in Section 01 61 00.

B. Provide spare parts that are identical to and interchangeable with similar parts installed for each engine-generator set plus following:

1. Two filter for all services

2. Two fuse for each rating

C. Provide a list of recommended spare parts for the first year of operation and for the first five years of operation, including a price list and location of the nearest facility from which all spare parts can be obtained.

D. Provide two sets of acoustic hearing protection, ear-muff devices, industrial grade, with acoustic foam filled cushions.

E. Pack spare parts in suitable containers or boxes bearing labels clearly designating contents and piece of equipment for which they are intended.

F. Deliver spare parts at same time as equipment to which they pertain. Properly store and safeguard spare parts until completion of the work, at which time deliver them where directed by the Engineer.

1.09 WARRANTY AND SERVICE:

A. Provide in accordance with Section 01 78 36.

B. The generator set manufacturer's standard factory warranty shall in no event be for a period of less than two (2) years from date of initial start-up of the system and shall

include repair parts, labor, reasonable travel expense necessary for repairs at the job site, and expendables (lubricating oil, filters, antifreeze, and other service items made unusable by the defect) used during the course of repair. Running hours shall be limited to 500 hours annually for the system warranty by both the manufacturer and servicing distributor.

C. Ensure that equipment manufacturer has local branch office staff with trained, full-time employees who are capable of performing testing, inspecting, repair, and maintenance services.

PART 2 - PRODUCTS

2.01 MANUFACTURERS:

A. Caterpillar Inc.

B. Cummins Power Generation Inc., Onan Products

C. Kohler Co.

D. Or approved equal.

2.02 GENERAL:

A. Engine-generator set and enclosure shall be a factory-assembled unit that is a standard production unit with existing torsional analysis data. Mixing and matching engine and generator by a third party supplier is not acceptable. The engine and generator shall be directly connected with a flexible coupling, shall be free from injurious torsional or other vibration.

B. The engine and generator shall be directly connected.

C. The engine-generator set shall allow easy access to the various parts for maintenance purposes.

D. The engine-generator set shall be pre-piped and pre-wired.

E. The complete engine-generator unit shall be free from harmful torsional or other vibration throughout the entire operating range of speed and load. The engine manufacturer shall provide an analysis of the complete engine-generator unit, which shall show where any critical speed will be encountered, together with the order, the frequency and magnitude of any critical speed.

F. The engine-generator set operating in an ambient temperature of 40 degrees C shall have a standby power capacity of not less than that indicated at 0.80 power factor, and shall operate at a speed not to exceed 1,800 rpm. It shall be rated as previously indicated in this section.

G. Frequency regulation shall not exceed 3 Hertz for step load from no load to rated load. Frequency variation shall not exceed plus or minus 0.3 Hertz for constant loads from no load to rated load.

H. Voltage regulation for step load from no load to rated load shall be within plus or minus 4 percent of rated voltage for units up to and including 25 kW and within plus or minus 5 percent or percent of rated voltage for units rated 30 kW or higher. Voltage variation shall be within plus or minus 1 percent of the mean value for constant loads from no load to rated load.

I. Mount the engine generator on a heavy steel sub-base with spring type vibration isolators.

J. Provide generator set with integral neutral grounding resistor.

K. Provide generator set with internal panelboard for distribution of onboard loads. Delegated Design – design and submit power system for enclosure with generator set. Provide lightning protection system for enclosure and external Surge Protective Device adjacent to panelboard.

2.03 GENERATOR:

A. Generator shall be rated for continuous duty; shall be rotating field, engine-driven, direct-connected, synchronous type with amortisseur winding. Generator frame shall be dripproof with all openings guarded. Bearings shall be sleeve or sealed ball type. The generator shall be mechanically and torsionally matched to the engine driver and shall be provided to withstand inherent pulsating torques of the engine. Full load efficiency of the combined generator, exciter and regulator shall be not less than 95 percent. The generator windings, insulation and excitation system shall be braced to withstand any possible short-circuit stresses.

B. Generator insulation shall be Class H or F in accordance with NEMA Standard MG1-1.65. Stator shall be form wound – random wound is unacceptable. Temperature rise shall be no more than 105 deg C at 40 deg C in accordance with NEMA Standard MG1-22.40 for continuous duty at all output ratings.

C. Design generator system to accept loads without slowing by more than 6 Hz and without decreasing system voltage below 10% of nominal.

D. Voltage regulator shall be an automatic, temperature compensated, solid-state type with a manual adjustment range of plus or minus 5 percent of rated voltage. The generator windings, insulation and excitation system shall be braced to withstand any possible short-circuit stresses.

E. Exciter shall be a solid-state, static type or brushless rotating type utilizing rotating diode rectifiers. Minimum rating of exciter shall be as indicated in NEMA Std. MG-1-22.16.

PMG type exciters, with a minimum exciter rating per NEMA Std. MG-1-22.16, is an acceptable alternative.

F. Include components for field flashing and field discharge. Fast acting fuses or other protective devices shall be incorporated where failure of regulator or exciter components could result in damage to the generator field or exciter windings. Provide spares for fuses and other non-resettable protective devices.

G. Voltage regulator and static exciter shall be mounted in generator control panel or elsewhere so as to protect from and isolate from vibration.

H. The generator shall conform to the applicable parts of the following standards, unless otherwise specified:

1. NEMA MG1, Motors and Generators.

2. IEEE 43, Recommended Practice for Insulation Testing of Large AC Rotating Machinery.

3. CSA C22.2- No. 100, Motors and Generators.

4. Testing shall be in accordance with IEEE-115 and NEMA MG-1 standards

I. The stator frame shall be fabricated bar and plate steel construction.

1. All insulation materials used in the stator shall have a temperature rating of Class H per IEEE Standard 1. The coils shall be of a formed coil construction using a magnet wire meeting NEMA MW36-C specifications.

2. The complete stator shall be wound with a 2/3 stator winding pitch and processed in a vacuum pressure impregnation chamber. Encapsulation of the stator shall be accomplished with a two-part epoxy system.

J. Generator lead terminal box shall be of ample size to accept and terminate connecting cables as indicated on the drawings. Generator leads shall be furnished with terminal connectors suitable for the customers connecting cables.

K. Provide generator stator winding heater with thermostat wired at 120 VAC to prevent formation of condensation.

2.04 DIESEL ENGINE:

A. Heavy-duty compression-ignition, cold-starting diesel type arranged for direct connection to an alternating current generator. It shall be a current model of a type in a regular production by a manufacturer regularly engaged in building this type of diesel engine. Engine shall have at least a published intermittent brake horsepower rating at specified generator speed required by generator at rated full load output and shall operate without undue heating, vibration, or wear.

B. Engine may be a two-cycle or four-cycle and may be naturally aspirated, scavenged, or turbocharged.

C. Engine shall operate satisfactorily on No. 2 fuel oil.

D. Performance, materials, and workmanship shall be in accordance with Diesel Engine Manufacturers Association standard practices.

2.05 ENGINE ELECTRICAL SYSTEM:

A. Electrical system shall include a battery, starting motor, voltage and current-regulated charging generator or alternator, and a separate battery charger. Battery shall be of suitable capacity to start engine at conditions specified and shall be guaranteed for three years.

B. Battery charger shall be automatic, two rate type providing for equalizing charge and continuous taper charging. Output characteristics shall match requirements of battery furnished. Provide charger suitable for operation on 120 volt, single-phase, 60 Hertz current to be rated not less than 10 amp direct current. Furnish battery charger with following features:

1. Direct current voltage regulation: plus or minus 2 percent for variations in line voltage of plus or minus 10 percent.

2. Direct current voltmeter and direct current ammeter, each with suitable scales.

3. Automatic surge suppressor.

4. Automatic current limiting to prevent overloading due to engine cranking, shorted output or reversed battery connections.

5. Alternating current line fusing.

6. Equalize charge rate with manually set timer.

7. Integral protection to prevent battery discharge through charger on loss of alternating current line voltage.

8. Terminal block with terminals for all external connections.

C. Where wall mounting is indicated, enclosures shall be suitable for conduit connection and ventilating openings shall be guarded.

D. Provide battery rack to accommodate starting batteries and supporting rack for battery charger. Racks shall be seismically rated, secured to (and within) the weatherproof enclosure, free-standing type.

E. Provide 120 VAC battery pad heater with thermostat or and provide lead/lad redundant space heaters for the weatherproof enclosure interior instead of using block heater, battery heater, etc.

2.06 ENGINE APPURTENANCES:

A. Furnish engine with following appurtenances:

1. Combustion air cleaner of oil bath type or dry replaceable filter type. A tube shall connect crankcase breather with air cleaner to prevent accumulation of objectionable smoke and fumes.

2. Critical grade exhaust silencers complete with drains and flexible stainless-steel connection. The entire exhaust system shall be insulated.

B. Governors:

1. Provide governor capable of:

a. Maintaining engine speed from no load to full load within 3 percent of synchronous speed.

b. Load sensing and load sharing controls.

c. Electronic control from from paralleling switchgear.

2. Governors shall be controlled electrically from paralleling switchgear.

2.07 CONTROL PANELS:

A. Engine and generator control panels may be separate panels, or a combined panel, and mounted with vibration isolators on the unit. Instruments shall be of direct-reading type, factory mounted and factory connected. Instruments shall be accurate within 3 percent.

B. Provide engine panel with following features and instruments:

C. Three-position engine control switch:

1. Stop/Reset: In this position, the engine shall not be capable of starting and/or running. If the engine was shutdown due to the operation of a protective device, the shutdown malfunction shall be reset when the switch is moved to this position. If the engine is running when the switch is moved to this position, it shall be immediately shutdown. Provide audible alarm when switch is in this position.

2. Automatic: In this position, the engine control shall be in readiness for fully automatic operation upon receipt of a start signal.

3. Test: When placed in this position, the engine shall start and run as if a start signal were received except it shall not be connected to the bus unless a start signal is received. When returned to the automatic position, the engine will shut down.

4. Manual starting switch.

5. Full automatic starting from pilot device initiating start when normal power fails. Automatic cranking shall be interrupted cycle type not affected by ambient temperature with overall time limit. A total of five cranking cycles shall automatically shut down engine after a time delay.

6. Automatic shutdown devices with manual reset and individual indicating lights for:

    a. Low oil pressure

    b. High water temperature

    c. Low coolant level

    d. Engine overspeed

    e. Failure of engine to start

7. Auxiliary contacts on all aforementioned shutdown devices to operate a remote alarm. In addition, provide the following alarm contacts.

    a. Sub-base oil tank rupture

    b. Low fuel

    c. Low battery voltage

    d. Common fault alarm

    e. Not in automatic

    f. Generator run status

    g. Low coolant level

    h. Fuel tank system leak

8. Water temperature gauge

9. Ammeter-charging circuit

10. Tachometer

11. Lubricating oil pressure gauge

12. Fuel pressure gauge

13. Running time meter

14. Contacts and relays to operate exhaust fans and dampers required as part of the enclosure operation.

15. Generator panel shall include following instruments and information displays:

    a. Voltmeter, alternating current and phase selector switch with OFF position

    b. Ammeter, alternating current, and phase selector switch with OFF position

    c. Voltage-adjusting rheostat

    d. Three-phase wattmeter

    e. Frequency meter

    f. Where automatic synchronizing, and paralleling with other generator units is required generator breaker shall be electrically operated low voltage power circuit breaker. Circuit breaker shall conform to the provisions of NEMA Standard SG3.

2.08 FUEL STORAGE SYSTEM:

A. Above ground fuel storage system is specified under separate section.

B. Provide necessary suction and return line connections at pipe openings specified on plans.

C. Fuel piping between storage tank, sub-base tank, and engine shall be type K soft temper copper tubing with flared fittings unless noted otherwise in fuel system design. Where installed underground or embedded in concrete, tubing shall be run in protective conduit made of standard weight black steel pipe.

D. Tapped openings in storage tank shall be bushed to desired size with single- or double-tapped cast-iron tank bushing.

E. Provide foot valve on lower end of suction line in tank, 3 inch above bottom of tank. It shall be an all-bronze, double-poppet combination foot valve and strainer.

F. Sub-base tank vent shall be standard weight, black steel pipe with screwed malleable-iron fittings.

2.09 ENGINE FUEL SYSTEM:

A. Diesel fuel system shall consist of an engine-driven fuel supply pump, fuel filters, and a sub-base tank and lift pump set. Sub-base tank shall provide minimum 4500 gallons of fuel storage at the engine generator enclosure.

B. Fuel filters shall have elements which may be easily replaced without breaking any fuel line connection or disturbing fuel pumps or any other part of engine. Oil filters shall be conveniently located ahead of injection or circulating pump so that fuel is thoroughly filtered before it reaches injectors. Screens or filters requiring cleaning or replacement shall not be used in injection or circulating pump, or in injection valve assemblies.

2.10 ENGINE COOLING SYSTEM (RADIATOR COOLED):

A. Provide a unit-mounted radiator with integral jacket water circulating pump, and thermostatic control for cooling system.

B. Provide radiator of sufficient capacity to operate engine at full rated generator load at 120 degrees F ambient temperature.

C. Provide radiator with flange for connection to exhaust duct specified under Heating and Ventilating.

D. Provide engine coolant heater rated 208V, single phase, with thermostat.

E. Engine cooling system shall be charged with inhibited ethylene-glycol solution to provide antifreeze protection to 0 degrees F.

2.11 ENGINE LUBRICATION:

A. Provide full pressure system, supplying oil to all surfaces requiring lubrication. Circulation shall be by positive displacement pump. Full flow-type filters or filters with bypass feature shall be included. Filter elements shall be replaceable without disconnecting oil piping. Provide an oil cooler, if recommended by engine manufacturer, to properly lubricate engine at full rated generator load. Provide full charge of new oil after tests have been completed.

2.12 ENGINE GENERATOR SET ENCLOSURE:

A. Provide sound attenuated weather-proof outdoor, walk-in type enclosure, including:

1. Corrosion Resistant Construction

2. Stainless steel fasteners.

3. Guards for cooling fan and battery charging alternator.

B. Rigidity wind test equal to 150 mph

C. Roof load equal to 50 psf

D. Rain test equal to 5 inches per hour

E. Certified to meet following codes:

1. BOCA Basic Building Code

2. BOCA Basic Mechanical Code

3. State of Utah Building Code

4. 2018 International Building Code

F. Building to consist of roof, two side walls, and two end walls of prepainted steel stressed-skin construction, door and door frame, lifting rings, mounting frame, insulation, electrical package, louvers, exhaust fan, muffler mounting bracket, and other appurtenances to make complete installation.

1. Roof:

a. One piece combered roof sheet, min. 0.040 inch thick steel alloy, with extruded recessed side and end rails.

b. Roof bows, extruded "I" beams, spaced as required to carry loads.

2. Walls:

a. Posts to be extruded steel sections, sized and spaced as required to carry loads.

b. Panels to be min. 0.045 inch thick steel sheet, mill-prepainted, inside and outside, and riveted to posts.

3. Door and Door Frame:

a. Provide welded steel door frame of extruded steel alloy, riveted to side panels.

b. Provide personnel door gasketed to form weathertight seal, panic bar hardware with three point stainless steel locks and opening from inside in locked condition.

4. Lifting Rings:

a. Provide four lifting rings, two in each side of roof, for lifting shelter only. Capacity of lifting rings to match load.

5. Mounting Frame:

    a. Provide steel perimeter mounting frame for mounting onto concrete pad.

6. Insulation:

    a. Provide semi-rigid fiberglass thermoacoustic insulation. Insulation shall be held into the walls with perforated metal.

    b. Provide Level 1 sound attenuation for a 15 dBA noise reduction up to 23 feet from the enclosure.

7. Electrical Package:

    a. All equipment and devices UL listed. 125-Ampere Main circuit breaker with single phase, 3 wire, 60 Hertz, 125 Ampere bussing/gframe, 20 amp trip, 8-20 amp branch circuit breakers or as required by the auxiliary equipment required by the enclosure and related systems. Panelboards shall conform to the latest NEMA standards, National Electrical Code and Underwriters Laboratories, Inc. Provide equipment suitable for this power system, either identified for supply from 120V single-phase power or 208V single-phase power.

    b. Circuits as follows:

        (1) No. 1 - Lighting

        (2) No. 2 - Receptacles

        (3) No. 3 - Electric Heater

        (4) No. 4 - Exhaust Fan

        (5) No. 5 - Engine and Battery Heaters

        (6) No. 6 - Battery Charger

        (7) No. 7 - Motorized Dampers

        (8) No. 8 - Sub-base Tank

        (9) No. 9 - Spare

    c. Electric heater, control stations, and thermostat shall be as recommended by the manufacturer, subject to review by the Engineer.

d. Receptacles shall be duplex, 20 amp, 125 volt, 3 pole, 2 wire and shall be a ground fault interrupter receptacle unless protected by a ground fault interrupter circuit breaker.

e. Light switch shall be toggle type, 15 amp, 120 volt, single pole.

f. Light fixtures shall be a ceiling or pendant mounted enclosed and gasketed vapor tight LED type with acrylic lens.

g. Provide additional external full-cutoff LED wallpacks to illuminate walkway and stair treads, 4000K Correlated Color Temperature.

8. Manual Motor Starters:

a. Provide manual motor starters where indicated and for 120 volt, 60-Hertz fractional horsepower motors that do not have built-in thermal overload devices.

b. Manual starters within sight of motors, as defined by NEC.

9. Louvers:

a. Provide louvers and dampers for engine generator inlet and exhaust and ventilation air.

b. Fixed louvers, all aluminum construction, riveted into aluminized steel frame to form rigid, water resistant assembly. Motorized dampers as specified hereinafter.

c. Properly size louvers and dampers to allow sufficient engine combustion air, radiator cooling air, and ventilation air with maximum 0.5 inch water restriction. Coordinate with engine generator manufacturer.

10. Exhaust Fan:

a. Provide roof mounted exhaust fan capable of providing six air changes per hour.

11. Muffler Mounting Bracket:

a. Provide suitable bracket to secure critical grade generator silencer within the enclosure.

b. Coordinate with engine generator supplier as required.

G. Provide integral main fuel tank mounted at base of enclosure rated to UL 142.

1. The tank shall be double-walled with leak detection system provided. Coordinate with facility leak protection system, and both provide and integrate sensor into the overall master alarm, including points for notification in the plant SCADA system. Provide means to accommodate this secondary containment leak detection sensor, and associated interconnection(s). Reference 23 13 25, Facility Aboveground Diesel Fuel-Oil Storage Tanks, for additional requirements.

2. Provide means to accommodate 4-position floats, and associated interconnection, as specified in 23 13 25 Facility Aboveground Diesel Fuel-Oil Storage Tanks.

3. Float switch shall alarm on low level and at 95 percent capacity.

4. Tank shall have the capacity for uninterrupted service at 100 percent rated load for a period of 30 hours without being refilled.

2.13 PAINT:

A. Paint for exterior surfaces of equipment shall be two coats of acceptable oil- and heat-resistant paint, applied after surfaces have been thoroughly cleaned and prepared with suitable priming coat.

B. Provide touch-up paint in a quart container to Owner for use in field.

2.14 TOOLS:

A. Provide in accordance with Section 01 78 23.

B. Provide all special tools required for maintenance and repair of unit in metal box complete with lock and keys.

2.15 SHOP TESTING:

A. The complete engine-generator set with enclosure shall be shop tested at full load using a 0.8 power factor reactive load bank to simulate a complete and integrated system prior to shipment.

B. Provide all details of the proposed testing, including arrangements, test instruments and calibration, and procedures to be used to verify controls and alarms. The completed certified test record shall be submitted within 30 days after the completed test.

C. Tests shall verify that unit will operate successfully and meet all specified operational requirements and verify adequate means of enclosure ventilation is provided.

D. The shop test shall include four continuous hours of operation at full load and rated power factor. Voltage and frequency regulation and transient response shall be tested

and recorded to show full compliance with this specification. During the shop test, readings shall be taken and recorded every thirty minutes for each of the following:

1. Time
2. Ambient temperature
3. Volts for each phase
4. Load:
    a. Amps for each phase
    b. kW
    c. Power factor
    d. Frequency
5. Engine jacket water temperature
6. Lubricating oil pressure
7. Exhaust gas temperature
8. Fuel consumption

E. The procedure for the shop test of the diesel engine shall include the engine manufacturer's standard practice.

F. Make arrangements for factory test witnessing by Engineer. Notify Engineer not less than 30 days prior to scheduled test.

2.16 NEUTRAL GROUNDING RESISTOR (NGR):

A. Reference NGR specifications for each engine generator are as indicated on the Single-Line Diagram(s) provided. Locate NGR and NGR enclosure within the generator enclosure. Additional requirements include:

1. The NGR assembly shall comply with IEEE C57.32.
2. Resistor element shall be rated as shown on the drawings.
3. Provide integral Neutral Grounding Resistor monitoring system. Provide voltage divider monitoring to assure bond to ground is intact.
4. Provide the resistor within the generator set, in an expanded galvanized steel enclosure of the personnel-safety type and include any necessary supports and

mounting hardware. Finish the NGR enclosure to be at least as durable as the other electrical finishes within the generator enclosure.

5. Where located outside of the generator set, provide in stainless steel enclosure, including additional stainless steel enclosure with door to cover transparent plastic cover parts that would otherwise be exposed to sunlight.

PART 3 - EXECUTION

3.01 COORDINATION:

A. Coordinate with ventilation, fuel supply, and exhaust, to provide an efficient, well coordinated layout.

3.02 INSTALLATION:

A. Install unit complete and make operational.

B. Install muffler horizontally on spring type compensating hangers as close to unit as practical, within weatherproof enclosure.

C. Provide 1/2-inch copper drain with draincock from bottom of muffler to nearest floor drain for periodic draining of muffler.

D. Install engine at sufficient height above base to permit dropping oil pan without removing unit.

E. Provide vibration isolation of exhaust equipment to prevent transfer of vibration into building components enclosing the standby power system.

F. External conduit and wiring and transfer switch will be furnished and installed under applicable electrical sections, but all conduit, wiring and connections between the engine and its control panel and generator and its control panel, is included herein.

G. Mount engine-generator set on a structural steel frame or skid. Provide vibration isolators suitable to prevent transmission of vibration to building structure between set and frame, and securely anchored to the concrete foundation. Obtain from supplier of engine-generator set a drawing giving location and size of foundation bolts for unit proposed, in sufficient time to be available when needed to place foundation. Galvanized anchor bolts shall be furnished by engine-generator set manufacturer.

H. Electrical equipment and materials shall be listed by UL wherever standards have been established by that agency.

3.03 WIRING AND CONNECTIONS:

A. Provide conduit, wiring, and connections required and recommended by unit supplier. All conduit shall be terminated with flexible conduit. All wiring shall be multi-stranded.

B. Connect neutral point of generator and generator frame to ground by green insulated copper conductor of adequate size.

C. Enclsure to be pre-wired for all auxiliary equipment required for operation of the engine and related systems.

3.04 STARTUP AND TESTING:

A. Provide services of factory-trained Service Technician, specifically trained on type of equipment specified:

1. Service Technician must be present on site for all items listed below. Person-day requirements listed are exclusive of travel time, and do not relieve Contractor of the obligation to place equipment in operation as specified.

2. Comply with requirements for checkout, startup, and testing in Section 01 78 25.

3. Services of Service Engineer, specifically trained on type of equipment specified. Person-day requirements listed exclusive of travel time.

a. Physical Checkout and Field Testing (Functional Completion Testing): Inspect grouting, location of anchor bolts; setting, leveling, alignment, field erection; coordination of piping, electrical and miscellaneous utility connections; certify proper installation: Assist in location of devices, methods of mounting, field erection, etc.

5 person-day

b. Startup and Testing: Calibrate, check alignment and perform a functional test with water or process fluid. Tests to include all items specified.

5 person-day

c. Service-inspections during first year of operation, for use at Owner's request, and exclusive of repair, malfunction or other trouble-shooting service calls:

5 person-day

d. Person-day is defined as one 8-hour day, excluding travel time.

B. Operate the unit to demonstrate ability to operate continuously without vibration, jamming, leaking or overheating and to perform specified functions, after installation and after manufacturer's representative check of installed equipment.

C. Comply with manufacturer's operating and maintenance instructions during start-up and operation.

D. Make all final adjustments necessary to place the equipment in working order. Prior to any testing or operation of the units, the manufacturer's service representative shall inspect the installation, and shall certify, in writing, that the assemblies are, in all ways, ready for operation. Start-up shall not commence without the presence of the manufacturer's representative.

3.05 FIELD TEST:

A. Upon completion of the installation and as soon as conditions permit, the diesel engine driven generator, including the engine, generator, electrical circuit controls, transfer controls other devices shall be tested in the presence of the Owner by the service representative for the manufacturer of the engine driven generator unit to verify that the system functions as specified.

1. Perform load test with 0.8 power factor reactive load bank connected to the generator for a full load nameplate test. Run the test for a duration of four hours. Take system data readings each 20 minutes.

2. The manufacturers' representatives shall make such changes in wiring or connections and such adjustments, repairs or replacements to make the circuit, device or control system function as specified and comply with the Contract Documents.

3. Acceptance of test will be verified when the unit operates without alarm or abnormal conditions for the duration of the entire test. Retest if this requirement is not met until acceptance criteria has been verified.

B. Record in 20 minute intervals during four hour test:

1. Kilowatts

2. Amps

3. Voltage

4. Coolant temperature

5. Air temperature

6. Frequency

7. Oil pressure

C. As part of the field test, each of the automatic shutdown devices shall be tested and the respective values recorded at which the devices will stop engine. Any adjustments

required shall be made in the devices to make the operating values correspond to those recommended by the engine manufacturer and as recorded during the stop test.

D. Take and record octave band sound pressure level readings while the engine driven generator is operating using the station load. These readings shall be within the limits identified in the engine generator data submittals for acceptable sound revel.

E. After completion of testing, provide additional fuel, as required, to fill the fuel system tank.

3.06 CONTRACT CLOSEOUT:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 26 33 23

CENTRAL BATTERY EQUIPMENT

PART 1 - GENERAL

1.01 DESCRIPTION:

A. This section specifies the requirements for the design, fabrication, inspection, testing, delivery, and installation of a NiCad battery, two battery chargers, and required battery racks for switchgear 01-SWGR-99100.

B. Battery, battery chargers and associated equipment shall provide power to critical 01-SWGR-99100 loads as indicated on the Contract drawings and documents.

1.02 REFERENCES:

A. American National Standards Institute (ANSI)

B. Institute of Electrical and Electronics Engineers (IEEE):

C. National Electrical Manufacturers Association

D. National Fire Protection Association (NFPA)

1. 70: National Electrical Code (NEC)

E. Underwriter’s Laboratory (UL)

1.03 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00 and Section 26 05 10.

B. Delegated Design Submittals: For each device, equipment or appurtenance provide written certification from Professional Engineer licensed in the State of Utah stating that supports systems, anchorage and equipment have been designed according to the requirements of Section 1613 of the building codes of Utah, Salt Lake City and ASCE/SEI 7, and in accordance with Specification 01 41 20. Submit calculations stamped

by a Professional Engineer licensed in the State of Utah for support systems and anchorage for wind, seismic, and all other pertinent loads.

C. Information to include:

1. Dimensions

2. Data sheets

3. Mounting details

D. Submittals for Information Only:

1. Provide information on operation and maintenance requirements in accordance with Section 01 33 00 and Section 01 78 25.

2. Certified battery sizing and battery charger calculations.

1.04 RELATED SECTIONS:

A. Section 01 33 00: Submittals

B. Section 01 41 20: Seismic and wind Requirements

C. Section 01 78 25: Operations and maintenance Data

D. Section 26 05 10: Electrical Work, General

E. Section 26 05 50: Seismic Controls

F. Section 26 05 53: Electrical Identification

G. Section 26 08 13: Field Inspection and Acceptance Tests

1.05 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.06 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 43 00.

1.07 DELIVERY, PROTECTION AND STORAGE

A. Comply with the requirements of Section 01 66 10.

B. Store batteries and chargers in heated, dry, weather-protected area.

1.08 WARRANTY:

A. Comply with the requirements specified in Section 01 78 36.

PART 2 - PRODUCTS

2.01 ACCEPTABLE MANUFACTURERS:

A. SBS

B. Alcad

C. Enersys

2.02 MATERIALS:

A. Steel for battery racks shall conform to Section 05 12 00.

2.03 BATTERY CHARACTERISTICS:

A. Nominal battery voltage, full charge, 125 V.

B. Battery shall be designed to supply total load cycle for charging, closing, and tripping all breakers (including spare cells) plus control and protection panels connected to battery unit.

C. The battery shall be capable of being charged in a period of six (6) hours to not less than 95 percent full charge after being discharged to 100 volts. This charging cycle shall not cause any harmful effects on the battery, including leaking or foaming of electrolyte.

D. Battery to deliver specified output at 25 degrees C.

E. Provide certified calculations for the battery sizing. Include in the sizing calculations the entire 4.16 kV 01-SWGR-99100 switchgear, other required equipment, protection and control systems, and the sustained normal 125 VDC operating load as shown on drawings. . Also include in the battery and rack sizing calculations the 230 kV GIS circuit breaker and other equipment requiring 125 VDC power for operation, control, and protection. The 125VDC control power demand requirements for the equipment and components are not known at this time. Request the 125 VDC requirements from the Prime Contractor (entity responsible for the overall construction and installation of the project) and include the information in the sizing calculations. The overall system capacity of the batteries and racks shall accommodate the normal sustained operating load plus the demand loads of equipment. Batteries shall be capable of supplying the duty cycle with a minimum of 20 percent spare capacity.

F. Battery and battery chargers to be supplied by one manufacturer.

2.04 NICKEL CADMIUM BATTERIES:

A. Plates: Perforated sheet steel, pocket type

B. Cell Containers: Impact resistant translucent plastic

C. Electrolyte: 20 percent solution of potassium hydroxide in water with special additives

D. Vents: Spring loaded flap type

E. Inter-cell Connectors: Removable bolted type, plated copper, sized to carry battery maximum discharge current and clearance in fit to facilitate replacement of cells.

F. Cells identical construction and from same production run.

G. Cells and battery parts in clean state, with no evidence of electrolyte on cell cases or crystallization at vents. Clean cells prior to assembly into crates and apply coating of Vaseline to cell tops.

H. Battery Accessories: Thermometer, plastic topping-up bottle, level testing tube, self-adhesive numbers for cell identification. Accessories required for normal maintenance.

2.05 BATTERY CHARGER:

A. Two battery chargers shall be provided for 100 percent redundancy; each capable of charging the battery in a period of six (6) hours to not less than 95 percent full charge after being discharged to 100 volts.

B. Each battery charger shall be capable of charging battery as stated Paragraph 2.05A with a spare capacity of 20 percent. Charger size can be the next highest industry normally available rated unit.

C. Chargers to be supplied by same manufacturer as battery.

D. Provide certified calculations for the charger sizing.

E. Chargers shall be rated for 120/208 VAC three phase input.

F. Accessories:

1. Input and output circuit breakers

2. LCD displays: Volts DC, Amps DC, Timer Hrs., Fault Codes and Charger Settings

3. LEDs on cabinet front: AC On/Off, DC On,/Off, Float, and Equalize

4. Summary Form C alarm contact/relay for DC Failure, High VDC, Low VDC, AC Failure, High VAC, Low VAC, Pos/Neg Ground Fault and End of Discharge Alarms for customer use.

5. LEDs on cabinet front: To indicate each listed condition in Paragraph 2.05E4.

6. Local summary flashing LED and audible alarm on cabinet front with pushbutton acknowledge and reset for all conditions listed in Paragraph 2.05E4.

7. Equalize timer.

8. Charging mode selector switch on cabinet front.

9. Recommended spare parts list for first five years of operation.

2.06 BATTERY CHARGER CABINETS

A. Provide battery chargers in separate individual free-standing enclosures.

B. Suitable for top entry of cables.

C. Enclosures shall be NEMA 12 , ANSI 61, light gray.

D. Ground pad with compression ground lug; capable of accepting bare copper ground cable; size to recommended by manufacturer, but no smaller than No. 2 AWG.

E. Dimensions of space allowable as indicated on Contract Drawings.

F. Provide seismic restraint as required. Ref: Sections 01 41 20 and 26 05 50.

2.07 BATTERY RACK:

A. Rack shall be maximum five (5) tier, size as required. Bottom tier minimum 6 inches above floor, top of battery cells on highest tier not more than 78 inches above floor.

B. Frames: Angle iron with welded joints ground smooth.

C. Rails: Steel channels, bolted to frames.

D. Rubber strips to insulate rails from cells.

E. Insulated from ground and floor.

F. Free standing.

G. Primed and epoxy painted to prevent corrosion.

H. Corrosion resistant bolts and hardware.

I. Configuration permitting any one cell to be removed without removing any other cell.

J. Dimensions of space allowable as indicated on Contract Drawings.

K. Provide seismic restraint as required. See Section 01 41 20 and Section 26 05 50.

PART 3 - EXECUTION

3.01 INSTALLATION:

A. Locate and erect battery rack and battery chargers.

B. Install battery cells on rack.

C. For nickel cadmium batteries, arrange vent flaps to open away from access side when cells placed in battery rack.

D. Clean posts and connectors and apply no-oxide grease.

E. Install inter-cell connectors and hand tighten nuts in accordance with manufacturer's instructions.

F. Using torque wrenches, tighten nuts in accordance with manufacturer’s recommend value.

G. Perform required field tests per IEEE 1106.

H. Connect battery and battery chargers to load circuit.

3.02 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 26 33 53

UNINTERRUPTIBLE POWER SUPPLY SYSTEMS

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide 3-phase, on-line, static-type, nonredundant, uninterruptible power supply system (UPS), including following principal component parts: as indicated and in compliance with Contract Documents.

1. Rectifier/Battery Charger

2. Battery

3. Inverter

4. Static Bypass Transfer Switch

5. Maintenance Bypass Isolation Switch

1.02 REFERENCES:

A. ASTM International (ASTM):

1. E699: Standard Specification for Agencies Involved in Testing, Quality Assurance, and Evaluating of Manufactured Building Components

B. National Electrical Manufacturers Association (NEMA):

1. 250: Enclosures for Electrical Equipment (1000 Volts Maximum)

2. PB2: Deadfront Distribution Switchboards

C. Underwriters' Laboratories, Inc. (UL):

1. 891: Standard for Safety Switchboards

2. 1449: Standard for Safety Surge Protective Devices

3. 1778: Standard for Safety Uninterruptible Power Systems

1.03 DEFINITIONS:

A. Rated Full-Load: Load corresponding to full-rated kVA at 80 percent power factor.

B. Static: Containing no moving electrical parts and using solid-state components for switching and control.

C. Transient: That part of change in variable such as voltage or current that disappears during transition from one steady-state operating condition to another.

D. Uninterruptible Power Supply (UPS): System that automatically provides power, without delay or transients, during any period when normal power supply is incapable of performing acceptably.

1.04 SYSTEM DESCRIPTION:

A. Configuration: Factory-fabricated, in single modular cabinet. Automatic operational features include following:

1. Normal Conditions: Supply load with power flowing from normal a.c. power input terminals, through rectifier/battery charger and inverter, with battery connected in parallel with rectifier output.

2. Abnormal Supply Conditions: When normal ac supply deviates from specified voltage, waveform, or frequency limits, battery supplies energy to maintain constant inverter output to load.

3. When normal power fails, energy supplied by battery through inverter continues supply to load without switching or disturbance.

4. When power is restored at normal supply terminals of system, rectifier/battery charger supplies power to load through inverter and simultaneously recharges battery. Inverter is synchronized with external source before load is transferred.

5. When battery becomes discharged and normal supply is available, battery is charged by rectifier/charger. Upon reaching full charge, rectifier/charger automatically shifts to float-charge mode.

6. When any element of UPS system fails, and power is available at normal supply terminals of system, static bypass transfer switch switches load to normal source with less than 1/4 cycle interruption of supply.

7. If fault occurs in system supplied by UPS and current flows in excess of overload rating of UPS system, static bypass switch operates to bypass fault current to normal supply circuit of UPS system for fault clearing.

8. When fault has cleared, static bypass switch returns load to UPS system.

B. Functional Description of Manual Operation: Manual operation features include following:

1. Turning inverter off causes load to be transferred by static bypass switch directly to normal ac input source without interruption.

2. Turning inverter on causes static bypass switch to transfer load to inverter.

C. Maintenance Bypass Isolation Switch: Interlocked so it cannot be operated unless static bypass switch is in bypass mode. Device has 3 settings that produce following conditions without interrupting supply to load during switching:

1. Full Isolation: Load is supplied bypassing UPS system. UPS system ac supply input, static bypass switch, and load terminals are completely disconnected from external circuits.

2. Maintenance Bypass: Load is supplied bypassing UPS system. UPS system ac supply terminals are energized to permit operational checking, but system load terminals are isolated from load.

3. Normal: UPS system ac supply terminals are energized and load is being supplied through either static bypass switch or UPS rectifier and inverter.

1.05 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Product Data:

1. Submit for products specified.

2. Include data on features, components, ratings, and performance.

C. Shop Drawings:

1. Detail fabrication, internal and interconnecting wiring, and installation of UPS system.

2. Include dimensioned plan, elevation views, and details of control panels.

3. Show access and clearance requirements.

4. Differentiate between field-installed and factory-installed wiring and components.

D. Operating and Maintenance Data:

1. Lists of spare parts and replacement components recommended to be stored at site for ready access.

2. Detailed operating instructions covering operation under both normal and abnormal conditions.

E. Miscellaneous:

1. Qualification data for manufacturer to demonstrate their capabilities and experience. Include list of completed projects with Project names, addresses, and names of Engineers and Owners, plus other information specified.

F. Test Results:

1. Factory Test Plan: Detailed list, schedule, or tabulation of events for each factory test requirement. Include following:

a. Description of input source and output loads to be used. Describe actions required to simulate source load variation and simulation of various operating conditions and malfunctions.

b. List of indications, parameter values, and system responses considered satisfactory for each test action. Provide space for tabulation of actual observations during test.

c. Description of Instruments and Test Equipment Required: Provide adequate detail to make test plan reusable in field for those tests required to be repeated there.

2. Factory test reports evidencing compliance with specified requirements.

3. Field test reports for tests.

1.06 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.07 SPARE PARTS:

A. Comply with the requirements specified in Section 01 61 00.

1.08 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

B. Manufacturer Qualifications: Firms experienced in manufacturing equipment of types and capacities indicated with record of successful in-service performance.

1. Service Center: UPS system manufacturer maintains service center capable of providing training, parts, and emergency maintenance and repairs at Project site with 4 hours maximum response time.

C. Items provided under this section shall be listed or labeled by UL or other Nationally Recognized Testing Laboratory (NRTL).

1. Term “NRTL” shall be as defined in OSHA Regulation 1910.7.

2. Terms “listed” and “labeled” shall be as defined in National Electrical Code, Article 100.

D. Single-Source Responsibility: Obtain UPS system components from single manufacturer with responsibility for entire system.

1.09 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

B. Deliver equipment in fully enclosed vans after specified environmental conditions have been permanently established in spaces where equipment is to be placed.

C. Store equipment in spaces with noncondensing environments that are controlled within manufacturer’s ambient tolerances for nonoperating equipment.

1.10 WARRANTY:

A. Special Project Warranty for Batteries: Submit written warranty, mutually executed by manufacturer and Principal Installer, agreeing to replace UPS system storage batteries that fail in materials or workmanship within special project warranty period specified below. This warranty will be in addition to, and not limitation of, other rights and remedies Owner may have against Contractor under Contract Documents.

1. Special Project Warranty Period for Batteries: 10 years beginning on date of Substantial Completion. Full warranty applies to first year of period, and pro rata warranty for last 9 years.

1.11 MAINTENANCE:

A. Extra Materials:

1. Furnish extra materials matching products installed as described below, packaged with protective covering for storage, and identified with labels describing contents. Deliver extra materials to Owner.

2. Fuses: 1 for every 10 of each type and rating, but not less than 1 of each.

PART 2 - PRODUCTS

2.01 MANUFACTURERS:

A. Best Power Technology, Inc.

B. EPE Technologies, Inc.

C. HDR Power Systems, Inc.

D. Eaton/Liebert Corp.

E. Mitsubishi Electric Sales America, Inc.

F. APC Schneider

2.02 SYSTEM SERVICE CONDITIONS:

A. Environmental Conditions Capabilities: Operate in following environmental conditions without mechanical or electrical damage or degradation of operating capability.

1. Ambient Temperature: 0 degrees°C to 40 degrees°C.

2. Relative Humidity: 0 to 95 percent, non-condensing.

3. Altitude: Sea level to 5,000 feet.

2.03 SYSTEM CHARACTERISTICS:

A. Input Power Nominal Supply Voltage and Supply Connections: As indicated.

B. Output kVA and kW Ratings: 20KVA/18KW

C. Minimum Duration of Supply: 20 minutes, where rated full load is being supplied solely from battery.

D. System Performance when Supplied from Battery: Performance under steady-state and transient load conditions remains within specified tolerances throughout minimum duration of supply from battery specified.

E. Input Voltage and Frequency Tolerance: System steady-state and transient performance remains within specified tolerances with steady-state a.c. input voltage varying plus or minus 10 percent from nominal voltage, with steady-state input frequency varying plus or minus 5 percent from 60 Hertz, and with harmonic content of load anywhere within specified envelope.

2.04 LOAD COMPATIBILITY:

A. UPS system operates within specified tolerances serving distribution components as indicated and loads with following characteristics:

1. Electronic equipment with switch mode power supplies drawing load current with minimum of 15 percent total harmonic distortion and with individual harmonics as great as 5 percent of fundamental. Aggregate load is 60 percent of UPS capacity.

2. Future Loads: Unknown characteristics, 20 percent of UPS system capacity.

2.05 SYSTEM PERFORMANCE:

A. Overall system efficiency, when operated within indicated nominal input and output voltage and frequency limits, is within following minimums:

1. Up to 20 kVA Systems: 98 percent at 100 percent load.

2. Up to 20 kVA Systems: 97.5 percent at 50 percent load.

B. Maximum Acoustical Noise: 58 dB, "A" weighting, emanating from system under any condition of normal operation, measured 3 feet from nearest surface of enclosure.

C. Overload Capacity of System at Rated Voltage: 125 percent of full-load rating for 10 minutes and 150 percent for 10 seconds.

D. Maximum Output Voltage Transient Excursions from Rated Value: Voltage shall recover to within plus or minus 2 percent of rated value within 100 milliseconds. Following instantaneous load changes are relative to full load:

1. 50 percent: Plus or minus 8 percent.

2. 100 percent: Plus or minus 10 percent.

3. Loss of A.C. Input Power: Plus or minus 5 percent.

4. Restoration of Input Power: Plus or minus 5 percent.

2.06 SYSTEM COMPONENTS:

A. Components: Solid-state devices using semiconductor elements of hermetically sealed type. Devices include rectifier/battery charger, inverter, static bypass switch, and system controls.

B. Enclosure: Major components such as static bypass switch, rectifier, battery, inverter, and maintenance bypass in separate compartments of enclosures or in separate cabinets.

C. Control Assemblies: Mount on modular plug-ins, arranged for easy maintenance.

D. Surge Suppression: Protect UPS system input elements, rectifier/charger, inverter, controls, and output components against voltage transients with surge suppressors conforming to UL 1449.

E. Design and fabricate internal supports for assemblies, subassemblies, components, supports, and fastenings for batteries, to withstand static, anticipated seismic forces, or both in any direction with minimum force value used being equal to equipment weight.

2.07 RECTIFIER/BATTERY CHARGER:

A. Capacity: Adequate to supply inverter during full output load conditions and simultaneously recharge battery from fully discharged condition to 95 percent of full charge within 10 times rated discharge time for duration of supply under battery power at full load.

B. Harmonic suppression inherent in rectifier/battery charger design reduces total harmonic content of current drawn from input power source by system to less than 10 percent for sources with X/R ratios from 2 to 30. This applies for all load currents from 0 to 100 percent of full load.

C. Battery float charging conditions, in terms of voltage and charging current under normal operating conditions, are within battery manufacturer's recommendations for maximum battery life.

2.08 BATTERY:

A. Manufacturers:

1. C&D Charter Power Systems.

2. SAFT America, Inc.

3. Chloride Systems.

4. Exide Corp.

5. Hoppecke Battery Systems, Inc.

6. Mitsubishi Electric Sales America, Inc.

7. Nife, Inc.

8. Sonnenschein Batteries, Inc.

9. Yuasa Battery (American), Inc.

B. Type: Valve-regulated, recombinant, lead-calcium units, factory-assembled in an isolated compartment of UPS system cabinet, and complete with battery disconnect.

2.09 INVERTER:

A. Type: Pulse-width modulated, with sinusoidal output.

2.10 STATIC BYPASS SWITCH:

A. Switch Rating: Continuous-duty at rated full load. Switch provides make-before-break transfer. Contactor or electrically operated circuit breaker in inverter output provides electrical isolation.

2.11 MAINTENANCE BYPASS ISOLATION SWITCH:

A. Comply with NEMA PB2, and UL 891.

B. Switch Rating: Continuous-duty at rated full load of system.

C. Mounting Provisions: Locate inside one of modular system cabinets, behind lockable door.

D. Key interlock requires unlocking maintenance bypass isolation switch before switching from normal position with key that is released only when UPS is bypassed by static bypass switch. Lock is type designed specifically for electrical component interlocking.

2.12 INDICATION AND CONTROL:

A. General: Group displays, indications, and basic system controls on common control panel on front of UPS enclosure.

B. Minimum displays, indicating devices, and controls include those in lists below. Provide sensors, transducers, terminals, relays, and wiring required to support listed items. An audible signal sounds for all alarms in addition to visual indication.

C. Indications: Plain-language messages on liquid crystal or digital LED display.

1. Quantitative Indications: Include following:

a. Input voltage, each phase, line-to-line.

b. Input current, each phase, line-to-line.

c. Bypass input voltage, each phase, line-to-line.

d. Bypass input frequency.

e. System output voltage, each phase, line-to-line.

f. System output current, each phase.

g. System output frequency.

h. D.C. bus voltage.

i. Battery current and direction (charge/discharge).

j. Elapsed time-discharging battery.

2. Status Indications: Include following:

a. Normal operation.

b. Load on bypass.

c. Load on battery.

d. Inverter off.

e. Alarm condition exists.

3. Alarm Indications: Include following:

a. Bypass a.c. input overvoltage or undervoltage.

b. Bypass a.c. input overfrequency or underfrequency.

c. Bypass a.c. input and inverter out of synchronization.

d. Bypass a.c. input has wrong-phase rotation.

e. Bypass a.c. input has single-phase condition.

f. Bypass a.c. input filter fuse blown.

g. Internal frequency standard in use.

h. Battery system alarm.

i. Control power failure.

j. Fan failure.

k. UPS overload.

l. Battery charging control faulty.

m. Input overvoltage or undervoltage.

n. Input transformer overtemperature.

o. Input circuit breaker tripped.

p. Input has wrong-phase rotation.

q. Input has single-phase condition.

r. Approaching end of battery operation.

s. Battery undervoltage shutdown.

t. Maximum battery voltage.

u. Inverter fuse blown.

v. Inverter transformer overtemperature.

w. Inverter overtemperature.

x. Static bypass switch overtemperature.

y. Inverter power supply fault.

z. Inverter transistors out of saturation.

aa. Identification of faulty inverter section/leg.

bb. Inverter output overvoltage or undervoltage.

cc. UPS overload shutdown.

dd. Inverter current sensor fault.

ee. Inverter output contactor open.

ff. Inverter current limit.

4. Controls: Include following:

a. Inverter on-off.

b. UPS start.

c. Battery test.

d. Alarm silence/reset.

e. Output voltage adjustment.

D. Dry Form “C” Contacts: Available for remote indication of following conditions:

1. UPS on battery

2. UPS on-line

3. UPS load on bypass

4. UPS in alarm condition

2.13 REMOTE UPS CONTROL AND MONITORING SYSTEM:

A. Description: Make available indication and control functions specified above for unit control panel at remote microcomputer. Record power-line transients and provides analytical capability. Include items described below, but do not include remote computer or connecting signal wiring. System includes:

1. Software that permits secure monitoring and controlling of UPS functions; and provides on-screen explanations, interpretations, and action guidance for monitoring indications. Include on-screen descriptions of control functions and guidance for their use. Permit storage and analysis of power-line transient records. Design for IBM-compatible microcomputer systems.

2.14 MECHANICAL FEATURES:

A. Enclosures: NEMA Class 1 conforming to NEMA 250.

B. Ventilation: Redundant fans or blowers draw in ambient air near bottom of cabinet and discharge it near top rear.

2.15 SOURCE QUALITY CONTROL:

A. Factory test complete UPS system, including battery, prior to shipment. Include following tests:

1. Functional test and demonstration of all functions, controls, indicators, sensors, and protective devices.

2. Full-load test.

3. Transient load response test.

4. Overload test.

5. Power failure test.

6. Efficiency test at 50 percent, 75 percent, and 100 percent load.

PART 3 - EXECUTION

3.01 INSTALLATION:

A. Install system components on 4 inches-high concrete housekeeping bases. Cast-in-place concrete, reinforcing, and formwork are specified in Section 03 30 00. Install systems according to manufacturer's printed instructions.

B. Maintain minimum working space at equipment according to Shop Drawings and NEC.

C. Connections: Interconnect system components. Make connections to supply and load circuits according to manufacturer's wiring diagrams and as indicated.

3.02 IDENTIFICATION:

A. Identify components according to Section 26 05 53.

3.03 FIELD QUALITY CONTROL:

A. Supervised Adjustment and Pretesting: Under supervision of factory-authorized service representative, pretest system functions, operations, and protective features. Adjust to ensure operation complies with specifications. Load system using variable load bank simulating kVA, kW, and power factor of loads for which unit is rated.

B. Tests: Provide services of qualified testing agency to perform tests listed below according to manufacturer's recommendations upon completion of installation of system. Load system using variable load bank simulating kVA, kW, and power factor of load for which unit is rated. Use instruments that have been recently calibrated according to NIST standards.

1. Simulation of malfunctions to verify protective device operation.

2. Tests of duration of supply on emergency, demonstrations of low-battery voltage shutdown, and transfers due to normal source failure and restoration.

3. Tests of harmonic content of input and output current under 25 percent, 50 percent, and 100 percent of rated load.

4. Tests of voltage output under specified transient-load conditions.

5. Tests of efficiency at 50 percent, 75 percent, and 100 percent rated load.

C. Retest: Correct deficiencies and retest until specified requirements are met.

3.04 CLEANING:

A. Upon completion of installation, inspect system components. Remove paint splatters and other spots, dirt, and debris. Repair scratches and mars of finish to match original

finish. Clean components internally using methods and materials recommended by manufacturer.

3.05 DEMONSTRATION:

A. Training: Arrange and pay for services of factory-authorized service representative to demonstrate adjustment, operation, and maintenance of system and to train Owner's personnel.

3.06 COMMISSIONING:

A. Battery Equalization: Equalize charging of battery cells according to manufacturer's instructions. Record individual cell voltages.

3.07 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 26 41 13

LIGHTNING PROTECTION FOR STRUCTURES

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide lightning protection system on each building and structure consisting of air terminals, conductors, ground terminals, interconnection conductors, arresters, and other connectors or fittings required for a complete system. Buildings requiring delegated design and installation of NFPA 780-compliant and UL 96A master-labelled lighting protection systems, with certifications include, but are not limited to, the following:

1. IPS Building:

a. Exterior above-grade piping and valve actuators

2. IPS Electrical Building:

a. Building

b. 4 pad-mount transformers

c. 2 RTU-style ground-mounted HVAC units and associated ducting.

3. Standby Power and Fuel Storage:

a. Fuel tanks

b. Generator Enclosures

c. Switchgear Enclosure

d. Electrical Rack

e. Dry type transformer.

4. IPS Odor Control:

a. Tank

b. Odor Control Media

c. Exhaust stack

d. Electrical Rack

e. Freestanding Control Panel Enclosure.

B. All systems are to be designed, furnished and installed by a Lightning Protection Contractor.

1.02 REFERENCES:

A. National Fire Protection Association (NFPA):

1. 70: National Electrical Code (NEC).

2. 780: Lightning Protection Code.

B. Underwriters' Laboratories, Inc. (UL):

1. 96: Lightning Protection Components.

2. 96A: Installation Requirements for Lightning Protection Systems.

1.03 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Submit shop drawings and manufacturers' product data in accordance with the requirements of Section 26 05 00.

C. Shop Drawings:

1. Consisting of a complete list of equipment and materials, including manufacturer's descriptive and technical literature, catalog cuts, installation instructions.

2. Shop drawings indicating type, placement, and location of protection devices, including cable attachments, grounding, mounting and any other details integral with the system.

D. Spare Parts Data: Provide a list of recommended spare parts for the material and equipment to be provided, including current unit prices and source of supply (indicate which supplies are furnished at no extra cost with purchase of equipment).

E. Inspection and Maintenance: Provide a written recommended inspection and maintenance procedure, including periodicity of inspections.

F. Record Drawings: Provide a complete set of "as-constructed" drawings showing the location of all grounds as well as a detailed layout of type, size, location and method of installation of all downleads, roof cables, bonding leads and connections, air terminals, etc., and in the case where structural steel is used for downleads, the method and location of all roof and ground connections to the steel must be clearly detailed.

1.04 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

B. Ensure that conduit size and wire quantity, size, and type are suitable for the equipment supplied.

C. Services of Manufacturer's Representative as stated in Section 01 45 00 and as specified herein.

D. Provide services of factory-trained Service Technician, specifically trained on type of equipment specified:

1. Service Technician must be present on site for all items listed below. Person-day requirements listed are exclusive of travel time, and do not relieve Contractor of the obligation to place equipment in operation as specified.

2. Installation: Inspect grouting, location of anchor bolts; setting, leveling, alignment, field erection; coordination of piping, electrical and miscellaneous utility connection:

a. 1 person-day

3. Functional Testing: Calibrate, check alignment and perform a functional test with water. Tests to include all items specified.

a. 0.5 person-day

4. Performance Testing: Field performance test equipment specified.

a. 0.5 person-day

5. Vendor Training: Provide classroom and field operation and maintenance instruction including all materials, slides, videos, handouts and preparation to lead and teach classroom sessions.

a. 1 person-day.

6. Service inspections during first two years of operation, for use at Owner's request, and exclusive of repair, malfunction or other troubleshooting service calls.

a. 2 person-days, 2 trips

7. Credit to the Owner, all unused service person-days specified above, at the manufacturer’s published field service rate.

8. Any additional time required of the factory trained service technician to assist in placing the equipment in operation, or testing or to correct deficiencies in

installation, equipment or material shall be provided at no additional cost to the Owner.

E. Provide systems designed, furnished and installed by a Lightning Protection Contractor.

F. Provide a "Certificate of Compliance" for work performed after completion. The certificate should state that the following has been done:

1. The Contractor has complied with all requirements of Underwriters' Laboratories, Inc. Master Label Service as outlined in UL 96A including the completion and execution of the Master Label application form and the procurement and delivery of the U/L "C" plate to the Owner or his representative.

2. The lightning protection system ground system has been tested and interconnected to the facility grounding system as required by NFPA 70.

3. Record drawings have been turned over to the Owner or his representative.

G. Use UL listed components.

1.05 REQUIREMENTS OF REGULATORY AGENCIES:

A. Conform to UL 96 and 96A and NFPA 780.

1.06 DELIVERY, STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

B. Shipping:

1. Ship equipment and materials, complete with identification and quantity of items.

2. Pack spare parts in containers bearing labels clearly designating contents and pieces of equipment for which intended.

3. Deliver spare parts at same time as pertaining equipment. Delivery to Owner after completion of work.

C. Storage:

1. Inspection and inventory items upon delivery to site.

2. Store and safeguard equipment, material and spare parts.

1.07 WARRANTY AND SERVICE:

A. Guarantee components, parts, and assemblies supplied by manufacturer against defects in materials and workmanship for a period of 12 months.

PART 2 - PRODUCTS

2.01 MANUFACTURERS:

A. Thompson Lightning Protection Company, St. Paul, MN

B. Heary Brothers Lightning Protection Company, Springville, NY

C. American Lightning Rod Co., Dover, NH

2.02 MATERIALS:

A. Class I Materials: Provide conductors, fittings, and fixtures necessary to protect ordinary buildings and structures not exceeding 75 feet in height.

B. Materials, Class I. Table I gives minimum sizes and weights for air terminals, and main and secondary conductors. Secondary conductors which are used for bonding and interconnecting metallic bodies to the main conductor, and which will not be required to carry the main lightning current, may be reduced in size but not less than No. 6 AWG copper or equivalent. Provide main conductor size for interconnection to metal water systems, steam or hot water heating systems, or other metallic masses having a low resistance to ground.

C. Table I: Class I Material Requirements.

Type of Copper Conductor		**Standard**
Air Terminal, Solid	Min. Diameter	3/8-inch
Air Terminal, Tubular	Min. Diameter Min. Wall Thickness	 0.032 inch
Main Conductor, Cable	Min. Size ea. Strand Wgt. per Length Cross Sect. Area	17 AWG 187 lbs/1000 ft. 57,400 cm
Main Conductor, Solid Strip	Thickness Width	16 AWG 1 inch
Secondary Conductor Cable	Wire Size Number of Wires	17 AWG 14
Secondary Conductor Solid Strip	Thickness Width	16 AWG 1/2 inch

D. Where any part of a protection system is exposed to mechanical injury, provide protection by covering it with molding or tubing. If ferrous metal pipe or tubing is used

around the conductor, connect the conductor electrically to the pipe or tubing at both ends.

E. Furnish conductors made of stranded copper. Except where copper would otherwise cause a material compatibility problem, in which case, aluminum may be used for such locations.

PART 3 - EXECUTION

3.01 INSTALLATION:

A. Provide all material, equipment, and labor to install the lightning protection system as indicated and as specified.

B. No bend of conductor is to form an included angle of less than 90 degrees nor have a radius of bend less than 8 inches.

C. Interconnect all conductors, air terminals to form a two-way path from each air terminal horizontally or downward to connections with ground terminals.

D. Conductors may be coursed through air without support for a distance of 3 feet or less. With a 5/8-inch rod or its equivalent as a support, securely fastened at each end, a conductor may be coursed through air for a distance not to exceed 6 feet.

E. Install roof conductors to interconnect all air terminals and provide a two-way path to ground horizontally or downward from the base of each terminal.

F. Install at least two down conductors on any kind of structure. Location depends on placement of air terminals, size of structure, most direct coursing, security against displacement and location of metallic bodies, water pipes, and ground conditions. Separate down conductors as widely as practicable. For structures over 200 feet in perimeter, install one additional down conductor for each additional 100 feet of perimeter or fraction thereof.

G. Terminate each down conductor at a ground terminal.

H. Bond radio and television masts of metal, located on a protected building, to the lightning protection system with a main-size conductor and fittings.

I. Use connector fittings on all lightning conductors at "end-to-end" "tee" or "Y" splices. Attach them so as to withstand a pull test of 200 pounds. Make fittings for connection to metal tracts, gutters, downspouts, ventilators, chimney extensions, or other metal parts about the structure tight to the object by compression under bolt heads. Both crimp type and exothermic weld splicers of stamped or cast metal are acceptable under Class I requirements.

J. Securely attach conductors to the building or other object upon which they are placed. Use fasteners not subject to breakage. Furnish nails, screws and bolts, with which fasteners are secured, of the same material as the conductor or of such nature that there will be no electrolytic corrosion in the presence of moisture because of contact between the different parts. Space conductor fasteners not more than 3 feet apart on all conductors.

K. All requirements covering exposed systems apply to concealed installations. Conductors are coursed the same except that they may be coursed behind the exterior wall facing, in concealed or embedded conduit, or embedded directly in concrete.

L. In a concealed installation where conductors are embedded in concrete, bond the reinforcing steel to the cable with a main size conductor. Bond reinforcing steel at the top and bottom of each embedded downlead.

M. Materials, installation methods and procedures are to be in accordance with UL 96 and 96A, NFPA 780, NEC and local electrical codes. Provide for and obtain a "Certificate of Compliance" for the work performed.

3.02 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

Page Intentionally Left Blank

SECTION 26 43 13

SURGE PROTECTION DEVICES FOR LOW-VOLTAGE ELECTRICAL POWER CIRCUITS

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Section Includes:

1. Type 2 surge protective devices (SPDs).

2. Enclosures.

B. Related Requirements:

1. Section 262416 "Panelboards" for integral SPD units installed by panelboard manufacturer.

2. Section 262419 “Motor Control Centers” for integral SPD units installed by MCC manufacturer.

3. Section 262726 "Wiring Devices" for integral SPD units installed by receptacle manufacturer.

1.02 DEFINITIONS:

A. I_n: Nominal discharge current.

B. Voltage Protection Rating (VPR): A rating selected from UL 1449 list of preferred values assigned to each mode of protection.

1.03 ACTION SUBMITTALS:

A. Product Data:

1. For each type of product.

a. Include electrical characteristics, specialties, and accessories for SPD units.

b. Certification of compliance with UL 1449 by qualified electrical testing laboratory recognized by authorities having jurisdiction including the following information:

(1) Tested values for VPRs.

(2) I_n ratings.

(3) MCOV, type designations.

(4) OCPD requirements.

(5) Manufacturer's model number.

(6) System voltage.

(7) Modes of protection.

B. Field quality-control reports.

1.04 INFORMATION SUBMITTALS:

A. Sample warranty.

1.05 WARRANTY:

A. Provide in accordance with Section 01 74 13 and as specified.

B. The Surge Protective Device (SPD) manufacturer is to warranty the components against defective materials and workmanship for a period of five (5) years following delivery from the manufacturer.

PART 2 - PRODUCTS

2.01 TYPE 2 SURGE PROTECTIVE DEVICES (SPDs):

A. Manufacturers:

1. ABB

2. Intermatic

3. Mersent

4. Eaton

5. Square D

B. Source Limitations: Obtain devices from single source from single manufacturer.

C. General Characteristics:

1. Reference Standards: UL 1449, Type 2

2. MCOV: Not less than 125 percent of nominal system voltage for 208Y/120 V and 120/240 V power systems, and not less than 115 percent of nominal system voltage for 480Y/277 V power systems.

3. Peak Surge Current Rating: Minimum single-pulse surge current withstand rating per phase must not be less than 200 kA. Peak surge current rating must be arithmetic sum of the ratings of individual MOVs in a given mode.

4. Protection modes and UL 1449 VPR for neutralless grounded wye circuits with 480V, three-phase, three-wire circuits must not exceed the following

    a. Line to Ground: 1200 V for 480Y/277 V.

    b. Neutral to Ground: 1200 V for 480Y/277 V.

    c. Line to Line: 2000 V for 480Y/277 V.

5. Protection modes and UL 1449 VPR for grounded wye circuits with 208Y/120 V, three-phase, four-wire circuits must not exceed the following:

    a. Line to Neutral: 700 V for 208Y/120 V.

    b. Line to Ground: 700 V for 208Y/120 V.

    c. Neutral to Ground: 700 V for 208Y/120 V.

    d. Line to Line: 1200 V for 208Y/120 V.

6. Protection modes and UL 1449 VPR for 240/120 V, single-phase, three-wire circuits must not exceed the following:

    a. Line to Neutral: 700 V.

    b. Line to Ground: 700 V.

    c. Neutral to Ground: 700 V.

    d. Line to Line: 1200 V.

7. SCCR: Equal or exceed 200 kA.

8. I_n Rating: 20 kA for 208Y/120V and 120/240V systems, 65kA for 480V systems.

D. Options:

1. Include LED indicator lights for power and protection status.

2. Include NEMA ICS 5, dry Form C contacts rated at 2 A and 120 V(ac) for remote monitoring of protection status.

3. Include surge counter.

2.02 ENCLOSURES:

A. Indoor Enclosures: Type 1.

B. Outdoor Enclosures: Type 4X.

PART 3 - EXECUTION

3.01 INSTALLATION:

A. Provide OCPD and disconnect for installation of SPD in accordance with UL 1449 and manufacturer's instructions.

3.02 FIELD QUALITY CONTROL:

A. Field tests and inspections must be witnessed by Owner and/or Engineer, or their representatives. Repeat test as required to satisfy Owner or Engineer’s requirements.

B. Tests and Inspections:

1. Compare equipment nameplate data for compliance with Drawings and the Specifications.

2. Inspect anchorage, alignment, grounding, and clearances.

3. Verify that electrical wiring installation complies with manufacturer's installation requirements.

C. Nonconforming Work:

1. SPDs that do not pass tests and inspections will be considered defective.

2. Remove and replace defective units and retest.

D. Prepare test and inspection reports.

3.03 STARTUP SERVICES:

A. Complete startup checks in accordance with manufacturer's instructions.

B. Do not perform insulation-resistance tests of the distribution wiring equipment with SPDs installed. Disconnect SPDs before conducting insulation-resistance tests; reconnect them immediately after the testing is over.

C. Energize SPDs after power system has been energized, stabilized, and tested.

END OF SECTION

Page Intentionally Left Blank

SECTION 26 50 00

INTERIOR LIGHTING

1.01 DESCRIPTION:

A. Provide complete indoor lighting systems as indicated and in compliance with Contract Documents .

B. Light fixture schedules are provided on the Contract Drawings. These Specifications are to be considered supplementary to the information contained in the light fixture schedule. In areas of conflict the scheduled items shall be provided.

C. Fixtures shall be “Energy Star” rated.

1.02 DEFINITIONS:

A. Emergency Lighting Unit: Fixture with integral emergency battery-powered supply and means for controlling and charging battery. Also known as an emergency light set.

B. Fixture: Complete lighting unit, exit sign, or emergency lighting unit. Fixtures include lamps and parts required to distribute light, position and protect lamps, and connect lamps to power supply. Internal battery-powered exit signs and emergency lighting units also include battery and means for controlling and recharging battery. Emergency lighting units include ones with and without integral lamp heads.

2. 8750: Light Emitting Diode (LED) Equipment for Use in Lighting Products.

D. Illuminating Engineering Society of North America (IESNA or IES):

1. LM-79: IESNA Approved Method for the Electrical and Photometric Measurements of Solid-State Lighting Products

2. LM-80: IESNA Approved Method for Measuring Lumen Maintenance of LED Light Sources

1.04 SUBMITTALS:

A. Submit shop drawings in accordance with Section 01 33 00.

B. Submit shop drawings and manufacturer's product data with installation instructions in accordance with the requirements of Section 26 05 10.

C. Submit manufacturer's shop drawings including photometric laboratory test data to show that luminaires proposed are of same type, construction and quality as those indicated. Luminaires are to be listed and labeled by Underwriters' Laboratories.

D. Submit manufacturer’s data for each ballast provided. Include detailed information for each luminaire showing wattage, voltage, and full load amp draw for each.

E. Submit photometric calculations based on maintained lighting foot candle levels for areas where lighting fixtures are substituted. Substituted fixtures must provide similar lighting performance and energy usage as those scheduled, and must be constructed of similar quality and materials.

1.05 QUALITY ASSURANCE:

A. Provide in accordance with Section 01 45 00 and as specified.

B. Provide hangers and supports to resist failure from earthquake damage in accordance with NEC and all local and State codes.

C. Lighting fixtures to be provided with dedicated supporting systems.

D. Comply with the Code for Buildings and all local and State energy laws and regulations.

1.06 EXTRA MATERIALS:

A. Furnish extra materials described below that match products installed, are packaged with protective covering for storage, and are identified with labels describing contents.

1. Lamps: 10 lamps for every 100 of each type and rating installed. Furnish at least 1 of each type.

PART 2 - PRODUCTS

2.01 GENERAL:

A. Metal Parts: Free from burrs, sharp corners, and edges.

B. Sheet Metal Components: Steel, except as indicated. Form and support to prevent warping and sagging.

C. Doors, Frames, and Other Internal Access: Smooth operating, free from light leakage under operating conditions, and arranged to permit relamping without use of tools. Arrange doors, frames, lenses, diffusers, and other pieces to prevent accidental falling during relamping and when secured in operating position.

D. Reflecting Surfaces: Minimum reflectance as follows, except as otherwise indicated:

1. White Surfaces: 85 percent.

2. Specular Surfaces: 83 percent.

3. Diffusing Specular Surfaces: 75 percent.

4. Laminated Silver Metallized Film: 90 percent.

E. Lenses, Diffusers, Covers, and Globes: 100 percent virgin acrylic plastic or water white, annealed crystal glass, except as otherwise indicated.

1. Plastic: High resistance to yellowing and other changes due to aging, exposure to heat, and UV radiation.

2. Lens Thickness: 0.125 inches minimum; except where greater thickness is indicated.

F. Fixture Support Components:

1. Single Stem Hangers: 1/2 inches steel tubing with swivel ball fitting and ceiling canopy. Finish same as fixture.

2. Twin Stem Hangers: Two, 1/2 inch steel tubes with single canopy arranged to mount a single fixture. Finish same as fixture.

3. Rod Hangers: 3/8 inch minimum diameter, zinc plated, threaded steel rod.

4. Hook Hanger: Integrated assembly matched to fixture and line voltage and equipped with threaded attachment, cord, and locking type plug.

2.02 LED FIXTURES:

A. Provide fixtures on the Design Lights Consortium (DLC) Qualified Products List.

B. Thermal Management: Liquids or other moving parts shall be clearly indicated in submittals, and shall be consistent with product testing.

C. Color Rendering Index (CRI): >70.

D. Correlated Color Temperature: 4000K.

E. Minimum luminaire efficacies: 85 lumens per watt. Nominal input wattage shall account for nominal applied voltage and any reduction in driver efficiency due to sub-optimal driver loading.

F. Fully enclosed wiring and LED diodes enclosed to prevent penetration of dust, insects, and other debris into the lamp and driver compartment.

G. Driver/LED combined system shall have rated life based on IESNA LM-80-2008 (or latest) of 50,000 hours at 70 percent lumen maintenance.

H. Driver is high efficiency type with THD < 20 percent and power factor > 0.90.

2.03 EMERGENCY LIGHTING AND EXIT LIGHTING UNITS:

A. Exit Signs: Conform to UL 924 and following:

1. Sign Colors: Conform to local code.

2. Minimum Height of Letters: Conform to local code.

3. Arrows: Include as indicated.

B. Emergency Lighting Units: Conform to UL 924. Provide self-contained units with following features:

1. Battery: Sealed, maintenance free, lead acid type with minimum 10 year nominal life and special warranty.

2. Charger: Minimum 2 rate, fully automatic, solid state type, with sealed transfer relay.

3. Operation: Relay automatically turns lamp on when supply circuit voltage drops to 80 percent of nominal voltage or below. Lamp automatically disconnects from battery when voltage approaches deep discharge level. Relay disconnects lamps and battery and automatically recharges and floats on trickle charger when normal voltage is restored.

4. Wire Guard: Where indicated, provide heavy chrome plated wire guard arranged to protect lamp heads or fixtures.

5. Time Delay Relay: Provide time delay relay in emergency lighting unit control circuit arranged to hold unit ON for fixed interval after restoration of power after outage. Provide adequate time delay to permit HID lamps to restrike and develop adequate output.

2.04 LIGHTING CONTROLS:

A. Reference Specficiation 26 09 29, Lighting Control Systems, for additional lighting control requirements.

PART 3 - EXECUTION

3.01 LUMINAIRES AND LAMPS:

A. Install types and sizes indicated, complete. Deliver lamps of proper type, wattage and voltage rating to site and install in luminaires prior to completion of project.

B. Install all luminaires to comply with applicable provisions of National Electrical Code. Suspend pendant luminaires by means of suitable outlet box cover-type aligners, each having flexible joint permitting unit to hang plumb.

1. Provide hangers capable of supporting twice the combined weight of fixtures supported by hangers.

2. Provide with swivel hangers to ensure a plumb installation. Hangers shall be cadmium-plated steel with a swivel-ball tapped for the conduit size indicated.

3. Brace pendants 4 feet or longer to limit swinging.

4. Single-unit suspended fixtures shall have twin-stem hangers.

5. Multiple-unit or continuous row fixtures shall have a tubing or stem for wiring at one point and a tubing or rod suspension provided for each unit length of chassis, including one at each end.

6. Rods shall be a minimum 3/8-inch diameter.

C. Use aligners of shock absorbing type, where indicated.

D. Install accessories such as straps, mounting plates, nipples, or brackets necessary for proper installation.

E. Connect emergency light units to the unswitched branch circuit powering the luminaires in the same space.

3.02 CONTRACT CLOSEOUT

A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 26 56 00

EXTERIOR LIGHTING

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide complete outdoor lighting systems as indicated and in compliance with Contract Documents.

B. Light fixture schedules are provided on the Contract Drawings. These Specifications are to be considered supplementary to the information contained in the light fixture schedule. In areas of conflict the scheduled items shall be provided.

C. Fixtures shall be “Energy Star” rated and full cut-off.

2. 844: UL Standard for Safety Luminaires for Use in Hazardous (Classified) Locations-Twelfth Edition

3. 1598: UL Standard for Safety Luminaires

1.03 DEFINITIONS:

A. Fixture: Complete lighting device. Fixtures include lamp or lamps and parts required to distribute light, position and protect lamps, and connect lamps to power supply.

B. Lighting Unit: Fixture or assembly of fixtures with common support, including pole or bracket plus mounting and support accessories.

C. Luminaire: Fixture.

D. CCT: Correlated color temperature.

E. CRI: Color rendering index.

F. Fixture: An enclosed apparatus with all elements required to illuminate a space, using the optical distribution specified, with points for power connection.

G. IP: International Protection or Ingress Protection Rating.

H. Lumen: Measured output of lamp and luminaire, or both.

1.04 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Submit shop drawings and manufacturer's product data with installation instructions in accordance with the requirements of Section 26 05 00.

C. Submit manufacturer's shop drawings including photometric laboratory test data to show that luminaires proposed are of same type, construction and quality as those indicated. Luminaires are to be listed and labeled by Underwriters' Laboratories.

D. Submit manufacturer’s data for each ballast / driver provided. Include detailed information for each luminaire showing wattage, voltage, and full load amp draw for each.

E. Submit photometric calculations based on maintained lighting foot candle levels for areas where lighting fixtures are substituted. Substituted fixtures must provide similar

lighting performance and energy usage as those scheduled, and must be constructed of similar quality and materials.

F. Product Data:

1. Describe fixtures, lamps, ballasts, poles, and accessories. Arrange Product Data for fixtures in order of fixture designation. Include data on features, poles, accessories, finishes, and following:

a. Outline drawings indicating dimensions and principal features of fixtures and poles.

b. Electrical Ratings and Photometric Data: Certified results of laboratory tests for fixtures and lamps.

G. Shop Drawings:

1. Detail non-standard fixtures and poles and indicating dimensions, weights, method of field assembly, components, and accessories.

2. Wiring diagrams detailing wiring for control system showing both factory installed and field installed wiring for specific system of this Project, and differentiating between factory installed and field installed wiring.

3. Anchor-Bolt Templates: Keyed to specific poles and certified by manufacturer.

H. Operating and Maintenance Data (O&M): Maintenance data for products to include operation and maintenance information.

1.05 QUALITY ASSURANCE:

A. Comply with IEEE C2.

B. Items provided under this section shall be listed or labeled labelled by UL or other Nationally Recognized Testing Laboratory (NRTL).

1. Term “NRTL” shall be as defined in OSHA Regulation 1910.7.

2. Terms “listed” and “labeled” shall be as defined in National Electrical Code (NEC), Article 100.

C. Regulatory Requirements:

1. National Electrical Code (NEC): Components and installation shall comply with National Fire Protection Association (NFPA) 70.

D. Fixtures for Hazardous Locations: Conform to UL 844. Provide units that have Factory Mutual Engineering and Research Corporation (FM) certification for indicated class and division of hazard.

1.06 STORAGE AND HANDLING OF POLES:

A. Store poles on decay-resistant treated skids at least 12 inches above grade and vegetation. Support pole to prevent distortion and arrange to provide free air circulation.

B. Metal Poles: Retain factory applied pole wrappings until just before pole installation. For poles with nonmetallic finishes, handle with web fabric straps.

1.07 EXTRA MATERIALS:

A. Furnish extra materials described below that match products installed, are packaged with protective covering for storage, and are identified with labels describing contents.

1. LED Arrays: 1 for every 100 of each type provided – including each optic.

2. Glass and Plastic Lenses, Covers, and Other Optical Parts: 1 for every 100 of each type and rating installed. Furnish at least one of each type.

3. Ballasts / Drivers: 1 for every 100 of each type and rating installed. Furnish at least one of each type.

4. Globes and Guards: 1 for every 20 of each type and rating installed. Furnish at least one of each type.

PART 2 - PRODUCTS

2.01 PERFORMANCE REQUIREMENTS

A. Seismic Performance: Luminaires shall withstand the effects of earthquake motions determined according to ASCE/SEI 7 and 2018 International Building Code (IBC) Section 1613.

1. The term "withstand" means "the luminaire will remain in place without separation of any parts when subjected to the seismic forces specified and the luminaire will be fully operational during and after the seismic event."

2.02 FIXTURES AND FIXTURE COMPONENTS:

A. Metal Parts: Free from burrs, sharp edges, and corners.

B. Sheet Metal Components: Corrosion resistant aluminum, except as otherwise indicated. Form and support to prevent warping and sagging.

C. Housings: Rigidly formed, weather and light tight enclosures that will not warp, sag, or deform in use. Provide filter/breather for enclosed fixtures.

D. Doors, Frames, and Other Internal Access: Smooth operating, free from light leakage under operating conditions, and arranged to permit relamping without use of tools. Arrange doors, frames, lenses, diffusers, and other pieces to prevent accidental falling during relamping and when secured in operating position. Provide for door removal for cleaning or replacing lens. Arrange for door opening to disconnect ballast.

E. Exposed Hardware Material: Stainless steel.

F. Reflecting Surfaces: Minimum reflectances as follows, except as otherwise indicated:

1. White Surfaces: 85 percent

2. Specular Surfaces: 83 percent

3. Diffusing Specular Surfaces: 75 percent

G. Plastic Parts: High resistance to yellowing and other changes due to aging, exposure to heat, and UV radiation.

H. Lenses and Refractors: Materials as indicated. Use heat- and aging-resistant, resilient gaskets to seal and cushion lens and refractor mounting in fixture doors.

I. Photoelectric Relays: Conform to UL 773.

1. Contact Relays: Single throw, arranged to fail in ON position and factory set to turn light unit on at 1.5 to 3 foot-candles and off at 4.5 to 10 foot-candles with 15 second minimum time delay.

2. Relay Mounting: In fixture housing.

J. Electronic Timer Switch:

1. Programmable for 24-hour or 7 day schedules with resolution to the minute.

2. Automatic daylight savings changeover

3. Lithium Ion battery maintains program for 2 weeks or more

4. Intermatic Model Digi 42/2-120

K. LED Fixtures: Conform to ANSI/UL 8750.

2.03 LED ARRAYS:

A. Furnish optics, CCT, lumen output, and other salient features as identified in the luminaire schedule.

2.04 LED FIXTURES:

A. Provide fixtures on the DesignLights Consortium (DLC) Qualified Products List.

B. Thermal Management: Liquids or other moving parts shall be clearly indicated in submittals, and shall be consistent with product testing.

C. Color Rendering Index (CRI): >80.

D. Correlated Color Temperature: 3000K or as indicated on the fixture schedule.

E. Minimum luminaire efficacies: 85 lumens per watt. Nominal input wattage shall account for nominal applied voltage and any reduction in driver efficiency due to sub-optimal driver loading.

F. Fully enclosed wiring and LED diodes enclosed to prevent penetration of dust, insects, and other debris into the lamp and driver compartment.

G. Driver/LED combined system shall have rated life based on IESNA LM-80-2008 (or latest) of 100,000 hours at 70 percent lumen maintenance.

H. Driver is high efficiency type with THD < 20 percent and power factor > 0.90.

I. Outdoor fixtures capable of reliable operation in temperature range of minus 30 degrees C to plus 40 degrees C minimum.

J. Luminaires are to be full cut-off type.

K. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

L. L70 lamp life of 90,000 hours, minimum.

M. Nominal Operating Voltage: As identified on fixture schedule.

N. In-line Fusing: Separate in-line fuse for each luminaire.

O. Source Limitations:

1. Obtain luminaires from single source from a single manufacturer.

P. For luminaires, obtain each color, grade, finish, type, and variety of luminaire from single source with resources to provide products of consistent quality in appearance and physical properties.

2.05 FIXTURE SUPPORT COMPONENTS:

A. Pole-Mounted Fixtures: Conform to AASHTO LTS-6.

B. Wind-load strength of total support assembly, including pole, arms, appurtenances, base, and anchorage, is adequate to carry itself plus fixtures indicated at indicated heights above grade without failure, permanent deflection, or whipping in steady winds of 109 miles/hour with gust factor of 1.3, or as otherwise appropriate for this location, assuming ASCE Risk Category III

C. Arm, Bracket, and Tenon Mount Materials: Match poles' finish.

D. Mountings, Fastenings, and Appurtenances: Corrosion-resistant items compatible with support components. Use materials that will not cause galvanic action at contact points. Use mountings that correctly position luminaire to provide indicated light distribution.

E. Pole Shafts: Round, tapered.

F. Pole Bases: Hinged-anchor type with steel hold-down or anchor bolts, leveling nuts, and bolt covers.

G. Poles: Steel tubing conforming to ASTM A500, Grade B, carbon steel with minimum yield of 46,000 psi. Poles are 1 piece construction up to 40 feet in length and have access handhole in wall.

H. Aluminum Poles: ASTM B209, 5052-H34 alloy. Provide access handhole in pole wall.

I. Metal Pole Grounding Provisions: Welded 1/2 inch threaded lug, accessible through handhole.

J. Aluminum Mast Arms: Tapered oval arms continuously welded to pole attachment plate with span and rise as indicated.

K. Metal Pole Brackets: Designed to match pole metal. Provide cantilever brackets without under-brace, in sizes and styles indicated, with straight tubular end section to accommodate fixture.

L. Pole Top Tenons: Fabricated to support fixture or fixtures and brackets indicated and securely fastened to pole top.

M. Concrete for Pole Foundations:

1. Comply with Section 03 30 00

2. Use 3000 psig strength, 28 day concrete

2.06 FINISHES:

A. Metal Parts: Manufacturer's standard finish, except as otherwise indicated, applied over corrosion resistant primer, free of streaks, runs, holidays, stains, blisters, and similar defects.

B. Other Parts: Manufacturer's standard finish, except as otherwise indicated.

PART 3 - EXECUTION

3.01 INSTALLATION:

A. Set units plumb, square, level, and secure according to manufacturer's written instructions and accepted submittals.

B. Concrete Foundations: Construct according to Section 03 30 00.

1. Comply with details and manufacturer's recommendations for reinforcing, anchor bolts, nuts, and washers. Verify anchor bolt templates by comparing with actual pole bases furnished.

2. Finish: Trowel and rub smooth parts exposed to view.

C. Pole Installation: Use web fabric slings (not chain or cable) to raise and set poles.

D. Fixture Attachment: Fasten to indicated structural supports.

E. Lamp fixtures with indicated lamps according to manufacturer's written instructions. Replace malfunctioning lamps.

3.02 GROUNDING:

A. Ground fixtures and metal poles according to Section 26 05 26.

1. Poles: Install 3/4"-nominal x10 feet driven ground rod at each pole.

3.03 FIELD QUALITY CONTROL:

A. Inspect each installed unit for damage. Replace damaged fixtures and components.

B. Tests and Observations:

1. Give advance notice of dates and times for field tests.

2. Provide instruments to make and record test results.

3. Replace or repair damaged and malfunctioning units, make necessary adjustments, and retest. Repeat procedure until units operate properly.

3.04 ADJUSTING AND CLEANING:

A. Clean units after installation. Use methods and materials recommended by manufacturer.

3.05 CONTRACT CLOSEOUT:

A. Provide in accordance with Section 01 77 00.

SECTION 27 05 26

GROUNDING AND BONDING FOR COMMUNICATIONS SYSTEMS

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide grounding conductors, connectors, busbars, rods, and labeling as indicated and in compliance with Contract Documents.

1.02 REFERENCES:

A. ASTM International (ASTM):

1. B3: Standard Specification for Soft or Annealed Copper Wire

2. B8: Standard Specification for Concentric-Lay-Stranded Copper Conductors, Hard, Medium-Hard, or Soft

3. B33: Standard Specification for Tin-Coated Soft or Annealed Copper Wire for Electrical Purposes

B. Institute of Electrical and Electronics Engineers (IEEE):

1. C2: National Electrical Safety Code.

C. National Electrical Contractors Association (NECA):

1. 1: Standard for Good Workmanship in Electrical Construction

D. National Fire Protection Association (NFPA):

1. 70: National Electrical Code.

E. Telecommunications Industry Association (TIA):

1. 568: Generic Telecommunications Cabling for Customer Premises

2. 607B: Generic Telecommunications Bonding and Grounding (Earthing) for Customer Premises

F. Underwriters' Laboratories, Inc. (UL):

1. 467: Standard for Safety Grounding and Bonding Equipment

2. 486A: Standard for Safety Wire Connectors and Soldering Lugs for Use with Copper Conductors

3. 486B: Standard for Safety Wire Connectors

4. 891: Standard for Safety Switchboards

1.03 DEFINITIONS:

A. BCT: Bonding conductor for telecommunications.

B. TGB: Telecommunications grounding busbar.

C. TMGB: Telecommunications main grounding busbar.

D. Service Provider: The operator of a service that provides telecommunications transmission delivered over access provider facilities.

1.04 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Shop Drawings: For communications equipment room signal reference grid. Include plans, elevations, sections, details, and attachments to other work.

C. Record Drawing Data: Plans showing record drawing locations of grounding and bonding infrastructure, including the following:

1. Ground rods.

2. Ground and roof rings.

3. BCT, TMGB, TGBs, and routing of their bonding conductors.

D. Qualification Data: For installation supervisor, and field inspector.

E. Qualification Data: For testing agency and testing agency's field supervisor.

F. Field quality-control reports.

G. Operation and Maintenance Data: For grounding to include in emergency, operation, and maintenance manuals.

1. In addition to items specified in Section 01 78 23, include the following:

a. Result of the ground-resistance test, measured at the point of BCT connection.

b. Result of the bonding-resistance test at each TGB and its nearest grounding electrode.

c. Field quality-control test results.

1.05 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.06 SPARE PARTS:

A. Comply with the requirements specified in Section 01 61 00.

1.07 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

1. Installation Supervision: Installation shall be under the direct supervision of ITS Technician, who shall be present at all times when Work of this Section is performed at Project site.

2. Field Inspector: Currently registered by BICSI as a designer RCDD to perform the on-site inspection.

1.08 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

PART 2 - PRODUCTS

2.01 SYSTEM DESCRIPTION:

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

B. Comply with UL 467 for grounding and bonding materials and equipment.

C. Comply with TIA-607-B.

2.02 CONDUCTORS:

A. Manufacturers:

1. Harger Lightning & Grounding

2. Panduit Corp.

3. TE Connectivity Ltd.

B. Comply with UL 486A-486B.

C. Insulated Conductors: Stranded copper wire, green or green with yellow stripe insulation, insulated for 600 V, and complying with UL 83.

1. Ground wire for custom-length equipment ground jumpers shall be No. 6 AWG, 19-strand, UL-listed, Type THHN wire.

2. Cable Tray Equipment Grounding Wire: No. 6 AWG.

D. Cable Tray Grounding Jumper:

1. Not smaller than No. 6 AWG and not longer than 12 inches. If jumper is a wire, it shall have a crimped grounding lug with two holes and long barrel for two crimps. If jumper is a flexible braid, it shall have a one-hole ferrule. Attach with grounding screw or connector provided by cable tray manufacturer.

2. Not smaller than No. 10 AWG and not longer than 12 inches. If jumper is a wire, it shall have a crimped grounding lug with one hole and standard barrel for one crimp. If jumper is a flexible braid, it shall have a one- or two-hole ferrule. Attach with grounding screw or connector provided by cable tray manufacturer.

E. Bare Copper Conductors:

1. Solid Conductors: ASTM B3.

2. Stranded Conductors: ASTM B8.

3. Tinned Conductors: ASTM B33.

4. Bonding Cable: 28 kcmils, 14 strands of No. 17 AWG conductor, and 1/4 inch in diameter.

5. Bonding Conductor: No. 4 or No. 6 AWG, stranded conductor.

6. Bonding Jumper: Tinned-copper tape, braided conductors terminated with two-hole copper ferrules; 1-5/8 inches wide and 1/16 inch thick.

2.03 CONNECTORS:

A. Manufacturers:

1. Brundy; Hubbel Incorporated, Construction and Energy

2. Chatsworth Products, Inc.

3. Harger Lightning & Grounding

4. Panduit Corp.

5. TE Connectivity Ltd.

B. Irreversible connectors listed for the purpose. Listed by an NRTL as complying with NFPA 70 for specific types, sizes, and combinations of conductors and other items connected. Comply with UL 486A-486B.

C. Compression Wire Connectors: Crimp-and-compress connectors that bond to the conductor when the connector is compressed around the conductor. Comply with UL 467.

1. Electroplated tinned copper, C and H shaped.

D. Signal Reference Grid Connectors: Combination of compression wire connectors, access floor grounding clamps, bronze U-bolt grounding clamps, and copper split-bolt connectors, designed for the purpose.

E. Busbar Connectors: Cast silicon bronze, solderless exothermic-type, mechanical connector; with a long barrel and two holes spaced on 5/8- or 1-inch centers for a two-bolt connection to the busbar.

F. Welded Connectors: Exothermic-welding kits of types recommended by kit manufacturer for materials being joined and installation conditions.

2.04 GROUNDING BUSBARS:

A. Manufacturers:

1. Harger Lightning & Grounding

2. Panduit Corp.

3. TE Connectivity Ltd.

B. TMGB: Predrilled, wall-mounted, rectangular bars of hard-drawn solid copper, 1/4 by 4 inches in cross section, length as indicated on Drawings. The busbar shall be NRTL listed for use as TMGB and shall comply with TIA-607-B.

1. Predrilling shall be with holes for use with lugs specified in this Section.

2. Mounting Hardware: Stand-off brackets that provide a 4-inch clearance to access the rear of the busbar. Brackets and bolts shall be stainless steel.

3. Stand-off insulators for mounting shall be Lexan or PVC. Comply with UL 891 for use in 600-V switchboards, impulse tested at 5000 V.

C. TGB: Predrilled rectangular bars of hard-drawn solid copper, 1/4 by 4 inches in cross section, length as indicated on Drawings. The busbar shall be for wall mounting, shall be NRTL listed as complying with UL 467, and shall comply with TIA-607-B.

1. Predrilling shall be with holes for use with lugs specified in this Section.

2. Mounting Hardware: Stand-off brackets that provide at least a 4-inch clearance to access the rear of the busbar. Brackets and bolts shall be stainless steel.

3. Stand-off insulators for mounting shall be Lexan or PVC. Comply with UL 891 for use in 600-V switchboards, impulse tested at 5000 V.

D. Rack and Cabinet Grounding Busbars: Rectangular bars of hard-drawn solid copper, accepting conductors ranging from No. 14 to No. 2/0 AWG, NRTL listed as complying with UL 467, and complying with TIA-607-B. Predrilling shall be with holes for use with lugs specified in this Section.

1. Cabinet-Mounted Busbar: Terminal block, with stainless-steel or copper-plated hardware for attachment to the cabinet.

2. Rack-Mounted Horizontal Busbar: Designed for mounting in 19- or 23-inch equipment racks. Include a copper splice bar for transitioning to an adjoining rack, and stainless-steel or copper-plated hardware for attachment to the rack.

3. Rack-Mounted Vertical Busbar: 72 or 36 inches long, with stainless-steel or copper-plated hardware for attachment to the rack.

2.05 GROUND RODS:

A. Manufacturers:

1. Harger Lightning & Grounding

2. TE Connectivity Ltd.

B. Ground Rods: Copper-clad Zinc-coated Stainless steel 3/4 inch by 10 feet 5/8 by 96 inches in 3/4 inch diameter.

2.06 IDENTIFICATION:

A. Comply with requirements for identification products in Section 27 05 53.

PART 3 - EXECUTION

3.01 EXAMINATION:

A. Inspect the test results of the ac grounding system measured at the point of BCT connection.

B. Prepare written report, endorsed by Installer, listing conditions detrimental to performance of the Work.

C. Proceed with connection of the BCT only after unsatisfactory conditions have been corrected.

3.02 INSTALLATION:

A. Bonding shall include the ac utility power service entrance, the communications cable entrance, and the grounding electrode system. The bonding of these elements shall form a loop so that each element is connected to at least two others.

B. Comply with NECA 1.

C. Comply with TIA-607-B.

3.03 APPLICATION:

A. Conductors: Install solid conductor for No. 8 AWG and smaller and stranded conductors for No. 6 AWG and larger unless otherwise indicated.

1. The bonding conductors between the TGB and structural steel of steel-frame buildings shall not be smaller than No. 6 AWG.

2. The bonding conductors between the TMGB and structural steel of steel-frame buildings shall not be smaller than No. 6 AWG.

B. Underground Grounding Conductors: Install bare tinned-copper conductor, No. 2 AWG minimum.

C. Conductor Terminations and Connections:

1. Pipe and Equipment Grounding Conductor Terminations: Bolted connectors.

2. Underground Connections: Welded connectors except at test wells and as otherwise indicated.

3. Connections to Ground Rods at Test Wells: Bolted connectors.

4. Connections to Structural Steel: Welded connectors.

D. Conductor Support:

1. Secure grounding and bonding conductors at intervals of not less than 36 inches.

E. Grounding and Bonding Conductors:

1. Install in the straightest and shortest route between the origination and termination point, and no longer than required. The bend radius shall not be smaller than eight times the diameter of the conductor. No one bend may exceed 90 degrees.

2. Install without splices.

3. Support at not more than 36-inch intervals.

4. Install grounding and bonding conductors in 3/4-inch PVC conduit until conduit enters a telecommunications room. The grounding and bonding conductor pathway through a plenum shall be in EMT. Conductors shall not be installed in EMT unless otherwise indicated.

a. If a grounding and bonding conductor is installed in ferrous metallic conduit, bond the conductor to the conduit using a grounding bushing that complies with requirements in Section 27 05 28, and bond both ends of the conduit to a TGB.

3.04 GROUNDING ELECTRODE SYSTEM:

A. The BCT between the TMGB and the ac service equipment ground shall not be smaller than No. 4/0 AWG.

3.05 GROUNDING BUSBARS:

A. Indicate locations of grounding busbars on Drawings. Install busbars horizontally, on insulated spacers 4 inches minimum from wall, 12 inches above finished floor unless otherwise indicated.

B. Where indicated on both sides of doorways, route bus up to top of door frame, across top of doorway, and down; connect to horizontal bus.

3.06 CONNECTIONS:

A. Bond metallic equipment in a telecommunications equipment room to the grounding busbar in that room, using equipment grounding conductors not smaller than No. 6 AWG.

B. Stacking of conductors under a single bolt is not permitted when connecting to busbars.

C. Assemble the wire connector to the conductor, complying with manufacturer's written instructions and as follows:

1. Use crimping tool and the die specific to the connector.

2. Pre-twist the conductor.

3. Apply an antioxidant compound to all bolted and compression connections.

D. Primary Protector: Bond to the TMGB with insulated bonding conductor.

E. Interconnections: Interconnect all TGBs with the TMGB with the telecommunications backbone conductor. If more than one TMGB is installed, interconnect TMGBs using the grounding equalizer conductor. The telecommunications backbone conductor and grounding equalizer conductor size shall not be less than 2 kcmils/linear foot of conductor length, up to a maximum size of No. 3/0 AWG unless otherwise indicated.

F. Telecommunications Enclosures and Equipment Racks: Bond metallic components of enclosures to the telecommunications bonding and grounding system. Install top-mounted, vertically mounted rack grounding busbar unless the enclosure and rack are manufactured with the busbar. Bond the equipment grounding busbar to the TGB No. 2 AWG bonding conductors.

G. Structural Steel: Where the structural steel of a steel frame building is readily accessible within the room or space, bond each TGB and TMGB to the vertical steel of the building frame.

H. Electrical Power Panelboards: Where an electrical panelboard for telecommunications equipment is located in the same room or space, bond each TGB to the ground bar of the panelboard.

I. Shielded Cable: Bond the shield of shielded cable to the TGB in communications rooms and spaces. Comply with TIA-568-C.1 and TIA-568-C.2 when grounding shielded balanced twisted-pair cables.

J. Rack- and Cabinet-Mounted Equipment: Bond powered equipment chassis to the cabinet or rack grounding bar. Power connection shall comply with NFPA 70; the equipment grounding conductor in the power cord of cord- and plug-connected equipment shall be considered as a supplement to bonding requirements in this Section.

K. Access Floors: Bond all metal parts of access floors to the TGB.

L. Equipment Room Signal Reference Grid: Provide a low-impedance path between telecommunications cabinets, equipment racks, and the reference grid, using No. 6 AWG bonding conductors.

1. Install the conductors in grid pattern on 4-foot centers, allowing bonding of one pedestal from each access floor tile.

2. Bond the TGB of the equipment room to the reference grid at two or more locations.

3. Bond all conduits and piping entering the equipment room to the TGB at the perimeter of the room.

M. Towers and Antennas:

1. Ground Ring: Buried at least 30 inches below grade and at least 24 inches from the base of the tower or mounting.

2. Bond each tower base and metallic frame of a dish to the ground ring, buried at least 18 inches below grade.

3. Bond the ground ring and antenna grounds to the equipment room TMGB or TGB, buried at least 30 inches below grade.

4. Bond metallic fences within 6 feet of towers and antennas to the ground ring, buried at least 18 inches below grade.

5. Special Requirements for Roof-Mounted Towers:

a. Roof Ring: Meet requirements for the ground ring except the conductors shall comply with requirements in Section 26 41 13.

b. Bond tower base footings steel, the TGB in the equipment room, and antenna support guys to the roof ring.

c. Connect roof ring to the perimeter conductors of the lightning protection system.

6. Waveguides and Coaxial Cable:

a. Bond cable shields at the point of entry into the building to the TGB and to the cable entrance plate, using No. 2 AWG bonding conductors.

b. Bond coaxial cable surge arrester to the ground or roof ring using bonding conductor size recommended by surge-arrester manufacturer.

3.07 GROUNDING UNDERGROUND DISTRIBUTION SYSTEM COMPONENTS:

A. Duct-Bank Grounding Conductor: Bury 12 inches above duct bank when indicated as part of duct-bank installation.

B. Comply with IEEE C2 grounding requirements.

C. Grounding Maintenance Holes and Handholes: Install a driven ground rod through maintenance hole or handhole floor, close to wall, and set rod depth so 4 inches extends

above finished floor. If necessary, install ground rod before maintenance hole is placed and provide No. 1/0 AWG bare, tinned-copper conductor from ground rod into maintenance hole through a waterproof sleeve in maintenance hole wall. Protect ground rods passing through concrete floor with a double wrapping of pressure-sensitive insulating tape or heat-shrunk insulating sleeve from 2 inches above to 6 inches below concrete. Seal floor opening with waterproof, non-shrink grout.

D. Grounding Connections to Maintenance Hole Components: Bond exposed-metal parts such as inserts, cable racks, pulling irons, ladders, and cable shields within each maintenance hole or handhole, to ground rod or grounding conductor. Make connections with No. 4 AWG minimum, bonding conductor. Train conductors' level or plumb around corners and fasten to maintenance hole walls. Connect grounding conductors to cable armor and cable shields according to written instructions by manufacturer of splicing and termination kits.

3.08 IDENTIFICATION:

A. Labels shall be preprinted or computer-printed type.

1. Label TMGB(s) with "fs-TMGB," where "fs" is the telecommunications space identifier for the space containing the TMGB.

2. Label TGB(s) with "fs-TGB," where "fs" is the telecommunications space identifier for the space containing the TGB.

3. Label the BCT and each telecommunications backbone conductor at its attachment point: "WARNING! TELECOMMUNICATIONS BONDING CONDUCTOR. DO NOT REMOVE OR DISCONNECT!"

3.09 FIELD QUALITY CONTROL:

A. Testing Agency: Owner will engage a qualified testing agency to perform tests and inspections.

B. Perform tests and inspections.

C. Tests and Inspections:

1. Inspect physical and mechanical condition. Verify tightness of accessible, bolted, electrical connections with a calibrated torque wrench according to manufacturer's written instructions.

2. Test the bonding connections of the system using an ac earth ground-resistance tester, taking two-point bonding measurements in each telecommunications equipment room containing a TMGB and a TGB and using the process recommended by BICSI TDMM. Conduct tests with the facility in operation.

    a. Measure the resistance between the busbar and the nearest available grounding electrode. The maximum acceptable value of this bonding resistance is 100 milliohms.

3. Test for ground loop currents using a digital clamp-on ammeter, with a full-scale of not more than 10 A, displaying current in increments of 0.01 A at an accuracy of plus/minus 2.0 percent.

    a. With the grounding infrastructure completed and the communications system electronics operating, measure the current in every conductor connected to the TMGB and in each TGB. Maximum acceptable ac current level is 1 A.

D. Excessive Ground Resistance: If resistance to ground at the BCT exceeds 5 ohms, notify Architect promptly and include recommendations to reduce ground resistance.

E. Grounding system will be considered defective if it does not pass tests and inspections.

F. Prepare test and inspection reports.

3.10 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 27 05 28

PATHWAYS FOR COMMUNICATIONS SYSTEMS

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide pathways for communications systems as indicated and in compliance with Contract Documents.

1. Metal conduits and fittings.

2. Nonmetallic conduits and fittings.

3. Optical-fiber-cable pathways and fittings.

4. Metal wireways and auxiliary gutters.

5. Nonmetallic wireways and auxiliary gutters.

6. Metallic surface pathways.

7. Nonmetallic surface pathways.

8. Boxes, enclosures, and cabinets.

1.03 DEFINITIONS:

A. ARC: Aluminum rigid conduit.

B. GRC: Galvanized rigid conduit.

C. IMC: Intermediate metal conduit.

D. RTRC: Reinforced thermosetting resin conduit.

1.04 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Product data for the following:

1. Surface pathways

2. Wireways and fittings

3. Tele-power poles

4. Boxes, enclosures, and cabinets

5. Underground handholes and boxes

C. Shop Drawings: For custom enclosures and cabinets and custom underground handholes and boxes. Include plans, elevations, sections, and attachment details.

D. Samples: For wireways, nonmetallic wireways, surface pathways, tele-power poles and for each color and texture specified, 12 inches long.

E. Coordination Drawings: Pathway routing plans, drawn to scale, on which the following items are shown and coordinated with each other, using input from installers of items involved:

1. Structural members in paths of pathway groups with common supports.

2. HVAC and plumbing items and architectural features in paths of conduit groups with common supports.

3. Underground ducts, piping, and structures in location of underground enclosures and handholes.

F. Qualification Data: For professional engineer.

G. Seismic Qualification Data: Provide seismic bracing for all pathway racks, enclosures, cabinets, equipment racks, and their mounting provisions, including those for internal components, from manufacturer.

1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.

2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.

3. Detailed description of equipment anchorage devices on which certification is based and their installation requirements.

4. Detailed description of conduit support devices and interconnections on which certification is based and their installation requirements.

H. Source quality-control reports.

1.05 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.06 SPARE PARTS:

A. Comply with the requirements specified in Section 01 61 00.

1.07 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

1.08 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

PART 2 - PRODUCTS

2.01 METAL CONDUITS AND FITTINGS:

A. Description: Metal raceway of circular cross section with manufacturer-fabricated fittings.

B. Manufacturers:

1. Alpha Wire

2. Electri-Flex Company

3. Plasti-Bond

4. Republic Conduit

5. Southwire Company

C. General Requirements for Metal Conduits and Fittings:

1. Listed and labeled as defined in NFPA 70, by a nationally recognized testing laboratory, and marked for intended location and application.

2. Comply with TIA-569-D.

D. GRC: Comply with ANSI C80.1 and UL 6.

E. IMC: Comply with ANSI C80.6 and UL 1242.

F. PVC-Coated Steel Conduit: PVC-coated GRC, IMC.

1. Comply with NEMA RN 1.

2. Coating Thickness: 0.040 inch, minimum.

G. SS IMC: Type 304 or 316 Stainless Steel conduit. Comply with ANSI and UL for intermediate metallic conduit.

H. EMT: Comply with ANSI C80.3 and UL 797.

I. Fittings for Metal Conduit: Comply with NEMA FB 1 and UL 514B.

1. Conduit Fittings for Hazardous (Classified) Locations: Comply with UL 1203 and NFPA 70.

2. Fittings for EMT:

a. Material: Steel or die cast.

b. Type: Set screw or compression.

3. Expansion Fittings: PVC or steel to match conduit type, complying with UL-467, rated for environmental conditions where installed, and including flexible external bonding jumper.

4. Coating for Fittings for PVC-Coated Conduit: Minimum thickness of 0.040 inch, with overlapping sleeves protecting threaded joints.

J. Joint Compound for IMC, GRC, or ARC: Approved, as defined in NFPA 70, by authorities having jurisdiction for use in conduit assemblies, and compounded for use to lubricate and protect threaded conduit joints from corrosion and to enhance their conductivity.

2.02 NONMETALLIC CONDUITS AND FITTINGS:

A. Description: Nonmetallic raceway of circular section with manufacturer-fabricated fittings.

B. Manufacturers:

1. ABB (Electrification Products Division)

2. Cantex Inc.

3. Dura-line

4. Electric-Flex Company

5. Kraloy Fittings

C. General Requirements for Nonmetallic Conduits and Fittings:

1. Listed and labeled as defined in NFPA 70, by an NRTL, and marked for intended location and application.

2. Comply with TIA-569-D.

D. RNC: Type EPC-40-PVC, Type EPC-80-PVC, complying with NEMA TC 2 and UL 651 unless otherwise indicated.

E. Rigid HDPE: Comply with UL 651A.

F. Continuous HDPE: Comply with UL 651A.

G. RTRC: Comply with UL 2515A and NEMA TC 14.

H. Solvents and Adhesives: As recommended by conduit manufacturer.

2.03 OPTICAL-FIBER-CABLE PATHWAYS AND FITTINGS:

A. Description: Comply with UL 2024; flexible-type pathway with a circular cross section, approved for plenum riser or general-use installation unless otherwise indicated.

B. Manufacturers:

1. Alpha Wire

2. Carlon; a brand of Thomas & Betts Corporation

3. Dura-line

4. Endot-Industries Inc.

5. IPEX USA LLC

C. Listed and labeled as defined in NFPA 70, by an NRTL, and marked for intended location and application.

D. Comply with TIA-569-D.

2.04 METAL WIREWAYS AND AUXILIARY GUTTERS:

A. Description: Sheet metal trough of rectangular cross section fabricated to required size and shape, without holes or knockouts, and with hinged or removable covers.

B. Manufacturers:

1. Eaton (B-line)

2. MonoSystems, Inc

3. nVent (Hoffman)

4. Schneider Electric USA (Square D)

C. General Requirements for Metal Wireways and Auxiliary Gutters:

1. Comply with UL 870 and NEMA 250, Type 1, Type 3R, Type 4, Type unless otherwise indicated, and sized according to NFPA 70.

2. Metal wireways installed outdoors shall be listed and labeled as defined in NFPA 70, by an NRTL, and marked for intended location and application.

3. Comply with TIA-569-D.

D. Fittings and Accessories: Include covers, couplings, offsets, elbows, expansion joints, adapters, hold-down straps, end caps, and other fittings to match and mate with wireways as required for complete system.

E. Wireway Covers: Hinged type, Screw-cover type, Flanged-and-gasketed type unless otherwise indicated.

F. Finish: Manufacturer's standard enamel finish.

2.05 NONMETALLIC WIREWAYS AND AUXILIARY GUTTERS:

A. Description: Fiberglass polyester, extruded and fabricated to required size and shape, without holes or knockouts. Cover shall be gasketed with oil-resistant gasket material and fastened with captive screws treated for corrosion resistance. Connections shall be flanged and have stainless-steel screws and oil-resistant gaskets.

B. Manufacturers:

1. Allied Moulded Products, Inc.

2. Carlon; a brand of Thomas & Betts Corporation

3. Niedax Inc.

4. nVent (Hoffman)

C. General Requirements for Nonmetallic Wireways and Auxiliary Gutters:

1. Listed and labeled as defined in NFPA 70, by an NRTL, and marked for intended location and application.

2. Comply with TIA-569-D.

D. Fittings and Accessories: Couplings, offsets, elbows, expansion joints, adapters, hold-down straps, end caps, and other fittings shall match and mate with wireways as required for complete system.

E. Solvents and Adhesives: As recommended by conduit manufacturer.

2.06 SURFACE METAL PATHWAYS:

A. Description: Galvanized steel with snap-on covers, complying with UL 5. Manufacturer’s standard enamel finish.

B. Manufacturers:

1. MonoSystems, Inc.

2. Niedax Inc.

3. Panduit Corp.

4. Wiremold; Legrand North America, LLC.

C. Finish: Manufacturer's standard enamel finish in color selected by Architect, Prime coated, ready for field painting.

D. Listed and labeled as defined in NFPA 70, by an NRTL, and marked for intended location and application.

E. Comply with TIA-569-D.

2.07 SURFACE NONMETALLIC PATHWAYS:

A. Description: Two- or three-piece construction, complying with UL 5A, and manufactured of rigid PVC.

B. Manufacturers:

1. Carlon; a brand of Thomas & Betts Corporation

2. MonoSystems, Inc.

3. Panduit Corp.

4. Quazite; Hubbell Incorporation, Power Systems

5. Wiremold; Legrand North America, LLC.

C. Finish: Texture and color selected by Architect from manufacturer's standard custom colors.

D. Product shall comply with UL 94 V-0 requirements for self-extinguishing characteristics.

E. Listed and labeled as defined in NFPA 70, by an NRTL, and marked for intended location and application.

F. Comply with TIA-569-D.

2.08 BOXES, ENCLOSURES, AND CABINETS:

A. Description: Enclosures for communications.

B. Manufacturers:

1. ABB (Electrification Products Division)

2. Carlon; a brand of Thomas & Betts Corporation

3. Erikson Electrical Equipment Company

4. MonoSystems, Inc.

5. Wiremold; Legrand North America, LLC.

C. General Requirements for Boxes, Enclosures, and Cabinets:

1. Comply with TIA-569-D.

2. Boxes, enclosures, and cabinets installed in wet locations shall be listed and labeled as defined in NFPA 70, by an NRTL, and marked for use in wet locations.

3. Box extensions used to accommodate new building finishes shall be of same material as recessed box.

4. Device Box Dimensions: 4 inches square by 2-1/8 inches deep.

5. Gangable boxes are allowed.

D. Sheet Metal Outlet and Device Boxes: Comply with NEMA OS 1 and UL 514A.

E. FB 1, ferrous alloy or aluminum, Type FD, with gasketed cover.

F. Metal Floor Boxes:

1. Material: Cast metal or sheet metal.

2. Type: Fully adjustable

3. Shape: Rectangular.

4. Metal floor boxes shall be listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

G. Nonmetallic Floor Boxes: Nonadjustable, rectangular.

1. Nonmetallic floor boxes shall be listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

H. Small Sheet Metal Pull and Junction Boxes: NEMA OS 1.

I. Cast-Metal Access, Pull, and Junction Boxes: Comply with NEMA FB 1 and UL 1773, cast aluminum with gasketed cover.

J. Nonmetallic Outlet and Device Boxes: Comply with NEMA OS 2 and UL 514C.

K. Hinged-Cover Enclosures: Comply with UL 50 and NEMA 250, Type 1, Type 3R, Type 4, Type 12, with continuous-hinge cover with flush latch unless otherwise indicated.

1. Metal Enclosures: Steel, finished inside and out with manufacturer's standard enamel.

2. Nonmetallic Enclosures:

a. Material: Fiberglass.

b. Finished inside with radio-frequency-resistant paint.

3. Interior Panels: Steel; all sides finished with manufacturer's standard enamel.

L. Cabinets:

1. NEMA 250, Type 3R, Type 4, galvanized-steel box with removable interior panel and removable front, finished inside and out with manufacturer's standard enamel.

2. Hinged door in front cover with flush latch and concealed hinge.

3. Key latch to match panelboards.

4. Metal barriers to separate wiring of different systems and voltage.

5. Accessory feet where required for freestanding equipment.

6. Nonmetallic cabinets shall be listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

PART 3 - EXECUTION

3.01 PATHWAY APPLICATION:

A. Outdoors: Apply pathway products as specified below unless otherwise indicated:

1. Exposed Conduit: GRC, IMC, RNC, Type EPC-40-PVC RNC, Type EPC-80-PVC.

2. Corrosive / Wet Areas: SS IMC or PVC-coated GRC, IMC.

3. Concealed Conduit, Aboveground: GRC, IMC, EMT, RNC, Type EPC-40-PVC.

4. Underground Conduit: RNC, Type EPC-40-PVC Type EPC-80-PVC, direct buried concrete encased.

5. Boxes and Enclosures, Aboveground: NEMA 250, Type 3R Type 4.

B. Indoors: Apply pathway products as specified below unless otherwise indicated:

1. Exposed, Not Subject to Physical Damage: EMT or RNC.

2. Exposed, Not Subject to Severe Physical Damage: EMT, RNC identified for such use.

3. Exposed and Subject to Severe Physical Damage: GRC, IMC. Pathway locations include the following:

    a. Loading dock.

    b. Corridors used for traffic of mechanized carts, forklifts, and pallet-handling units.

    c. Mechanical rooms.

    d. Gymnasiums

4. Concealed in Ceilings and Interior Walls and Partitions: EMT, RNC, Type EPC-40-PVC or innerduct.

5. Damp or Wet Locations: GRC, IMC.

6. Pathways for Optical-Fiber or Communications Cable in Spaces Used for Environmental Air: Plenum-type, optical-fiber-cable pathway Plenum-type, communications-cable pathway EMT.

7. Pathways for Optical-Fiber or Communications-Cable Risers in Vertical Shafts: Riser-type, optical-fiber-cable pathway Riser-type, communications-cable pathway EMT.

8. Pathways for Concealed General-Purpose Distribution of Optical-Fiber or Communications Cable: General-use, optical-fiber-cable pathway Riser-type, optical-fiber-cable pathway Plenum-type, optical-fiber-cable pathway General-use, communications-cable pathway Riser-type, communications-cable pathway Plenum-type, communications-cable pathway EMT.

9. Boxes and Enclosures: NEMA 250, Type 1, except use NEMA 250, Type 4 nonmetallic units in institutional and commercial kitchens and damp or wet locations.

C. Minimum Pathway Size: 1-inch trade size for copper and aluminum cables, and 1 inch for optical-fiber cables.

D. Pathway Fittings: Compatible with pathways and suitable for use and location.

1. Rigid and Intermediate Steel Conduit: Use threaded rigid steel conduit fittings unless otherwise indicated. Comply with NEMA FB 2.10.

2. PVC Externally Coated, Rigid Steel Conduits: Use only fittings listed for use with this type of conduit. Patch and seal all joints, nicks, and scrapes in PVC coating after installing conduits and fittings. Use sealant recommended by fitting manufacturer and apply in thickness and number of coats recommended by manufacturer.

3. EMT: Use compression, steel cast-metal fittings. Comply with NEMA FB 2.10.

E. Do not install aluminum conduits, boxes, or fittings in contact with concrete .

F. Install surface pathways only where indicated on Drawings.

G. Do not install nonmetallic conduit where ambient temperature exceeds 120 degrees F.

3.02 INSTALLATION:

A. Comply with the following standards for installation requirements except where requirements on Drawings or in this section are stricter:

1. NECA 1.

2. NECA/BICSI 568.

3. TIA-569-D.

4. NECA 101

5. NECA 105.

6. NECA 111.

B. Comply with NFPA 70 limitations for types of pathways allowed in specific occupancies and number of floors.

C. Comply with requirements in Section 27 05 29 for hangers and supports.

D. Comply with requirements in Section 27 05 44 for sleeves and sleeve seals for communications.

E. Keep pathways at least 6 inches away from parallel runs of flues and steam or hot-water pipes. Install horizontal pathway runs above water and steam piping.

F. Complete pathway installation before starting conductor installation.

G. Arrange stub-ups so curved portions of bends are not visible above finished slab.

H. Install no more than the equivalent of two 90-degree bends in any pathway run. Support within 12 inches of changes in direction. Utilize long radius ells for all optical-fiber cables.

I. Conceal rigid conduit within finished walls, ceilings, and floors unless otherwise indicated. Install conduits parallel or perpendicular to building lines.

J. Support conduit within 12 inches of enclosures to which attached.

K. Pathways Embedded in Slabs:

1. Run conduit larger than 1-inch trade size, parallel or at right angles to main reinforcement. Where at right angles to reinforcement, place conduit close to slab support. Secure pathways to reinforcement at maximum 10-foot intervals.

2. Arrange pathways to cross building expansion joints at right angles with expansion fittings. Comply with requirements for expansion joints specified in this article.

3. Arrange pathways to keep a minimum of 2 inches of concrete cover in all directions.

4. Do not embed threadless fittings in concrete unless specifically approved by Architect for each specific location.

5. Change from nonmetallic conduit and fittings to RNC, Type EPC-40-PVC, GRC or IMC and fittings before rising above floor.

L. Stub-ups to Above Recessed Ceilings:

1. Use EMT, IMC, or RMC for pathways.

2. Use a conduit bushing or insulated fitting to terminate stub-ups not terminated in hubs or in an enclosure.

M. Threaded Conduit Joints, Exposed to Wet, Damp, Corrosive, or Outdoor Conditions: Apply listed compound to threads of pathway and fittings before making up joints. Follow compound manufacturer's written instructions.

N. Coat field-cut threads on PVC-coated pathway with a corrosion-preventing conductive compound prior to assembly.

O. Terminate threaded conduits into threaded hubs or with locknuts on inside and outside of boxes or cabinets. Install insulated bushings on conduits terminated with locknuts.

P. Install pathways square to the enclosure and terminate at enclosures with locknuts. Install locknuts hand tight plus one additional quarter-turn.

Q. Do not rely on locknuts to penetrate nonconductive coatings on enclosures. Remove coatings in the locknut area prior to assembling conduit to enclosure, to assure a continuous ground path.

R. Cut conduit perpendicular to the length. For conduits of 2-inch trade size and larger, use roll cutter or a guide to ensure cut is straight and perpendicular to the length.

S. Install pull wires in empty pathways. Use polypropylene or monofilament plastic line with not less than 200-pound tensile strength. Leave at least 12 inches of slack at each

end of pull wire. Secure pull wire, so it cannot fall into conduit. Cap pathways designated as spare alongside pathways in use.

T. Surface Pathways:

1. Install surface pathway for surface telecommunications outlet boxes only where indicated on Drawings.

2. Install surface pathway with a minimum 2-inch radius control at bend points.

3. Secure surface pathway with screws or other anchor-type devices at intervals not exceeding 48 inches and with no less than two supports per straight pathway section. Support surface pathway according to manufacturer's written instructions. Tape and glue are not acceptable support methods.

U. Pathways for Optical-Fiber and Communications Cable: Install pathways, metal and nonmetallic, rigid and flexible, as follows:

1. 1-Inch Trade Size and Larger: Install pathways in maximum lengths of 75 feet.

2. Install with a maximum of two 90-degree bends or equivalent for each length of pathway unless Drawings show stricter requirements. Separate lengths with pull or junction boxes or terminations at distribution frames or cabinets where necessary to comply with these requirements.

V. Install pathway-sealing fittings at accessible locations according to NFPA 70 and fill them with listed sealing compound. For concealed pathways, install each fitting in a flush steel box with a blank cover plate having a finish similar to that of adjacent plates or surfaces. Install pathway-sealing fittings according to NFPA 70.

1. Where conduits pass from warm to cold locations, such as boundaries of refrigerated spaces.

2. Where an underground service pathway enters a building or structure.

3. Where otherwise required by NFPA 70.

W. Comply with manufacturer's written instructions for solvent welding PVC conduit and fittings.

X. Expansion-Joint Fittings:

1. Install in each run of aboveground RNC that is located where environmental temperature change may exceed 30 degrees F, and that has straight-run length that exceeds 25 feet. Install in each run of aboveground RMC and EMT that is located where environmental temperature change may exceed 100 degrees F, and that has straight-run length that exceeds 100 feet.

2. Install type and quantity of fittings that accommodate temperature change listed for each of the following locations:

   a. Outdoor Locations Not Exposed to Direct Sunlight: 125 degrees F temperature change.

   b. Outdoor Locations Exposed to Direct Sunlight: 155 degrees F temperature change.

   c. Indoor Spaces Connected with Outdoors without Physical Separation: 125 degrees F temperature change.

   d. Attics: 135 degrees F temperature change.

3. Install fitting(s) that provide expansion and contraction for at least 0.00041 inch per foot of length of straight run per degrees F of temperature change for PVC conduits. Install fitting(s) that provide expansion and contraction for at least 0.000078 inch per foot of length of straight run per degrees F of temperature change for metal conduits.

4. Install expansion fittings at all locations where conduits cross building or structure expansion joints.

5. Install each expansion-joint fitting with position, mounting, and piston setting selected according to manufacturer's written instructions for conditions at specific location at time of installation. Install conduit supports to allow for expansion movement.

Y. Hooks:

1. Size to allow a minimum of 25 percent future capacity without exceeding design capacity limits.

2. Shall be supported by dedicated support wires. Do not use ceiling grid support wire or support rods.

3. Hook spacing shall allow no more than 6 inches of slack. The lowest point of the cables shall be no less than 6 inches adjacent to ceilings, mechanical ductwork and fittings, luminaires, power conduits, power and telecommunications outlets, and other electrical and communications equipment.

4. Space hooks no more than 5 feet o.c.

5. Provide a hook at each change in direction.

Z. Mount boxes at heights indicated on Drawings. If mounting heights of boxes are not individually indicated, give priority to ADA requirements. Install boxes with height measured to center of box unless otherwise indicated.

AA. Recessed Boxes in Masonry Walls: Saw-cut opening for box in center of cell of masonry block, and install box flush with surface of wall. Prepare block surface to provide a flat surface for a raintight connection between box and cover plate or supported equipment and box.

BB. Horizontally separate boxes mounted on opposite sides of walls, so they are not in the same vertical channel.

CC. Support boxes of three gangs or more from more than one side by spanning two framing members or mounting on brackets specifically designed for the purpose.

DD. Fasten junction and pull boxes to or support from building structure. Do not support boxes by conduits.

EE. Set metal floor boxes level and flush with finished floor surface.

FF. Set nonmetallic floor boxes level. Trim after installation to fit flush with finished floor surface.

3.03 SLEEVE AND SLEEVE-SEAL INSTALLATION FOR COMMUNICATIONS PENETRATIONS:

A. Install sleeves and sleeve seals at penetrations of exterior floor and wall assemblies. Comply with requirements in Section 27 05 44.

3.04 FIRESTOPPING:

A. Install firestopping at penetrations of fire-rated floor and wall assemblies.

3.05 PROTECTION:

A. Protect coatings, finishes, and cabinets from damage or deterioration.

1. Repair damage to galvanized finishes with zinc-rich paint recommended by manufacturer.

2. Repair damage to PVC coatings or paint finishes with matching touchup coating recommended by manufacturer.

3.06 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 27 05 29

HANGERS AND SUPPORTS FOR COMMUNICATIONS SYSTEMS

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide hangers and supports for communication systems as indicated and in compliance with Contract Documents.

1. Steel slotted support systems for communication raceways.

2. Aluminum slotted support systems for communication raceways as indicated.

3. Stainless steel supports as indicated.

4. Nonmetallic slotted support systems for communication raceways.

5. Conduit and cable support devices.

6. Support for conductors in vertical conduit.

7. Structural steel for fabricated supports and restraints.

8. Mounting, anchoring, and attachment components, including powder-actuated fasteners, mechanical expansion anchors, concrete inserts, clamps, through bolts, toggle bolts, and hanger rods.

9. Fabricated metal equipment support assemblies.

1.03 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Product Data: For each type of product.

1. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes for the following:

a. Slotted support systems, hardware, and accessories

b. Clamps

c. Hangers

d. Sockets

e. Eye nuts

f. Fasteners

g. Anchors

h. Saddles

i. Brackets

2. Include rated capacities and furnished specialties and accessories.

C. Shop Drawings: Signed and sealed by a qualified professional engineer. For fabrication and installation details for communications hangers and support systems.

1. Trapeze hangers. Include product data for components.

2. Steel slotted-channel systems.

3. Aluminum slotted-channel systems.

4. Nonmetallic slotted-channel systems.

5. Equipment supports.

6. Vibration Isolation Base Details: Detail fabrication, including anchorages and attachments to structure and to supported equipment. Include adjustable motor bases, rails, and frames for equipment mounting.

D. Delegated-Design Submittal: For hangers and supports for communications systems.

1. Include design calculations and details of trapeze hangers.

2. Include design calculations for seismic restraints.

E. Coordination Drawings: Reflected ceiling plan(s) and other details, drawn to scale, on which the following items are shown and coordinated with each other, using input from installers of the items involved:

1. Structural members to which hangers and supports will be attached.

2. Size and location of initial access modules for acoustical tile.

3. Items penetrating finished ceiling, including the following:

a. Luminaires

b. Air outlets and inlets

c. Speakers

d. Sprinklers

e. Access panels

f. Projectors

F. Seismic Qualification Data: Certificates, for hangers and supports for communications equipment and systems, accessories, and components, from manufacturer.

1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.

2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.

3. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.

G. Welding certificates.

1.04 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.05 SPARE PARTS:

A. Comply with the requirements specified in Section 01 61 00.

1.06 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

B. Welding Qualifications: Qualify procedures and personnel according to AWS D1.1 and AWS D1.2.

C. Welding Qualifications: Qualify procedures and personnel according to the following:

1. AWS D1.1

2. AWS D1.2

1.07 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

PART 2 - PRODUCTS

2.01 PERFORMANCE REQUIREMENTS:

A. Delegated Design: Engage a qualified professional engineer, as defined in Section 01 45 00, to design hanger and support system.

B. Seismic Performance: Hangers and supports shall withstand the effects of earthquake motions determined according to ASCE/SEI 7.

1. The term "withstand" means "the supported equipment and systems will remain in place without separation of any parts when subjected to the seismic forces specified and the system will be fully operational after the seismic event."

2. Component Importance Factor: 1.5.

C. Surface-Burning Characteristics: Comply with ASTM E84; testing by a qualified testing agency. Identify products with appropriate markings of applicable testing agency.

1. Flame Rating: Class 1.

2. Self-extinguishing according to ASTM D635.

2.02 SUPPORT, ANCHORAGE, AND ATTACHMENT COMPONENTS

A. Steel Slotted Support Systems: Preformed steel channels and angles with minimum 13/32-inch-diameter holes at a maximum of 8 inches o.c. in at least one surface.

1. Manufacturers:

a. Atkore International (allied Tube & Conduit)

b. Eaton (B-line)

c. Flex-strut Inc.

d. G-strut

e. nVent (CADDY)

2. Standard: Comply with MFMA-4 factory-fabricated components for field assembly.

3. Material for Channel, Fittings, and Accessories: Galvanized steel, Plain steel, Stainless Steel, Type 304, Stainless Steel, Type 316.

4. Channel Width: 1-1/4 inches.

5. Metallic Coatings: Hot-dip galvanized after fabrication and applied according to MFMA-4.

6. Nonmetallic Coatings: Manufacturer's standard PVC, polyurethane, or polyester coating applied according to MFMA-4.

7. Painted Coatings: Manufacturer's standard painted coating applied according to MFMA-4.

8. Protect finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipping.

9. Channel Dimensions: Selected for applicable load criteria.

B. Aluminum Slotted Support Systems: Extruded aluminum channels and angles with minimum 13/32-inch-diameter holes at a maximum of 8 inches o.c. in at least one surface.

1. Manufacturers:

a. ABB (Electrification Products Division)

b. Cooper Industries, Inc.

c. Flex-Strut Inc.

d. Haydon Corporation

e. MKT Metal Manufacturing

2. Standard: Comply with MFMA-4 factory-fabricated components for field assembly.

3. Channel Material: 6063-T6 aluminum alloy.

4. Fittings and Accessories Material: 5052-H32 aluminum alloy.

5. Channel Width: 1-1/4 inches.

6. Nonmetallic Coatings: Manufacturer's standard PVC, polyurethane, or polyester coating applied according to MFMA-4.

7. Painted Coatings: Manufacturer's standard painted coating applied according to MFMA-4.

8. Protect finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipping.

9. Channel Dimensions: Selected for applicable load criteria.

C. Nonmetallic Slotted Support Systems: Structural-grade, factory-formed, glass-fiber-resin channels and angles with minimum 13/32-inch-diameter holes at a maximum of 8 inches o.c., in at least one surface.

1. Manufacturers:

a. Atkore International (allied Tube & Conduit)

b. Eaton (B-line)

c. G-strut

d. Haydon Corporation

e. Seasafe, Inc.; AMICO, a Gibraltar Industries Company

2. Standard: Comply with MFMA-4 factory-fabricated components for field assembly.

3. Channel Width: 1-1/4 inches.

4. Fittings and Accessories: Products provided by channel and angle manufacturer and designed for use with those items.

5. Fitting and Accessory Materials: Same as those for channels and angles, except metal items may be stainless steel.

6. Rated Strength: Selected to suit applicable load criteria.

7. Protect finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipping.

D. Conduit and Cable Support Devices: Steel, Steel and malleable-iron, Stainless-steel, Glass-fiber-resin, clamps, hangers, and associated fittings, designed for types and sizes of raceway or cable to be supported.

E. Support for Conductors in Vertical Conduit: Factory-fabricated assembly consisting of threaded body and insulating wedging plug or plugs for nonarmored communications conductors or cables in riser conduits. Plugs shall have number, size, and shape of conductor gripping pieces as required to suit individual conductors or cables supported. Body shall be made of malleable iron.

F. Structural Steel for Fabricated Supports and Restraints: ASTM A36 steel plates, shapes, and bars; black and galvanized.

G. Mounting, Anchoring, and Attachment Components: Items for fastening electrical items or their supports to building surfaces include the following:

1. Powder-Actuated Fasteners: Threaded-steel stud for use in hardened Portland cement concrete, steel, or wood, with tension, shear, and pullout capacities appropriate for supported loads and building materials where used.

a. Manufacturers:

(1) Hilti, Inc.

(2) ITW Ramset/Red Head; Illinois Tool Works, Inc

(3) MKT Fastening, LLC

(4) Simpson Strong-Tie Co., Inc.

2. Mechanical-Expansion Anchors: Insert-wedge-type zinc-coated steel, stainless steel for use in hardened Portland cement concrete, with tension, shear, and pullout capacities appropriate for supported loads and building materials where used.

a. Manufacturers:

(1) Eaton (B-line)

(2) Empire Tool and Manufacturing Co., Inc.

(3) Hilti, Inc.

(4) ITW Ramset/Red Head; Illinois Tool Works, Inc

(5) MKT Fastening, LLC

3. Concrete Inserts: Steel or malleable-iron, slotted support system units are similar to MSS Type 18 units and comply with MFMA-4 or MSS SP-58.

4. Clamps for Attachment to Steel Structural Elements: MSS SP-58 units are suitable for attached structural element.

5. Through Bolts: Structural type, hex head, and high strength. Comply with ASTM F3125,Grade A325.

6. Toggle Bolts: All-steel, Stainless-steel springhead type.

7. Hanger Rods: Threaded steel.

2.03 FABRICATED METAL EQUIPMENT SUPPORT ASSEMBLIES:

A. Description: Welded or bolted structural-steel shapes, shop or field fabricated to fit dimensions of supported equipment.

B. Materials: Comply with requirements in Section 05 50 00 for steel shapes and plates.

PART 3 - EXECUTION

3.01 APPLICATION:

A. Comply with the following standards for application and installation requirements of hangers and supports, except where requirements on Drawings or in this Section are stricter:

1. NECA 1

2. NECA/BICSI 568

3. TIA-569-D

4. NECA 101

5. NECA 102

6. NECA 105

7. NECA 111

B. Comply with requirements for pathways specified in Section 27 05 28.

C. Maximum Support Spacing and Minimum Hanger Rod Size for Raceway: Space supports for EMTs, IMCs, and RMCs as required by scheduled in NECA 1, where its Table 1 lists maximum spacings that are less than those stated in NFPA 70. Minimum rod size shall be 1/4 inch in diameter.

D. Multiple Raceways or Cables: Install trapeze-type supports fabricated with steel slotted support system, sized so capacity can be increased by at least 25 percent in future without exceeding specified design load limits.

1. Secure raceways and cables to these supports with two-bolt conduit clamps, single-bolt conduit clamps, single-bolt conduit clamps, using spring friction action for retention in support channel.

E. Spring-steel clamps designed for supporting single conduits without bolts may be used for 1-1/2-inch and smaller raceways serving branch circuits and communication systems above suspended ceilings and for fastening raceways to trapeze supports.

3.02 SUPPORT INSTALLATION:

A. Raceway Support Methods: In addition to methods described in NECA 1, EMT, IMC and RMC may be supported by openings through structure members, according to NFPA 70.

B. Strength of Support Assemblies: Where not indicated, select sizes of components, so strength will be adequate to carry present and future static loads within specified loading limits. Minimum static design load used for strength determination shall be weight of supported components plus 200 pounds.

C. Mounting and Anchorage of Surface-Mounted Equipment and Components: Anchor and fasten communications items and their supports to building structural elements by the following methods unless otherwise indicated by code:

1. To Wood: Fasten with lag screws or through bolts.

2. To New Concrete: Bolt to concrete inserts.

3. To Masonry: Use approved toggle-type bolts on hollow masonry units and expansion anchor fasteners on solid masonry units.

4. To Existing Concrete: Use expansion anchor fasteners.

5. Instead of expansion anchors, powder-actuated-driven threaded studs, provided with lock washers and nuts, may be used in existing standard-weight concrete 4 inches thick or greater. Do not use for anchorage to lightweight-aggregate concrete or for slabs less than 4 inches thick.

6. To Steel: Welded threaded studs complying with AWS D1.1, with lock washers and nuts, Beam clamps (MSS SP-58, Type 19, 21, 23, 25, or 27), complying with MSS SP-69, Spring-tension clamps.

7. To Light Steel: Sheet metal screws.

8. Items Mounted on Hollow Walls and Nonstructural Building Surfaces: Mount cabinets, panelboards, disconnect switches, control enclosures, pull and junction boxes, transformers, and other devices on slotted-channel racks attached to substrate by means that comply with seismic-restraint strength and anchorage requirements.

D. Drill holes for expansion anchors in concrete at locations and to depths that avoid the need for reinforcing bars.

3.03 INSTALLATION OF FABRICATED METAL SUPPORTS:

A. Comply with installation requirements in Section 05 50 00 for site-fabricated metal supports.

B. Cut, fit, and place miscellaneous metal supports accurately in location, alignment, and elevation to support and anchor communications materials and equipment.

C. Stainless Steel Hangers and Supports are required when installed in corrosive / wet areas.

D. Aluminum Supports and Hangers may only be used in interior conditioned non-corrosive areas.

E. Field Welding: Comply with AWS D1.1.

3.04 FIELD PAINTING:

A. Touchup: Clean field welds and abraded areas of shop paint. Paint exposed areas immediately after erecting hangers and supports. Use same materials as used for shop painting. Comply with SSPC-PA 1 requirements for touching up field-painted surfaces.

1. Apply paint by brush or spray to provide minimum dry film thickness of 2.0 mils.

B. Touchup: Comply with requirements in Section 09 91 13, Section 09 91 23, and Section 09 96 00 for cleaning and touchup painting of field welds, bolted connections, and abraded areas of shop paint on miscellaneous metal.

C. Galvanized Surfaces: Clean welds, bolted connections, and abraded areas, and apply galvanizing-repair paint to comply with ASTM A780.

3.05 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

Page Intentionally Left Blank

SECTION 27 05 36

CABLE TRAYS FOR COMMUNICATIONS SYSTEMS

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide cable trays for communications systems as indicated and in compliance with Contract Documents.

1. Ladder cable tray

2. Wire-mesh cable tray

3. Cable tray accessories

4. Warning signs

1.02 REFERENCES:

A. American National Standards Institute (ANSI):

1.03 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Product Data: For each type of cable tray.

1. Include data indicating dimensions and finishes for each type of cable tray indicated.

C. Shop Drawings: For each type of cable tray.

1. Show fabrication and installation details of cable trays, including plans, elevations, and sections of components and attachments to other construction elements. Designate components and accessories, including clamps, brackets, hanger rods, splice-plate connectors, expansion-joint assemblies, straight lengths, and fittings.

2. Cable tray layout, showing cable tray route to scale, with relationship between the tray and adjacent structural, electrical, and mechanical elements. Include the following:

a. Vertical and horizontal offsets and transitions.

b. Clearances for access above and to sides of cable trays.

c. Vertical elevation of cable trays above the floor or bottom of ceiling structure.

d. Load calculations to show dead and live loads as not exceeding manufacturer's rating for tray and its support elements.

D. Delegated-Design Submittal: For seismic restraints.

1. Seismic-Restraint Details: Signed and sealed by a qualified professional engineer, licensed in the state where Project is located, who is responsible for their preparation.

2. Design Calculations: Calculate requirements for selecting seismic restraints.

3. Detail fabrication, including anchorages and attachments to structure and to supported cable trays.

E. Coordination Drawings: Floor plans and sections, drawn to scale, on which the following items are shown and coordinated with each other, using input from installers of the items involved:

1. Scaled cable tray layout and relationships between components and adjacent structural, electrical, and mechanical elements.

2. Vertical and horizontal offsets and transitions.

3. Clearances for access above and to side of cable trays.

4. Vertical elevation of cable trays above the floor or below bottom of ceiling structure.

F. Seismic Qualification Data: Certificates, for cable trays, accessories, and components, from manufacturer.

1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.

2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.

3. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.

G. Field quality-control reports.

1.04 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.05 SPARE PARTS:

A. Comply with the requirements specified in Section 01 61 00.

1.06 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

1.07 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

PART 2 - PRODUCTS

2.01 PERFORMANCE REQUIREMENTS:

A. Delegated Design: Engage a qualified professional engineer, as defined in Section 01 45 00, to design cable tray supports and seismic bracing.

B. Seismic Performance: Cable trays and supports shall withstand the effects of earthquake motions determined according to ASCE/SEI 7.

1. The term "withstand" means "the cable trays will remain in place without separation of any parts when subjected to the seismic forces specified."

2. Component Importance Factor: 1.5, 1.0

C. Thermal Movements: Allow for thermal movements from ambient and surface temperature changes in cable tray installed outdoors.

1. Temperature Change: 120 degrees F, ambient; 180 degrees F, material surfaces.

2.02 GENERAL REQUIREMENTS FOR CABLE TRAYS:

A. Cable Trays and Accessories: Identified as defined in NFPA 70 and marked for intended location, application, and grounding.

1. Source Limitations: Obtain cable trays and components from single manufacturer.

B. Sizes and Configurations: See the Cable Tray Schedule on Drawings for specific requirements for types, materials, sizes, and configurations.

C. Structural Performance: See articles for individual cable tray types for specific values for the following parameters:

1. Uniform Load Distribution: Capable of supporting a uniformly distributed load on the indicated support span when supported as a simple span and tested according to NEMA VE 1.

2. Concentrated Load: A load applied at midpoint of span and centerline of tray.

3. Load and Safety Factors: Applicable to both side rails and rung capacities.

2.03 LADDER CABLE TRAY:

A. Manufacturers:

1. Atkore International (Cope)

2. Eaton (B-line)

3. MonoSystems, Inc.

4. Niedex Inx.

B. Description:

1. Configuration: Two longitudinal side rails with transverse rungs swaged or welded to side rails, complying with NEMA VE 1.

2. Width: 18 inches unless otherwise indicated on Drawings.

3. Minimum Usable Load Depth: 4 inches.

4. Straight Section Lengths: 10 feet, except where shorter lengths are required to facilitate tray assembly.

5. Rung Spacing: 9 inches o.c.

6. Radius-Fitting Rung Spacing: 9 inches at center of tray's width.

7. Minimum Cable-Bearing Surface for Rungs: 7/8-inch width with radius edges.

8. No portion of the rungs shall protrude below the bottom plane of side rails.

9. Structural Performance of Each Rung: Capable of supporting a maximum cable load, with a safety factor of 1.5, plus a 200-pound concentrated load, when tested according to NEMA VE 1.

10. Fitting Minimum Radius: 24 inches.

11. Class Designation: Comply with NEMA VE 1, Class 8A.

12. Splicing Assemblies: Bolted type using serrated flange locknuts.

13. Splice-Plate Capacity: Splices located within support span shall not diminish rated loading capacity of cable tray.

14. Covers: Solid Louvered Ventilated-hat 2-in-3 pitch type made of same materials and with same finishes as cable tray.

C. Materials and Finishes:

1. Steel:

a. Straight Section and Fitting Side Rails and Rungs: Steel complies with the minimum mechanical properties of ASTM A1011, SS, Grade 33 ASTM A1008, Grade 33, Type 2.

b. Steel Tray Splice Plates: ASTM A1011, HSLAS, Grade 50, Class 1.

c. Fasteners: Steel complies with the minimum mechanical properties of ASTM A510, Grade 1008.

d. Finish: Hot-dip galvanized after fabrication, complying with ASTM A123, Class B2.

(1) Galvanized, ASTM B633, Chromium-zinc plated ASTM F1136 or Stainless steel, Type 316

e. Finish: Hot-dip galvanized after fabrication, complying with ASTM A653, G90.

(1) Hardware: Galvanized, ASTM B633 Chromium-zinc plated, ASTM F1136.

f. Finish: Electrogalvanized after fabrication, complying with ASTM B633.

(1) Hardware: Galvanized, ASTM B633.

g. Finish: Epoxy-resin Powder-coat enamel paint.

(1) Powder-Coat Enamel: Cable tray manufacturer's recommended primer and corrosion-inhibiting treatment, with factory-applied powder-coat paint.

(2) Epoxy-Resin Prime Coat: Cold-curing epoxy primer, MPI# 101.

(3) Epoxy-Resin Topcoat: Epoxy, cold-cured gloss, MPI# 77.

(4) Hardware: Chromium-zinc plated, ASTM F1136, Stainless steel, Type 316, ASTM F593 and ASTM F594.

h. Finish: Factory-standard primer, ready for field painting, with chromium-zinc-plated hardware according to ASTM F1136.

i. Finish: Black oxide finish for support accessories and miscellaneous hardware according to ASTM D769.

2. Aluminum:

a. Materials: Alloy 6063-T6 according to ANSI H35.1 for extruded components, and Alloy 5052-H32 or Alloy 6061-T6 according to ANSI H35.1 for fabricated parts.

b. Hardware: Chromium-zinc-plated steel, ASTM F1136, Stainless steel, Type 316, ASTM F593 and ASTM F594.

c. Hardware for Aluminum Cable Tray Used Outdoors: Stainless steel, Type 316, ASTM F593 and ASTM F594.

3. Stainless Steel:

a. Materials: Low-carbon, passivated stainless steel, Type 304L or Type 316L, ASTM F593 and ASTM F594.

b. Hardware for Stainless-Steel Cable Tray Used Outdoors: Stainless steel, Type 316, ASTM F593 and ASTM F594.

2.04 WIRE-MESH CABLE TRAY:

A. Manufacturers:

1. Atkore International (Cope)

2. Cablofil; Legrand North America, LLC

3. Eaton (B-line)

4. MonoSystems, Inc.

5. Niedex Inx.

B. Description:

1. Configuration: Galvanized- steel wire mesh, complying with NEMA VE 1.

2. Width: 18 inches unless otherwise indicated on Drawings.

3. Minimum Usable Load Depth: 4 inches.

4. Straight Section Lengths: 10 feet, except where shorter lengths are required to facilitate tray assembly.

5. Structural Performance: Capable of supporting a maximum cable load, with a safety factor of 1.5, plus a 200-pound concentrated load, when tested according to NEMA VE 1.

6. Class Designation: Comply with NEMA VE 1, Class 5A.

7. Splicing Assemblies: Bolted type using serrated flange locknuts.

8. Splice-Plate Capacity: Splices located within support span shall not diminish rated loading capacity of cable tray.

C. Materials and Finishes:

1. Steel:

a. Straight Sections and Fittings: Steel complies with the minimum mechanical properties of ASTM A1011, SS, Grade 33, ASTM A1008, Grade 33, Type 2.

b. Steel Tray Splice Plates: ASTM A1011, HSLAS, Grade 50, Class 1.

c. Fasteners: Steel complies with the minimum mechanical properties of ASTM A510, Grade 1008.

d. Finish: Hot-dip galvanized after fabrication, complying with ASTM A123, Class B2.

(1) Hardware: Galvanized, ASTM B633, Chromium-zinc plated ASTM F1136 or Stainless steel, Type 316.

e. Finish: Hot-dip galvanized after fabrication, complying with ASTM A653, G90.

(1) Hardware: Galvanized, ASTM B633, Chromium-zinc plated, ASTM F1136.

f. Finish: Electrogalvanized after fabrication, complying with ASTM B633.

(1) Hardware: Galvanized, ASTM B633.

g. Finish: Epoxy-resin, Powder-coat enamel paint.

(1) Powder-Coat Enamel: Cable tray manufacturer's recommended primer and corrosion-inhibiting treatment, with factory-applied powder-coat paint.

(2) Epoxy-Resin Prime Coat: Cold-curing epoxy primer, MPI# 101.

(3) Epoxy-Resin Topcoat: Epoxy, cold-cured gloss, MPI# 77.

(4) Hardware: Chromium-zinc plated, ASTM F1136, Stainless steel, Type 316, ASTM F593 and ASTM F594.

h. Finish: Factory-standard primer, ready for field painting, with chromium-zinc-plated hardware according to ASTM F1136.

i. Finish: Black oxide finish for support accessories and miscellaneous hardware according to ASTM D769.

2.05 NONMETALLIC CABLE TRAYS

A. Description: This product category covers nonmetallic, including fiberglass (fiberglass-reinforced plastic), cable trays and cable tray systems intended for field assembly and for use in accordance with Article 392 of NFPA 70.

B. Performance Criteria:

1. Regulatory Requirements:

a. Listed and labeled in accordance with NFPA 70, by qualified electrical testing laboratory recognized by authorities having jurisdiction, and marked for intended location and application.

2. Listing Criteria: UL CCN CYOV; including UL 568.

C. UL CYOV - Fiberglass Cable Tray:

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

a. ABB, Electrification Business.

b. Allied Tube & Conduit; Atkore International.

c. Cablofil; Legrand North America, LLC.

d. Cooper B-line; brand of Eaton, Electrical Sector.

e. Enduro Composites Inc.

f. MP Husky USA Cable Tray & Cable Bus.

g. MonoSystems, Inc.

2. Source Limitations: Obtain products from single manufacturer.

3. General Characteristics:

a. Configuration: Two longitudinal members with rounded edges and smooth surfaces, supporting a bearing surface, complying with NEMA FG 1.

b. Temperature Rating: Reduce the load rating of trays exposed to temperatures above 75 degrees F in accordance with Table 4-3, "Working Loads," in NEMA FG 1.

c. Splicing Assemblies: Minimum four nuts and bolts per plate. Splice plates must be furnished with straight sections and fittings.

d. Splicing Assembly Capacity: Splices located within support span must not diminish rated loading capacity of cable tray.

e. Fasteners: Fiberglass-encapsulated, ASTM F593 and ASTM F594 stainless steel, Type 316. Design fasteners so that no metal is visible when fully assembled and tightened. Fastener encapsulation must not be damaged when torqued to manufacturer's recommended value.

4. Options:

a. Materials: Straight section structural elements; side rails, rungs, and splice plates must be pultruded from glass-fiber-reinforced vinyl ester resin, complying with NEMA FG 1 and UL 568.

b. Width: 24 inch unless otherwise indicated on Drawings.

c. Minimum Usable Load Depth: 5 inch in accordance with NEMA FG 1.

d. Straight Section Lengths: 10 ft.

e. Class Designation: Comply with NEMA VE 1, Class 8C.

f. Fitting Minimum Radius: 12 inch.

g. Covers: Solid type made of same materials and with same finishes as cable tray.

2.06 CABLE TRAY ACCESSORIES:

A. Fittings: Tees, crosses, risers, elbows, and other fittings as indicated, of same materials and finishes as cable tray.

B. Barrier Strips: Same materials and finishes as for cable tray.

C. Cable tray supports and connectors, including bonding jumpers, as recommended by cable tray manufacturer.

2.07 WARNING SIGNS:

A. Comply with requirements for identification in Section 27 05 53.

B. Lettering: 1-1/2-inch-high, black letters on yellow background with legend "Warning! Not To Be Used as Walkway, Ladder, or Support for Ladders or Personnel."

2.08 SOURCE QUALITY CONTROL:

A. Testing: Test and inspect cable trays according to NEMA FG 1, NEMA VE 1.

PART 3 - EXECUTION

3.01 PREPARATION

A. Shop Drawings: Prepare and submit the following for each cable tray system:

1. Cable Tray Fabrication Drawings, Diagrams, and Supporting Documents:

a. Show fabrication and installation details of cable trays, including plans, elevations, and sections of components and attachments to other construction elements. Designate components and accessories, including clamps, brackets, hanger rods, splice-plate connectors, expansion-joint assemblies, straight lengths, and fittings.

b. Include load calculations to show that dead and live loads do not exceed manufacturer's rating for tray and its support elements.

c. Cable tray layout, showing cable tray route to scale, with relationship between the tray and adjacent structural, electrical, and mechanical elements. Include the following:

(1) Vertical and horizontal offsets and transitions.

(2) Clearances for access above and to sides of cable trays.

(3) Vertical elevation of cable trays above the floor or bottom of ceiling structure.

3.02 CABLE TRAY INSTALLATION:

A. Install cable trays according to NEMA FG 1, NEMA VE 2.

B. Install cable trays as a complete system, including fasteners, hold-down clips, support systems, barrier strips, adjustable horizontal and vertical splice plates, elbows, reducers, tees, crosses, cable dropouts, adapters, covers, and bonding.

C. Install cable trays so that the tray is accessible for cable installation and all splices are accessible for inspection and adjustment.

D. Remove burrs and sharp edges from cable trays.

E. Join aluminum cable tray with splice plates; use four square neck-carriage bolts and locknuts.

F. Fasten cable tray supports to building structure and install seismic restraints.

G. Design fasteners and supports to carry cable tray, the cables, and a concentrated load of 200 pound. Comply with requirements in Section 26 05 48.16 and Section 27 05 29. Comply with seismic-restraint details according to Section 26 05 50 and Section 27 05 48.

H. Place supports so that spans do not exceed maximum spans on schedules and provide clearances shown on Drawings. Install intermediate supports when cable weight exceeds the load-carrying capacity of the tray rungs.

I. Construct supports from channel members, threaded rods, and other appurtenances furnished by cable tray manufacturer. Arrange supports in trapeze or wall-bracket form as required by application.

J. Support bus assembly to prevent twisting from eccentric loading.

K. Install center-hung supports for single-rail trays designed for 60 versus 40 percent eccentric loading condition, with a safety factor of 3.

L. Locate and install supports according to NEMA FG 1, NEMA VE 2. Do not install more than one cable tray splice between supports.

M. Support wire-basket cable trays with center support hangers, trapeze hangers wall brackets.

N. Support center support hangers, trapeze hangers for wire-basket trays with 3/8-inch-diameter rods.

O. Make connections to equipment with flanged fittings fastened to cable trays and to equipment. Support cable trays independent of fittings. Do not carry weight of cable trays on equipment enclosure.

P. Install expansion connectors where cable trays cross building expansion joints and in cable tray runs that exceed dimensions recommended in NEMA FG 1 NEMA VE 2. Space connectors and set gaps according to applicable standard.

Q. Make changes in direction and elevation using manufacturer's recommended fittings.

R. Make cable tray connections using manufacturer's recommended fittings.

S. Seal penetrations through fire and smoke barriers.

T. Install capped metal sleeves for future cables through firestop-sealed cable tray penetrations of fire and smoke barriers.

U. Install cable trays with enough workspace to permit access for installing cables.

V. Install barriers to separate cables of different systems, such as power, communications, and data processing; or of different insulation levels, such as 600, 5000, and 15 000 V.

W. Install permanent covers, if used, after installing cable. Install cover clamps according to NEMA VE 2.

X. Clamp covers on cable trays installed outdoors with heavy-duty clamps.

Y. Install warning signs in visible locations on or near cable trays after cable tray installation.

3.03 CABLE TRAY GROUNDING:

A. Ground cable trays according to NFPA 70 unless additional grounding is specified. Comply with requirements in Section 27 05 26.

B. Cable trays shall be bonded together with splice plates listed for grounding purposes or with listed bonding jumpers.

C. Cable trays with single-conductor power conductors shall be bonded together with a grounding conductor run in the tray along with the power conductors and bonded to the tray at 72-inch intervals. The grounding conductor shall be sized according to NFPA 70, Article 250.122, "Size of Equipment Grounding Conductors," and Article 392, "Cable Trays."

D. When using epoxy- or powder-coat painted cable trays as a grounding conductor, completely remove coating at all splice contact points or ground connector attachment. After completing splice-to-grounding bolt attachment, repair the coated surfaces with coating materials recommended by cable tray manufacturer.

E. Bond cable trays to power source for cables contained within with bonding conductors sized according to NFPA 70, Article 250.122, "Size of Equipment Grounding Conductors."

3.04 CABLE INSTALLATION:

A. Install cables only when each cable tray run has been completed and inspected.

B. Fasten cables on horizontal runs with cable clamps or cable ties according to NEMA VE 2. Tighten clamps only enough to secure the cable, without indenting the cable jacket. Install cable ties with a tool that includes an automatic pressure-limiting device.

C. Fasten cables on vertical runs to cable trays every 18 inches.

D. Fasten and support cables that pass from one cable tray to another or drop from cable trays to equipment enclosures. Fasten cables to the cable tray at the point of exit and support cables independent of the enclosure. The cable length between cable trays or between cable tray and enclosure shall be no more than 72 inches.

E. Tie MI cables down every 36 inches where required to provide a 2-hour fire rating and every 72 inches elsewhere.

F. In existing construction, remove inactive or dead cables from cable trays.

3.05 CONNECTIONS:

A. Remove paint from all connection points before making connections. Repair paint after the connections are completed.

B. Connect pathways to cable trays according to requirements in NEMA VE 2 and NEMA FG 1.

3.06 INSTALLATION OF CABLE TRAY MARKINGS AND SIGNS

A. Trays Containing Cables Operating Over 600 V: Provide hazard markings in accordance with Section 392.18 of NFPA 70 and with NEMA Z535.4.

1. Legend: "DANGER - HIGH VOLTAGE - KEEP AWAY."

B. Ladder Cable Trays: Provide warning signs to prevent use as personnel ladder.

3.07 FIELD QUALITY CONTROL:

A. Perform the following tests and inspections with the assistance of a factory-authorized service representative:

1. After installing cable trays and after electrical circuitry has been energized, survey for compliance with requirements.

2. Visually inspect cable insulation for damage. Correct sharp corners, protuberances in cable trays, vibrations, and thermal expansion and contraction conditions, which may cause or have caused damage.

3. Verify that the number, size, and voltage of cables in cable trays do not exceed that permitted by NFPA 70. Verify that communications or data-processing circuits are separated from power circuits by barriers or are installed in separate cable trays.

4. Verify that there are no intruding items such as pipes, hangers, or other equipment in the cable tray.

5. Remove dust deposits, industrial process materials, trash of any description, and any blockage of tray ventilation.

6. Visually inspect each cable tray joint and each ground connection for mechanical continuity. Check bolted connections between sections for corrosion. Clean and retorque in suspect areas.

7. Check for improperly sized or installed bonding jumpers.

8. Check for missing, incorrect, or damaged bolts, bolt heads, or nuts. When found, replace with specified hardware.

9. Perform visual and mechanical checks for adequacy of cable tray grounding; verify that all takeoff raceways are bonded to cable trays. Test entire cable tray system for continuity. Maximum allowable resistance is 1 ohm.

B. Field tests and inspections must be witnessed by authorities having jurisdiction.

C. Tests and Inspections:

1. After installing cable trays and after electrical circuitry has been energized, survey for compliance with requirements.

2. Visually inspect cable insulation for damage. Correct sharp corners, protuberances in cable trays, vibrations, and thermal expansion and contraction conditions, which may cause or have caused damage.

3. Verify that the number, size, and voltage of cables in cable trays do not exceed that permitted by NFPA 70. Verify that communications or data-processing circuits are separated from power circuits by barriers or are installed in separate cable trays.

4. Verify that there are no intruding items, such as pipes, hangers, or other equipment, in the cable tray.

5. Remove dust deposits, industrial process materials, trash of any description, and any blockage of tray ventilation.

6. Visually inspect each cable tray joint and each ground connection for mechanical continuity. Check bolted connections between sections for corrosion. Clean and retorque in suspect areas.

7. Check for improperly sized or installed bonding jumpers.

8. Check for missing, incorrect, or damaged bolts, bolt heads, or nuts. When found, replace with specified hardware.

9. Perform visual and mechanical checks for adequacy of cable tray grounding; verify that all takeoff raceways are bonded to cable trays. Test entire cable tray system for continuity. Maximum allowable resistance is 1 Ω.

D. Nonconforming Work:

1. Cable tray will be considered defective if it does not pass tests and inspections.

2. Remove and replace defective units and retest.

E. Field Quality-Control Reports: Collect, assemble, and submit test and inspection reports

F. Manufacturer Services: Engage factory-authorized service representative to support field tests and inspections.

1. Manufacturer's Field Reports for Field Quality-Control Support: Prepare and submit report after each visit by factory-authorized service representative, documenting activities performed at Project site.

3.08 PROTECTION:

A. Protect installed cable trays and cables.

1. Install temporary protection for cables in open trays to safeguard exposed cables against falling objects or debris during construction. Temporary protection for cables and cable tray can be constructed of wood or metal materials and shall remain in place until the risk of damage is over.

2. Repair damage to galvanized finishes with zinc-rich paint recommended by cable tray manufacturer.

3. Repair damage to paint finishes with matching touchup coating recommended by cable tray manufacturer.

3.09 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

Page Intentionally Left Blank

SECTION 27 05 43

UNDERGROUND PATHWAYS AND STRUCTURES FOR COMMUNICATIONS SYSTEMS

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide underground pathways and structures for communications systems as indicated and in compliance with Contract Documents.

1. Metal conduit and fittings, including GRC and PVC-coated GRC.

2. Rigid nonmetallic duct.

3. Duct accessories, including rigid innerduct and fabric innerduct.

4. Precast concrete handholes.

5. Polymer concrete handholes and boxes with polymer concrete cover.

6. Fiberglass handholes and boxes with polymer concrete cover.

7. Fiberglass handholes and boxes.

8. High density plastic boxes.

9. Precast maintenance holes.

10. Cast-in-place maintenance holes.

11. Utility structure accessories.

1.03 DEFINITIONS:

A. Direct-Buried: Duct or a duct bank that is buried in the ground, without any additional casing materials, such as concrete.

B. Duct: A single duct or multiple ducts. Duct may be either installed singly or as component of a duct bank.

C. Duct Bank:

1. Two or more ducts installed in parallel, with or without additional casing materials.

2. Multiple duct banks.

D. GRC: Galvanized rigid conduit

E. IMC: Intermediate metal conduit

F. RNC: Rigid nonmetallic conduit

G. Trafficways: Locations where vehicular or pedestrian traffic is a normal course of events.

1.04 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Product Data: For each type of product.

1. Include duct-bank materials, including spacers and miscellaneous components.

2. Include duct and conduits and their accessories, including elbows, end bells, bends, fittings, duct spacers and solvent cement.

3. Include accessories for maintenance holes, handholes, and boxes, and other utility structures.

4. Include underground-line warning tape.

C. Shop Drawings:

1. Precast or Factory-Fabricated Underground Utility Structures:

a. Include plans, elevations, sections, details, attachments to other work, and accessories.

b. Include duct entry provisions, including location and duct size.

c. Include reinforcement details.

d. Include frame and cover design and maintenance hole chimneys.

e. Include ladder details.

f. Include grounding details.

g. Include dimensioned locations of cable rack inserts, pulling-in and lifting irons, and sumps.

h. Include joint details.

2. Factory-Fabricated Handholes and Boxes Other Than Precast Concrete:

a. Include dimensioned plans, sections, and elevations, and fabrication and installation details.

b. Include duct entry provisions, including location and duct size.

c. Include cover design.

d. Include grounding details.

e. Include dimensioned locations of cable rack inserts, and pulling-in and lifting irons.

D. Duct and Duct-Bank Coordination Drawings: Show duct profiles and coordination with other utilities and underground structures.

1. Include plans and sections, drawn to scale, and show bends and locations of expansion fittings.

2. Drawings shall be signed and sealed by a qualified professional engineer.

E. Product Certificates: For concrete and steel used in precast concrete maintenance holes and handholes, as required by ASTM C858.

F. Qualification Data: For professional engineer and testing agency responsible for testing nonconcrete handholes and boxes.

G. Source quality-control reports.

H. Field quality-control reports.

I. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

J. Furnish cable-support stanchions, arms, and associated fasteners in quantities equal to 5 percent of quantity of each item installed.

1.05 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.06 SPARE PARTS:

A. Comply with the requirements specified in Section 01 61 00.

1.07 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

B. Testing Agency Qualifications: Qualified according to ASTM E329 for testing indicated.

1.08 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

1.09 PROJECT/SITE CONDITIONS:

A. Interruption of Existing Communications Service: Do not interrupt communications service to facilities occupied by Owner or others unless permitted under the following conditions, and then only after arranging to provide temporary communications service according to requirements indicated:

1. Notify Owner no fewer than two days in advance of proposed interruption of communications service.

2. Do not proceed with interruption of communications service without Owner's written permission.

B. Ground Water: Assume ground-water level is at grade level unless a lower water table is noted on Drawings.

PART 2 - PRODUCTS

2.01 METAL CONDUITS AND FITTINGS:

A. GRC: Comply with ANSI C80.1 and UL 6.

B. PVC-Coated Steel Conduit: PVC-coated GRC IMC.

1. Comply with NEMA RN 1.

2. Coating Thickness: 0.040 inch, minimum.

C. Manufacturers:

1. ABB (Electrification Products Division)

2. Champion Fiberglass, Inc.

3. FSR Inc.

4. NewBasis

5. Plasti-bond

D. General Requirements for Metal Conduits and Fittings:

1. Listed and labeled as defined in NFPA 70, by a nationally recognized testing laboratory, and marked for intended location and application.

2. Comply with TIA-569-C and TIA-758-C.

2.02 RIGID NONMETALLIC DUCTS:

A. Underground Plastic Utilities Duct: Type EPC-80-PVC and Type EPC-40-PVC RNC, complying with NEMA TC 2 and UL 651, with matching fittings complying with NEMA TC 3 by same manufacturer as duct.

B. Manufacturers:

1. Beck Manufacturing

2. Cantex Inc.

3. ElecSys, Inc

4. IPEX USA LLC

5. National Pipe & Plastics

C. General Requirements for Nonmetallic Ducts and Fittings:

1. Listed and labeled as defined in NFPA 70, by a nationally recognized testing laboratory, and marked for intended location and application.

2. Comply with TIA-569-C and TIA-758-C.

D. Solvents and Adhesives: As recommended by duct manufacturer.

1. Refer to Division 01 specifications for sustainable design requirements.

2.03 FLEXIBLE NONMETALLIC DUCTS:

A. HDPE Duct: Type EPEC 40-HDPE, Type EPEC 80-HDPE complying with NEMA TC 7 and UL 651A.

1. Manufacturers:

a. ARNCO Corp

b. Carlon; a brand of Thomas & Betts Corporation

c. National Pipe & Plastics

d. Opti-Com Manufacturing Network, Inc (OMNI)

e. Premier Conduit

2. Listed and labeled as defined in NFPA 70, by a nationally recognized testing laboratory, and marked for intended location and application.

3. Comply with TIA-569-C and TIA-758-C.

2.04 DUCT ACCESSORIES:

A. Rigid Innerduct: Smooth HDPE duct, orange in color, designed for installation within a duct or pathway.

1. Manufacturers:

a. ABB (Electrification Products Division)

b. Blue Diamond Industries

c. Carlon; a brand of Thomas & Betts Corporation

d. Dura-Line

e. Premier Conduit

B. Fabric Innerduct: Continuous, polyester, multi -pocket fabric innerduct, with internal pull tape and tracer wire.

1. Manufacturers:

a. Maxcell

C. Duct Spacers: Factory-fabricated rigid PVC interlocking spacers, sized for type and size of duct with which used, and selected to provide minimum duct spacing indicated while supporting duct during concreting or backfilling.

1. Manufacturers:

a. Atkore International (Allied Tube & Conduit)

b. Cantex, Inc.

c. Carlon; a brand of Thomas & Betts Corporation

d. PenCell Plastics

e. Underground Devices, Inc

D. Underground-Line Warning Tape: Underground-line warning tape specified in Section 27 05 53.

2.05 PRECAST CONCRETE HANDHOLES AND BOXES:

A. Description: Monolithically poured, factory-fabricated, reinforced-concrete walls and bottom unless open-bottom enclosures are indicated. Frame and cover shall form top of enclosure and shall have load rating consistent with that of handhole or box.

B. Manufacturers:

1. Christy Concrete Products

2. Elmhurst-Chicago Stone Co

3. Rinker Group, Ltd

4. Utility Concrete Products, LLC

5. Wausau Tile Inc.

C. Comply with ASTM C858 for design and manufacturing processes.

D. Frame and Cover: Weatherproof cast-iron frame, with cast-iron cover with recessed cover hook eyes and tamper-resistant, captive, cover-securing bolts.

E. Frame and Cover: Weatherproof steel frame, with steel cover with recessed cover hook eyes and tamper-resistant, captive, cover-securing bolts.

F. Frame and Cover: Weatherproof steel frame, with hinged steel access door assembly with tamper-resistant, captive, cover-securing bolts.

1. Cover Hinges: Concealed, with hold-open ratchet assembly.

2. Cover Handle: Recessed.

G. Frame and Cover: Weatherproof aluminum frame, with hinged aluminum access door assembly with tamper-resistant, captive, cover-securing bolts.

1. Cover Hinges: Concealed, with hold-open ratchet assembly.

2. Cover Handle: Recessed.

H. Cover Finish: Nonskid finish shall have a minimum coefficient of friction of 0.50.

I. Cover Legend: Molded lettering, "COMMUNICATIONS"

J. Configuration: Units shall be designed for flush burial and have integral closed bottom unless otherwise indicated.

K. Extensions and Slabs: Designed to mate with bottom of enclosure, and made of same material as enclosure.

1. Extension shall provide increased depth of 12 inches.

2. Slab: Same dimensions as bottom of enclosure, and arranged to provide closure.

L. Joint Sealant: Asphaltic-butyl material with adhesion, cohesion, flexibility, and durability properties necessary to withstand maximum hydrostatic pressures at the installation location with the ground-water level at grade.

M. Knockout Panels: Precast openings in walls, arranged to match dimensions and elevations of approaching duct and duct banks, plus an additional 6 inches or 12 inches vertically and horizontally to accommodate alignment variations.

1. Knockout panels shall be located no less than 6 inches from interior surfaces of walls, floors, or frames and covers of handholes, but close enough to corners to facilitate racking of cables on walls.

2. Knockout panel opening shall have cast-in-place, welded-wire fabric reinforcement for field cutting and bending to tie into concrete envelopes of duct banks.

3. Knockout panel openings shall be framed with at least two additional No. 3 steel reinforcing bars in concrete around each opening.

4. Knockout panels shall be 1-1/2 to 2 inches thick.

N. Duct Entrances in Handhole Walls: Cast end-bell or duct-terminating fitting in wall for each entering duct.

1. Type and size shall match fittings to duct or conduit to be terminated.

2. Fittings shall align with elevations of approaching duct and be located near interior corners of handholes to facilitate racking of cable.

O. Handholes 12 inches wide by 24 inches long and larger shall have inserts for cable racks and pulling-in irons installed before concrete is poured.

2.06 POLYMER CONCRETE HANDHOLES AND BOXES WITH POLYMER CONCRETE COVER:

A. Description: Molded of sand and aggregate, bound together with a polymer resin, and reinforced with steel or fiberglass or a combination of the two.

B. Manufacturers:

1. Armorcast Products Company

2. MacLean Highline

3. NewBasis

4. Oldcastle Enclosure Solutions

5. Quazite; Hubbell Incorporated, Power Systems

C. Standard: Comply with SCTE 77. Comply with tier requirements in "Underground Enclosure Application" Article.

D. Color: Green.

E. Configuration: Units shall be designed for flush burial and have integral closed bottom unless otherwise indicated.

F. Cover: Weatherproof, secured by tamper-resistant locking devices and having structural load rating consistent with enclosure.

G. Cover Finish: Nonskid finish shall have a minimum coefficient of friction of 0.50.

H. Cover Legend: Molded lettering, “COMMUNICATIONS”.

I. Direct-Buried Wiring Entrance Provisions: Knockouts equipped with insulated bushings or end-bell fittings, selected to suit box material, sized for wiring indicated, and arranged for secure, fixed installation in enclosure wall.

J. Duct Entrance Provisions: Duct-terminating fittings shall mate with entering duct for secure, fixed installation in enclosure wall.

K. Handholes 12 inches wide by 24 inches long and larger shall have factory-installed inserts for cable racks and pulling-in irons.

2.07 FIBERGLASS HANDHOLES AND BOXES WITH POLYMER CONCRETE FRAME AND COVER:

A. Description: Sheet-molded, fiberglass-reinforced, polyester resin enclosure joined to polymer concrete top ring or frame.

B. Manufacturers:

1. Armorcast Products Company

2. Christy Concrete Products

3. NewBasis

4. Oldcastle Enclosure Solutions

5. Quazite; Hubbell Incorporated, Power Systems

C. Standard: Comply with SCTE 77. Comply with tier requirements in "Underground Enclosure Application" Article.

D. Color: Green.

E. Configuration: Units shall be designed for flush burial and have integral closed bottom unless otherwise indicated.

F. Cover: Weatherproof, secured by tamper-resistant locking devices and having structural load rating consistent with enclosure.

G. Cover Finish: Nonskid finish shall have a minimum coefficient of friction of 0.50.

H. Cover Legend: Molded lettering, “COMMUNICATIONS”

I. Direct-Buried Wiring Entrance Provisions: Knockouts equipped with insulated bushings or end-bell fittings, selected to suit box material, sized for wiring indicated, and arranged for secure, fixed installation in enclosure wall.

J. Duct Entrance Provisions: Duct-terminating fittings shall mate with entering duct for secure, fixed installation in enclosure wall.

K. Handholes 12 inches wide by 24 inches long and larger shall have factory-installed inserts for cable racks and pulling-in irons.

2.08 FIBERGLASS HANDHOLES AND BOXES:

A. Description: Molded of fiberglass-reinforced polyester resin, with covers made of polymer concrete reinforced concrete cast iron hot-dip galvanized-steel diamond plate.

B. Manufacturers:

1. Christy Concrete Products

2. MacLean Highline

3. Nordic Fiberglass, Inc

4. Oldcastle Enclosure Solutions

5. Quazite; Hubbell Incorporated, Power Systems

C. Standard: Comply with SCTE 77. Comply with tier requirements in "Underground Enclosure Application" Article.

D. Color: Green.

E. Configuration: Units shall be designed for flush burial and have integral closed bottom unless otherwise indicated.

F. Cover: Weatherproof, secured by tamper-resistant locking devices and having structural load rating consistent with enclosure.

G. Cover Finish: Nonskid finish shall have a minimum coefficient of friction of 0.50.

H. Cover Legend: Molded lettering, “COMMUNICATIONS”

I. Direct-Buried Wiring Entrance Provisions: Knockouts equipped with insulated bushings or end-bell fittings, selected to suit box material, sized for wiring indicated, and arranged for secure, fixed installation in enclosure wall.

J. Duct Entrance Provisions: Duct-terminating fittings shall mate with entering duct for secure, fixed installation in enclosure wall.

K. Handholes 12 inches wide by 24 inches long and larger shall have factory-installed inserts for cable racks and pulling-in irons.

2.09 HIGH-DENSITY PLASTIC BOXES:

A. Description: Injection molded of high-density polyethylene or copolymer-polypropylene. Cover shall be made of polymer concrete hot-dip galvanized-steel diamond plate plastic.

B. Manufacturers:

1. Nordic Fiberglass, Inc

2. Oldcastle Enclosure Solutions

3. PenCell Plastics

4. Quazite; Hubbell Incorporated, Power Systems

C. Standard: Comply with SCTE 77. Comply with tier requirements in "Underground Enclosure Application" Article.

D. Color: Green.

E. Configuration: Units shall be designed for flush burial and have integral closed bottom unless otherwise indicated.

F. Cover: Weatherproof, secured by tamper-resistant locking devices and having structural load rating consistent with enclosure.

G. Cover Finish: Nonskid finish shall have a minimum coefficient of friction of 0.50.

H. Cover Legend: Molded lettering, “COMMUNICATIONS”

I. Direct-Buried Wiring Entrance Provisions: Knockouts equipped with insulated bushings or end-bell fittings, selected to suit box material, sized for wiring indicated, and arranged for secure, fixed installation in enclosure wall.

J. Duct Entrance Provisions: Duct-terminating fittings shall mate with entering duct for secure, fixed installation in enclosure wall.

K. Handholes 12 inches wide by 24 inches long and larger shall have factory-installed inserts for cable racks and pulling-in irons.

2.10 PRECAST MAINTENANCE HOLES:

A. Description: One-piece units and units with interlocking mating sections, complete with accessories, hardware, and features.

B. Manufacturers:

1. Carder Concrete Products

2. Christy Concrete Products

3. Oldcastle Precast, Inc.

4. Rinker Group, Ltd

5. Utility Vault Co.

C. Standard: Comply with ASTM C858.

D. Structural Design Loading: Comply with requirements in "Underground Enclosure Application" Article.

E. Knockout Panels: Precast openings in walls, arranged to match dimensions and elevations of approaching duct and duct banks, plus an additional 6 inches vertically and horizontally to accommodate alignment variations.

1. Splayed Center window location.

2. Knockout panels shall be located no less than 6 inches from interior surfaces of walls, floors, or roofs of maintenance holes, but close enough to corners to facilitate racking of cables on walls.

3. Knockout panel opening shall have cast-in-place, welded-wire fabric reinforcement for field cutting and bending to tie into concrete envelopes of duct banks.

4. Knockout panel openings shall be framed with at least two additional No. 3 steel reinforcing bars in concrete around each opening.

5. Knockout panels shall be 1-1/2 to 2 inches thick.

F. Duct Entrances in Maintenance Hole Walls: Cast end-bell or duct-terminating fitting in wall for each entering duct.

1. Type and size shall match fittings to duct or conduit to be terminated.

2. Fittings shall align with elevations of approaching duct and be located near interior corners of maintenance holes to facilitate racking of cable.

G. Ground Rod Sleeve: Provide a 3-inch PVC sleeve in maintenance hole floors 2 inches from the wall adjacent to, but not underneath, the duct routed from the facility.

H. Joint Sealant: Asphaltic-butyl material with adhesion, cohesion, flexibility, and durability properties necessary to withstand maximum hydrostatic pressures at the installation location with the ground-water level at grade.

2.11 CAST-IN-PLACE MAINTENANCE HOLES:

A. Description: Underground utility structures, constructed in place, complete with accessories, hardware, and features. Include concrete knockout panels for duct entrance and sleeve for ground rod.

B. Materials: Comply with ASTM C858 and with Section 03 30 00.

C. Structural Design Loading: As specified in "Underground Enclosure Application" Article.

2.12 UTILITY STRUCTURE ACCESSORIES:

A. Accessories for Utility Structures: Utility equipment and accessory items used for utility structure access and utility support, listed and labeled for intended use and application.

B. Manufacturers:

1. BILCO Company (the)

2. Carder Concrete Products

3. EJ

4. New Basis

5. Oldcastle Precast Inc.

6. Quazite; Hubbell Incorporated, Power Systems

C. Maintenance Hole Frames, Covers, and Chimney Components: Comply with structural design loading specified for maintenance hole.

1. Frame and Cover: Weatherproof, gray cast iron complying with ASTM A48, Class 30B cast aluminum, with milled cover-to-frame bearing surfaces; 26-inch or 29-inch diameter.

a. Cover Finish: Nonskid finish shall have a minimum coefficient of friction of 0.50.

b. Special Covers: Recess in face of cover designed to accept finish material in paved areas.

2. Cover Legend: Cast in. Selected to suit system.

3. Maintenance Hole Chimney Components: Precast concrete rings, with dimensions matched to those of roof opening.

a. Mortar for Chimney Ring and Frame and Cover Joints: Comply with ASTM C270, Type M, except for quantities of less than 2.0 cubic feet, where packaged mix complying with ASTM C387, Type M, may be used.

b. Seal joints watertight using preformed plastic or rubber conforming to ASTM C990. Install sealing material according to the sealant manufacturers' printed instructions.

D. Maintenance Hole Sump Frame and Grate: ASTM A48, Class 30B, gray cast iron.

E. Pulling Eyes in Concrete Walls: Eyebolt with reinforcing-bar fastening insert, 2-inch-diameter eye, and 1-by-4-inch bolt.

1. Working Load Embedded in 6-inch, 4000-psi Concrete: 13,000-lbf minimum tension.

F. Pulling Eyes in Nonconcrete Walls: Eyebolt with reinforced fastening, 1-1/4-inch-diameter eye, rated 2500-lbf minimum tension.

G. Pulling-In and Lifting Irons in Concrete Floors: 7/8-inch-diameter, hot-dip galvanized, bent steel rod; stress relieved after forming; and fastened to reinforcing rod. Exposed triangular opening.

1. Ultimate Yield Strength: 40,000-lbf shear and 60,000-lbf tension.

H. Bolting Inserts for Concrete Utility Structure Cable Racks and Other Attachments: Flared, threaded inserts of noncorrosive, chemical-resistant, nonconductive

thermoplastic material; 1/2-inch ID by 2-3/4 inches deep, flared to a minimum of 1-1/4 inches at base.

1. Tested Ultimate Pullout Strength: 12,000 lbf minimum.

I. Ground Rod Sleeve: 3-inch, PVC duct sleeve in maintenance hole floors 2 inches from the wall adjacent to, but not underneath, the duct entering the structure.

J. Expansion Anchors for Installation after Concrete Is Cast: Zinc-plated, carbon-steel-wedge type with stainless-steel expander clip, with 1/2-inch bolt, 5300-lbf rated pullout strength, and minimum 6800-lbf rated shear strength.

K. Cable Rack Assembly: Nonmetallic. Components fabricated from nonconductive, fiberglass-reinforced polymer.

1. Stanchions: Nominal 36 inches high by 4 inches wide, with minimum of nine holes for arm attachment.

2. Arms: Arranged for secure, drop-in attachment in horizontal position at any location on cable stanchions, and capable of being locked in position. Arms shall be available in lengths ranging from 3 inches with 450-pound minimum capacity to 20 inches with 250-lb minimum capacity. Top of arm shall be nominally 4 inches wide, and arm shall have slots along full length for cable ties.

L. Duct-Sealing Compound: Nonhardening, safe for contact with human skin, not deleterious to cable insulation, and workable at temperatures as low as 35 degrees F. Capable of withstanding temperature of 300 degrees F without slump and adhering to clean surfaces of plastic duct, metallic duct, duct coatings, concrete, masonry, lead, cable sheaths, cable jackets, insulation materials, and common metals.

M. Fixed Maintenance Hole Ladders: Arranged for attachment to roof or wall of maintenance hole. Ladder, mounting brackets, and braces shall be fabricated from nonconductive, structural-grade, fiberglass-reinforced resin hot-dip galvanized steel.

N. Portable Maintenance Hole Ladders: UL-listed, heavy-duty fiberglass specifically designed for portable use for access to electrical maintenance holes. Minimum length equal to distance from deepest maintenance hole floor to grade plus 36 inches. One required.

O. Cover Hooks: Heavy duty, designed for lifts 60 lbf and greater Light duty, designed for lifts less than 60 lbf. Two required.

2.13 SOURCE QUALITY CONTROL:

A. Test and inspect precast concrete utility structures according to ASTM C1037.

B. Nonconcrete Handhole and Pull-Box Prototype Test: Test prototypes of maintenance holes and boxes for compliance with SCTE 77. Strength tests shall be for specified tier ratings of products supplied.

1. Tests of materials shall be performed by an independent testing agency.

2. Strength tests of complete boxes and covers shall be by either an independent testing agency or manufacturer. A qualified registered professional engineer shall certify tests by manufacturer.

3. Testing machine pressure gages shall have current calibration certification, complying with ISO 9000 and ISO 10012, and traceable to NIST standards.

PART 3 - EXECUTION

3.02 PREPARATION:

A. Coordinate layout and installation of duct, duct bank, maintenance holes, handholes, and boxes with final arrangement of other utilities, site grading, and surface features as determined in the field. Notify Architect if there is a conflict between areas of excavation and existing structures or archaeological sites to remain.

B. Coordinate elevations of duct and duct-bank entrances into maintenance holes, handholes, and boxes with final locations and profiles of duct and duct banks, as determined by coordination with other utilities, underground obstructions, and surface features. Revise locations and elevations as required to suit field conditions and to ensure that duct runs drain to maintenance holes and handholes, and as approved by Architect.

C. Clear and grub vegetation to be removed, and protect vegetation to remain according to Section 31 10 00. Remove and stockpile topsoil for reapplication according to Section 31 10 00.

3.03 UNDERGROUND DUCT APPLICATION:

A. Duct for Communications: Type EPC-80-PVC or Type EPC-40-PVC RNC in concrete-encased duct bank unless otherwise indicated.

B. Duct for Communications: Type EPEC-40-HDPE Type EPEC-80-HDPE duct in direct-bored duct bank unless otherwise indicated.

C. Underground Duct Crossing Paved Paths Walks and Driveways Roadways and Railroads: Type EPC-40-PVC RNC, encased in reinforced concrete.

D. Stub-Ups for Communications: Concrete-encased RNC GRC PVC-coated GRC.

3.04 UNDERGROUND ENCLOSURE APPLICATION:

A. Handholes and Boxes for Communications:

1. Units in Roadways and Other Deliberate Traffic Paths: Precast concrete. AASHTO HB 17, H-10 H-20 structural load rating.

2. Units in Driveway, Parking Lot, and Off-Roadway Locations, Subject to Occasional, Nondeliberate Loading by Heavy Vehicles: Precast concrete, AASHTO HB 17, H-20 Polymer concrete, SCTE 77, Tier 15 Fiberglass enclosures with polymer concrete frame and cover, SCTE 77, Tier 15 Fiberglass-reinforced polyester resin, SCTE 77, Tier 15 High-density plastic, SCTE 77, Tier 15 structural load rating.

3. Units in Sidewalk and Similar Applications with a Safety Factor for Nondeliberate Loading by Vehicles: Precast concrete, AASHTO HB 17, H-5 Precast concrete, AASHTO HB 17, H-10 Polymer concrete units, SCTE 77, Tier 8 Heavy-duty fiberglass units with polymer concrete frame and cover, SCTE 77, Tier 8 High-density plastic, SCTE 77, Tier 8 structural load rating.

4. Units Subject to Light-Duty Pedestrian Traffic Only: Fiberglass-reinforced polyester resin High-density plastic, structurally tested according to SCTE 77 with 3000-lbf vertical loading.

5. Cover design load shall not exceed the design load of the handhole or box.

B. Maintenance Holes: Precast or cast-in-place concrete.

1. Units Located in Roadways and Other Deliberate Traffic Paths by Heavy or Medium Vehicles: H-20 structural load rating according to AASHTO HB 17.

2. Units Not Located in Deliberate Traffic Paths by Heavy or Medium Vehicles: H-10 load rating according to AASHTO HB 17.

3.05 EARTHWORK:

A. Excavation and Backfill: Comply with Section 31 23 00, but do not use heavy-duty, hydraulic-operated, compaction equipment.

B. Restoration: Replace area immediately after backfilling is completed or after construction in immediate area is complete.

C. Restore surface features at areas disturbed by excavation, and re-establish original grades unless otherwise indicated.

D. Restore areas disturbed by trenching, storing of dirt, cable laying, and other work. Restore vegetation and include necessary topsoiling, fertilizing, liming, seeding, sodding, sprigging, and mulching. .

E. Cut and patch existing pavement in the path of underground duct, duct bank, and utility structures according to Section 01 73 29.

3.06 DUCT AND DUCT-BANK INSTALLATION:

A. Where indicated on Drawings, install duct, spacers, and accessories into the duct configuration shown. Duct installation requirements in this Section also apply to duct bank.

B. Install duct and duct bank according to NEMA TCB 2 and TIA-758-C.

C. Slope: Pitch duct and duct bank a minimum slope of 1:100 down toward maintenance holes and handholes and away from buildings and equipment. Slope duct and duct bank from a high point in runs between two maintenance holes, to drain in both directions.

D. Curves and Bends: Use 5-degree angle couplings for small changes in direction. Use manufactured long sweep bends with a minimum radius of 48 inches, both horizontally and vertically, at other locations unless otherwise indicated.

1. Duct and duct banks shall have maximum of two 90-degree bends, or the total of all bends shall be no more 180 degrees between pull points.

E. Joints: Use solvent-cemented joints in duct and fittings, and make watertight according to manufacturer's written instructions. Stagger couplings, so those of adjacent ducts do not lie in same plane.

F. Installation Adjacent to High-Temperature Steam Lines: Where duct or duct banks are installed parallel to underground steam lines, perform calculations showing the duct or duct bank will not be subject to environmental temperatures above 40 degrees C. Where environmental temperatures are calculated to rise above 40 degrees C, and anywhere the duct or duct bank crosses above an underground steam line, install insulation blankets listed for direct burial to isolate the duct bank from the steam line.

G. End-Bell Entrances to Maintenance Holes and Concrete and Polymer Concrete Handholes: Use end bells, spaced approximately 6 inches o.c. for 4-inch duct, and vary proportionately for other duct sizes.

1. Begin change from regular spacing to end-bell spacing 10 feet from the end bell without reducing duct slope and without forming a trap in the line.

2. Expansion and Deflection Fittings: Install an expansion and deflection fitting in each duct in the area of disturbed earth adjacent to maintenance hole or handhole. Install an expansion fitting near the center of all straight-line direct-buried duct and duct banks, with calculated expansion of more than 3/4 inch.

3. Grout end bells into structure walls from both sides to provide watertight entrances.

H. Terminator Entrances to Maintenance Holes and Concrete and Polymer Concrete Handholes: Use manufactured, cast-in-place duct terminators, with entrances into structure spaced approximately 6 inches o.c. for 4-inch duct, and vary proportionately for other duct sizes.

1. Begin change from regular spacing to terminator spacing 10 feet from the terminator without reducing duct slope and without forming a trap in the line.

2. Expansion and Deflection Fittings: Install an expansion and deflection fitting in each duct in the area of disturbed earth adjacent to maintenance hole or handhole. Install an expansion fitting near the center of all straight-line duct or duct bank, with calculated expansion of more than 3/4 inch.

I. Building Wall Penetrations: Make a transition from underground duct to GRC at least 10 feet outside the building wall, without reducing duct slope away from the building or forming a trap in the duct. Use fittings manufactured for RNC duct-to-GRC conduit transition. Install GRC penetrations of building walls as specified in Section 27 05 44.

J. Sealing: Provide temporary closure at terminations of duct that has cables pulled. Seal spare ducts at terminations. Use sealing compound and plugs to withstand at least 15-psig hydrostatic pressure.

K. Innerduct: Install immediately after mandreling duct. Size and type as indicated on Drawings. Provide three innerducts per duct.

L. Pulling Cord: Install 200-lbf-test nylon cord in empty duct and innerduct.

M. Concrete-Encased Duct and Duct Bank:

1. Excavate trench bottom to provide firm and uniform support for duct or duct bank. Prepare trench bottoms as specified in Section 31 23 00 for pipes less than 6 inches in nominal diameter.

2. Width: Excavate trench 12 inches wider than duct or duct bank on each side.

3. Width: Excavate trench 3 inches wider than duct or duct bank on each side.

4. Depth: Install top of duct and duct bank at least 24 inches below finished grade in areas not subject to deliberate traffic, and at least 30 inches below finished grade in deliberate traffic paths for vehicles unless otherwise indicated.

5. Support duct and duct bank on duct spacers coordinated with duct size, duct spacing, and outdoor temperature.

6. Minimum Space Between Duct: 3 inches between edge of duct and exterior envelope wall, 2 inches between ducts for like services, and 4 inches between power and communications ducts.

7. Spacer Installation: Place spacers close enough to prevent sagging and deforming of duct, with not less than five spacers per 20 feet of duct. Place spacers within 24 inches of duct ends. Stagger spacers approximately 6 inches between tiers. Secure spacers to earth and duct to prevent floating during concreting. Tie entire assembly together using fabric straps; do not use tie wires or reinforcing steel that may form conductive or magnetic loops around duct or duct bank.

8. Elbows: Use manufactured duct elbows for stub-ups, at building entrances, and at changes of direction in duct run unless otherwise indicated. Extend concrete encasement throughout length of elbow.

9. Elbows: Use manufactured GRC elbows for stub-ups, at building entrances, and at changes of direction in duct run.

    a. Couple GRC to duct with adapters designed for this purpose, and encase coupling with 3 inches of concrete.

    b. Stub-Ups to Outdoor Equipment: Extend concrete-encased GRC horizontally a minimum of 60 inches from edge of base. Install insulated grounding bushings on terminations at equipment.

        (1) Stub-ups shall be flush with minimum 4 inches above finished floor and minimum 3 inches from conduit side to edge of slab.

    c. Stub-Ups to Indoor Equipment: Extend concrete-encased GRC horizontally a minimum of 60 inches from edge of wall. Install insulated grounding bushings on terminations at equipment.

        (1) Stub-ups shall be flush with minimum 4 inches above finished floor and no less than 3 inches from conduit side to edge of wall.

10. Reinforcement: Reinforce concrete-encased duct and duct bank where they cross disturbed earth and where indicated. Arrange reinforcing rods and ties without forming conductive or magnetic loops around ducts or duct groups.

11. Forms: Use trench walls to form side walls of duct and duct bank where soil is self-supporting and concrete envelope can be poured without soil inclusions; otherwise, use forms.

12. Concrete Cover: Install a minimum of 3 inches of concrete cover between edge of duct to exterior envelope wall, 2 inches between ducts, and 4 inches between power and communications duct.

13. Concreting Sequence: Pour each run of envelope between maintenance holes or other terminations in one continuous operation.

    a. Start at one end and finish at the other, allowing for expansion and contraction of duct as its temperature changes during and after the pour. Use expansion fittings installed according to manufacturer's written recommendations, or use other specific measures to prevent expansion-contraction damage.

    b. If more than one pour is necessary, terminate each pour in a vertical plane and install 3/4-inch reinforcing-rod dowels extending a minimum of 18 inches into concrete on both sides of joint near corners of envelope.

14. Pouring Concrete: Comply with requirements in "Concrete Placement" Article in Section 03 30 00. Place concrete carefully during pours to prevent voids under and between ducts and at exterior surface of envelope. Do not allow a heavy mass of concrete to fall directly onto duct. Allow concrete to flow to center of bank and rise up in middle, uniformly filling all open spaces. Do not use power-driven agitating equipment unless specifically designed for duct-bank application.

N. Direct-Buried Duct and Duct Banks:

1. Excavate trench bottom to provide firm and uniform support for duct and duct bank. Comply with requirements in Section 31 23 00 for preparation of trench bottoms for duct less than 6 inches in nominal diameter.

2. Install duct with a minimum of 3 inches between duct for like services and 6 inches between power and signal duct.

3. Width: Excavate trench 12 inches wider than duct or duct bank on each side.

4. Width: Excavate trench 3 inches wider than duct or duct bank on each side.

5. Depth: Install top of duct or duct bank at least 36 inches below finished grade unless otherwise indicated.

6. Set elevation of bottom of duct or duct bank below frost line.

7. Support duct on duct spacers coordinated with duct size, duct spacing, and outdoor temperature.

8. Spacer Installation: Place spacers close enough to prevent sagging and deforming of duct, with not less than five spacers per 20 feet of duct. Place spacers within 24 inches of duct ends. Stagger spacers approximately 6 inches between tiers. Secure spacers to earth and duct to prevent floating during concreting. Tie entire assembly together using fabric straps; do not use tie wires or reinforcing steel that may form conductive or magnetic loops around duct or duct bank.

9. Elbows: Install manufactured duct elbows for stub-ups, at building entrances through floor, and at changes of direction in duct unless otherwise indicated. Encase elbows for stub-ups throughout length of elbow. Extend encasement minimum of 36 inches beyond elbow joints.

10. Install manufactured GRC elbows for stub-ups, at building entrances, and at changes of direction in duct.

    a. Couple GRC to duct with adapters designed for this purpose, and encase coupling with 3 inches of concrete.

    b. For equipment mounted on outdoor bases, extend GRC horizontally a minimum of 60 inches from edge of equipment pad or foundation. Install insulated grounding bushings on terminations at equipment.

11. After installing first tier of duct, backfill and compact. Start at tie-in point and work toward end of duct run, leaving duct at end of run free to move with expansion and contraction, as temperature changes during this process. Repeat procedure after placing each tier. After placing last tier, hand place backfill to 4 inches over duct and hand tamp. Firmly tamp backfill around duct to provide maximum supporting strength. Use hand tamper only. After placing controlled backfill over final tier, make final duct connections at end of run and complete backfilling with normal compaction. Comply with requirements in Section 31 23 00 for installation of backfill materials.

    a. Place minimum of 3 inches of sand as a bed for duct and duct bank. Place sand to a minimum of 6 inches above top level of duct and duct bank.

    b. Place minimum of 6 inches of engineered fill above concrete encasement of duct bank.

O. Underground-Line Warning Tape: Bury conducting underground-line warning tape specified in Section 27 05 53 no less than 12 inches above all concrete-encased duct and duct bank and approximately 12 inches below grade. Align tape parallel to and within 3 inches of centerline of duct bank. Provide an additional warning tape for each 12-inch increment of ductbank width over a nominal 18 inches. Space additional tapes 12 inches apart, horizontally.

3.07 INSTALLATION OF CONCRETE MAINTENANCE HOLES, HANDHOLES, AND BOXES:

A. Cast-in-Place Maintenance Hole Installation:

1. Finish interior surfaces with a smooth-troweled finish.

2. Knockouts for Future Duct Connections: Form and pour concrete knockout panels 1-1/2 to 2 inches thick, arranged as indicated.

3. Comply with requirements in Section 03 30 00 for cast-in-place concrete, formwork, and reinforcement.

B. Precast Concrete Handhole and Maintenance Hole Installation:

1. Comply with ASTM C891 unless otherwise indicated.

2. Install units level and plumb and with orientation and depth coordinated with connecting duct, to minimize bends and deflections required for proper entrances.

3. Unless otherwise indicated, support units on a level bed of crushed stone or gravel, graded from 1-inch sieve to No. 4 sieve and compacted to same density as adjacent undisturbed earth.

C. Elevations:

1. Maintenance Hole Roof: Install with rooftop at least 15 inches below finished grade.

2. Maintenance Hole Frame: In paved areas and trafficways, set frames flush with finished grade. Set other maintenance hole frames 1 inch above finished grade.

3. Install handholes with bottom below frost line, below grade.

4. Handhole Covers: In paved areas and trafficways, set surface flush with finished grade. Set covers of other handholes 1 inch above finished grade.

5. Where indicated, cast handhole cover frame integrally with handhole structure.

D. Drainage: Install drains in bottom of maintenance holes where indicated. Coordinate with drainage provisions indicated.

E. Maintenance Hole Access: Circular opening in maintenance hole roof; sized to match cover size.

1. Maintenance holes with Fixed Ladders: Offset access opening from maintenance hole centerlines to align with ladder.

2. Install chimney, constructed of precast concrete collars and rings, to support cast-iron frame to connect cover with maintenance hole roof opening. Provide moisture-tight masonry joints and waterproof grouting for frame to chimney.

F. Waterproofing: Apply waterproofing to exterior surfaces of maintenance holes and handholes after concrete has cured at least three days. Waterproofing materials and installation are specified in Section 07 21 00 and Section 07 92 00. After duct has been connected and grouted, and before backfilling, waterproof joints and connections, and touch up abrasions and scars. Waterproof exterior of maintenance hole chimneys after mortar has cured at least three days.

G. Dampproofing: Apply dampproofing to exterior surfaces of maintenance holes and handholes after concrete has cured at least three days. Dampproofing materials and installation are specified in Section 07 11 13. After duct has been connected and grouted, and before backfilling, dampproof joints and connections, and touch up abrasions and scars. Dampproof exterior of maintenance hole chimneys after mortar has cured at least three days.

H. Hardware: Install removable hardware, including pulling eyes, cable stanchions, and cable arms, and insulators, as required for installation and support of cables and conductors and as indicated.

I. Fixed Maintenance Hole Ladders: Arrange to provide for safe entry with maximum clearance from cables and other items in maintenance holes.

J. Field-Installed Bolting Anchors in Maintenance Holes and Concrete Handholes: Do not drill deeper than 3-7/8 inches for maintenance holes and 2 inches for handholes, for field-installed anchor bolts installed. Use a minimum of two anchors for each cable stanchion.

3.08 INSTALLATION OF HANDHOLES AND BOXES OTHER THAN PRECAST CONCRETE:

A. Install handholes and boxes level and plumb and with orientation and depth coordinated with connecting duct, to minimize bends and deflections required for proper entrances. Use box extension if required to match depths of duct and duct bank, and seal joint between box and extension as recommended by manufacturer.

B. Unless otherwise indicated, support units on a level bed of crushed stone or gravel, graded from 1/2-inch sieve to No. 4 sieve and compacted to same density as adjacent undisturbed earth.

C. Elevation: In paved areas and trafficways, set cover flush with finished grade. Set covers of other handholes 1 inch above finished grade.

D. Install handholes and boxes with bottom below frost line, below grade.

E. Install removable hardware, including pulling eyes, cable stanchions, cable arms, and insulators, as required for installation and support of cables and conductors and as indicated. Select arm lengths to be long enough to provide spare space for future cables, but short enough to preserve adequate working clearances in enclosure.

F. Field cut openings for duct according to enclosure manufacturer's written instructions. Cut wall of enclosure with a tool designed for material to be cut. Size holes for terminating fittings to be used, and seal around penetrations after fittings are installed.

G. For enclosures installed in asphalt paving and subject to occasional, nondeliberate, heavy-vehicle loading, form and pour a concrete ring, encircling, and in contact with,

enclosure, and with top surface screeded to top of box cover frame. Bottom of ring shall rest on compacted earth.

1. Concrete: 3000 psi, 28-day strength, complying with Section 03 30 00, with a troweled finish.

2. Dimensions: 10 inches wide by 12 inches deep.

3.09 GROUNDING:

A. Ground underground duct, duct bank, and utility structures according to Section 27 05 26.

3.10 FIELD QUALITY CONTROL:

A. Perform the following tests and inspections and prepare test reports:

1. Demonstrate capability and compliance with requirements on completion of installation of underground duct, duct bank, and utility structures.

2. Pull solid aluminum or wood test mandrel through duct to prove joint integrity and adequate bend radii, and test for out-of-round duct. Provide a minimum 12-inch-long mandrel equal to duct size minus 1/4 inch. If obstructions are indicated, remove obstructions and retest.

3. Test maintenance hole and handhole grounding to ensure electrical continuity of grounding and bonding connections. Measure and report ground resistance as specified in Section 27 05 26.

B. Correct deficiencies and retest as specified above to demonstrate compliance.

3.11 CLEANING:

A. Pull leather-washer-type duct cleaner, with graduated washer sizes, through full length of duct until duct cleaner indicates that duct is clear of dirt and debris.

B. Clean internal surfaces of maintenance holes, including sump.

1. Sweep floor, removing dirt and debris.

2. Remove foreign material.

3.12 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

Page Intentionally Left Blank

SECTION 27 05 44

SLEEVES AND SLEEVE SEALS FOR COMMUNICATIONS PATHWAYS AND CABLING

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide sleeves and sleeve seals for communication pathways and cabling as indicated and in compliance with Contract Documents.

1. Round sleeves

2. Rectangular sleeves

3. Sleeve seal systems

4. Grout

5. Pourable sealants

6. Foam sealants

1.02 REFERENCES:

A. ASTM International (ASTM):

1. A53: Standard Specification for Pipe, Steel, Black and Hot-Dipped, Zinc-Coated, Welded and Seamless

2. C1107: Standard Specification for Packaged Dry, Hydraulic-Cement Grout (Nonshrink)

3. D1785: Standard Specification for Poly(Vinyl Chloride) (PVC) Plastic Pipe, Schedules 40, 80, and 120

B. National Electrical Contractors Association (NECA):

1. 1: Standard for Good Workmanship in Electrical Construction

1.03 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Product Data: For each type of product.

1.04 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.05 SPARE PARTS:

A. Comply with the requirements specified in Section 01 61 00.

1.06 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

1.07 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

PART 2 - PRODUCTS

2.01 ROUND SLEEVES:

A. Wall Sleeves, Steel:

1. Manufacturers:

a. Advance Products & Systems, LLC

b. CCI Piping Systems

c. Flexicraft Industries

d. GPT; an EnPro Industries Company

2. Description: ASTM A53, Type E, Grade B, Schedule 40, zinc coated, plain ends and integral waterstop.

2.02 RECTANGULAR SLEEVES:

A. Sheet Metal Sleeves, Galvanized Steel, Rectangular:

1. Manufacturers:

a. Abesco Fire LLC

b. Specified Technologies, Inc.

c. Wiremold; Legrand North America, LLC

2. Description:

a. Material: Galvanized sheet steel.

b. Minimum Metal Thickness:

(1) For sleeve cross-section rectangle perimeter less than 50 inches and with no side larger than 16 inches, thickness must be 0.052 inch.

(2) For sleeve cross-section rectangle perimeter not less than 50 inches or with one or more sides larger than 16 inches, thickness must be 0.138 inch.

2.03 SLEEVE SEAL SYSTEMS:

A. Manufacturers:

1. Advance Products & Systems, Inc.

2. BWM Company

3. CALPICO, Inc

4. Flexicraft Industries

5. Metraflex Company (The)

B. Description: Modular sealing device, designed for field assembly, to fill annular space between sleeve and pathway or cable or between pathway and cable.

1. Sealing Elements: EPDM Nitrile (Buna N) rubber interlocking links shaped to fit surface of pipe. Include type and number required for pipe material and size of pipe.

2. Pressure Plates: Carbon steel Fiber-reinforced plastic Stainless steel.

3. Connecting Bolts and Nuts: Carbon steel, with corrosion-resistant coating, Stainless steel of length required to secure pressure plates to sealing elements.

2.04 GROUT:

A. Manufacturers:

1. W. R. Meadows, Inc.

B. Description: Non-shrink; recommended for interior and exterior sealing openings in non-fire-rated walls or floors.

1. Standard: ASTM C1107, Grade B, post-hardening and volume-adjusting, dry, hydraulic-cement grout.

2. Design Mix: 5000-psi, 28-day compressive strength.

3. Packaging: Premixed and factory packaged.

2.05 POURABLE SEALANTS:

A. Manufacturers:

1. Carlisle SynTec Incorporated

2. GAF

3. Johns Manville; a Berkshire Hathaway Company

B. Description: Single-component, neutral-curing elastomeric sealants of grade indicated below.

1. Grade: Pourable (self-leveling) formulation for openings in floors and other horizontal surfaces that are not fire rated.

2.06 FOAM SEALANTS:

A. Manufacturers:

1. Dow Chemical Company (The)

2. Innovative Chemical Products (Building Solutions Group)

B. Description: Multicomponent, liquid elastomers that, when mixed, expand and cure in place to produce a flexible, non-shrinking foam. Foam expansion must not damage cables or crack penetrated structure.

PART 3 - EXECUTION

3.01 INSTALLATION OF SLEEVES FOR NON-FIRE-RATED ELECTRICAL PENETRATIONS:

A. Comply with NECA 1.

B. Sleeves for Conduits Penetrating Above-Grade, Non-Fire-Rated, Concrete and Masonry-Unit Floors and Walls:

1. Interior Penetrations of Non-Fire-Rated Walls and Floors:

a. Seal space outside of sleeves with mortar or grout. Pack sealing material solidly between sleeve and wall or floor so no voids remain. Tool exposed surfaces smooth; protect material while curing.

b. Seal annular space between sleeve and pathway or cable, using joint sealant appropriate for size, depth, and location of joint. Comply with requirements in Section 07 92 00.

2. Use pipe sleeves unless penetration arrangement requires rectangular sleeved opening.

3. Size pipe sleeves to provide 1/4-inch annular clear space between sleeve and pathway or cable, unless sleeve seal system is to be installed or seismic criteria require different clearance.

4. Install sleeves for wall penetrations unless core-drilled holes or formed openings are used. Install sleeves during erection of walls. Cut sleeves to length for mounting flush with both surfaces of walls. Deburr after cutting.

5. Install sleeves for floor penetrations. Extend sleeves installed in floors 2 inches above finished floor level. Install sleeves during erection of floors.

C. Sleeves for Conduits Penetrating Non-Fire-Rated Wall Assemblies:

1. Use circular metal sleeves unless penetration arrangement requires rectangular sleeved opening.

2. Seal space outside of sleeves with approved joint compound for wall assemblies.

D. Roof-Penetration Sleeves: Seal penetration of individual pathways and cables with flexible boot-type flashing units applied in coordination with roofing work.

E. Aboveground, Exterior-Wall Penetrations: Seal penetrations using steel cast-iron pipe sleeves and mechanical sleeve seal systems. Size sleeves to allow for 1-inch annular clear space between pipe and sleeve for installing mechanical sleeve seals.

F. Underground, Exterior-Wall and Floor Penetrations:

1. Install steel pipe sleeves. Size sleeves to allow for 1-inch annular clear space between pathway or cable and sleeve for installing sleeve seal system. Grout sleeve into wall or floor opening.

3.02 INSTALLATION OF RECTANGULAR SLEEVES AND SLEEVE SEALS:

A. Install sleeves in existing walls without compromising structural integrity of walls. Do not cut structural elements without reinforcing the wall to maintain the designed weight bearing and wall stiffness.

B. Install conduits and cable with no crossings within the sleeve.

C. Fill opening around conduits and cables with expanding foam without leaving voids.

D. Provide metal sheet covering at both wall surfaces and finish to match surrounding surfaces. Metal sheet must be same material as sleeve.

3.03 INSTALLATION OF SLEEVE SEAL SYSTEMS:

A. Install sleeve seal systems in sleeves in exterior concrete walls and slabs-on-grade at pathway entries into building.

B. Install type and number of sealing elements recommended by manufacturer for pathway or cable material and size. Position pathway or cable in center of sleeve. Assemble mechanical sleeve seals and install in annular space between pathway or cable and sleeve. Tighten bolts against pressure plates that cause sealing elements to expand and make watertight seal.

3.04 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 27 05 48

VIBRATION AND SEISMIC CONTROLS FOR COMMUNICATIONS SYSTEMS

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide vibration and seismic controls for communications systems as indicated and in compliance with Contract Documents.

1. Elastomeric isolation pads

2. Restraints – rigid type

3. Restraints – cable type

4. Restraint accessories

5. Post-installed concrete anchors

6. Concrete inserts

1.02 REFERENCES:

G. National Fire Protection Association (NFPA):

1. 70: National Electrical Code.

H. Underwriters' Laboratories, Inc. (UL):

1. 723: Standard for Safety Test for Surface Burning Characteristics of Building Materials

1.03 DEFINITIONS:

A. Designated Seismic System: A communications system component that requires design in accordance with ASCE/SEI 7, Ch. 13 and for which the Component Importance Factor is greater than 1.0.

1.04 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Delegated Design Submittals: Product Data: For each type of product.

1. Include rated load capacity for each seismic- and wind-load-restraint device.

2. Illustrate and indicate style, material, strength, fastening provision, and finish for each type and size of seismic- and wind-load-restraint component used.

3. Annotate types and sizes of seismic restraints and accessories, complete with listing markings or report numbers and load rating in tension and compression as evaluated by ICC-ES product listing UL product listing FM Approvals an evaluation service member of ICC-ES OSHPD an agency acceptable to authorities having jurisdiction.

4. Annotate to indicate application of each product submitted and compliance with requirements.

C. Shop Drawings:

1. Detail fabrication and assembly of equipment bases.

2. Vibration Isolation Base Details: Detail fabrication including anchorages and attachments to structure and to supported equipment. Include adjustable motor bases, rails, and frames for equipment mounting.

D. Delegated Design Submittal for Each Seismic-Restraint Device:

1. For each device, equipment or appurtenance provide written certification from Professional Engineer licensed in the State of Utah stating that supports systems and anchorage for equipment have been designed according to the requirements of Section 1613 of the building codes of Utah, Salt Lake City and ASCE/SEI 7, and in accordance with Specification 01 41 20. Submit calculations stamped by a Professional Engineer licensed in the State of Utah for support systems and anchorage for wind, seismic, and all other pertinent loads.

2. For each seismic-restraint device, including restraint - rigid and cable type, restraint accessory, and concrete anchor and insert that is required by this Section or is indicated on Drawings, submit the following:

a. Seismic Restraints: Select seismic restraints complying with performance requirements, design criteria, and analysis data.

b. Post-Installed Concrete Anchors and Inserts: Include calculations showing anticipated seismic loads. Include certification that device is approved by an NRTL for seismic reinforcement use.

c. Seismic Design Calculations: Submit all input data and loading calculations prepared under "Seismic Design Calculations" Paragraph in "Performance Requirements" Article.

d. Qualified Professional Engineer: All designated design submittals for seismic calculations are to be signed and sealed by the qualified professional engineer responsible for their preparation.

E. Delegated Design Submittal for Each Wind-Load Protection Device:

1. For each wind-load protection device, including restraint - rigid and cable type, restraint accessory, and concrete anchor and insert that is required by this Section or is indicated on Drawings, submit the following:

   a. Wind-Load Restraint: Select wind-load restraints complying with performance requirements, design criteria, and analysis data.

   b. Post-Installed Concrete Anchors and Inserts: Include calculations showing anticipated wind-loads. Include certification that device is approved by an NRTL for reinforcement use.

   c. Wind-Load Design Calculations: Submit all static and dynamic loading calculations prepared under "Wind-Load Design Calculations" Paragraph in "Performance Requirements" Article.

   d. Qualified Professional Engineer: All designated design submittals for wind-load restraint calculations are to be signed and sealed by the qualified professional engineer responsible for their preparation.

2. Seismic- and Wind-Load-Restraint Detail Drawings:

   a. Design Analysis: To support selection and arrangement of seismic and wind-load restraints. Include calculations of combined tensile and shear loads.

   b. Details: Indicate fabrication and arrangement. Detail attachments of restraints to restrained items and to the structure. Show attachment locations, methods, and spacings. Identify components, list their strengths, and indicate directions and values of forces transmitted to the structure during seismic events. Indicate association with vibration isolation devices.

   c. Coordinate seismic-restraint details with wind-load details required for equipment mounted outdoors.

3. Product Listing, Preapproval and Evaluation Documentation: By an evaluation service member of ICC-ES UL FM Approvals OSHPD an agency acceptable to authorities having jurisdiction, showing maximum ratings of restraint items and the basis for approval (tests or calculations).

4. All delegated design submittals for seismic and wind-load-restraint detail drawings are to be signed and sealed by the qualified professional engineer responsible for their preparation.

F. Coordination Drawings: Show coordination of seismic and wind-load bracing for communications components with other systems and equipment in the vicinity, including other supports and seismic restraints.

G. Qualification Data: For professional engineer and testing agency.

H. Welding certificates.

I. Field quality-control reports.

J. Seismic Qualification Data: Provide special certification for designated seismic systems as indicated in ASCE/SEI 7-05, ASCE/SEI 7-10, ASCE/SEI 7-16, Paragraph 13.2.2, "Special Certification Requirements for Designated Seismic Systems" for all Designated Seismic Systems identified as such on Drawings or in the Specifications.

1. Provide equipment manufacturer's written certification for each designated active communications seismic device and system, stating that it will remain operable following the design earthquake. Certification must be based on requirements of ASCE/SEI 7, including shake table testing per ICC-ES AC156 or a similar nationally recognized testing standard procedure acceptable to authorities having jurisdiction or experience data as permitted by ASCE/SEI 7-05, ASCE/SEI 7-10, and ASCE/SEI 7-16.

2. Provide equipment manufacturer's written certification that components with hazardous contents maintain containment following the design earthquake by methods required in ASCE/SEI 7-05, ASCE/SEI 7-10, and ASCE/SEI 7-16.

3. Submit evidence demonstrating compliance with these requirements for approval to authorities having jurisdiction after review and acceptance by a licensed Professional Engineer.

4. The following communications systems and components are Designated Seismic Systems and require written special certification of seismic qualification by manufacturer:

K. Wind-Load Performance Certification: Provide special certification for communications components subject to high wind exposure and impact damage and designated on Drawings or in the Specifications to require wind-load performance certification.

1. Provide equipment manufacturer's written certification for each designated communications device, stating that it will remain in place and operable following the design wind event and comply with all requirements of authorities having jurisdiction.

2. Certification must be based on ICC-ES or similar nationally recognized testing standard procedures acceptable to authorities having jurisdiction

3. The following communications systems and components require special certification for high wind performance. Written special certification of resistance to effects of high wind load and impact damage must be provided by manufacturer.

1.05 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.06 SPARE PARTS:

A. Comply with the requirements specified in Section 01 61 00.

1.07 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

B. Testing Agency Qualifications: Independent agency must have experience and capability to conduct testing indicated, be and NRTL as defined by OSHA in 29 CFR 1910.7, and be acceptable to authorities having jurisdiction.

C. Welding Qualifications: Qualify procedures and personnel in accordance with AWS D1.1, "Structural Welding Code – Steel."

D. Seismic- and Wind-Load-Restraint Device Load Ratings: Devices to be tested and rated in accordance with applicable code requirements and authorities having jurisdiction. Devices to be listed by a nationally recognized third party that requires periodic follow-up inspections and has a listing directory available to the public. Provide third-party listing by one or more of the following: ICC-ES product listing UL product listing FM Approvals an evaluation service member of ICC-ES an agency acceptable to authorities having jurisdiction.

E. Comply with NFPA 70.

1.08 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

PART 2 - PRODUCTS

2.01 PERFORMANCE REQUIREMENTS:

A. Delegated Design: Engage a qualified professional engineer, as defined in Section 01 45 00, to design seismic and wind-load control system.

1. Seismic and Wind-Load Performance: Equipment shall withstand the effects of earthquake motions and high wind events determined in accordance with ASCE/SEI 7-05, ASCE/SEI 7-10, and ASCE/SEI 7-16.

B. Seismic Design Calculations:

1. Perform calculations to obtain force information necessary to properly select seismic restraint devices, fasteners, and anchorage. Perform calculations using methods acceptable to applicable code authorities and as presented in ASCE/SEI 7-05 and ASCE/SEI 7-10 including Supplement No. 1, ASCE/SEI 7-16. Where "ASCE/SEI 7" is used throughout this Section, it is to be understood that the edition referred to in this subparagraph is the edition intended as reference throughout the section text.

   a. Data indicated below to be determined by Delegated Design Contractor must be obtained by Contractor and must be included in individual component submittal packages.

   b. Coordinate seismic design calculations with wind-load calculations for equipment mounted outdoors.

   c. Building Occupancy Category: III

   d. Building Risk Category: III

   e. Building Site Classification: D

2. Calculation Factors, ASCE/SEI 7-16, Ch. 13 – Seismic Design Requirements for Nonstructural Components: All section, paragraph, equation, and table numbers refer to ASCE/SEI 7-16 unless otherwise noted.

   a. Horizontal Seismic Design Force F_p: Value is to be calculated by Delegated Design Contractor using Equation 13.3-1. Factors below must be obtained for this calculation.

      (1) S_{DS} = Spectral Acceleration: Value applies to all components on Project.

      (2) a_p = Component Amplification Factor: See Drawing Schedule for each component.

      (3) I_p = Component Importance Factor: See Drawing Schedule for each component.

      (4) W_p = Component Operating Weight: For each component. Obtain by Delegated Design Contractor from each component submittal.

      (5) R_p = Component Response Modification Factor: See Drawing Schedule for each component.

      (6) z = Height in Structure of Point of Attachment of Component with Respect to Base: Determine from Project Drawings for each

component by Delegated Design Contractor. For items at or below the base, "z" shall be taken as zero.

(7) h = Average Roof Height of Structure with Respect to Base: Determine from Project Drawings by Delegated Design Contractor.

b. Vertical Seismic Design Force: Calculated by Delegated Design Contractor using method explained in ASCE/SEI 7-16, Paragraph 13.3.1.2.

c. Seismic Relative Displacement D_{pl}: Calculated by Delegated Design Contractor using methods explained in ASCE/SEI 7-16, Paragraph 13.3.2. Factors below must be obtained for this calculation:

(1) D_p = Relative Seismic Displacement that Each Component Must Be Designed to Accommodate: Calculated by Delegated Design Contractor in accordance with ASCE/SEI 7-16, Paragraph 13.3.2.

(2) I_e = Structure Importance Factor: Value applies to all components on Project.

(3) 8_{xA} = Deflection at Building Level x of Structure A: See Drawing Schedule for each component.

(4) 8_{yA} = Deflection at Building Level y of Structure A: See Drawing Schedule for each component.

(5) 8_{yB} = Deflection at Building Level y of Structure B: See Drawing Schedule for each component.

(6) h_x = Height of Level x to Which Upper Connection Point Is Attached: Determine for each component by Delegated Design Contractor from Project Drawings and manufacturer's data.

(7) h_y = Height of Level y to Which Upper Connection Point Is Attached: Determine for each component by Delegated Design Contractor from Project Drawings and manufacturer's data.

(8) A_{aA} = Allowable Story Drift for Structure A: See Drawing Schedules for each component.

(9) A_{aB} = Allowable Story Drift for Structure B: See Drawing Schedules for each component.

(10) h_{sx} = Story Height Used in the Definition of the Allowable Drift A_a: See Drawings Schedules for each component.

d. Component Fundamental Period T_p: Calculated by Delegated Design Contractor using methods explained in ASCE/SEI 7-16, Paragraph 13.3.3. Factors below must be obtained for this calculation:

(1) W_p = Component Operating Weight: Determined by Contractor from Project Drawings and manufacturer's data.

(2) g = Gravitational Acceleration: 32.17 fps^2 K_p = Combined Stiffness of the Component, Supports, and Attachments: Determined by delegated design seismic engineer.

3. Calculation Factors, ASCE/SEI 7-10, Ch. 13 – Seismic Design Requirements for Nonstructural Components: All section, paragraph, equation, and table numbers refer to ASCE/SEI 7-10 unless otherwise noted.

a. Horizontal Seismic Design Force F_p: Calculated by Delegated Design Contractor by ASCE/SEI 7-10, Equation 13.3-1. Factors below must be obtained for this calculation:

(1) S_{DS} = Spectral Acceleration: Value applies to all components on Project.

(2) a_p = Component Amplification Factor: See Drawing Schedule for each component.

(3) I_p = Component Importance Factor: See Drawing Schedule for each component.

(4) W_p = Component Operating Weight: For each component. Obtain by Delegated Design Contractor from equipment submittal.

(5) R_p = Component Response Modification Factor: See Drawing Schedule for each component.

(6) z = Height in Structure of Point of Attachment of Component with Respect to Base: Determined from Project Drawings for each component by Contractor. For items at or below the base, "z" shall be taken as zero.

(7) h = Average Roof Height of Structure with Respect to Base: Determine from Project Drawings by Delegated Design Contractor.

b. Vertical Seismic Design Force: Calculate by Delegated Design Contractor using method explained in ASCE/SEI 7-10, Paragraph 13.3.1.

c. Seismic Relative Displacement D_{pI}: Calculate by Delegated Design Contractor using methods explained in ASCE/SEI 7-10, Paragraph 13.3.2. Factors below must be obtained for this calculation:

(1) D_p = Relative Seismic Displacement that Each Component Must Be Designed to Accommodate: Calculate by Delegated Design Contractor in accordance with ASCE/SEI 7-10, Paragraph 13.3.2.

(2) I_e = Structure Importance Factor: Value applies to all components on Project.

(3) 8_{xA} = Deflection at Building Level x of Structure A: See Drawing Schedule for each component.

(4) 8_{yA} = Deflection at Building Level y of Structure A: See Drawing Schedule for each component.

(5) 8_{yB} = Deflection at Building Level y of Structure B: See Drawing Schedule for each component.

(6) h_x = Height of Level x to Which Upper Connection Point Is Attached: Determine for each component by Delegated Design Contractor from Project Drawings and manufacturer's data.

(7) h_y = Height of Level y to Which Upper Connection Point Is Attached: Determine for each component by Delegated Design Contractor from Project Drawings and manufacturer's data.

(8) A_{aA} = Allowable Story Drift for Structure A: See Drawing Schedule for each component.

(9) A_{aB} = Allowable Story Drift for Structure B: See Drawing Schedule for each component.

(10) h_{sx} = Story Height Used in the Definition of the Allowable Drift A_a: See Schedule for each component.

4. Calculation Factors, ASCE/SEI 7-05, Ch. 13 – Seismic Design Requirements for Nonstructural Components: All section, paragraph, equation, and table numbers refer to ASCE/SEI 7-05 unless otherwise noted.

a. Horizontal Seismic Design Force F_p: Calculated by Delegated Design Contractor by ASCE/SEI 7-05, Equation 13.3-1. Factors below must be obtained for this calculation:

(1) S_{DS} = Spectral Acceleration: Value applies to all components on Project.

(2) a_p = Component Amplification Factor: See Drawing Schedule for each component.

(3) I_p = Component Importance Factor: See Drawing Schedule for each component.

(4) W_p = Component Operating Weight: Obtain by Delegated Design Contractor for each component from component submittal.

(5) R_p = Component Response Modification Factor: See Drawing Schedule for each component.

(6) z = Height in Structure of Point of Attachment of Component with Respect to Base: Determine by Delegated Design Contractor for each component from Project Drawings. For items at or below the base, "z" shall be taken as zero.

(7) h = Average Roof Height of Structure with Respect to Base: Determine by Delegated Design Contractor from Project Drawings.

b. Vertical Seismic Design Force: Calculated by Delegated Design Contractor using method explained in ASCE/SEI 7-05, Paragraph 13.3.1.

c. Seismic Relative Displacement D_p: Calculated by Delegated Design Contractor using methods explained in ASCE/SEI 7-05, Paragraph 13.3.2. Factors below must be obtained for this calculation:

(1) 8_{xA} = Deflection at Building Level x of Structure A: See Drawing Schedule for each component.

(2) 8_{yA} = Deflection at Building Level y of Structure A: See Drawing Schedule for each component.

(3) 8_{yB} = Deflection at Building Level y of Structure B: See Drawing Schedule for each component.

(4) h_x = Height of Level x to Which Upper Connection Point Is Attached: Determine for each component by Delegated Design Contractor from Project Drawings and manufacturer's data.

(5) h_y = Height of Level y to Which Upper Connection Point Is Attached: Determine for each component by Delegated Design Contractor from Project Drawings and manufacturer's data.

(6) A_{aA} = Allowable Story Drift for Structure A: See Drawing Schedule for each component.

(7) A_{aB} = Allowable Story Drift for Structure B: See Drawing Schedule for each component.

(8) h_{sx} = Story Height Used in the Definition of Allowable Drift A_a: See Drawing Schedule for each component.

C. Wind-Load Design Calculations:

1. Perform calculations to obtain force information necessary to properly select wind-load-restraint devices, fasteners, and anchorage. Perform calculations using methods acceptable to applicable code authorities and as presented in ASCE/SEI 7-05, ASCE/SEI 7-10, and ASCE/SEI 7-16. Where "ASCE/SEI 7" is used throughout this Section, it is to be understood that the edition referred to in this subparagraph is intended as referenced throughout the Section Text unless otherwise noted.

a. Data indicated below that are specific to individual pieces of equipment must be obtained by Contractor and must be included in individual component submittal packages.

b. Coordinate design wind-load calculations with seismic load calculations for equipment requiring both seismic and wind-load reinforcement. Comply with requirements in other Sections in addition to those in this Section.

2. Design wind pressure "p" for external sidewall-mounted equipment is to be calculated by Delegated Design Contractor using methods in ASCE/SEI 7-16, Ch. 30. Perform calculations according to one of the following, as appropriate:

a. PART 1: Low-Rise Buildings

b. PART 2: Low-Rise Buildings (Simplified)

c. PART 3: Buildings with "h" less than 60 feet

d. PART 4: Buildings with "h" greater than 60 feet and less than 160 feet

e. PART 5: Open Buildings

D. Consequential Damage: Provide additional seismic and wind-load restraints for suspended communications components or anchorage of floor-, roof-, or wall-mounted communications components as indicated in ASCE/SEI 7-05, ASCE/SEI 7-10, and ASCE/SEI 7-16 so that failure of a non-essential or essential communications component will not cause failure of any other essential architectural, mechanical, or communications building component.

E. Fire/Smoke Resistance: Seismic- and wind-load-restraint devices that are not constructed of ferrous metals must have a maximum flame-spread index of 25 and maximum smoke-

developed index of 450 when tested by an NRTL in accordance with ASTM E84 or UL 723, and be so labeled.

F. Component Supports:

1. Load ratings, features, and applications of all reinforcement components must be based on testing standards of a nationally recognized testing agency.

2. All component support attachments must comply with force and displacement resistance requirements of ASCE/SEI 7-05 Section 13.6, ASCE/SEI 7-10 Section 13.6, and ASCE/SEI 7-16 Section 13.6.

2.02 ELASTOMERIC ISOLATION PADS:

A. Manufacturers:

1. Ace Mounting Co., Inc.

2. California Dynamics Corporation

3. Isolation Technology, Inc.

4. Korfund

5. nVent (CADDY)

B. Fabrication: Single or multiple layers of sufficient durometer stiffness for uniform loading over pad area.

C. Size: Factory or field cut to match requirements of supported equipment.

D. Pad Material: Oil and water resistant with elastomeric properties. Neoprene rubber, silicone rubber, or other elastomeric material.

E. Surface Pattern: Smooth, ribbed, or waffle pattern.

F. Infused nonwoven cotton or synthetic fibers.

G. Load-bearing metal plates adhered to pads.

H. Sandwich-Core Material: Resilient and elastomeric.

1. Surface Pattern: Smooth, ribbed, or waffle pattern.

2. Infused nonwoven cotton or synthetic fibers.

2.03 RESTRAINTS – RIGID TYPE:

A. Manufacturers:

1. Atkore International (Unistrut)

2. Eaton (B-line)

3. Hilti, Inc.

4. Isolation Technology, Inc.

5. nVent (CADDY)

B. Description: Shop- or field-fabricated bracing assembly made of ANSI/AISI S110-07-S1 slotted steel channels, ANSI/ASTM A53 steel pipe, or other rigid steel brace member. Includes accessories for attachment to braced component at one end and to building structure at the other end and other matching components and with corrosion-resistant coating; rated in tension, compression, and torsion forces.

2.04 RESTRAINTS – CABLE TYPE:

A. Manufacturers:

1. Atkore International (Unistrut)

2. Eaton (B-line)

3. Hilti, Inc.

4. Mason Industries, Inc.

5. nVent (CADDY)

B. Seismic- and Wind-Load-Restraint Cables: ASTM A1023 galvanized or ASTM A603 galvanized-steel ASTM A492 stainless steel cables. End connections made of steel assemblies with thimbles, brackets, swivel, and bolts designed for seismic restraining cable service; with fittings attached by means of poured socket, swaged socket or mechanical (Flemish eye) loop.

C. Restraint cable assembly and cable fittings must comply with ASCE/SEI 19. All cable fittings and complete cable assembly must maintain the minimum cable breaking force. U-shaped cable clips and wedge-type end fittings do not comply and are unacceptable.

2.05 RESTRAINT ACCESSORIES:

A. Manufacturers:

1. Atkore International (Unistrut)

2. Eaton (B-line)

3. Hilti, Inc.

4. Mason Industries, Inc.

5. nVent (CADDY)

B. Hanger-Rod Stiffener: Steel tube or steel slotted-support-system sleeve with internally bolted connections Reinforcing steel angle clamped to hanger rod. Non-metallic stiffeners are unacceptable.

C. Hinged and Swivel Brace Attachments: Multifunctional steel connectors for attaching hangers to rigid channel bracings and restraint cables.

D. Bushings for Floor-Mounted Equipment Anchor Bolts: Neoprene bushings designed for rigid equipment mountings, and matched to type and size of anchor bolts and studs.

E. Bushing Assemblies for Wall-Mounted Equipment Anchorage: Assemblies of neoprene elements and steel sleeves designed for rigid equipment mountings, and matched to type and size of attachment devices used.

F. Resilient Isolation Washers and Bushings: One-piece, molded, oil- and water-resistant neoprene, with a flat washer face.

2.06 POST-INSTALLED CONCRETE ANCHORS:

A. Mechanical Anchor Bolts:

1. Manufacturers:

a. Atkore International (Unistrut)

b. Eaton (B-line)

c. Hilti, Inc.

d. Mason Industries, Inc.

e. Powers Fasteners

2. Drilled-in and stud-wedge or female-wedge type in zinc-coated steel for interior applications and stainless steel for exterior applications. Select anchor bolts with strength for anchor and as tested according to ASTM E488.

B. Adhesive Anchor Bolts:

1. Manufacturers:

a. Atkore International (Unistrut)

b. Eaton (B-line)

c. Hilti, Inc.

d. Mason Industries, Inc.

e. Powers Fasteners

2. Drilled-in and capsule anchor system containing PVC or urethane methacrylate-based resin and accelerator, or injected polymer or hybrid mortar adhesive. Provide anchor bolts and hardware with zinc-coated steel for interior applications and stainless steel for exterior applications. Select anchor bolts with strength required for anchor and as tested according to ASTM E488.

C. Provide post-installed concrete anchors which have been prequalified for use in seismic applications. Post-installed concrete anchors must conform to all requirements of ASCE/SEI 7-05 Ch. 13, ASCE/SEI 7-10 Ch. 13, and ASCE/SEI 7-16, Ch. 13.

1. Prequalify post-installed anchors in concrete in accordance with ACI 355.2 or other approved qualification testing procedures.

2. Prequalify post-installed anchors in masonry in accordance with approved qualification procedures.

D. Expansion-type anchor bolts are not permitted for equipment in excess of 10 hp that is not vibration isolated.

1. Undercut expansion anchors are permitted.

2.07 CONCRETE INSERTS:

A. Manufacturers:

1. Atkore International (Unistrut)

2. Eaton (B-line)

3. Hilti, Inc

4. Mason Industries, Inc.

5. Power Fasteners

B. Provide preset concrete inserts that are seismically prequalified in accordance with ICC-ES AC466 testing.

C. Comply with MSS SP-58.

PART 3 - EXECUTION

3.01 EXAMINATION:

A. Examine areas and equipment to receive seismic and wind-load control devices for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.

B. Examine roughing-in for reinforcement and cast-in-place anchors to verify actual locations before installation.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 APPLICATIONS:

A. Multiple Raceways or Cables: Secure raceways and cables to trapeze member with clamps approved for application by an evaluation service member of ICC-ES OSHPD an agency acceptable to authorities having jurisdiction.

B. Hanger-Rod Stiffeners: Install hanger-rod stiffeners where indicated or scheduled on Drawings to receive them and where required to prevent buckling of hanger rods caused by seismic forces.

C. Strength of Support and Seismic-Restraint Assemblies: Where not indicated, select sizes of components so strength will be adequate to carry static, wind-load, and seismic loads within specified loading limits.

3.03 INSTALLATION OF SEISMIC RESTRAINT AND WIND-LOAD CONTROL DEVICES:

A. Provide seismic restraint and wind-load control]devices for systems and equipment where indicated in Equipment Schedules or Communications Seismic and Wind-Load Controls Schedule, where indicated on Drawings, where the Specifications indicate they are to be installed on specific equipment and systems, and where required by applicable codes.

1. Install all equipment and devices to withstand the effects of earthquake motions and high wind events determined in accordance with ASCE/SEI 7-05 ASCE/SEI 7-10 ASCE/SEI 7-16.

B. Coordinate location of embedded connection hardware with supported equipment attachment and mounting points and with requirements for concrete reinforcement and formwork specified in Section 03 30 00.

C. Installation of seismic and wind-load restraints must not cause any stresses, misalignment, or change of position of equipment or conduits.

D. Equipment Restraints:

1. Install resilient bolt isolation washers on equipment anchor bolts where clearance between anchor and adjacent surface exceeds 0.125 inch.

2. Install seismic-restraint and wind-load-restrain devices using methods approved by an evaluation service member of ICC-ES OSHPD an agency acceptable to authorities having jurisdiction that provides required submittals for component.

E. Raceway, Cable, Wireway, Cable Tray, and Busway Support and Hanger Restraints:

1. Install resilient bolt isolation washers on equipment anchor bolts where clearance between anchor and adjacent surface exceeds 0.125 inch.

2. Install seismic-restraint and wind-load-restraint devices using methods approved by an evaluation service member of ICC-ES OSHPD or an agency acceptable to authorities having jurisdiction that provides required submittals for component.

3. Comply with requirements in NFPA 70 and ASCE/SEI 7-16.

F. Equipment and Hanger Restraints:

1. Install resilient, bolt-isolation washers on equipment anchor bolts where clearance between anchor and adjacent surface exceeds 0.125 inch.

2. Install seismic-restraint devices using methods approved by an evaluation service member of ICC-ES OSHPD an agency acceptable to authorities having jurisdiction providing required submittals for component.

G. Install cables so they do not bend across edges of adjacent equipment or building structure.

H. Install bushing assemblies for mounting bolts for wall-mounted equipment, arranged to provide resilient media where equipment or equipment-mounting channels are attached to wall.

I. Attachment to Structure: If specific attachment is not indicated, anchor bracing to structure at flanges of beams, at upper truss chords of bar joists, or at concrete members.

J. Post-Installed Concrete Anchors:

1. Identify position of reinforcing steel and other embedded items prior to drilling holes for anchors. Do not damage existing reinforcing or embedded items during coring or drilling. Notify structural engineer if reinforcing steel or other embedded items are encountered during drilling. Locate and avoid prestressed tendons, electrical and telecommunications conduit, and gas lines.

2. Do not drill holes in concrete or masonry until concrete, mortar, or grout has achieved full design strength.

3. Mechanical-Type Anchor Bolts: Protect threads from damage during anchor installation. Heavy-duty sleeve anchors shall be installed with sleeve fully engaged in the structural element to which anchor is to be fastened.

4. Adhesive-Type Anchor Bolts: Clean holes to remove loose material and drilling dust prior to installation of adhesive. Place adhesive in holes proceeding from the bottom of the hole and progressing toward the surface in such a manner as to avoid introduction of air pockets in the adhesive.

5. Set anchors to manufacturer's recommended torque using a torque wrench.

6. Install zinc-coated steel anchors for interior and stainless steel anchors for exterior applications.

3.04 ACCOMMODATION OF DIFFERENTIAL SEISMIC MOTION:

A. Install flexible connections in runs of raceways, cables, wireways, cable trays, and busways where they cross seismic joints, where adjacent sections or branches are supported by different structural elements, and where connection is terminated to equipment that is anchored to a different structural element from the one supporting them as they approach equipment.

3.05 FIELD QUALITY CONTROL:

A. Testing Agency: Owner will engage a qualified testing agency to perform tests and inspections.

B. Tests and Inspections:

1. Perform tests and inspections with the assistance of a factory-authorized service representative.

2. Provide evidence of recent calibration of test equipment by a testing agency acceptable to authorities having jurisdiction.

3. Schedule test with Owner, through Architect, before connecting anchorage device to restrained component (unless post-connection testing has been approved), and with at least seven days' advance notice.

4. Obtain Architect's approval before transmitting test loads to structure. Provide temporary load-spreading members.

5. Test no fewer than four of each type and size of installed anchors and fasteners selected by Architect.

6. Test to 90 percent of rated proof load of device.

C. Remove and replace malfunctioning units and retest as specified above.

D. Seismic controls will be considered defective if they do not pass tests and inspections.

E. Prepare test and inspection reports.

3.06 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 27 05 53

IDENTIFICATION FOR COMMUNICATIONS SYSTEMS

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide identification for communications systems as indicated and in compliance with Contract Documents.

1. Underground-line warning tape

2. Signs

3. Bands and tubes

4. Cable ties

5. Miscellaneous identification products

6. Labels

1.02 REFERENCES:

A. American National Standards Institute (ANSI):

1. Z535.1: Safety Colors

2. Z535.2: Environmental and Facility Safety Signs

3. Z535.3: Criteria for Safety Symbols

4. Z535.4: Product Safety Signs and Labels

B. ASTM International (ASTM):

1. D638: Standard Test Method for Tensile Properties of Plastics

2. D882: Standard Test Method for Tensile Properties of Thin Plastic Sheeting

C. National Fire Protection Association (NFPA):

1. 70: National Electrical Code.

D. Telecommunications Industry Association (TIA):

1. 606: Administration Standard for Telecommunications Infrastructure

E. Underwriters' Laboratories, Inc. (UL):

1. 94: Standard for Safety Tests for Flammability of Plastic Materials for Parts in Devices and Appliances

2. 969: Standard for Safety Marking and Labeling Systems

1.03 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Product Data: For each type of product.

1. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes for communications identification products.

C. Samples: For each type of label and sign to illustrate composition, size, colors, lettering style, mounting provisions, and graphic features of identification products.

D. Identification Schedule:

1. Outlets: Scaled drawings indicating location and proposed designation.

2. Backbone Cabling: Riser diagram showing each communications room, backbone cable, and proposed backbone cable designation.

3. Racks: Scaled drawings indicating location and proposed designation.

4. Patch Panels: Enlarged scaled drawings showing rack row, number, and proposed designations.

1.04 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.05 SPARE PARTS:

A. Comply with the requirements specified in Section 01 61 00.

1.06 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

1.07 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

PART 2 - PRODUCTS

2.01 PERFORMANCE REQUIREMENTS:

A. Comply with NFPA 70 and TIA 606-B.

B. Comply with ANSI Z535.4 for safety signs and labels.

C. Adhesive-attached labeling materials, including label stocks, laminating adhesives, and inks used by label printers, shall comply with UL 969.

D. Thermal Movements: Allow for thermal movements from ambient and surface temperature changes.

1. Temperature Change: 120 degrees F, ambient; 180 degrees F, material surfaces.

2.02 COLOR AND LEGEND REQUIREMENTS:

A. Equipment Identification Labels:

1. Black letters on a white field.

2.03 LABELS:

A. Vinyl Wraparound Labels: Preprinted, flexible labels laminated with a clear, weather- and chemical-resistant coating and matching wraparound clear adhesive tape for securing label ends.

1. Manufacturers:

a. Brady Corporation

b. Champion America

c. Emedco

d. HellermannTyton

e. Panduit Corp

B. Snap-Around Labels: Slit, pretensioned, flexible, preprinted, color-coded acrylic sleeves, with diameters sized to suit diameters of raceway or cable they identify, that stay in place by gripping action.

1. Manufacturers:

a. Brady Corporation

b. HellermanTyton

c. Marking Services, Inc.

d. Panduit Corp.

e. Seton Identification Products; a Brady Corporation company

C. Self-Adhesive Wraparound Labels: Preprinted, 3-mil-thick, polyester flexible labels with acrylic pressure-sensitive adhesive.

1. Manufacturers:

a. Brady Corporation

b. Emedco

c. Grafoplast Wire Markers

d. Ideal Industries, Inc.

e. Panduit Corp

2. Self-Lamination: Clear; UV-, weather- and chemical-resistant; self-laminating protective shields over the legend. Labels sized such that the clear shield overlaps the entire printed legend.

3. Marker for Labels:

a. Permanent, waterproof black ink marker recommended by tag manufacturer.

b. Machine-printed recommended by printer manufacturer.

D. Self-Adhesive Labels: Polyester Vinyl, thermal, transfer-printed, 3-mil-thick, multicolor, weather- and UV-resistant, pressure-sensitive adhesive labels, configured for intended use and location.

1. Manufacturers:

a. Brady Corporation

b. Emedco

c. HellermannTyton

d. Ideal Industries, Inc.

e. Panduit Corp

2. Minimum Nominal Size:

a. 1-1/2 by 6 inches for raceway and conductors.

b. 3-1/2 by 5 inches for equipment.

c. As required by authorities having jurisdiction.

2.04 BANDS AND TUBES:

A. Snap-Around, Color-Coding Bands: Slit, pretensioned, flexible, solid-colored acrylic sleeves, 2 inches long, with diameters sized to suit diameters of raceway or cable they identify, that stay in place by gripping action.

1. Manufacturers:

a. Brady Corporation

b. HellermannTyton

c. Marking Services, Inc.

d. Panduit Corp

2.05 UNDERGROUND-LINE WARNING TAPE:

A. Manufacturers:

1. Brady Corporation

2. Brimar Industries, Inc.

3. Ideal Industries, Inc

4. LEM Products Inc.

5. Marking Services, Inc.

B. Tape:

1. Recommended by manufacturer for the method of installation and suitable to identify and locate underground communications utility lines.

2. Printing on tape shall be permanent and shall not be damaged by burial operations.

3. Tape material and ink shall be chemically inert and not subject to degradation when exposed to acids, alkalis, and other destructive substances commonly found in soils.

C. Color and Printing:

1. Comply with ANSI Z535.1, ANSI Z535.2, ANSI Z535.3, and ANSI Z535.4.

2. Inscriptions for Orange-Colored Tapes: "TELEPHONE CABLE, CATV CABLE, COMMUNICATIONS CABLE, OPTICAL-FIBER CABLE".

D. Tag, Nonconducting Polyolefin: Type I:

1. Pigmented polyolefin, bright colored, continuous-printed on one side with the inscription of the utility, compounded for direct-burial service.

2. Width: 3 inches

3. Thickness: 4 mils

4. Weight: 18.5 lb/1000 sq. ft.

5. Tensile according to ASTM D882: 30 lbf and 2500 psi

E. Tag, Nonconducting Multilayer Laminate: Type II:

1. Multilayer laminate, consisting of high-density polyethylene scrim coated with pigmented polyolefin; bright colored, continuous-printed on one side with the inscription of the utility, compounded for direct-burial service.

2. Width: 3 inches

3. Thickness: 12 mils

4. Weight: 36.1 lb/1000 sq. ft.

5. Tensile according to ASTM D882: 400 lbf and 11,500 psi

F. Tag, Detectable:

1. Detectable three-layer laminate, consisting of a printed pigmented polyolefin film, a solid aluminum-foil core, and a clear protective film that allows inspection of the continuity of the conductive core; bright colored, continuous-printed on one side with the inscription of the utility, compounded for direct-burial service.

2. Width: 3 inches

3. Overall Thickness: 5 mils

4. Foil Core Thickness: 0.35 mil

5. Weight: 28 lb/1000 sq. ft.

6. Tensile according to ASTM D882: 70 lbf and 4600 psi

G. Tag, Detectable, Reinforced:

1. Reinforced, detectable three-layer laminate, consisting of a printed pigmented woven scrim, a solid aluminum-foil core, and a clear protective film that allows inspection of the continuity of the conductive core; bright-colored, continuous-printed on one side with the inscription of the utility, compounded for direct-burial service.

2. Width: 3 inches

3. Overall Thickness: 8 mils

4. Foil Core Thickness: 0.35 mil

5. Weight: 34 lb/1000 sq. ft.

6. Tensile according to ASTM D882: 300 lbf and 12,500 psi

2.06 SIGNS:

A. Baked-Enamel Signs:

1. Manufacturers:

a. Carlton Industries, LP

b. Champion America

c. Emedco

d. Marking Services, Inc

2. Preprinted aluminum signs, high-intensity reflective, punched or drilled for fasteners, with colors, legend, and size required for application.

3. 1/4-inch grommets in corners for mounting.

4. Nominal Size: 7 by 10 inches.

B. Metal-Backed Butyrate Signs:

1. Manufacturers:

a. Brady Corporation

b. Champion America

c. Emedco

d. Marking Services, Inc

2. Weather-resistant, nonfading, preprinted, cellulose-acetate butyrate signs, with 0.0396-inch galvanized-steel backing, punched and drilled for fasteners, and with colors, legend, and size required for application.

3. 1/4-inch grommets in corners for mounting.

4. Nominal Size: 10 by 14 inches.

C. Laminated-Acrylic or Melamine-Plastic Signs:

1. Manufacturers:

a. Brady Corporation

b. Carlton Industries, LP

c. Emedco

d. Marking Services, Inc

2. Engraved legend.

3. Thickness:

a. For signs up to 20 square inches., minimum 1/16 inch thick.

b. For signs larger than 20 square inches, 1/8 inch thick.

c. Engraved legend with black letters on white face white letters on a dark gray background.

d. Punched or drilled for mechanical fasteners with 1/4-inch grommets in corners for mounting Self-adhesive.

e. Framed with mitered acrylic molding and arranged for attachment at applicable equipment.

2.07 CABLE TIES:

A. Manufacturers:

1. HellermannTyton

2. Ideal Industries, Inc.

3. Marking Service, Inc.

4. Panduit Corp.

B. General-Purpose Cable Ties: Fungus inert, self-extinguishing, one piece, self-locking, and Type 6/6 nylon.

1. Minimum Width: 3/16 inch.

2. Tensile Strength at 73 degrees F according to ASTM D638: 12,000 psi.

3. Temperature Range: -40 to +185 degrees F.

4. Color: Black, except where used for color-coding.

C. UV-Stabilized Cable Ties: Fungus inert, designed for continuous exposure to exterior sunlight, self-extinguishing, one piece, self-locking, and Type 6/6 nylon.

1. Minimum Width: 3/16 inch.

2. Tensile Strength at 73 degrees F according to ASTM D638: 12,000 psi.

3. Temperature Range: -40 to +185 degrees F.

4. Color: Black.

D. Plenum-Rated Cable Ties: Self-extinguishing, UV stabilized, one piece, and self-locking.

1. Minimum Width: 3/16 inch.

2. Tensile Strength at 73 degrees F according to ASTM D638: 7000 psi.

3. UL 94 Flame Rating: 94V-0.

4. Temperature Range: -50 to + 284 degrees F.

5. Color: Black.

2.08 MISCELLANEOUS IDENTIFICATION PRODUCTS:

A. Paint: Comply with requirements in painting Sections for paint materials and application requirements. Retain paint system applicable for surface material and location (exterior or interior).

B. Fasteners for Labels and Signs: Self-tapping, stainless-steel screws or stainless-steel machine screws with nuts and flat and lock washers.

PART 3 - EXECUTION

3.01 PREPARATION:

A. Self-Adhesive Identification Products: Before applying communications identification products, clean substrates of substances that could impair bond, using materials and methods recommended by manufacturer of identification product.

3.02 INSTALLATION:

A. Verify and coordinate identification names, abbreviations, colors, and other features with requirements in other Sections requiring identification applications, Drawings, Shop Drawings, manufacturer's wiring diagrams, and operation and maintenance manual. Use consistent designations throughout Project.

B. Install identifying devices before installing acoustical ceilings and similar concealment.

C. Verify identity of each item before installing identification products.

D. Coordinate identification with Project Drawings, manufacturer's wiring diagrams, and operation and maintenance manual.

E. Apply identification devices to surfaces that require finish after completing finish work.

F. Install signs with approved legend to facilitate proper identification, operation, and maintenance of communications systems and connected items.

G. Elevated Components: Increase sizes of labels, signs, and letters to those appropriate for viewing from the floor.

H. Vinyl Wraparound Labels:

1. Secure tight to surface of raceway or cable at a location with high visibility and accessibility.

2. Attach labels that are not self-adhesive type with clear vinyl tape, with adhesive appropriate to the location and substrate.

3. Provide label 6 inches from cable end.

I. Snap-Around Labels:

1. Secure tight to surface at a location with high visibility and accessibility.

2. Provide label 6 inches from cable end.

J. Self-Adhesive Wraparound Labels:

1. Secure tight to surface at a location with high visibility and accessibility.

2. Provide label 6 inches from cable end.

K. Self-Adhesive Labels:

1. On each item, install unique designation label that is consistent with wiring diagrams, schedules, and operation and maintenance manual.

2. Unless otherwise indicated, provide a single line of text with 1/2-inch-high letters on 1-1/2-inch-high label; where two lines of text are required, use labels 2 inches high.

L. Snap-Around, Color-Coding Bands: Secure tight to surface at a location with high visibility and accessibility.

M. Underground-Line Warning Tape:

1. During backfilling of trenches, install continuous underground-line warning tape directly above cable or raceway at 6 to 8 inches below finished grade. Use multiple tapes where width of multiple lines installed in a common trench or concrete envelope exceeds 16 inches overall.

2. Limit use of underground-line warning tape to direct-buried cables.

3. Install underground-line warning tape for direct-buried cables and cables in raceways.

N. Cable Ties: General purpose, except as listed below:

1. Outdoors: UV-stabilized nylon.

2. In Spaces Handling Environmental Air: Plenum rated.

3.03 IDENTIFICATION SCHEDULE:

A. Install identification materials and devices at locations for most convenient viewing without interference with operation and maintenance of equipment. Install access doors or panels to provide view of identifying devices.

B. Identify conductors, cables, and terminals in enclosures and at junctions, terminals, pull points, and locations with high visibility. Identify by system and circuit designation.

C. Accessible Fittings for Raceways and Cables within Buildings: Identify covers of each junction and pull box with self-adhesive labels containing wiring system legend.

1. System legends shall be telecommunications.

D. Faceplates: Label individual faceplates with self-adhesive labels. Place label at top of faceplate. Each faceplate shall be labeled with its individual, sequential designation, numbered clockwise when entering room from primary egress, composed of the following, in the order listed:

1. Wiring closet designation.

2. Colon.

3. Faceplate number.

E. Equipment Room Labeling:

1. Racks, Frames, and Enclosures: Identify front and rear of each with self-adhesive labels containing equipment designation.

2. Patch Panels: Label individual rows in each rack, starting at top and working down, with self-adhesive labels. Label individual rows and outlets, starting at to left and working down, with self-adhesive labels.

3. Data Outlets: Label each outlet with a self-adhesive label indicating the following, in the order listed:

a. Room number being served

b. Colon

c. Faceplate number

F. Backbone Cables: Label each cable with a vinyl-wraparound label snap-around label self-adhesive wraparound label indicating the location of the far or other end of the backbone cable. Patch panel or punch down block where cable is terminated should be labeled identically.

G. Horizontal Cables: Label each cable with a vinyl-wraparound label snap-around label self-adhesive wraparound label indicating the following, in the order listed:

1. Room number

2. Colon

3. Faceplate number

H. Locations of Underground Lines: Underground-line warning tape for copper, coaxial, hybrid copper/fiber, and optical-fiber cable.

I. Instructional Signs: Self-adhesive labels.

J. Warning Labels for Indoor Cabinets, Boxes, and Enclosures: Self-adhesive labels Baked-enamel warning signs Metal-backed, butyrate warning signs.

1. Apply to exterior of door, cover, or other access.

K. Equipment Identification Labels:

1. Indoor Equipment: Self-adhesive label Baked-enamel signs Metal-backed butyrate signs Laminated-acrylic or melamine-plastic sign.

2. Outdoor Equipment: Laminated-acrylic or melamine-plastic sign.

3. Equipment to be Labeled:

a. Communications cabinets.

b. Uninterruptible power supplies.

c. Computer room air conditioners.

d. Fire-alarm and suppression equipment.

e. Egress points.

f. Power distribution components.

3.04 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

Page Intentionally Left Blank

SECTION 27 11 00

COMMUNICATIONS EQUIPMENT ROOM FITTINGS

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide communications equipment room fittings as indicated and in compliance with Contract Documents.

1. Backboards.

2. Boxes, enclosures, and cabinets.

3. Power strips.

1.02 REFERENCES:

5. 1449: Standard for Safety Surge Protective Devices

6. 1773: Standard for Safety Termination Boxes

1.03 DEFINITIONS:

A. Access Provider: An operator that provides a circuit path or facility between the service provider and user. An access provider can also be a service provider.

B. BICSI: Building Industry Consulting Service International.

C. RCDD: Registered communications distribution designer.

D. Service Provider: The operator of a telecommunications transmission service delivered through access provider facilities.

E. TGB: Telecommunications grounding bus bar.

F. TMGB: Telecommunications main grounding bus bar.

1.04 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Product Data: For each type of product.

1. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes for equipment racks and cabinets.

2. Include rated capacities, operating characteristics, electrical characteristics, and furnished specialties and accessories.

C. Shop Drawings: For communications equipment room fittings. Include plans, elevations, sections, details, and attachments to other work.

1. Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.

2. Equipment Racks and Cabinets: Include workspace requirements and access for cable connections.

3. Grounding: Indicate location of grounding bus bar and its mounting detail showing standoff insulators and wall mounting brackets.

D. Qualification Data: For qualified layout technician, installation supervisor, and field inspector.

E. Seismic Qualification Data: Certificates, from manufacturer.

1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.

2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions. Base certification on the maximum number of components capable of being mounted in each rack type. Identify components on which certification is based.

3. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.

1.05 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.06 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

B. Installer Qualifications: Cabling Installer must have personnel certified by BICSI on staff.

1. Layout Responsibility: Preparation of Shop Drawings shall be under direct supervision of RCDD.

2. Installation Supervision: Installation shall be under direct supervision of Technician, who shall be present at all times when Work of this section is performed at Project site.

3. Field Inspector: Currently registered by BICSI as RCDD to perform the on-site inspection.

1.07 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

PART 2 - PRODUCTS

2.01 PERFORMANCE REQUIREMENTS:

A. Seismic Performance: Equipment shall withstand the effects of earthquake motions determined according to ASCE/SEI 7 Telcordia GR-63-CORE requirements for Zone 4 Seismic Earthquake Environments.

1. The term "withstand" means "the unit will remain in place without separation of any parts when subjected to the seismic forces specified and the unit will be fully operational after the seismic event."

2.02 BACKBOARDS:

A. Backboards: Plywood, fire-retardant treated, 3/4 by 48 by 96 inches.

B. Backboard Paint: Pre-painted light-colored fire-retardant paint, light-colored interior latex paint.

2.03 BOXES, ENCLOSURES, AND CABINETS:

A. Manufacturers:

1. Adalet

2. Eaton (Crouse-Hinds)

3. FSR Inc

4. nVent (Hoffman)

5. Plasti-Bond

B. General Requirements for Boxes, Enclosures, and Cabinets: Boxes, enclosures, and cabinets shall be listed and labeled for intended location and use.

C. Sheet Metal Outlet and Device Boxes: Comply with NEMA OS 1 and UL 514A.

D. Cast-Metal Outlet and Device Boxes: Comply with NEMA FB 1, Type FD, ferrous alloy or aluminum, with gasketed cover.

E. Nonmetallic Outlet and Device Boxes: Comply with NEMA OS 2 and UL 514C.

F. Small Sheet Metal Pull and Junction Boxes: NEMA OS 1.

G. Cast-Metal Access, Pull, and Junction Boxes: Comply with NEMA FB 1 and UL 1773, cast aluminum galvanized cast iron with gasketed cover.

H. Box extensions used to accommodate new building finishes shall be of same material as recessed box.

I. Device Box Dimensions: 4 inches square by 2-1/8 inches deep.

J. Hinged-Cover Enclosures: Comply with UL 50 and NEMA 250, Type 1 Type 3R Type 4 Type 12 with continuous-hinge cover with flush latch unless otherwise indicated.

1. Metal Enclosures: Steel, finished inside and out with manufacturer's standard enamel.

2. Nonmetallic Enclosures: Plastic Fiberglass.

3. Interior Panels: Steel; all sides finished with manufacturer's standard enamel.

K. Cabinets:

1. NEMA 250, Type 1 Type 3R Type 12 galvanized-steel box with removable interior panel and removable front, finished inside and out with manufacturer's standard enamel.

2. Hinged door in front cover with flush latch and concealed hinge.

3. Key latch to match panelboards.

4. Metal barriers to separate wiring of different systems and voltage.

5. Accessory feet where required for freestanding equipment.

6. Nonmetallic cabinets shall be listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

2.04 POWER STRIPS:

A. Comply with requirements in Section 27 11 16.

B. Power Strips: Comply with UL 1363.

1. Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

2. Rack mounting, with detachable integral flanges.

3. Height: 1 RU.

4. Housing: Metal.

5. Six, 15-A, 120-V ac, NEMA WD 6, Configuration 5-15R 20-A, 120-V ac, NEMA WD 6, Configuration 5-20R receptacles.

6. Front Rear-facing receptacles.

7. LED indicator lights for power and protection status.

8. LED indicator lights for reverse polarity and open outlet ground.

9. Circuit Breaker and Thermal Fusing: When protection is lost, circuit opens and cannot be reset.

10. Close-coupled, direct plug-in Cord connected with 15-foot line cord.

11. Rocker-type on-off switch, illuminated when in on position.

12. Surge Protection: UL 1449, Type 3.

    a. Maximum Surge Current, Line to Neutral: 27 kA 72 kA.

    b. Protection modes shall be line to neutral, line to ground, and neutral to ground.

    c. UL 1449 Voltage Protection Rating for line to neutral and line to ground shall be 600 V and 500 V for neutral to ground.

PART 3 - EXECUTION

3.01 ENTRANCE FACILITIES:

A. Contact telecommunications service provider and arrange for installation of demarcation point, protected entrance terminals, and a housing when so directed by service provider.

B. Comply with requirements in Section 27 05 28 for materials and installation requirements for underground buried aerial pathways.

3.02 INSTALLATION:

A. Comply with NECA 1.

B. Comply with BICSI's "Telecommunications Distribution Methods Manual" for layout of communications equipment spaces.

C. Comply with BICSI's "Information Technology Systems Installation Methods Manual" for installation of equipment in communications equipment spaces.

D. Bundle, lace, and train conductors and cables to terminal points without exceeding manufacturer's limitations on bending radii. Install lacing bars and distribution spools.

E. Coordinate layout and installation of communications equipment in tracks and in room. Coordinate service entrance configuration with service provider.

1. Meet jointly with systems providers, equipment suppliers, and Owner to exchange information and agree on details of equipment configurations and installation interfaces.

2. Record agreements reached in meetings and distribute them to other participants.

3. Adjust configurations and locations of distribution frames, cross-connects, and patch panels in equipment rooms to accommodate and optimize configurations and space requirements of communications equipment.

4. Adjust configurations and locations of equipment with distribution frames, cross-connects, and patch panels of cabling systems of other communications, electronic safety and security, and related systems that share space in equipment room.

F. Coordinate location of power raceways and receptacles with locations of communications equipment requiring electrical power to operate.

G. Backboards:

1. Install from 6 inches to 8 feet, 6 inches above finished floor. If plywood is fire rated, ensure that fire-rating stamp is visible after installation.

2. Paint all sides of backboard with two coats of paint, leaving fire rating stamp visible.

3. Comply with requirements for backboard installation in BICSI's "Information Technology Systems Installation Methods Manual" and TIA-569-D.

3.03 SLEEVE AND SLEEVE SEAL INSTALLATION FOR ELECTRICAL PENETRATIONS:

A. Install sleeves and sleeve seals at penetrations of exterior floor and wall assemblies. Comply with requirements in Section 27 05 44.

3.04 FIRESTOPPING:

A. Comply with requirements in Section 07 84 00.

B. Comply with TIA-569-D, Annex A, "Firestopping."

C. Comply with BICSI's "Information Technology Systems Installation Methods Manual," "Firestopping Practices".

3.05 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 27 11 16

COMMUNICATIONS RACKS, FRAMES, AND ENCLOSURES

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide communications racks, frames and enclosures as indicated and in compliance with Contract Documents.

1. 19-inch freestanding and wall-mounted equipment cabinets

2. Power strips

3. Grounding

4. Labeling

1.03 DEFINITIONS:

A. Access Provider: An operator that provides a circuit path or facility between the service provider and user. An access provider can also be a service provider.

B. BICSI: Building Industry Consulting Service International.

C. LAN: Local area network.

D. RCDD: Registered communications distribution designer.

E. Service Provider: The operator of a telecommunications transmission service delivered through access provider facilities.

F. TGB: Telecommunications grounding bus bar.

G. TMGB: Telecommunications main grounding bus bar.

1.04 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Product Data: For each type of product.

1. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes for equipment racks and cabinets.

2. Include rated capacities, operating characteristics, electrical characteristics, certifications, standards compliance, and furnished specialties and accessories.

C. Shop Drawings: For communications racks, frames, and enclosures. Include plans, elevations, sections, details, and attachments to other work.

1. Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.

2. Equipment Racks and Cabinets: Include workspace requirements and access for cable connections.

3. Grounding: Indicate location of TGB and its mounting detail showing standoff insulators and wall-mounting brackets.

D. Qualification Data: For qualified layout technician, installation supervisor, and field inspector.

E. Seismic Qualification Data: Certificates, from manufacturer.

1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.

2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions. Base certification on the maximum number of components capable of being mounted in each rack type. Identify components on which certification is based.

3. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.

1.05 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.06 SPARE PARTS:

A. Comply with the requirements specified in Section 01 61 00.

1.07 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

1.08 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

PART 2 - PRODUCTS

2.01 PERFORMANCE REQUIREMENTS:

A. Seismic Performance: Equipment shall withstand the effects of earthquake motions determined according to ASCE/SEI 7 Telcordia GR-63-CORE requirements for Zone 4 Seismic Earthquake Environments.

1. The term "withstand" means "the unit will remain in place without separation of any parts when subjected to the seismic forces specified and the unit will be fully operational after the seismic event."

B. UL listed.

C. RoHS compliant.

D. Compliant with requirements of the Payment Card Industry Data Security Standard.

2.02 BACKBOARDS:

A. Backboards: Plywood, fire-retardant treated, 3/4 inch by 48 inches by 96 inches.

2.03 19-INCH EQUIPMENT CABINETS:

A. Description: Manufacturer-assembled four-post frame enclosed by side and top panels and front and rear doors, designed for mounting telecommunications equipment. Width is compatible with EIA/ECIA 310-E, 19-inch equipment mounting with an opening of 17.72 inches between rails.

B. Manufacturers:

1. CommScope, Inc.

2. Great Lakes Data Racks & Cabinets

3. Hammond Manufacturing

4. Leviton Manufacturing Co., Inc.

C. General Cabinet Requirements:

1. Modular units designed for telecommunications terminal support and coordinated with dimensions of units to be supported.

2. Material: Extruded steel Extruded aluminum Sheet steel Sheet aluminum.

3. Finish: Manufacturer's standard, baked-polyester powder coat.

4. Color: Black

D. Modular Freestanding Cabinets:

1. Overall Height: 84 inches

2. Overall Depth: 23 inches

3. Load Rating: 3300 pounds

4. Number of Rack Units: 48

a. Numbering: Every rack unit, on interior of rack.

5. Threads: 12-24

6. Removable and lockable side and top panels.

7. Hinged and lockable front and rear doors.

8. Adjustable feet for leveling.

9. Screened ventilation openings in roof and rear door.

10. Cable access provisions in roof and base.

11. TGB.

12. Rack mounted, 550-cfm fan with filter.

13. Power strip.

14. All cabinets keyed alike.

E. Cable Management:

1. Metal, with integral wire retaining fingers.

2. Baked-polyester powder coat finish.

3. Vertical cable management panels shall have front and rear channels, with covers.

4. Provide horizontal crossover cable manager at top of each relay rack, with a minimum height of two rack units each.

2.04 POWER STRIPS:

A. Power Strips: Comply with UL 1363.

1. Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

2. Rack mounting.

3. Six 15-A, 120-V ac, NEMA WD 6, Configuration 5-15R 20-A, 120-V ac, NEMA WD 6, Configuration 5-20R receptacles.

4. LED indicator lights for power and protection status.

5. LED indicator lights for reverse polarity and open outlet ground.

6. Circuit Breaker and Thermal Fusing: When protection is lost, circuit opens and supply of power is lost, circuit can be manually reset when fault is cleared.

7. .

8. Close-coupled, direct plug-in Cord connected with 15-foot line cord.

9. Rocker-type ON-OFF switch, illuminated when in ON position.

10. Peak Single-Impulse Surge Current Rating: 13 kA per phase.

11. Protection modes shall be line to neutral, line to ground, and neutral to ground. UL 1449 clamping voltage for all three modes shall be not more than 330 V.

2.05 GROUNDING:

A. Comply with requirements in Section 27 05 26 for grounding conductors and connectors.

B. Manufacturers:

1. Chatsworth Products, Inc.

2. Harger Lightning & Grounding

3. Panduit Corp

C. Rack and Cabinet TGBs: Rectangular bars of hard-drawn solid copper, accepting conductors ranging from No. 14 to No. 2/0 AWG, NRTL listed as complying with UL 467, and complying with TIA-606-B. Predrilling shall be with holes for use with lugs specified in this Section.

1. Cabinet-Mounted TGB: Terminal block, with stainless-steel or copper-plated hardware for attachment to cabinet.

2. Rack-Mounted Horizontal TGB: Designed for mounting in 19- or 23-inch equipment racks. Include a copper splice bar for transitioning to an adjoining rack, and stainless-steel or copper-plated hardware for attachment to the rack.

3. Rack-Mounted Vertical TGB: 72 or 36 inches long, with stainless-steel or copper-plated hardware for attachment to rack.

2.06 LABELING:

A. Comply with TIA-606-B and UL 969 for a system of labeling materials, including label stocks, laminating adhesives, and inks used by label printers.

PART 3 - EXECUTION

3.01 INSTALLATION:

A. Comply with NECA 1.

B. Comply with BICSI TDMM for layout of communications equipment spaces.

C. Comply with BICSI ITSIMM for installation of communications equipment spaces.

D. Bundle, lace, and train conductors and cables to terminal points without exceeding manufacturer's limitations on bending radii. Install lacing bars and distribution spools.

E. Coordinate layout and installation of communications equipment in racks and room. Coordinate service entrance configuration with service provider.

1. Meet jointly with system providers, equipment suppliers, and Owner to exchange information and agree on details of equipment configurations and installation interfaces.

2. Record agreements reached in meetings and distribute them to other participants.

3. Adjust configurations and locations of distribution frames, cross-connects, and patch panels in equipment spaces to accommodate and optimize configuration and space requirements of telecommunications equipment.

4. Adjust configurations and locations of equipment with distribution frames, cross-connects, and patch panels of cabling systems of other communications, electronic safety and security, and related systems that share space in equipment room.

F. Coordinate location of power raceways and receptacles with locations of communications equipment requiring electrical power to operate.

3.02 GROUNDING:

A. Comply with NECA/BICSI 607.

B. Install grounding according to BICSI ITSIMM, "Bonding, Grounding (Earthing) and Electrical Protection" Chapter.

C. Locate TGB to minimize length of bonding conductors. Fasten to wall, allowing at least 2 inches of clearance behind TGB. Connect TGB with a minimum No. 4 AWG grounding electrode conductor from TGB to suitable electrical building ground. Connect rack TGB to near TGB or the TMGB.

1. Bond the shield of shielded cable to patch panel, and bond patch panel to TGB or TMGB.

3.03 IDENTIFICATION:

A. Coordinate system components, wiring, and cabling complying with TIA-606-B. Comply with requirements in Section 27 05 53.

B. Comply with requirements in Section 09 90 00 for painting backboards. For fire-resistant plywood, do not paint over manufacturer's label.

C. Paint and label colors for equipment identification shall comply with TIA-606-B for Class 3 level of administration, including optional identification requirements of this standard.

D. Labels shall be machine printed. Type shall be 3/16 inch in height.

3.04 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 27 13 23

OPTICAL FIBER BACKBONE CABLING

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide fiber optic cables as indicated and as specified.

B. Fiber optic cables shall be provided for use with plant-wide systems, including the following: distributed control system; the fire detection and alarm system; the security access and surveillance system; and the telephone and paging system.

C. Provide fiber optic patch panels, splice closures, terminal connectors and ancillary equipment.

D. Provide fiber optic pull boxes based on fiber optic cable with a maximum allowable pulling tension of 600 pounds. Provide calculations for pulling with innerduct shop drawing submittal.

E. Provide innerduct, distribution pedestals, terminal connectors and ancillary equipment needed for a complete installation.

1.02 REFERENCES:

A. American National Standards Institute (ANSI):

1. TIA-568C: Generic Telecommunications Cabling for Customer Premises

2. TIA/EIA 598-C: Optical Fiber Cable Color Coding.

3. TIA/EIA 606-A: Administration Standard for Commercial Telecommunications Infrastructure

B. Insulated Cable Engineers Association, Inc. (ICEA):

1. S-104-696: Standard for Indoor-Outdoor Optical Fiber Cable.

C. International Electrical Testing Association (NETA):

1. ATS: Acceptance Testing Specifications for Electrical Power Distribution Equipment and Systems.

D. National Fire Protection Association (NFPA):

1. 70: National Electrical Code (NEC).

E. Underwriters Laboratories, Inc. (UL):

1. 94: Standard for Safety Tests for Flammability of Plastic Materials for Parts in Devices and Appliances

2. 1666: Standard for Safety Test for Flame Propagation Height of Electrical and Optical-Fiber Cables Installed Vertically in Shafts.

1.03 DEFINITIONS:

A. OFNR: Nonconductive optical fiber riser cable

B. OFCR: Conductive optical fiber riser cable

C. FOTP: Fiber Optic Test Procedure

1.04 SUBMITTALS:

A. Submit the following in accordance with Section 01 33 00:

1. Installer Qualifications - Include resumes of staff and previous project experience with references. Proposed Products List.

2. Outline drawings of termination cabinets showing dimensions, cables, jumpers and associated hardware for termination.

3. Provide written confirmation that product is to be submitted as acceptable to control systems supplier.

4. For each component and material submit shop drawing which shall include:

a. Manufacturer

b. Model number

c. General data and description

d. Engineering specifications and data sheets

e. Catalog cuts

f. For information purposes only, submit manufacturer’s printed installation instructions.

B. Submit a drawing showing the routing for the fiber optic network. Include the following information:

1. Routing, length, and attenuation based on TIA-568-C.

2. Cable and conduit identification.

3. Locations of maintenance holes, pull boxes, pedestals and patch panels.

C. Test Documentation:

1. Document results of tests (shop test, field test, acceptance test) and submit copies of documents to Engineer as tests are completed.

1.05 QUALITY ASSURANCE:

A. Provide in accordance with Section 01 45 00 and as specified.

B. Fiber optic cables and related equipment shall be the products of approved manufacturers. Fabrication of the fiber optic cables and related equipment shall utilize the most advanced commercial materials and manufacturing processes. Manufacturer shall be ISO 9001 and TL-9000 certified.

C. Fiber optic cable installation shall be performed by experienced fiber optic cable installers who shall have been regularly engaged in the installation of fiber optic cables for the last five years at the minimum. The installer shall be MDIS certified with current qualifications provided by the fiber optic cable manufacture.

D. Fiber optic cable splicing and terminations shall be performed by experienced cable splicers who shall have been regularly engaged in splicing and termination of fiber optic cables for the last five years at the minimum.

E. Provide the services of the fiber optic cable manufacturer's technical representative to certify that the fiber optic cable installation is in accordance with the manufacturer's installation requirements.

F. Provide the services of an independent testing firm who shall perform acceptance testing of the fiber optic cable installation. The testing firm shall have experience in the inspection and testing of cables of the specified type and shall be a member company of NETA.

1.06 DELIVERY, STORAGE AND HANDLING:

A. Provide in accordance with APWA Section 01 66 00 and as specified.

1.07 EQUIPMENT IDENTIFICATION:

A. Each fiber shall be labeled at each termination point and all splice location. Conductor or circuit identification shall be applied at specified points with circuit numbers or other identification stamped on terminal boards when provided, or on the cable itself in such a manner that the identification is visible around the cable's circumference.

B. Each fiber shall be identified in junction boxes, pull boxes, maintenance holes, handholes, terminal boxes, and cabinets. Where no termination is made, use a plastic-coated, self-adhesive, wire marker. Where termination is made, use a plastic, pre-printed sleeve wire marker. Paper self-adhesive wire markers are not acceptable.

1.08 WARRANTY:

A. The Contractor shall be a manufacturers' certified installer and shall provide a five-year extended warranty program; and shall also provide written warranty certification and evidence of current program membership.

B. The Contractor shall warrant that all materials and equipment furnished under the contract are in good working order, free from defects, and in conformance with system specifications. All installed equipment shall conform to the manufacturer's official published specifications. The warranty shall begin at the system acceptance date and remain in effect for a period of five years from that date. The Contractor shall agree to repair, adjust, and/or replace (as determined by the Engineer to be in its best interest) any defective equipment, materials, or other parts of the system at the Contractor's sole cost. The Owner will incur no costs for service or replacement of parts during the warranty period of five years. All third party warranties shall be passed through from the Contractor to the Owner.

C. The Contractor shall warrant and supply evidence that the installation of materials and hardware will be made in strict compliance with all applicable provisions of the National Electrical Code (NEC), the rules and regulations of the Federal Communications Commission, and state and/or local codes or ordinances that may apply.

D. The Contractor shall warrant that the system will function in accordance with the manufacturer's published technical description guide.

E. The Contractor shall warrant that the system shall accommodate traffic at the levels specified in the Specification.

1.09 SPARE PARTS:

A. Furnish two spare connectors for each type used.

PART 2 - PRODUCTS

2.01 MANUFACTURERS:

A. Corning Cable Systems

B. Belden

C. Draka

D. OFS Fiber

2.02 FIBER OPTIC CABLE:

A. Single Mode Fiber Optic Cable:

1. Provide indoor/outdoor tight-bound tight-buffered fiber optic cable. Provide gel-free and powder-free tight-buffered water-block cable. Provide cable fiber count as indicated on the drawings. Provide cable that shall pass the TIA-455-83B water-block test for 48 hours.

2. Provide Singlemode fiber optic cable as specified and as shown on the contract drawings.

3. Provide optical fiber proof tested by the fiber manufacturer at a minimum of 100 kpsi.

4. Provide fiber that meets the following minimum specifications in 12 fiber subgroups as:

Feature Performance	Specification Requirement
Fiber Type	Singlemode
Core Diameter	8.3µm
Cladding Diameter	125 µm
Secondary Buffer Diameter	900 µm
Wavelength	1310 nm
Gigabit Ethernet Distance	5 km
Max Attenuation	0.5 dB/km
Cable Diameter	~15 mm (30 fiber count)
Installation:	
Max Tensile Load	~5600 N
Min Bend Radius	~23 cm
Operating:	
Max Tensile Load	~2400 N
Min Bend Radius	~23 cm
Operating Temperature	-40 degrees C to +85 degrees C
Installation Temperature	-10 degrees C to + 60 degrees C
Flame Retardancy	UL Listed Type OFNR

B. Fiber Optic Non-Breakout Cable:

1. Heavy duty, tight buffer construction with additional strength members, and a oil, water, and chemical resistant, UV stabilized, flame retardant, PVC outer jacket, UL listed OFNR. Fiber cladding shall be 125 micron and fiber buffer shall be 900 micron.

2. Cable Specifications:

   a. Fiber Count: 12 or as indicated on the drawings

   b. Minimum Installation Load: 100 pounds

   c. Minimum Long Term Application Load: 14 pounds

   d. Minimum Crush Resistance: 80 pounds per /inch

   e. Operating Temperature: 14 to 122 degrees F

C. Code Compliance:

1. The cable must meet the requirements of the National Electrical Code (NEC) Section 770.

2. Non-Plenum Applications: Applicable Flame Tests: UL 1666. All-dielectric cables shall be listed OFNR. Armored cables and Interlocking armored cables shall be listed OFCR.

3. Finished cables shall conform to the applicable performance requirements of the Insulated Cable Engineers Association, Inc. (ICEA) Standard for Indoor-Outdoor Optical Fiber Cable (ICEA S-104-696).

D. Fiber Specifications:

1. General Fiber Specifications:

   a. All fibers in the cable must be usable and meet required specifications.

   b. Each optical fiber shall be sufficiently free of surface imperfections and inclusions to meet the optical, mechanical, and environmental requirements of this specification.

   c. Each optical fiber shall be proof tested by the fiber manufacturer at a minimum of 100 kpsi.

   d. The fiber shall be coated with a dual layer acrylate protective coating. The coating shall be in physical contact with the cladding surface.

E. Cable Construction:

1. Tight Buffer Fiber Optic Cable: Cladded Optic fiber strands shall be coated with a 900 microns protective coating and arranged in a PVC subcable containing 12 coated fiber strands surrounded by yarn strength members. Subcables are contained within a PVC outer jacket. The number of strands specified on the drawings will determine the number of Subcables.

2. Fiber Optic Cable Core: A central, nonmetallic core member shall be included to serve as a cable core foundation to reduce strain on the fibers, but not to serve as a pulling strength member. Fillers shall be used to ensure cable has a circular shape. Fiber optic cable and subcables shall have a rip cord.

3. Each buffer tube shall contain up to 12 fibers.

4. The fibers shall not adhere to the inside of the buffer tube.

5. Each fiber shall be distinguishable by means of color coding in accordance with TIA/EIA-598-C, “Optical Fiber Cable Color Coding."

6. The fibers shall be colored with ultraviolet (UV) curable inks. In buffer tubes containing multiple fibers, the colors shall be stable across the specified storage and operating temperature ranges, and not subject to fading or smearing onto each other. Colors shall not cause fibers to stick together.

7. Buffer tubes containing fibers shall be color coded with distinct and recognizable colors in accordance with TIA/EIA-598-C, “Optical Fiber Cable Color Coding.” Buffer tube colored stripes shall be inlaid in the tube by means of co-extrusion when required. The nominal stripe width shall be 0.04 inch. For dual layer buffer tube construction cables, standard colors are used for tubes 1 through 12 and standard colors with stripes are used to denote tubes 13 through 24. The color sequence applies to tubes containing fibers only, and shall begin with the first tube. The tube color sequence shall start from the inside layer and progress outward.

8. The buffer tubes shall be resistant to kinking.

9. The cable shall contain at least one ripcord under the sheath for easy sheath removal.

10. The tensile strength shall be provided by the central member, and additional dielectric yarns. The dielectric yarns shall be helically stranded evenly around the cable core.

11. A flame-retardant tape may be applied to provide additional resistance to flame propagation for higher fiber count cables.

12. Cables shall be sheathed with flame-retardant polyvinyl chloride (PVC). The nominal jacket thickness shall be 0.08 inch. Jacketing material shall be applied directly over the tensile strength members and water blocking tape. The PVC shall contain carbon black to provide ultraviolet light protection and shall not promote the growth of fungus.

13. The jacket shall be continuous, free from pinholes, splits, blisters, or other imperfections. The jacket shall have a consistent, uniform thickness; jackets extruded under high pressure are not acceptable.

14. Cable jackets shall be marked with the manufacturer's name or file number, month and year of manufacture, sequential meter or foot markings, a telecommunication handset symbol as required by Section 350G of the National Electrical Safety Code (NESCÒ), fiber count, and fiber type, flame rating and listing marking. The actual length of the cable shall be within plus or minus 1 percent of the length markings. The print color shall be white, with the exception that cable jackets containing one or more coextruded white stripes, which shall be printed in light blue. The height of the marking shall be approximately 0.1 inch.

15. If the initial marking fails to meet the specified requirements (i.e., improper text statement, color, legibility, or print interval), the cable may be remarked using a contrasting alternate color. The numbering sequence will differ from the previous numbering sequence, and a tag will be attached to both the outside end of the cable and to the reel to indicate the sequence of remarking. The preferred remarking color will be yellow, the secondary choice will be blue.

16. The maximum pulling tension shall be 600 pounds during installation (short term) and 135 pounds long-term installed.

17. The cable specified herein shall be available in three sheath designs. Un-armored, all-dielectric cables shall be listed OFNR and shall be as described previously in this section.

18. Armored cables shall be as described previously in this section, but shall also include a corrugated steel tape armor applied longitudinally underneath the cable jacket. The armor shall be plastic-coated on both sides for corrosion resistance and shall have an overlapping seam with the corrugations in register. Because of the metallic armor, this cable shall be listed OFCR and shall provide improved resistance to rodent damage. The corrugated armor option will be specified on the purchase order.

19. Interlocking armored cables shall be as described previously in this section but shall also include an interlocking steel or aluminum armor applied helically around the outside of the cable jacket. The interlocking armor may be left un-jacketed or may have a PVC outer jacket. The color of the armor jacket (if specified), shall match the jacket color of the optical fiber cable located inside of the armor. The armor for these cables shall be comparable to liquid tight flexible metal conduit if jacketed, or flexible metal conduit if not jacketed. Because of the interlocking metallic armor, this cable shall be listed OFCR and shall provide improved resistance to crush damage. The interlocking armor and outer jacket options will be specified on the purchase order.

F. Packing and Shipping:

1. The completed cable shall be packaged for shipment on non-returnable wooden reels. Required cable lengths shall be stated in the purchase order.

2. Top and bottom ends of the cable shall be available for testing.

3. Both ends of the cable shall be sealed to prevent the ingress of moisture.

4. Each reel shall have a weather resistant reel tag attached identifying the reel and cable.

5. Each cable shall be accompanied by a cable data sheet.

2.03 INNERDUCT:

A. Manufacturers:

1. Carlon

2. Endot

3. A-D Technologies

B. Features:

1. Innder duct shall be used for fiber optic installations in conduit 2 inches and lager.

2. Inner duct shall be minimum 1 inch and shall be sized properly for the fiber optic cable.

3. Inner duct shall be orange, ribbed, riser rated and UL listed.

4. System shall include:

a. Innerduct

b. Gasketing that allows watertight assembly and disassembly of outer and innerducts for direct buried and encased installations.

c. Couplings, access hole terminators, innerduct seals for both empty and cabled ducts, and fixed and flexible bends.

2.04 TERMINAL CONNECTORS:

A. Manufacturers:

1. Corning Cable Systems

2. AFL Telecommunications

3. 3M Telecom Systems Group

B. Field installable SC type fiber optic connectors, with ceramic ferrule material and a maximum insertion loss of 0.5 dB. If Pre-Connectorized cable assemblies or pigtails are used, the connectors shall terminate on a 10-foot length single-fiber cable. The fiber-cable shall contain a buffered optical fiber of the same type and specification as that used in the multi-fiber cable. Connectors and pre-connectorized cable assemblies or pigtails shall be in accordance with EIA ANSI/TIA/EIA-568-B.3.

2.05 OPTICAL HARDWARE:

A. Manufacturers:

1. Corning Cable Systems

2. 3M Telecom Systems

3. AFL Telecommunications AMP

4. OCC

B. Optical Splicing and Distribution Enclosure:

1. Provide pedestal type enclosure.

2. Provide NEMA 3 fiber enclosure.

3. Provide pedestal mounted on precast concrete base with bollard type traffic protection.

4. Provide splicing and distribution enclosure to support up to 240 single mode fibers.

5. Provide distribution hub within pedestal. Provide hub with grommet seal. Provide cable strain relief system.

C. Connector Panels: Rack and wall mountable connector housings shall accept an interchangeable connector panel. A connector panel is defined as a modular removable plate containing optical fiber connector adapters or copper jacks. The connector panel shall have the following characteristics:

1. The connector panel shall utilize a single mounting footprint and shall be available with three, four, six, eight or twelve connector adapters in each panel. Copper jack panels shall accept up to four copper jacks. The connector panel shall be interchangeable between the rack and wall mountable hardware being proposed. The panel shall be attached with two push-pull latches to allow quick installation and removal.

2. The connector panel shall be available with industry standard single fiber and small form factor multi-fiber adapters, including the SC duplex, ST compatible, SC-DC and MT-RJ. It shall also be available with industry standard copper jacks.

3. The connector panel shall include removable icons that identify the circuits. As a minimum, these icons shall be available with the following symbols: blank, telephone, computer, CATV, video camera, satellite dish, or CAT5. The icons shall also be available in a variety of colors, including blue, yellow, red, white, electric ivory, ash, green, purple, gray, black, brown and orange.

4. Blank connector panels shall be available to fill unused space within the housings. The blank connector panel shall be attached with at least two push-pull latches to allow quick installation and removal. Housings shall be supplied with blank connector panels for all available positions unless the housing is ordered with optical fiber adapters or copper jacks pre-installed. The blank panels shall be manufactured from injection molded polycarbonate and shall be finished with a wrinkled black texture to match the housing.

5. Panels shall be manufactured from 16 gage cold rolled steel or injection molded polycarbonate for structural integrity.

6. Panels shall be finished with a wrinkled black texture to match other hardware.

D. Connector Modules: Rack mountable connector housings shall accept an interchangeable connector module. A connector module is defined as a modular removable case containing optical fiber connector adapters and provisions for strain-relief, slack storage, and the furcation of fiber optic cables. The connector module shall have the following characteristics:

1. The connector module shall consist of a panel incorporated into a protective case with a removable cover for access to the interior connectors and fibers. Modules shall contain a fiber-retaining spool for managing fiber slack.

2. The connector module shall utilize a single mounting footprint and shall be available with three, four, six, eight or twelve connector adapters in each module. The module shall be attached with two push-pull latches to allow quick installation and removal.

3. The connector module shall be available with industry standard single fiber and small form factor multi-fiber adapters, including the SC duplex, ST compatible, and MT-RJ.

4. The connector module shall include removable icons that identify the circuits. As a minimum, these icons shall be available with the following symbols: blank, telephone, computer, CATV, video camera, satellite dish, or CAT5. The icons shall also be available in a variety of colors, including blue, yellow, red, white, electric ivory, ash, green, purple, gray, black, brown and orange.

5. Modules shall be manufactured from 16 gage cold rolled steel or injection molded polycarbonate (or thermoplastic resin) for structural integrity.

6. Modules shall be finished with a wrinkled black texture to match other hardware.

7. Modules shall be available in the following configurations: adapter modules, pigtailed modules, and pre-terminated system modules.

E. Rack Mountable Connector Housings: Rack mountable connector housings shall be available for cross-connecting or inter-connecting purposes. The units shall provide for direct connectorization and pigtail splicing.

1. The unit shall meet the design requirements of ANSI/TIA/EIA-568 and the plastics flammability requirements of UL 94 V-0.

2. Housings shall be manufactured using 16 gage aluminum or equivalent for structural integrity and shall be finished with a wrinkled black powder coat for durability. Installation fasteners shall be included and shall be black in color.

3. The unit shall have routing guides that allow a transition and segregation point for jumpers exiting the sides of the housing.

4. The unit shall include a clamshell-type cable clamping mechanism to provide cable strain relief. The cable clamp shall accept one cable from 0.37 to 1.13 inch in diameter. The cable clamp mechanism shall also handle multiple smaller fiber count cables when used with the multiple cable insert. The total cable capacity per clamp shall be five cables less than 0.4 inch OD when used with the multiple cable insert.

5. The connector housings shall have a labeling scheme that complies with ANSI/TIA/EIA 606.

6. Provisions for mounting fiber fan-out devices shall be incorporated into the housing.

7. The housings shall be available with factory installed connectorized cable stubs in multiple cable and connector types.

F. Wall Mountable Combination Connector/Splice Housings: Wall mountable combination connector and splice housings shall be available for splicing inside the same housing as the connectorized fiber. These combination units shall be the units described in the previous section for wall mountable connector housings; additionally they shall contain provisions for mounting splice trays and routing the associated fibers.

1. Splice tray mounting shall allow individual splice tray access without disturbing adjacent splice trays or fibers.

2. Splice tray shall be retained in the splice tray holder by a hook and loop strap.

3. Access to splice trays shall be accomplished by rotating the splice tray holder horizontally from the housing.

4. Wall mountable connector housings shall be convertible to combination connector/splice housings with the installation of a splice tray conversion kit.

G. Wall Mountable Splice Housings: Wall mountable splice housings shall be available for splicing multiple optical fiber cables. These units shall contain provisions for mounting splice trays and routing the associated fibers.

1. Splice tray mounting shall allow individual splice tray access without disturbing adjacent splice trays or fibers.

2. Splice trays shall be retained in the splice tray holder by a hook and loop strap.

3. Cable ports in the splice housing shall line up with the cable and jumper ports in the appropriate wall mountable connector housing so as to allow direct routing of cables and jumpers from one housing into the other.

4. Wall-mountable splice housing shall accept splice trays for industry standard splice types and store routing slack for these trays.

5. The unit shall be mountable on standard plywood walls.

6. The housing shall not exceed the following dimensions:

   a. 13.5 inch high x 22.5 inch wide x 5.1 inch deep.

7. The unit shall meet the design requirements of ANSI/TIA/IEA-568 and the plastics flammability requirements of UL 94 V-0.

8. Housing shall be manufactured using 16 gage aluminum or equivalent for structural integrity and shall be finished with a wrinkled black powder coat for durability. Assembly hardware and equipment attaching machine screws shall be included and shall be black in color.

9. The unit shall have fiber cable routing guides that allow a transition and segregation point for fibers existing the top and bottom of the housing. Cable entries shall be grommeted to minimize dust/water intrusion.

10. The unit shall accept a clamshell type cable clamping mechanism to provide cable strain relief. This clamp shall be included with the housing and also shall be available with an external mounting bracket as an optional accessory. The cable clamp shall accept one cable from 0.37 to 1.13 inch in diameter. The cable clamp mechanism shall also handle multiple smaller fiber count cables when used with the multiple cable insert. The total cable capacity per clamp shall be five cables less than 0.4 inch OD when used with the multiple cable insert. Housing cable clamp capacity shall e at least four clamps.

11. The splice housing shall have a metal door. This door shall be lockable when used with an optional key lock kit.

12. The splice housings shall have a labeling scheme that complies with ANSI/TIA/EIA 606.

13. Brackets shall be available that allow rack mounting of the wall-mount housings.

14. An optional offset bracket kit shall be available that allows mounting the housing away from the wall to give space for cable routing behind the unit. The offset brackets shall be stackable to allow incremental increase in the amount of offset from the wall.

H. Wall Mount Jumper Management: Wall mountable housings shall have an optional external means available to transition between the housing and nearby cable trough or tray. This means shall provide 1.5 inch minimum bend radius protection for cables.

2.06 SPLICE CLOSURES:

A. Manufacturers:

1. Corning Cable Systems

2. 3M Telecom Systems

3. AFL Telecommunications

B. Splice Closures: Constructed of thermoplastic, suitable for “butt” or “through” cable entry, moisture tight sealing arrangement, removable splice tray organizer, splice trays for mechanical splices, suitable for multimode system operation at 850 and 1,300 nm, grounding lugs or equivalent for grounding cable armor.

1. The optical fiber splice closure shall meet all requirements stated in this specification.

2. The splice closure housing shall be non-metallic. It shall be resistant to solvents, stress cracking, and creep. The housing materials shall also be compatible with chemicals and other materials to which they might be exposed in normal applications.

3. The optical fiber closure shall be capable of accepting any optical fiber cable used in interoffice, outside plant, and building entrance facilities.

4. As an option, the ability to double the cable capacity of an installed canister splice closure by use of a kit shall be available. Such a conversion shall not disturb existing cables or splices.

5. Encapsulation shall not be required to resist water penetration.

6. The splice closure shall be re-enterable. The closure end cap shall be capable of accepting additional cables without removal of the sheath retention or strength member clamping hardware on previously installed cables or disturbing existing splices. The optical fiber splice closure shall provide a clamping mechanism to prevent pistoning of the central member or strength members and to prevent cable sheath slip or pullout.

7. The splice closure shall have appropriate hardware and installation procedures to facilitate the bonding and grounding of metal components in the closure and the armored cable sheath. The cable bonding hardware shall be able to accommodate a copper conductor equal to or larger than a 6 AWG.

8. Aerial splice closures shall have available the necessary hardware to attach and secure the closure to an aerial strand.

9. The closure shall accommodate splice trays suitable for single fiber, single fiber heat shrink, mechanical, or ribbon heat shrink splices.

10. The small splice closure shall accommodate up to 72 single fiber splices or 144 ribbon fiber splices using 12-fiber ribbons. The medium sized closure shall accommodate up to 288 single fiber splices or 432 ribbon fiber splices. The large closure shall accommodate up to 480 single fiber splices or 864 ribbon fiber splices.

11. Spliced fibers shall not be subjected to a bend radius smaller than 1.2 inch. Buffer tubes shall not be subjected to a bend radius smaller than 1.5 inch.

12. The installation of the splice closure shall not require specialized tools or equipment, other than those normally carried by installation crews.

2.07 SHOP TESTS:

A. Fiber optic cables shall be shop tested at the manufacturer's plant in accordance with the manufacturer's standard testing procedures. Shop tests shall be performed prior to shipment of the fiber optic cables.

B. Provide test plan defining all tests required to ensure that the system meets specified requirements. The test plan shall define milestones for the tests, equipment, personnel, facilities, and supplies required. The test plan shall identify the capabilities and functions to be tested.

C. Provide test reports in booklets form showing all field tests performed shall be submitted no later than 7 days after completion and testing of the installed system.

D. Measurements shall be tabulated on a strand-by-strand basis.

E. Factory test results showing routine tests performed by the manufacturer shall be submitted prior to installation.

F. Optical fibers in cables shall be 100 percent attenuation tested. The attenuation shall be measured at 850 nm and 1300 nm for multimode fibers. The attenuation shall be measured at 1310 nm and 1550 nm for single-mode fibers. The manufacturer shall store these values for a minimum of five years. These values shall be available upon request.

G. The Contractor shall submit manufacturer's shop test reports.

PART 3 - EXECUTION

3.01 GENERAL:

A. Provide all material, equipment, and labor to install the fiber optic cables as indicated and as specified.

B. Installation shall be in accordance with the National Electrical Code and all local codes.

3.02 INSTALLATION:

A. Install cables in accordance with manufacturer's printed instructions.

B. Install cable directly from shipping reels. Ensure that cable is not:

1. Dented, nicked, or kinked.

2. Subjected to pull stress greater, or bend radius less, than manufacturer's specification.

3. Subjected to treatment which may damage fiber strands during installation.

C. Conduit: Install fiber optic cable directly in conduit/innerduct.

D. Identification: Identify each cable on both ends and in all maintenance holes and pull points it goes through.

E. Sequencing: Provide cables in accordance with sequencing requirements.

F. Sealing: Seal cables into innerducts to stop ingress of water and grit with expansion plugs or ductseal.

G. Maintenance Holes:

1. Provide supports for cables at maximum 12 inch centers along sides of maintenance holes.

2. Provide a minimum 4 foot coil of spare fiber in each maintenance hole throughout the cable length.

H. Install fiber optic cables in underground ducts. Rod and swab out ducts prior to installing cables.

I. Install fiber optic cables in the conduit systems provided inside buildings and structures.

J. Lubricate cables with lubricants specially formulated for fiber cabling jackets during installation. Do not exceed cable manufacturer's specifications for tensile strength and bending radius. All pulleys used to aid in the installation of the fiber optic cable must be sized according to the minimum bending radius.

K. Provide breakout kits, splice closures, patch panels, pigtails, and jumpers and as indicated to install a complete data highway communications network as indicated. Patch panels shall be wall mounted plumb and level. Splice closures shall be installed in pullboxes.

L. Splices: Splices shall be made only where indicated. Provide adequate put-up lengths on cable reels to make termination-to-termination runs without splices. Where splices are indicated provide mechanical splices with attenuation losses of 0.3 dB or less. Make splices watertight and provide mechanical protection equal to the cable jacket, or better.

M. Support cables in riser conduits at intervals as required by the National Electrical Code.

N. Installation tools and materials shall be provided by the cable manufacturer.

O. The polishing process of terminal connectors shall be a multi-stage dry and wet process using multiple lapping films for initial and final polishing polish.

3.03 CABLE TERMINATIONS:

A. Terminate cables in accordance with ANSI/TIA 568.

B. Fan out fibers to allow flexibility and ease of installations for future expansion at connection points. Provide a metal or high density plastic fan-out collar to relieve the stress on the individual fibers. To protect the individual fibers, provide sleeves from the fan-out collar to the terminal point. Terminate all fibers in each cable with a suitable connector as specified below.

C. Fiber connectors shall be bayonet-type with "twist-lock" mounting for quick and secure installation. Connectors shall be pull-proof with a durable ceramic tip to protect the fibers from damage during installation and frequent rearrangements. "Push-pull" couplings are unacceptable. Provide a sample of the connector to the Engineer for inspection and acceptance prior to installation.

D. Provide all equipment, mounting kits and consumable materials required for a proper installation as defined by the manufacturer.

E. Each individual cable shall be clearly and uniquely identified. At a terminal cabinet or backboard provide a type written directory listing the cable, identification code and type of signal. The directory shall be mounted within the termination cabinet or on the backboard and protected by a clear plastic cover.

F. Provide a minimum of 20 feet of neatly coiled, slack fiber optic cable at each terminal cabinet or backboard for flexibility.

3.04 MAINTEINANCE HOLES, INTERMEDIATE PULL BOXES AND DISTRIBUTION PEDESTALS:

A. Provide pull boxes and maintenance holes so the fiber pulling requirement is at least 5 percent below the manufacturers pulling strength recommendations. Provide pulling procedures as part of the fiber installation submittal requirements:

B. Provide plans showing proposed pull boxes, maintenance holes and distribution pedestals.

C. Provide distribution pedestal at the beginning and end point of the contract installation.

D. Provide fiber testing from the contract endpoint distribution pedestals.

3.05 PHYSICAL CHECKOUT:

A. General Procedures:

1. Conduct physical checkout of the fiber optic data highway network.

2. Physical checkout shall be performed prior to functional testing.

B. Check Procedures:

1. Verify that fiber optic cables reels have been off-loaded from truck carefully and not damaged.

2. Verify that the optical fibers of the cable assembly are the type and quantity as specified or as recommended by the Instrument and Controls supplier.

3. Verify that cable construction is the type specified.

4. Verify that fiber optic patch panels have been installed plumb and level at locations indicated.

5. Verify that fiber optic splice closures have been installed at locations indicated.

6. Verify that optical fiber connections or terminations within patch panels and splice closures are in accordance with cable manufacturer's printed recommendations.

3.06 FIELD TESTING:

A. Conduct the following field tests after cable installation:

1. Visually, inspect terminal connectors for out-of-round condition and surface defects such as micro-chips and cracks using a 100X (minimum) inspection microscope.

B. Cable Testing:

1. Provide equipment, instrumentation, and supplies necessary to perform testing. Engineer and Owner shall have the option to witness and participate actively in on-site tests.

a. Notify Engineer and Owner at least 3 days prior to testing.

2. Perform all tests and inspections as required by NETA ATS, paragraph 7.25.

3. Post-Installation Testing: Demonstrate that all fibers in each cable meet requirements of TIA-568 as modified here:

a. Maximum attenuation as specified.

b. Measure attenuation in both directions, not in one direction only.

4. Replace all cables or mated connector pairs that do not meet attenuation standards and redo tests until cable meets requirements and at no additional cost to the Owner.

3.07 CONTRACT CLOSEOUT:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

Page Intentionally Left Blank

SECTION 27 13 43

COMMUNICATIONS SERVICES CABLING

PART 1 - GENERAL

1.01 SUMMARY:

A. Section Includes: Premises wiring for telephone distribution, including installations for service by local telephone exchange carrier.

1.02 REFERENCES:

A. Insulated Cables Engineers Association, Inc. (ICEA):

1. S-80-576: Standard for Category 1 & 2 Individually Unshielded Twisted Pair Indoor Cables (With or Without an Overall Shield) for Use in Communications Wiring Systems Technical Requirements

B. National Fire Protection Association (NFPA):

1. 70: National Electrical Code (NEC).

C. Occupational Safety & Health Act (OSHA).

1. Regulation 1910.7

D. Telecommunications Industry Association (TIA)/Electronic Industries Association (EIA):

1. TIA-570: Residential Telecommunications Infrastructure Standard.

E. Underwriters' Laboratories, Inc., (UL):

1. 486A: UL Standard for Safety Wire Connectors and Soldering Lugs for Use with Copper Conductors

2. 486B: UL Standard for Safety Wire Connectors for Use with Aluminum Conductors

1.03 DEFINITIONS:

A. Local Exchange Carrier: Telephone utility or other entity that provides access line from local exchange into premises.

B. Exchange Access Line: Circuit carrying telephone service into premises.

C. Distribution Circuit: Circuit from network interface device to distribution device, such as terminal block or junction box.

D. Station Circuit: Circuit from distribution device to telecommunications outlet.

E. Telecommunications Outlet: Telephone jack for connecting equipment to communication circuits.

1.04 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Product Data:

1. For each type of product specified.

1.05 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

B. Items provided under this section shall be listed or labeled by UL or other Nationally Recognized Testing Laboratory (NRTL).

1. Term “NRTL” shall be as defined in OSHA Regulation 1910.7.

2. Terms “listed” and “labeled” shall be as defined in National Electrical Code, Article 100.

C. Regulatory Requirements:

1. National Electrical Code (NEC): Components and installation shall comply with National Fire Protection Association (NFPA) 70.

D. Comply with TIA-570.

1.06 PROJECT CONDITIONS:

A. Existing Utilities: Do not interrupt utilities serving facilities occupied by Owner or others unless permitted under following conditions and then only after arranging temporary utility services according to requirements indicated:

1. Notify Engineer not less than two days in advance of proposed utility interruptions.

2. Do not proceed with utility interruptions without Engineer written permission.

1.07 COORDINATION:

A. Coordinate premises wiring with requirements of telephone equipment supplier.

PART 2 - PRODUCTS

2.01 COMPONENTS:

A. Comply with TIA-570.

B. Telecommunications and Auxiliary Disconnect Outlets: Four-position modular, latching, plug-type, jack-in, flush-mounting wall plate, unless otherwise indicated.

C. Wall Plates: Design for telephone service. Match those indicated for power receptacle outlets in same spaces for materials and finish. For wall telephone units, include provision for support of unit.

D. Distribution and Station Cable: Four-pair, No. 24 AWG, solid-copper, unshielded, twisted-pair construction in PVC sheath.

1. Comply with ICEA S-80-576.

2. Cable used in plenums shall be UL listed for plenum use.

E. Cabinets: Comply with Section 26 27 17. Furnish cabinets with backboard.

F. Backboard: 3/4-inch interior grade plywood. Where installed in wire closet, height and width shall cover entire wall up to 96 inch above floor, unless otherwise indicated.

PART 3 - EXECUTION

3.01 INSTALLATION:

A. Telephone Service: Comply with local telephone exchange carrier's requirements for details of telephone service.

B. Existing Telephone Outlets and Wiring: Maintain fully operational until new system has been tested and is operational. As new outlets are installed, label them "Not in Service" with temporary labels.

C. Install outlet boxes and telecommunications outlets.

D. Install cable without damaging conductors and jacket.

1. Do not bend cable to smaller radius than minimum recommended by manufacturer.

E. Install premises wiring in raceways, unless otherwise indicated.

1. Install cables in walls unless walls are solid or filled with insulation. In solid walls, install in raceway and terminate raceway with bushing in ceiling space above outlet.

2. Install cables without raceway where concealed in accessible ceiling space, unless otherwise indicated.

3. Use pulling methods that will not damage cable or raceway, including fish tape, cable, rope, and wire-cable grips. Do not exceed manufacturer's recommended pulling tensions.

4. Pull cables simultaneously where more than one is being installed in same raceway or at same location.

5. Conceal raceway, except in unfinished spaces and as indicated.

F. Install exposed cable parallel or perpendicular to surfaces or exposed structural members and follow surface contours where possible.

1. Secure cable to independent supports at intervals as required to prevent sagging between supports.

3.02 CONNECTIONS:

A. Install ground terminal at local exchange carrier service location and connect according to Section 26 05 26.

B. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturers torque values are not indicated, use those specified in UL 486A-486B.

3.03 IDENTIFICATION:

A. Identify components and circuits according to Section 26 05 53.

B. Identify telephone system backboards and cabinets with legend "Telephone".

C. Identify terminals at terminal strips, telecommunications outlets, and pull-and-junction boxes with approved designations.

3.04 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 27 15 13

COMMUNICATIONS COPPER HORIZONTAL CABLING

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide communications copper horizontal cabling as indicated and in compliance with Contract Documents.

1. Category 6 twisted pair cable.

2. Twisted pair cable hardware, including plugs and jacks.

3. Cabling identification products.

4. Grounding provisions for twisted pair cable.

5. Source quality control requirements for twisted pair cable.

1.02 REFERENCES:

A. ASTM International (ASTM):

1. E84: Standard Test Method for Surface Burning Characteristics of Building Materials

B. Building Industry Consulting Service International (BICSI):

1. ITSIMM: Information Technology Systems Installation Methods Manual

2. TDMM: Telecommunications Distribution Methods Manual

C. Insulated Cable Engineers Association (ICEA):

1. 90-661: Category 3, 5, & 5e Individually Unshielded Twisted Pair Indoor Cables (With or Without an Overall Shield) for Use in General Purpose and LAN Communication Wiring Systems Technical Requirements

2. 103-701: Riser Cables Technical Requirements

3. S-116-732: Standard for Category 6 and 6A, 100 Ohm, Individually Unshielded Twisted Pairs, Indoor Cables (With or Without an Overall Shield) for Use in LAN Communication Wiring Systems

D. National Electrical Contractors Association (NECA):

1. 1: Standard for Good Workmanship in Electrical Construction

2. 568: Standard for Installing Commercial Building Telecommunications Cabling

3. 607: Standard for Telecommunications Bonding and Grounding Planning and Installation Methods for Commercial Buildings

E. National Electrical Manufacturers Association (NEMA):

1. WC 63.1: Performance Standard for Twisted Pair Premise Voice and Data Communications Cable

2. WC 66: Standard for Category 6 and 6A, 100 Ohm, Individually Unshielded Twisted Pairs, Indoor Cables (With or Without an Overall Shield) for Use in LAN Communication Wiring Systems

F. National Fire Protection Association (NFPA):

1. 70: National Electrical Code.

G. Telecommunications Industry Association (TIA):

1. 568: Generic Telecommunications Cabling for Customer Premises

2. 569-D: Telecommunications Pathways and Spaces

3. 606: Administration Standard for Telecommunications Infrastructure

4. 607: Generic Telecommunications Bonding and Grounding (Earthing) for Customer Premises

H. Underwriters' Laboratories, Inc. (UL):

1. 50: Standard for Safety Enclosures for Electrical Equipment, Non-Environmental Considerations

2. 969: Standard for Safety Marking and Labeling Systems

3. 1666: Standard for Safety Test for Flame Propagation Height of Electrical and Optical-Fiber Cables Installed Vertically in Shafts

4. 1685: Standard for Safety Vertical-Tray Fire-Propagation and Smoke-Release Test for Electrical and Optical-Fiber Cables

5. 1863: Standard for Safety Communications-Circuit Accessories

6. 2043: Standard for Safety Fire Test for Heat and Visible Smoke Release for Discrete Products and Their Accessories Installed in Air-Handling Spaces

1.03 DEFINITIONS:

A. Cross-Connect: A facility enabling the termination of cable elements and their interconnection or cross-connection.

B. EMI: Electromagnetic interference.

C. FTP: Shielded twisted pair.

D. F/FTP: Overall foil screened cable with foil screened twisted pair.

E. F/UTP: Overall foil screened cable with unscreened twisted pair.

F. IDC: Insulation displacement connector.

G. LAN: Local area network.

H. Jack: Also commonly called an "outlet," it is the fixed, female connector.

I. Plug: Also commonly called a "connector," it is the removable, male telecommunications connector.

J. RCDD: Registered Communications Distribution Designer.

K. Screen: A metallic layer, either a foil or braid, placed around a pair or group of conductors.

L. Shield: A metallic layer, either a foil or braid, placed around a pair or group of conductors.

M. S/FTP: Overall braid screened cable with foil screened twisted pair.

N. S/UTP: Overall braid screened cable with unscreened twisted pairs.

O. UTP: Unscreened (unshielded) twisted pair.

1.04 COPPER HORIZONTAL CABLING DESCRIPTION:

A. Horizontal cable cabling system shall provide interconnections between Distributor A, Distributor B, or Distributor C, and the equipment outlet, otherwise known as "Cabling Subsystem 1," in the telecommunications cabling system structure. Cabling system consists of horizontal cables, intermediate and main cross-connects, mechanical terminations, and patch cords or jumpers used for horizontal-to-horizontal cross-connection.

1. TIA-568-C.1 requires that a minimum of two equipment outlets be installed for each work area.

2. Horizontal cabling shall contain no more than one transition point or consolidation point between the horizontal cross-connect and the telecommunications equipment outlet.

3. Bridged taps and splices shall not be installed in the horizontal cabling.

B. A work area is approximately 100 square feet, and includes the components that extend from the equipment outlets to the station equipment.

C. The maximum allowable horizontal cable length is 295 feet. This maximum allowable length does not include an allowance for the length of 16 feet to the workstation equipment or in the horizontal cross-connect.

1.05 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Product Data: For each type of product.

C. Shop Drawings: Reviewed and stamped by RCDD.

1. System Labeling Schedules: Electronic copy of labeling schedules, in software and format selected by Owner.

2. System Labeling Schedules: Electronic copy of labeling schedules that are part of the cabling and asset identification system of the software.

3. Cabling administration Drawings and printouts.

4. Wiring diagrams and installation details of telecommunications equipment, to show location and layout of telecommunications equipment, including the following:

a. Telecommunications rooms plans and elevations.

b. Telecommunications pathways.

c. Telecommunications system access points.

d. Telecommunications grounding system.

e. Telecommunications conductor drop locations.

f. Typical telecommunications details.

g. Mechanical, electrical, and plumbing systems.

D. Twisted pair cable testing plan.

E. Samples: For telecommunications jacks and plugs, in specified finish, one for each type and configuration and faceplates for color selection and evaluation of technical features.

F. Qualification Data: For RCDD installation supervisor, and field inspector.

G. Product Certificates: For each type of product.

H. Source quality-control reports.

I. Field quality-control reports.

J. Maintenance Data: For splices and connectors to include in maintenance manuals.

K. Software and Firmware Operational Documentation:

1. Software operating and upgrade manuals.

2. Program Software Backup: On USB media or compact disk, complete with data files.

3. Device address list.

4. Printout of software application and graphic screens.

L. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Connecting Blocks: One of each type.

2. Faceplates: One of each type.

3. Jacks: Ten of each type.

4. Multiuser Telecommunications Outlet Assemblies: One of each type.

5. Patch-Panel Units: One of each type.

6. Plugs: Ten of each type.

1.06 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.07 SPARE PARTS:

A. Comply with the requirements specified in Section 01 61 00.

1.08 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

B. Installer Qualifications: Cabling Installer must have personnel certified by BICSI on staff.

1. Layout Responsibility: Preparation of Shop Drawings and cabling administration Drawings, cabling administration Drawings, and field testing program development by an RCDD.

2. Installation Supervision: Installation shall be under the direct supervision of Technician, who shall be present at all times when Work of this Section is performed at Project site.

3. Testing Supervisor: Currently certified by BICSI as an RCDD to supervise on-site testing.

C. Testing Agency Qualifications: Testing agency must have personnel certified by BICSI on staff.

1. Testing Agency's Field Supervisor: Currently certified by BICSI as an RCDD.

1.09 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

B. Test cables upon receipt at Project site.

1. Test each pair of twisted pair cable for open and short circuits.

1.10 PROJECT/SITE CONDITIONS:

A. Environmental Limitations: Do not deliver or install cables and connecting materials until wet work in spaces is complete and dry, and temporary HVAC system is operating and maintaining ambient temperature and humidity conditions at occupancy levels during the remainder of the construction period.

1.11 COORDINATION:

A. Coordinate layout and installation of telecommunications pathways and cabling with Owner's telecommunications and LAN equipment and service suppliers.

1.12 SOFTWARE SERVICE AGREEMENT:

A. Technical Support: Beginning with Substantial Completion, provide software support for two years.

B. Upgrade Service: Update software to latest version at Project completion. Install and program software upgrades that become available within two years from date of Substantial Completion. Upgrading software shall include operating system. Upgrade shall include new or revised licenses for use of software.

1. Provide 30 days' notice to Owner to allow scheduling and access to system and to allow Owner to upgrade computer equipment if necessary.

PART 2 - PRODUCTS

2.01 PERFORMANCE REQUIREMENTS:

A. General Performance: Horizontal cabling system shall comply with transmission standards in TIA-568-C.1, when tested according to test procedures of this standard.

B. Telecommunications Pathways and Spaces: Comply with TIA-569-D.

C. Grounding: Comply with TIA-607-B.

2.02 GENERAL CABLE CHARACTERISTICS:

A. Listed and labeled by an NRTL acceptable to authorities having jurisdiction as complying with the applicable standard and NFPA 70 for the following types:

1. Communications, Plenum Rated: Type CMP complying with UL 1685 or Type CMP in listed plenum communications raceway or Type CMP in listed cable routing assembly.

2. Communications, Non-plenum: Type CMR complying with UL 1666 and ICEA S-103-701.

3. Communications, Non-plenum: Type CMP or Type CMR in metallic conduit installed according to NFPA 70, Article 300.22, "Wiring in Ducts, Plenums, and Other Air-Handling Spaces."

B. Surface-Burning Characteristics: Comply with ASTM E84; testing by a qualified testing agency. Identify products with appropriate markings of applicable testing agency.

1. Flame-Spread Index: 25 or less

2. Smoke-Developed Index: 450 or less

C. RoHS compliant.

2.03 CATEGORY 6 TWISTED PAIR CABLE:

A. Description: Four-pair, balanced-twisted pair cable, with internal spline, certified to meet transmission characteristics of Category 6 cable at frequencies up to 250 MHz.

B. Manufacturers:

1. 3M

2. Belden CDT Networking Division/NORDX

3. CommScope, Inc.

4. Hitachi Cable America Inc.

5. Superior Essex Inc.

C. Standard: Comply with NEMA WC 66/ICEA S-116-732 and TIA-568-C.2 for Category 6 cables.

D. Conductors: 100-ohm, 23 AWG solid copper.

E. Shielding/Screening: Unshielded twisted pairs (UTP) Shielded twisted pairs (FTP) Screened twisted pairs (F/UTP) Screened and shielded twisted pairs (F/FTP).

F. Cable Rating: Plenum.

G. Jacket: White Gray Blue Yellow thermoplastic.

2.04 TWISTED PAIR CABLE HARDWARE:

A. Description: Hardware designed to connect, splice, and terminate twisted pair copper communications cable.

B. Manufacturers:

1. 3M

2. Belden CDT Networking Division/NORDX

3. Dynacom Corporation

4. KRONE Incorporated

5. Panduit Corp

C. General Requirements for Twisted Pair Cable Hardware:

1. Comply with the performance requirements of Category 6.

2. Comply with TIA-568-C.2, IDC type, with modules designed for punch-down caps or tools.

3. Cables shall be terminated with connecting hardware of same category or higher.

D. Source Limitations: Obtain twisted pair cable hardware from single source from single manufacturer. Obtain twisted pair cable hardware from same manufacturer as twisted pair cable, from single source.

E. Connecting Blocks:

1. 110-style IDC for Category 6.

2. Provide blocks for the number of cables terminated on the block, plus 25 percent spare, integral with connector bodies, including plugs and jacks where indicated.

F. Cross-Connect: Modular array of connecting blocks arranged to terminate building cables and permit interconnection between cables.

1. Number of Terminals per Field: One for each conductor in assigned cables.

G. Patch Panel: Modular panels housing numbered jack units with IDC-type connectors at each jack location for permanent termination of pair groups of installed cables.

1. Features:

a. Universal T568A and T568B wiring labels

b. Labeling areas adjacent to conductors

c. Replaceable connectors

d. 24 or 48 ports

2. Construction: 16-gauge steel and mountable on 19-inch equipment racks.

3. Number of Jacks per Field: One for each four-pair cable indicated conductor group of indicated cables, plus spares and blank positions adequate to suit specified expansion criteria.

H. Patch Cords: Factory-made, four-pair cables in 36-inch lengths; terminated with an eight-position modular plug at each end.

1. Patch cords shall have bend-relief-compliant boots and color-coded icons to ensure performance. Patch cords shall have latch guards to protect against snagging.

2. Patch cords shall have color-coded boots for circuit identification.

I. Plugs and Plug Assemblies:

1. Male; eight position; color-coded modular telecommunications connector designed for termination of a single four-pair, 100-ohm, unshielded or shielded twisted pair cable.

2. Standard: Comply with TIA-568-C.2.

3. Marked to indicate transmission performance.

J. Jacks and Jack Assemblies:

1. Female; eight position; modular; fixed telecommunications connector designed for termination of a single four-pair, 100-ohm, unshielded or shielded twisted pair cable.

2. Designed to snap-in to a patch panel or faceplate.

3. Standard: Comply with TIA-568-C.2.

4. Marked to indicate transmission performance.

K. Faceplate:

1. Four port, vertical single gang faceplates designed to mount to single gang wall boxes.

2. Eight port, vertical double gang faceplates designed to mount to double gang wall boxes.

3. Plastic Faceplate: High-impact plastic. Coordinate color with Section 26 27 26.

4. Metal Faceplate: Stainless steel, complying with requirements in Section 26 27 26.

5. For use with snap-in jacks accommodating any combination of twisted pair, optical fiber, and coaxial work area cords.

a. Flush mounting jacks, positioning the cord at a 45-degree angle.

L. Legend:

1. Machine printed, in the field, using adhesive-tape label.

2. Snap-in, clear-label covers and machine-printed paper inserts.

2.05 IDENTIFICATION PRODUCTS:

A. Comply with TIA-606-B and UL 969 for a system of labeling materials, including label stocks, laminating adhesives, and inks used by label printers.

2.06 GROUNDING:

A. Comply with requirements in Section 27 05 26 for grounding conductors and connectors.

B. Comply with TIA-607-B.

2.07 SOURCE QUALITY CONTROL:

A. Testing Agency: Engage a qualified testing agency to evaluate cables.

B. Factory test cables on reels according to TIA-568-C.1.

C. Factory test twisted pair cables according to TIA-568-C.2.

D. Cable will be considered defective if it does not pass tests and inspections.

E. Prepare test and inspection reports.

PART 3 - EXECUTION

3.01 WIRING METHODS:

A. Wiring Method: Install cables in raceways and cable trays, except within consoles, cabinets, desks, and counters and except in accessible ceiling spaces, attics, and gypsum board partitions where unenclosed wiring method may be used. Conceal raceway and cables, except in unfinished spaces.

1. Install plenum cable in environmental air spaces, including plenum ceilings.

2. Comply with requirements for raceways and boxes specified in Section 27 05 28.

B. Wiring Method: Conceal conductors and cables in accessible ceilings, walls, and floors where possible.

C. Wiring within Enclosures: Bundle, lace, and train cables within enclosures. Connect to terminal points with no excess and without exceeding manufacturer's limitations on bending radii. Provide and use lacing bars and distribution spools. Install conductors parallel with or at right angles to sides and back of enclosure.

3.02 INSTALLATION OF PATHWAYS:

A. Comply with requirements for demarcation point, cabinets, and racks specified in Section 27 11 00.

B. Comply with Section 27 05 28.

C. Comply with Section 27 05 29.

D. Comply with Section 27 05 36.

E. Drawings indicate general arrangement of pathways and fittings.

3.03 INSTALLATION OF TWISTED-PAIR HORIZONTAL CABLES:

A. Comply with NECA 1 and NECA/BICSI 568.

B. General Requirements for Cabling:

1. Comply with TIA-568-C.0, TIA-568-C.1, and TIA-568-C.2.

2. Comply with BICSI's "Information Transport Systems Installation Methods Manual (ITSIMM), Ch. 5, "Copper Structured Cabling Systems," "Cable Termination Practices" Section.

3. Install 110-style IDC termination hardware unless otherwise indicated.

4. Do not untwist twisted pair cables more than 1/2 inch from the point of termination to maintain cable geometry.

5. Terminate all conductors; no cable shall contain unterminated elements. Make terminations only at indicated outlets, terminals, cross-connects, and patch panels.

6. MUTOA shall not be used as a cross-connect point.

7. Consolidation points may be used only for making a direct connection to equipment outlets:

a. Do not use consolidation point as a cross-connect point, as a patch connection, or for direct connection to workstation equipment.

b. Locate consolidation points for twisted-pair cables at least 49 feet from communications equipment room.

8. Cables may not be spliced. Secure and support cables at intervals not exceeding 30 inches and not more than 6 inches from cabinets, boxes, fittings, outlets, racks, frames, and terminals.

9. Install lacing bars to restrain cables, prevent straining connections, and prevent bending cables to smaller radii than minimums recommended by manufacturer.

10. Bundle, lace, and train conductors to terminal points without exceeding manufacturer's limitations on bending radii, but not less than radii specified in BICSI Information Transport Systems Installation Methods Manual , Ch. 5, "Copper Structured Cabling Systems," "Cable Termination Practices" Section. Use lacing bars and distribution spools.

11. Do not install bruised, kinked, scored, deformed, or abraded cable. Do not splice cable between termination, tap, or junction points. Remove and discard cable if damaged during installation, and replace it with new cable.

12. Cold-Weather Installation: Bring cable to room temperature before dereeling. Heat lamps shall not be used for heating.

13. In the communications equipment room, install a 10-foot-long service loop on each end of cable.

14. Pulling Cable: Comply with BICSI Information Transport Systems Installation Methods Manual, Ch. 5, "Copper Structured Cabling Systems," "Pulling and Installing Cable" Section. Monitor cable pull tensions.

C. Open-Cable Installation:

1. Install cabling with horizontal and vertical cable guides in telecommunications spaces with terminating hardware and interconnection equipment.

2. Suspend twisted pair cabling, not in a wireway or pathway, a minimum of 8 inches above ceilings by cable supports not more than 60 inches apart.

3. Cable shall not be run through structural members or in contact with pipes, ducts, or other potentially damaging items.

D. Installation of Cable Routed Exposed under Raised Floors:

1. Install plenum-rated cable only.

2. Install cabling after the flooring system has been installed in raised floor areas.

3. Coil cable 6 feet long not less than 12 inches in diameter below each feed point.

E. Group connecting hardware for cables into separate logical fields.

F. Separation from EMI Sources:

1. Comply with recommendations from BICSI's "Telecommunications Distribution Methods Manual" and TIA-569-D for separating unshielded copper communication cable from potential EMI sources, including electrical power lines and equipment.

2. Separation between open communications cables or cables in nonmetallic raceways and unshielded power conductors and electrical equipment shall be as follows:

a. Electrical Equipment Rating Less Than 2 kVA: A minimum of 5 inches.

b. Electrical Equipment Rating between 2 and 5 kVA: A minimum of 12 inches.

c. Electrical Equipment Rating More Than 5 kVA: A minimum of 24 inches.

3. Separation between communications cables in grounded metallic raceways and unshielded power lines or electrical equipment shall be as follows:

a. Electrical Equipment Rating Less Than 2 kVA: A minimum of 2-1/2 inches.

b. Electrical Equipment Rating between 2 and 5 kVA: A minimum of 6 inches.

c. Electrical Equipment Rating More Than 5 kVA: A minimum of 12 inches.

4. Separation between communications cables in grounded metallic raceways, power lines, and electrical equipment located in grounded metallic conduits or enclosures shall be as follows:

a. Electrical Equipment Rating Less Than 2 kVA: No requirement.

b. Electrical Equipment Rating between 2 and 5 kVA: A minimum of 3 inches.

c. Electrical Equipment Rating More Than 5 kVA: A minimum of 6 inches.

5. Separation between Communications Cables and Electrical Motors and Transformers, 5 kVA or HP and Larger: A minimum of 48 inches.

6. Separation between Communications Cables and Fluorescent Fixtures: A minimum of 5 inches.

3.04 FIRESTOPPING:

A. Comply with requirements in Section 07 84 00.

B. Comply with TIA-569-D, Annex A, "Firestopping."

C. Comply with "Firestopping Systems" Article in BISCI's "Telecommunications Distribution Methods Manual."

3.05 GROUNDING:

A. Install grounding according to the "Grounding, Bonding, and Electrical Protection" chapter in BICSI's "Telecommunications Distribution Methods Manual."

B. Comply with TIA-607-B and NECA/BICSI-607.

C. Locate grounding bus bar to minimize the length of bonding conductors. Fasten to wall, allowing at least a 2-inch clearance behind the grounding bus bar. Connect grounding bus bar to suitable electrical building ground, using a minimum No. 4 AWG grounding electrode conductor.

D. Bond metallic equipment to the grounding bus bar, using not smaller than a No. 6 AWG equipment grounding conductor.

3.06 IDENTIFICATION:

A. Identify system components, wiring, and cabling complying with TIA-606-B. Comply with requirements for identification specified in Section 27 05 53.

1. Administration Class: Class 3.

2. Color-code cross-connect fields and apply colors to voice and data service backboards, connections, covers, and labels.

B. Paint and label colors for equipment identification shall comply with TIA-606-B for Class 3 level of administration, including optional identification requirements of this standard.

C. Cable Schedule: Install in a prominent location in each equipment room and wiring closet. List incoming and outgoing cables and their designations, origins, and destinations. Protect with rigid frame and clear plastic cover. Furnish an electronic copy of final comprehensive schedules for Project.

D. Cabling Administration Drawings: Show building floor plans with cabling administration-point labeling. Identify labeling convention and show labels for telecommunications closets, terminal hardware and positions, horizontal cables, work areas and workstation terminal positions, grounding buses and pathways, and equipment grounding conductors.

E. Cable and Wire Identification:

1. Label each cable within 4 inches of each termination and tap, where it is accessible in a cabinet or junction or outlet box, and elsewhere as indicated.

2. Each wire connected to building-mounted devices is not required to be numbered at the device if wire color is consistent with associated wire connected and numbered within panel or cabinet.

3. Exposed Cables and Cables in Cable Trays and Wire Troughs: Label each cable at intervals not exceeding 15 feet.

4. Label each terminal strip, and screw terminal in each cabinet, rack, or panel.

   a. Individually number wiring conductors connected to terminal strips, and identify each cable or wiring group, extended from a panel or cabinet to a building-mounted device, with the name and number of a particular device.

   b. Label each unit and field within distribution racks and frames.

5. Identification within Connector Fields in Equipment Rooms and Wiring Closets: Label each connector and each discrete unit of cable-terminating and -connecting hardware. Where similar jacks and plugs are used for both voice and data communication cabling, use a different color for jacks and plugs of each service.

F. Labels shall be preprinted or computer-printed type, with a printing area and font color that contrast with cable jacket color but still comply with TIA-606-B requirements for the following:

1. Cables use flexible vinyl or polyester that flexes as cables are bent.

3.07 FIELD QUALITY CONTROL:

A. Perform tests and inspections with the assistance of a factory-authorized service representative.

B. Tests and Inspections:

1. Visually inspect jacket materials for NRTL certification markings. Inspect cabling terminations in communications equipment rooms for compliance with color-coding for pin assignments, and inspect cabling connections for compliance with TIA-568-C.1.

2. Visually inspect cable placement, cable termination, grounding and bonding, equipment and patch cords, and labeling of all components.

3. Test twisted pair cabling for DC loop resistance, shorts, opens, intermittent faults, and polarity between conductors. Test operation of shorting bars in connection blocks. Test cables after termination but not cross-connection.

   a. Test instruments shall meet or exceed applicable requirements in TIA-568-C.2. Perform tests with a tester that complies with performance requirements in "Test Instruments (Normative)" Annex, complying with measurement accuracy specified in "Measurement Accuracy (Informative)" Annex. Use only test cords and adapters that are qualified by test equipment manufacturer for channel or link test configuration.

C. Data for each measurement shall be documented. Data for submittals shall be printed in a summary report that is formatted similarly to Table 10.1 in BICSI's "Telecommunications Distribution Methods Manual," or shall be transferred from the instrument to the computer, saved as text files, printed, and submitted.

D. Remove and replace cabling where test results indicate that they do not comply with specified requirements.

E. End-to-end cabling will be considered defective if it does not pass tests and inspections.

F. Prepare test and inspection reports.

3.08 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

Page Intentionally Left Blank

SECTION 27 15 23

COMMUNICATIONS OPTICAL FIBER HORIZONTAL CABLING

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide communications optical fiber horizontal cabling as indicated and in compliance with Contract Documents.

1. 850 nanometer laser-optimized 50/125 micrometer multimode optical fiber cable (OM4).

2. 9/125 micrometer, single-mode, indoor-outdoor optical fiber cable (OS2).

3. Optical fiber cable connecting hardware, patch panels, and cross-connects.

4. Grounding.

5. Cabling identification products.

1.03 DEFINITIONS:

A. BICSI: Building Industry Consulting Service International.

B. Cross-Connect: A facility enabling the termination of cable elements and their interconnection or cross-connection.

C. RCDD: Registered Communications Distribution Designer.

1.04 OPTICAL FIBER HORIZONTAL CABLING DESCRIPTION:

A. Optical fiber horizontal cabling system shall provide interconnections between Distributor A, Distributor B, or Distributor C and the equipment outlet, otherwise known as "Cabling Subsystem 1" in the telecommunications cabling system structure. Cabling system consists of horizontal cables, intermediate and main cross-connects, mechanical terminations, and patch cords or jumpers used for horizontal-to-horizontal cross-connection.

1. TIA-568-C.1 requires that a minimum of two equipment outlets be installed for each work area.

2. Horizontal cabling shall contain no more than one transition point or consolidation point between the horizontal cross-connect and the equipment outlet.

3. Bridged taps and splices shall not be installed in the horizontal cabling.

B. A work area is approximately 100 square feet, and includes the components that extend from the equipment outlets to the equipment.

C. The maximum allowable horizontal cable length is 295 feet. This maximum allowable length does not include an allowance for the length of 16 feet to the workstation equipment or in the horizontal cross-connect.

1.05 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Product Data: For each type of product.

C. Shop Drawings: Reviewed and stamped by RCDD.

1. System Labeling Schedules: Electronic copy of labeling schedules, in software and format selected by Owner.

2. System Labeling Schedules: Electronic copy of labeling schedules that are part of the cabling and asset identification system of the software.

3. Cabling administration Drawings and printouts.

4. Wiring diagrams and installation details of telecommunications equipment, to show location and layout of telecommunications equipment, including the following:

   a. Telecommunications rooms plans and elevations.

   b. Telecommunications pathways.

   c. Telecommunications system access points.

   d. Telecommunications grounding system.

   e. Telecommunications conductor drop locations.

   f. Typical telecommunications details.

   g. Mechanical, electrical, and plumbing systems.

D. Fiber optic cable testing plan.

E. Sustainable Design Submittals:

1. Samples: For telecommunications jacks and plugs, in specified finish, one for each type and configuration and faceplates for color selection and evaluation of technical features.

F. Qualification Data: For RCDD, installation supervisor, and field inspector.

G. Product Certificates: For each type of product.

H. Source quality-control reports.

I. Field quality-control reports.

J. Software and Firmware Operational Documentation:

1. Software operating and upgrade manuals.

2. Program Software Backup: On USB media or compact disk, complete with data files.

3. Device address list.

4. Printout of software application and graphic screens.

K. Maintenance Data: For optical fiber cable, splices, and connectors to include in maintenance manuals.

L. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Connecting Blocks: One of each type

2. Jacks: Ten of each type

3. Patch-Panel Units: One of each type

4. Plugs: Ten of each type

1.06 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.07 SPARE PARTS:

A. Comply with the requirements specified in Section 01 61 00.

1.08 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

B. Installer Qualifications: Cabling Installer must have personnel certified by BICSI on staff.

1. Layout Responsibility: Preparation of Shop Drawings and Cabling Administration Drawings, Cabling Administration Drawings, and field testing program development by an RCDD.

2. Installation Supervision: Installation shall be under the direct supervision of Technician**,** who shall be present at all times when Work of this Section is performed at Project site.

3. Testing Supervisor: Currently certified by BICSI as an RCDD.

C. Testing Agency Qualifications: Testing agency must have personnel certified by BICSI on staff.

1. Testing Agency's Field Supervisor: Currently certified by BICSI as an RCDD to supervise on-site testing.

1.09 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

B. Test cables upon receipt at Project site.

1. Test optical fiber cable to determine the continuity of the strand end to end. Use optical fiber flashlight or optical loss test set.

2. Test optical fiber cable while on reels. Use an optical time domain reflectometer to verify the cable length and locate cable defects, splices, and connector, including the loss value of each. Retain test data and include the record in maintenance data.

1.10 PROJECT/SITE CONDITIONS:

A. Environmental Limitations: Do not deliver or install cables and connecting materials until wet work in spaces is complete and dry, and temporary HVAC system is operating and maintaining ambient temperature and humidity conditions at occupancy levels during the remainder of the construction period.

1.11 COORDINATION:

A. Coordinate layout and installation of telecommunications pathways and cabling with Owner's telecommunications equipment and service suppliers.

1.12 SOFTWARE SERVICE AGREEMENT:

A. Technical Support: Beginning with Substantial Completion, provide software support for two years.

B. Upgrade Service: Update software to latest version at Project completion. Install and program software upgrades that become available within two years from date of Substantial Completion. Upgrading software shall include operating system. Upgrade shall include new or revised licenses for use of software.

1. Provide 30 days' notice to Owner to allow scheduling and access to system and to allow Owner to upgrade computer equipment if necessary.

PART 2 - PRODUCTS

2.01 PERFORMANCE REQUIREMENTS:

A. General Performance: Horizontal cabling system shall comply with transmission standards in TIA-568-C.1, when tested according to test procedures of this standard.

B. Telecommunications Pathways and Spaces: Comply with TIA-569-D.

C. Grounding: Comply with TIA-607-B.

2.02 850 NANOMETER LASER-OPTIMIZED, 50/125 MICROMETER, MULTIMODE OPTICAL FIBER CABLE (OM4):

A. Description: Multimode, 50/125-micrometer, fiber-strand count as indicated on drawings, nonconductive conductive, tight buffer, optical fiber cable.

B. Manufacturers:

1. Belden CDT Networking Division/NORDX

2. Corning Cable Systems

3. Hitachi Cable America Inc.

4. Superior Essex Inc.

5. TE Connectivity Ltd.

C. Standards:

1. Comply with ICEA S-83-596 for mechanical properties.

2. Comply with TIA-568-C.3 for performance specifications.

3. Comply with TIA-492AAAD for detailed specifications.

D. Conductive cable shall be aluminum armored type.

E. Maximum Attenuation: 3.50 dB/km at 850 nm; 1.5 dB/km at 1300 nm.

F. Minimum Overfilled Modal Bandwidth-length Product: 3500 MHz-km at 850 nm; 500 MHz-km at 1300 nm.

G. Minimum Effective Modal Bandwidth-length Product: 4700 MHz-km at 850 nm.

H. Jacket:

1. Jacket Color: Aqua.

2. Cable cordage jacket, fiber, unit, and group color shall be according to TIA-598-D.

3. Imprinted with fiber count, fiber type, and aggregate length at regular intervals not to exceed 40 inches.

I. Listed and labeled by an NRTL acceptable to authorities having jurisdiction as complying with UL 444, UL 1651, and NFPA 70 for the following types:

1. Plenum Rated, Nonconductive: Type OFNP, complying with NFPA 262.

2.03 9/125 MICROMETER, SINGLE-MODE, INDOOR-OUTDOOR OPTICAL FIBER CABLE (OS2):

A. Description: Single mode, 9/125-micrometer, 1 - 2 fibers, tight buffered, nonconductive conductive optical fiber cable.

B. Manufacturers:

1. 3M

2. Belden CDT Networking Division/NORDX

3. CommScope, Inc

4. Hitachi Cable America Inc.

5. Superior Essex Inc

C. Conductive cable shall be aluminum armored type.

D. Maximum Attenuation: 0.5 dB/km at 1310 nm; 0.5 dB/km at 1550 nm.

E. Jacket:

1. Jacket Color: Yellow.

2. Cable cordage jacket, fiber, unit, and group color shall be according to TIA-598-D.

3. Imprinted with fiber count, fiber type, and aggregate length at regular intervals not to exceed 40 inches.

F. Standards:

1. Comply with TIA-492CAAB for detailed specifications.

2. Comply with TIA-568-C.3 for performance specifications.

3. Comply with ICEA S-104-696 for mechanical properties.

G. Listed and labeled by an NRTL acceptable to authorities having jurisdiction as complying with UL 444, UL 1651, and NFPA 70 for the following types:

1. Plenum Rated, Nonconductive: Type OFNP, complying with NFPA 262.

2.04 OPTICAL FIBER CABLE HARDWARE:

A. Manufacturers:

1. ADC

2. Belden CDT Networking Division/NORDX

B. Standards:

1. Comply with Fiber Optic Connector Intermateability Standard (FOCIS) specifications of the TIA-604 series.

2. Comply with TIA-568-C.3.

C. Cross-Connects and Patch Panels: Modular panels housing multiple-numbered, duplex cable connectors.

1. Number of Connectors per Field: One for each fiber of cable or cables assigned to field, plus spares and blank positions adequate to suit specified expansion criteria.

D. Patch Cords: Factory-made, single-fiber cables in 36-inch lengths.

E. Connector Type: Type LC complying with TIA-604-10-B connectors.

F. Plugs and Plug Assemblies:

1. Male; color-coded modular telecommunications connector designed for termination of a single optical fiber cable.

2. Insertion loss not more than 0.25 0.75 dB.

3. Marked to indicate transmission performance.

G. Jacks and Jack Assemblies:

1. Female; quick-connect, simplex and duplex; fixed telecommunications connector designed for termination of a single optical fiber cable.

2. Insertion loss not more than 0.25 0.75 dB.

3. Marked to indicate transmission performance.

4. Designed to snap-in to a patch panel or faceplate.

H. Faceplate:

1. Two Four -port, vertical single-gang faceplates designed to mount to single-gang wall boxes.

2. Eight -port, vertical double-gang faceplates designed to mount to double-gang wall boxes.

3. Plastic Faceplate: High-impact plastic. Coordinate color with Section 26 27 26.

4. Metal Faceplate: Stainless steel, complying with requirements in Section 26 27 26.

5. For use with snap-in jacks accommodating any combination of twisted pair, optical fiber, and coaxial work area cords.

a. Flush mounting jacks, positioning the cord at a 45-degree angle.

2.05 GROUNDING:

A. Comply with requirements in Section 27 05 26 for grounding conductors and connectors.

B. Comply with TIA-607-B.

2.06 IDENTIFICATION PRODUCTS:

A. Comply with TIA-606-B and UL 969 for a system of labeling materials, including label stocks, laminating adhesives, and inks used by label printers.

2.07 SOURCE QUALITY CONTROL:

A. Testing Agency: Engage a qualified testing agency to evaluate cables.

B. Factory test multimode optical fiber cables according to TIA-526-14-B and TIA-568-C.3.

C. Factory test preterminated optical fiber cable assemblies according to TIA-526-14-B and TIA-568-C.3.

D. Cable will be considered defective if it does not pass tests and inspections.

E. Prepare test and inspection reports.

PART 3 - EXECUTION

3.01 WIRING METHODS:

A. Wiring Method: Install cables in raceways and cable trays except within consoles, cabinets, desks, and counters and except in accessible ceiling spaces, in attics, and in gypsum board partitions where unenclosed wiring method may be used. Conceal raceway and cables except in unfinished spaces.

1. Install plenum cable in environmental air spaces, including plenum ceilings.

2. Comply with requirements for pathways specified in Section 27 05 28.

B. Wiring Method: Conceal conductors and cables in accessible ceilings, walls, and floors where possible.

C. Wiring within Enclosures: Bundle, lace, and train cables within enclosures. Connect to terminal points with no excess and without exceeding manufacturer's limitations on bending radii. Provide and use lacing bars and distribution spools.

3.02 INSTALLATION OF OPTICAL FIBER BACKBONE CABLES:

A. Comply with NECA 1, NECA 301 and NECA/BICSI 568.

B. General Requirements for Optical Fiber Cabling Installation:

1. Comply with TIA-568-C.1 and TIA-568-C.3.

2. Comply with BICSI ITSIMM, Ch. 6, "Cable Termination Practices."

3. Terminate all cables; no cable shall contain unterminated elements. Make terminations only at indicated outlets, terminals, cross-connects, and patch panels.

4. Cables may not be spliced. Secure and support cables at intervals not exceeding 30 inches and not more than 6 inches from cabinets, boxes, fittings, outlets, racks, frames, and terminals.

5. Install lacing bars to restrain cables, to prevent straining connections, and to prevent bending cables to smaller radii than minimums recommended by manufacturer.

6. Bundle, lace, and train cable to terminal points without exceeding manufacturer's limitations on bending radii, but not less than radii specified in BICSI ITSIMM, "Cabling Termination Practices" Chapter. Use lacing bars and distribution spools.

7. Do not install bruised, kinked, scored, deformed, or abraded cable. Do not splice cable between termination, tap, or junction points. Remove and discard cable if damaged during installation and replace it with new cable.

8. Cold-Weather Installation: Bring cable to room temperature before dereeling. Heat lamps shall not be used for heating.

9. In the communications equipment room, provide a 10-foot-long service loop on each end of cable.

10. Pulling Cable: Comply with BICSI ITSIMM, Ch. 4, "Pulling Cable." Monitor cable pull tensions.

11. Cable may be terminated on connecting hardware that is rack or cabinet mounted.

C. Open-Cable Installation:

1. Install cabling with horizontal and vertical cable guides in telecommunications spaces with terminating hardware and interconnection equipment.

2. Cable shall not be run through structural members or in contact with pipes, ducts, or other potentially damaging items.

D. Installation of Cable Routed Exposed under Raised Floors:

1. Install plenum-rated cable only.

2. Install cabling after the flooring system has been installed in raised floor areas.

3. Coil cable 6 feet long not less than 12 inches in diameter below each feed point.

E. Group connecting hardware for cables into separate logical fields.

3.03 FIRESTOPPING:

A. Comply with TIA-569-D, Annex A, "Firestopping."

B. Comply with BICSI ITSIMM, "Firestopping" Chapter.

3.04 GROUNDING:

A. Install grounding according to BICSI ITSIMM, "Grounding (Earthing), Bonding, and Electrical Protection" Chapter.

B. Comply with TIA-607-B and NECA/BICSI-607.

C. Locate grounding bus bar to minimize the length of bonding conductors. Fasten to wall allowing at least 2-inch clearance behind the grounding bus bar. Connect grounding bus bar with a minimum No. 4 AWG grounding electrode conductor from grounding bus bar to suitable electrical building ground.

D. Bond metallic equipment to the grounding bus bar, using not smaller than No. 6 AWG equipment grounding conductor.

3.05 IDENTIFICATION:

A. Identify system components, wiring, and cabling complying with TIA-606-B. Comply with requirements for identification specified in Section 27 05 53.

1. Administration Class: Class 3.

2. Color-code cross-connect fields and apply colors to voice and data service backboards, connections, covers, and labels.

B. Paint and label colors for equipment identification shall comply with TIA-606-B for Class 3 level of administration including optional identification requirements of this standard.

C. Cable Schedule: Install in a prominent location in each equipment room and wiring closet. List incoming and outgoing cables and their designations, origins, and destinations. Protect with rigid frame and clear plastic cover. Furnish an electronic copy of final comprehensive schedules for Project.

D. Cabling Administration Drawings: Show building floor plans with cabling administration-point labeling. Identify labeling convention and show labels for telecommunications closets, horizontal pathways and cables, entrance pathways and cables, terminal hardware and positions, horizontal cables, work areas and workstation terminal positions, grounding buses and pathways, and equipment grounding conductors.

E. Cable and Wire Identification:

1. Label each cable within 4 inches of each termination and tap, where it is accessible in a cabinet or junction or outlet box, and elsewhere as indicated.

2. Each wire connected to building-mounted devices is not required to be numbered at device if color of wire is consistent with associated wire connected and numbered within panel or cabinet.

3. Exposed Cables and Cables in Cable Trays and Wire Troughs: Label each cable at intervals not exceeding 15 feet.

4. Label each unit and field within distribution racks and frames.

5. Identification within Connector Fields in Equipment Rooms and Wiring Closets: Label each connector and each discrete unit of cable-terminating and connecting hardware. Where similar jacks and plugs are used for both voice and data communication cabling, use a different color for jacks and plugs of each service.

F. Labels shall be preprinted or computer-printed type with printing area and font color that contrasts with cable jacket color but still complies with requirements in TIA 606-B, for the following:

1. Flexible vinyl or polyester that flexes as cables are bent.

3.06 FIELD QUALITY CONTROL:

A. Perform tests and inspections with the assistance of a factory-authorized service representative.

B. Tests and Inspections:

1. Visually inspect optical fiber jacket materials for NRTL certification markings. Inspect cabling terminations in communications equipment rooms for compliance with color-coding for pin assignments, and inspect cabling connections for compliance with TIA-568-C.1.

2. Visually inspect cable placement, cable termination, grounding and bonding, equipment and patch cords, and labeling of all components.

3. Optical Fiber Cable Tests:

a. Test instruments shall meet or exceed applicable requirements in TIA-568-C.1. Use only test cords and adapters that are qualified by test equipment manufacturer for channel or link test configuration.

b. Link End-to-End Attenuation Tests:

(1) Horizontal and Multimode Horizontal Link Measurements: Test at 850 or 1300 nm in one direction according to TIA-526-14-B, Method B, One Reference Jumper.

(2) Attenuation test results for horizontal links shall be less than 2.0 dB. Attenuation test results shall be less than those calculated according to equation in TIA-568-C.1.

C. Data for each measurement shall be documented. Data for submittals shall be printed in a summary report that is formatted similar to Table 10.1 in BICSI TDMM, or transferred from the instrument to the computer, saved as text files, and printed and submitted.

D. Remove and replace cabling where test results indicate that it does not comply with specified requirements.

E. End-to-end cabling will be considered defective if it does not pass tests and inspections.

F. Prepare test and inspection reports.

3.07 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

1.04 COAXIAL HORIZONTAL CABLING DESCRIPTION:

A. Coaxial horizontal cabling system shall provide interconnections between Distributor A, Distributor B, or Distributor C and the equipment outlet, otherwise known as "Cabling Subsystem 1" in the telecommunications cabling system structure. Cabling system consists of horizontal cables, mechanical terminations, and patch cords or jumpers used for horizontal-to-horizontal cross-connection.

1.05 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Product Data: For each type of product.

1. Nominal OD.

2. Minimum bending radius.

3. Maximum pulling tension.

C. Shop Drawings:

1. System Labeling Schedules: Electronic copy of labeling schedules, in software and format selected by Owner.

2. Cabling administration drawings and printouts.

3. Samples: For telecommunications jacks and plugs, in specified finish, one for each type and configuration and faceplates for color selection and evaluation of technical features.

D. Qualification Data: For RCDD, installation supervisor, and field inspector.

E. Source quality-control reports.

F. Field quality-control reports.

G. Maintenance Data: For splices and connectors to include in maintenance manuals.

H. Maintenance Data: For coaxial cable, splices, and connectors to include in maintenance manuals.

I. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Connecting Blocks: One each type

2. Jacks: Ten of each type

3. Patch-Panel Units: One of each type

4. Plugs: Ten of each type

1.06 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.07 SPARE PARTS:

A. Comply with the requirements specified in Section 01 61 00.

1.08 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

B. Installer Qualifications: Cabling Installer must have personnel certified by BICSI on staff.

1. Layout Responsibility: Preparation of Shop Drawings and Cabling Administration Drawings, Cabling Administration Drawings, and field testing program development by an RCDD.

2. Installation Supervision: Installation shall be under the direct supervision of Technician who shall be present at all times when Work of this Section is performed at Project site.

C. Testing Agency Qualifications: Testing agency must have personnel certified by BICSI on staff.

1. Testing Agency's Field Supervisor: Currently certified by BICSI as an RCDD.

1.09 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

B. Test cables upon receipt at Project site.

1. Test each coaxial cable on the reel for continuity.

1.10 PROJECT/SITE CONDITIONS:

A. Environmental Limitations: Do not deliver or install cables and connecting materials until wet work in spaces is complete and dry, and temporary HVAC system is operating and maintaining ambient temperature and humidity conditions at occupancy levels during the remainder of the construction period.

1.11 COORDINATION:

A. Coordinate layout and installation of telecommunications pathways and cabling with Owner's telecommunications and LAN equipment and service suppliers.

PART 2 - PRODUCTS

2.01 PERFORMANCE REQUIREMENTS:

A. General Performance: Horizontal cabling system shall comply with transmission standards in TIA-568-C.1, when tested according to test procedures of this standard, and the requirements of TIA-568-C.4.

B. Telecommunications Pathways and Spaces: Comply with TIA-569-D.

C. Grounding: Comply with TIA-607-B.

2.02 GENERAL CABLE CHARACTERISTICS:

A. Communications Cable: Listed and labeled by an NRTL acceptable to authorities having jurisdiction as complying with the applicable standard and NFPA 70 for the following types:

1. Communications, Plenum Rated: Type CMP complying with UL 1685 or Type CMP in listed plenum communications raceway or Type CMP in listed cable routing assembly.

2. Communications, Plenum Rated: Type CM, Type CMG, Type CMP, Type CMR, or Type CMX in metallic conduit installed per NFPA 70, Article 300.22, "Wiring in Ducts, Plenums, and Other Air-Handling Spaces."

B. CATV Cable: Listed and labeled by an NRTL acceptable to authorities having jurisdiction as complying with the applicable standard and NFPA 70 for the following types:

1. CATV Plenum Rated: Type CATVP installed in riser raceways or cable routing assemblies, complying with NFPA 262.

2. CATV Cable: Type CATV, or CATVP or CATVR installed in general purpose, riser, or plenum communications raceways or cable routing assemblies in fireproof riser shafts with firestops at each penetration.

2.03 COMMUNICATIONS COAXIAL CABLE:

A. Description: Coaxial cable with a 75-ohm characteristic impedance designed for broadband data transmission.

B. Manufacturers:

1. Alpha Wire

2. Belden CDT Networking Division/NORDX

3. Coleman Cable, Inc

4. CommScope, Inc

5. Prysmian Group North America

C. NFPA and UL compliance, listed and labeled by an NRTL acceptable to authorities having jurisdiction as complying with UL 444, UL 13, and with NFPA 70, "Class 1, Class 2, and

Class 3 Remote-Control, Signaling, and Power-Limited Circuits" and "Communications Circuits" articles. Types are as follows:

1. RG-6/U: UL Type CMP and CL2P.
    a. No. 18 AWG, solid, copper-covered steel conductor.
    b. Plenum rated.
    c. Gas-injected, foam-PE insulation.
    d. Shielded with 100 percent aluminum tape and 40 percent aluminum braid.
    e. Jacketed with white PVC or PE.
    f. Suitable for indoor installations.
2. RG-11/U: UL Type CMP and CL2P.
    a. No. 14 AWG, solid, copper-covered steel conductor.
    b. Plenum rated. Suitable for outdoor installations in ambient temperatures ranging from -40 to +85 degrees F.
    c. Gas-injected, foam-PE insulation.
    a. Shielded with 100 percent aluminum tape and 40 percent aluminum braid.
    b. Jacketed with sunlight-resistant, white PVC or PE.
3. RG-59/U: UL Type CMP and CL2P.
    a. No. 20 AWG, solid copper conductor.
    b. Plenum rated.
    c. Gas-injected, foam-PE insulation.
    d. Single shielded with 100 percent aluminum shield and 40 percent aluminum braid.
    e. PVC jacket.

2.04 CATV COAXIAL CABLE:

A. Description: Coaxial cable with a 75-ohm characteristic impedance designed for CATV transmission.

B. Manufacturers:

1. Alpha Wire

2. Belden CDT Networking Division/NORDX

3. Coleman Cable, Inc

4. CommScope, Inc

5. Prysmian Group North America

C. NFPA and UL compliance, listed and labeled by an NRTL acceptable to authorities having jurisdiction as complying with UL 1655 and with NFPA 70, "Community Antenna Television and Radio Distribution Systems" Article. Types are as follows:

1. RG-6/U: UL Type CATVP.

a. No. 18 AWG, solid, copper-covered steel conductor.

b. Plenum rated.

c. Gas-injected, foam-PE insulation.

d. Shielded with 100 percent aluminum tape and 60 percent aluminum braid.

e. Double shielded with 100 percent aluminum foil shield, 60 percent aluminum braided inner shield, and 40 percent aluminum braided outer shield.

f. Jacketed with white PVC or PE.

g. Suitable for indoor installations.

2.05 COAXIAL CABLE HARDWARE:

A. Description: Hardware designed to connect, splice, and terminate coaxial cable with a 75-ohm characteristic impedance.

B. Manufacturers:

1. Emerson Network Power Connectivity Solutions

2. Leviton Manufacturing Co., Inc.

3. Siemon Co. (The)

C. Coaxial-Cable Connectors: Type BNC, 75 ohms.

D. Jacks and Jack Assemblies: Modular, color-coded, with female Type BNC connectors.

E. Patch Cords: Factory-made cables in minimum of 36-inch lengths; terminated with a male Type BNC connector at each end.

F. Faceplates:

1. Plastic Faceplate: High-impact plastic. Coordinate color with Section 26 27 26.

2. Metal Faceplate: Stainless steel, complying with requirements in Section 26 27 26.

3. For use with snap-in jacks accommodating any combination of twisted pair, optical-fiber, and coaxial work area cords.

a. Flush-mounted jacks, positioning the cord at a 90-degree angle from faceplate surface.

4. Legend:

a. Factory labeled by silk-screening or engraving for stainless steel faceplates.

b. Machine printed, in the field, using adhesive-tape label.

c. Snap-in, clear-label covers and machine-printed paper inserts.

2.06 GROUNDING:

A. Comply with requirements in Section 27 05 26 for grounding conductors and connectors.

B. Comply with TIA-607-B.

2.07 IDENTIFICATION PRODUCTS:

A. Comply with TIA-606-B and UL 969 for a system of labeling materials, including label stocks, laminating adhesives, and inks used by label printers.

2.08 SOURCE QUALITY CONTROL:

A. Cable will be considered defective if it does not pass tests and inspections.

B. Prepare test and inspection reports.

PART 3 - EXECUTION

3.01 ENTRANCE FACILITIES:

A. Coordinate horizontal cabling with the protectors and demarcation point provided by communications service provider.

3.02 WIRING METHODS:

A. Wiring Method: Install cables in raceways and cable trays except within consoles, cabinets, desks, and counters and except in accessible ceiling spaces, in attics, and in gypsum board partitions where unenclosed wiring method may be used. Conceal raceway and cables except in unfinished spaces.

1. Install plenum cable in environmental air spaces, including plenum ceilings.

2. Comply with requirements for raceways and boxes specified in Section 27 05 28.

B. Wiring Method: Conceal conductors and cables in accessible ceilings, walls, and floors where possible.

C. Wiring within Enclosures: Bundle, lace, and train cables within enclosures. Connect to terminal points with no excess and without exceeding manufacturer's limitations on bending radii. Provide and use lacing bars and distribution spools.

3.03 INSTALLATION OF PATHWAYS:

A. Comply with Section 27 11 00. Comply with requirements in Section 27 05 28 for installation of conduits and wireways.

B. Comply with Section 27 05 28.

C. Drawings indicate general arrangement of pathways and fittings.

D. Comply with NFPA 70 for pull-box sizing and length of conduit and number of bends between pull points.

E. Install manufactured conduit sweeps and long-radius elbows whenever possible.

F. Pathway Installation in Communications Equipment Rooms:

1. Position conduit ends adjacent to a corner on backboard where a single piece of plywood is installed, or in the corner of room where multiple sheets of plywood are installed around perimeter walls of room.

2. Install cable trays to route cables if conduits cannot be located in these positions.

3. Secure conduits to backboard when entering room from overhead.

4. Extend conduits 3 inches above finished floor.

5. Install metal conduits with grounding bushings and connect with grounding conductor to grounding system.

G. Backboards: Install backboards with 96-inch dimension vertical. Butt adjacent sheets tightly, and form smooth gap-free corners and joints.

3.04 INSTALLATION OF COAXIAL HORIZONTAL CABLES:

A. Comply with NECA 1 and NECA/BICSI 568.

B. General Requirements for Cabling:

1. Comply with BICSI ITSIMM, Ch. 5, "Copper Structured Cabling Systems," "Cable Termination Practices" Section.

2. Terminate all conductors; no cable shall contain unterminated elements. Make terminations only at indicated outlets, terminals, and patch panels.

3. Cables may not be spliced. Secure and support cables at intervals not exceeding 30 inches and not more than 6 inches from cabinets, boxes, fittings, outlets, racks, frames, and terminals.

4. Install lacing bars to restrain cables, to prevent straining connections, and to prevent bending cables to smaller radii than minimums recommended by manufacturer.

5. Bundle, lace, and train conductors to terminal points without exceeding manufacturer's limitations on bending radii, but not less than radii specified in BICSI ITSIMM, Ch. 5, "Copper Structured Cabling Systems," "Cable Termination Practices" Section. Use lacing bars and distribution spools.

6. Do not install bruised, kinked, scored, deformed, or abraded cable. Do not splice cable between termination, tap, or junction points. Remove and discard cable if damaged during installation and replace it with new cable.

7. Cold-Weather Installation: Bring cable to room temperature before dereeling. Heat lamps shall not be used for heating.

8. In the communications equipment room, install a 10-foot-long service loop on each end of cable.

9. Pulling Cable: Comply with BICSI ITSIMM, Ch. 5, "Copper Structured Cabling Systems," "Pulling Cable" Section. Monitor cable pull tensions.

C. Open-Cable Installation:

1. Install cabling with horizontal and vertical cable guides in telecommunications spaces with terminating hardware and interconnection equipment.

2. Suspend coaxial cable not in a wireway or pathway a minimum of 8 inches above ceilings by cable supports not more than 60 inches apart.

3. Cable shall not be run through structural members or in contact with pipes, ducts, or other potentially damaging items.

D. Installation of Cable Routed Exposed under Raised Floors:

1. Install plenum-rated cable only.

2. Install cabling after the flooring system has been installed in raised floor areas.

3. Coil cable 6 feet long not less than 12 inches in diameter below each feed point.

E. Outdoor Coaxial Cable Installation:

1. Install outdoor connections in enclosures complying with NEMA 250, Type 4X. Install corrosion-resistant connectors with properly designed O-rings to keep out moisture.

2. Attach antenna lead-in cable to support structure at intervals not exceeding 36 inches.

F. Group connecting hardware for cables into separate logical fields.

G. Separation from EMI Sources:

1. Separation between open communications cables or cables in nonmetallic raceways and unshielded power conductors and electrical equipment shall be as follows:

a. Electrical Equipment Rating Less Than 2 kVA: A minimum of 5 inches.

b. Electrical Equipment Rating Between 2 and 5 kVA: A minimum of 12 inches.

c. Electrical Equipment Rating More Than 5 kVA: A minimum of 24 inches.

2. Separation between communications cables in grounded metallic raceways and unshielded power lines or electrical equipment shall be as follows:

a. Electrical Equipment Rating Less Than 2 kVA: A minimum of 2-1/2 inches.

b. Electrical Equipment Rating Between 2 and 5 kVA: A minimum of 6 inches.

c. Electrical Equipment Rating More Than 5 kVA: A minimum of 12 inches.

3. Separation between communications cables in grounded metallic raceways and power lines and electrical equipment located in grounded metallic conduits or enclosures shall be as follows:

a. Electrical Equipment Rating Less Than 2 kVA: No requirement.

b. Electrical Equipment Rating Between 2 and 5 kVA: A minimum of 3 inches.

c. Electrical Equipment Rating More Than 5 kVA: A minimum of 6 inches.

4. Separation between Communications Cables and Electrical Motors and Transformers, 5 kVA or HP and Larger: A minimum of 48 inches.

5. Separation between Communications Cables and Fluorescent Fixtures: A minimum of 5 inches.

3.05 FIRESTOPPING:

A. Comply with TIA-569-D, Annex A, "Firestopping."

B. Comply with BICSI TDMM, "Firestopping Systems" Article.

3.06 GROUNDING:

A. Install grounding according to BICSI TDMM, "Grounding, Bonding, and Electrical Protection" Chapter.

B. Comply with TIA-607-B and NECA/BICSI-607.

C. Locate grounding bus bar to minimize the length of bonding conductors. Fasten to wall allowing at least 2-inch clearance behind the grounding bus bar. Connect grounding bus bar with a minimum No. 4 AWG grounding electrode conductor from grounding bus bar to suitable electrical building ground.

D. Bond metallic equipment to the grounding bus bar, using not smaller than No. 6 AWG equipment grounding conductor.

3.07 IDENTIFICATION:

A. Identify system components, wiring, and cabling complying with TIA-606-B. Comply with requirements for identification specified in Section 26 05 53.

1. Administration Class: Class 3.

2. Color-code fields and apply colors to voice and data service backboards, connections, covers, and labels.

B. Cable Schedule: Install in a prominent location in each equipment room and wiring closet. List incoming and outgoing cables and their designations, origins, and destinations. Protect with rigid frame and clear plastic cover. Furnish an electronic copy of final comprehensive schedules for Project.

C. Cabling Administration Drawings: Show building floor plans with cabling administration-point labeling. Identify labeling convention and show labels for telecommunications

closets, horizontal pathways and cables, entrance pathways and cables, terminal hardware and positions, horizontal cables, work areas and workstation terminal positions, grounding buses and pathways, and equipment grounding conductors.

D. Cable and Wire Identification:

1. Label each cable within 4 inches of each termination and tap, where it is accessible in a cabinet or junction or outlet box, and elsewhere as indicated.

2. Each wire connected to building-mounted devices is not required to be numbered at device if color of wire is consistent with associated wire connected and numbered within panel or cabinet.

3. Exposed Cables and Cables in Cable Trays and Wire Troughs: Label each cable at intervals not exceeding 15 feet.

4. Label each terminal strip and screw terminal in each cabinet, rack, or panel.

a. Individually number wiring conductors connected to terminal strips and identify each cable or wiring group being extended from a panel or cabinet to a building-mounted device with name and number of particular device as shown.

b. Label each unit and field within distribution racks and frames.

5. Identification within Connector Fields in Equipment Rooms and Wiring Closets: Label each connector and each discrete unit of cable-terminating and connecting hardware. Where similar jacks and plugs are used for both voice and data communications cabling, use a different color for jacks and plugs of each service.

E. Labels shall be preprinted or computer-printed type with printing area and font color that contrasts with cable jacket color but still complies with requirements in TIA 606-B, for the following:

1. Cables use flexible vinyl or polyester that flexes as cables are bent.

3.08 FIELD QUALITY CONTROL:

A. Perform the following tests and inspections with the assistance of a factory-authorized service representative.

B. Tests and Inspections:

1. Visually inspect coaxial jacket materials for NRTL certification markings.

2. Visually inspect cable placement, cable termination, grounding and bonding, equipment and patch cords, and labeling of all components.

3. Test coaxial horizontal copper cabling for DC loop resistance, shorts, opens, intermittent faults, and polarity between conductors. Test operation of shorting bars in connection blocks. Test cables after termination.

C. Data for each measurement shall be documented. Data for submittals shall be printed in a summary report that is formatted similar to Table 10.1 in BICSI TDMM, or transferred from the instrument to the computer, saved as text files, and printed and submitted.

D. Remove and replace cabling where test results indicate that they do not comply with specified requirements.

E. End-to-end cabling will be considered defective if it does not pass tests and inspections.

F. Prepare test and inspection reports.

3.09 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

DIVISION 28

ELECTRONIC SAFETY AND SECURITY

Page Intentionally Left Blank

SECTION 28 05 13

CONDUCTORS AND CABLES FOR ELECTRONIC SECURITY

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide conductors and cables for electronic security as indicated and in compliance with Contract Documents.

1. UTP cabling

2. 50/125-micrometer, multimode optical-fiber cabling

3. Coaxial cabling

4. RS-232 cabling

5. RS-485 cabling

6. Control-voltage cabling

7. Control-circuit conductors

8. Identification products

1.02 REFERENCES:

5. 1581: Standard for Safety Reference Standard for Electrical Wires, Cables and Flexible Cords

6. 1651: Standard for Safety Optical Fiber Cable

1.03 DEFINITIONS:

A. EMI: Electromagnetic interference.

B. IDC: Insulation displacement connector.

C. Low Voltage: As defined in NFPA 70 for circuits and equipment operating at less than 50 V or for remote-control and signaling power-limited circuits.

D. Open Cabling: Passing telecommunications cabling through open space (e.g., between the studs of a wall cavity).

E. RCDD: Registered Communications Distribution Designer.

1.04 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Product Data: For each type of product.

1. Installation data for UTP and optical-fiber cables as specified in TIA 568-C-1.

C. Shop Drawings:

1. System Labeling Schedules: Electronic copy of labeling schedules, in software and format selected by Owner.

2. System Labeling Schedules: Electronic copy of labeling schedules that are part of the cabling and asset identification system of the software.

3. Cabling administration drawings and printouts.

4. Wiring diagrams to show typical wiring schematics, including the following:

a. Cross-connects

b. Patch panels

c. Patch cords

5. Cross-connects and patch panels. Detail mounting assemblies and show elevations and physical relationship between the installed components.

D. Qualification Data: For qualified layout technician, installation supervisor, and field inspector.

E. Source quality-control reports.

F. Field quality-control reports.

1.05 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.06 SPARE PARTS:

A. Comply with the requirements specified in Section 01 61 00.

1.07 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

B. Testing Agency Qualifications: An NRTL.

1. Testing Agency's Field Supervisor: Currently certified by BICSI as an RCDD to supervise on-site testing.

1.08 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

B. Test cables upon receipt at Project site.

1. Test optical-fiber cable to determine the continuity of the strand, end to end. Use optical loss test set.

2. Test optical-fiber cable on reels. Use an optical time domain reflectometer to verify the cable length, and locate cable defects, splices, and connector; include the loss value of each. Retain test data and include the record in maintenance data.

3. Test each pair of UTP cable for open and short circuits.

C. Refer and comply to Section 27 15 00 for all network cabling.

PART 2 - PRODUCTS

2.01 PERFORMANCE REQUIREMENTS:

A. Surface-Burning Characteristics: Comply with ASTM E84; testing by a qualified testing agency. Identify products with appropriate markings of applicable testing agency.

1. Flame-Spread Index: 25 or less.

2. Smoke-Developed Index: 50 or less.

B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

C. Refer and comply to Section 27 15 00 for all network cabling.

2.02 UTP CABLE:

A. Description: 100-ohm, four-pair UTP, covered with a blue thermoplastic jacket.

1. Comply with ICEA S-90-661 for mechanical properties.

2. Comply with TIA-568-C.1 for performance specifications.

3. Comply with TIA-568-C.2, Category 6A.

4. Listed and labeled by an NRTL acceptable to authorities having jurisdiction as complying with UL 444 and NFPA 70 for the following types:

a. Communications, Plenum Rated: Type CMP complying with NFPA 262.

b. Multipurpose, Plenum rated: Type MPP, complying with NFPA 262.

2.03 UTP CABLE HARDWARE:

A. UTP Cable Connecting Hardware: IDC type, using modules designed for punch-down caps or tools. Cables shall be terminated with connecting hardware of the same category or higher.

B. Connecting Blocks: 110-style for Category 6A. Provide blocks for the number of cables terminated on the block, plus 25 percent spare. Integral with connector bodies, including plugs and jacks where indicated.

2.04 OM4 OPTICAL-FIBER CABLE:

A. Description: Multimode, 50/125-micrometer, 24-fiber, nonconductive**,** tight buffer, optical-fiber cable.

1. Comply with ICEA S-83-596 for mechanical properties.

2. Comply with TIA-568-C.3 for performance specifications.

3. Comply with TIA-492AAAB, TIA-492-B for detailed specifications.

4. Listed and labeled by an NRTL acceptable to authorities having jurisdiction as complying with UL 444, UL 1651, and NFPA 70 for the following types:

a. Plenum Rated, Nonconductive: Type OFNP, complying with NFPA 262.

B. Jacket:

1. Jacket Color: Aqua for 50/125-micrometer cable.

2. Cable cordage jacket, fiber, unit, and group color shall be according to TIA-598-C.

3. Imprinted with fiber count, fiber type, and aggregate length at regular intervals not to exceed 40 inches.

2.05 OPTICAL-FIBER CABLE HARDWARE:

A. Cross-Connects and Patch Panels: Modular panels housing multiple-numbered, duplex cable connectors.

1. Number of Connectors per Field: One for each fiber of cable or cables assigned to field, plus spares and blank positions adequate to suit specified expansion criteria.

B. Patch Cords: Factory-made, dual-fiber cables in 36-inch lengths.

C. Cable Connecting Hardware: Comply with the Fiber Optic Connector Intermateability Standard (FOCIS) specifications of TIA-604-2-B, TIA-604-3-B, and TIA-604-12. Comply with TIA-568-C.3.

1. Quick-connect, simplex and duplex, Type LC, connectors. Insertion loss not more than 0.75 db.

2. Type SFF connectors may be used in termination racks, panels, and equipment packages.

2.06 RS-232 CABLE:

A. Plenum-Rated Cable: NFPA 70, Type CMP.

1. Nine No. 22 AWG, stranded (7x30) tinned copper conductors.

2. PE insulation.

3. Aluminum foil-polyester tape shield with 100 percent shield coverage.

4. Fluorinated ethylene propylene jacket.

5. Conductors are cabled on common axis with No. 24 AWG, stranded (7x32) tinned copper drain wire.

6. Flame Resistance: Comply with NFPA 262.

2.07 RS-485 CABLE:

A. Standard Cable: NFPA 70, Type CM

1. Paired, two pairs, twisted, No. 22 AWG, stranded (7x30) tinned copper conductors.

2. PVC insulation.

3. Unshielded.

4. PVC jacket.

5. Flame Resistance: Comply with UL 1581.

B. Plenum-Rated Cable: NFPA 70, Type CMP.

1. Paired, two pairs, No. 22 AWG, stranded (7x30) tinned copper conductors.

2. Fluorinated ethylene propylene insulation.

3. Unshielded.

4. Fluorinated ethylene propylene jacket.

5. Flame Resistance: NFPA 262, Flame Test.

2.08 CONTROL-VOLTAGE CABLE:

A. Paired Cable: NFPA 70, Type CMG.

1. One pair, twisted, No. 16 AWG, stranded (19x29) and No. 18 AWG, stranded (19x30**)** tinned copper conductors.

2. PVC insulation.

3. Unshielded.

4. PVC jacket.

5. Flame Resistance: Comply with UL 1581.

B. Plenum-Rated, Paired Cable: NFPA 70, Type CMP.

1. One pair, twisted, No. 16 AWG, stranded (19x29) and No. 18 AWG, stranded (19x30) tinned copper conductors.

2. PVC insulation.

3. Unshielded.

4. PVC jacket.

5. Flame Resistance: Comply with NFPA 262.

2.09 CONTROL-CIRCUIT CONDUCTORS:

A. Class 1 Control Circuits: Stranded copper. Type THHN-THWN, complying with UL 83, in pathway Type XHHN, complying with UL 44, in pathway, XLP/PVC tray cable, complying with UL 83, in cable tray.

B. Class 2 Control Circuits: Stranded copper. Type THHN-THWN, complying with UL 83, in pathway, power-limited cable, complying with UL 83, concealed in building finishes, power-limited tray cable, complying with UL 83, in cable tray, Type XHHN, complying with UL 44, in pathway.

C. Class 3 Remote-Control and Signal Circuits: Stranded copper, Type TW or TF in pathway, Power-limited tray cable, complying with UL 83, in cable tray, complying with UL 83.

2.10 IDENTIFICATION PRODUCTS:

A. Comply with TIA-606-B and UL 969 for a system of labeling materials, including label stocks, laminating adhesives, and inks used by label printers.

2.11 CABLE MANAGEMENT SYSTEM:

A. Description: Computer-based cable management system, with integrated database capabilities.

B. Document physical characteristics by recording the network, TIA details, and connections between equipment and cable.

C. Information shall be presented in database view.

2.12 SOURCE QUALITY CONTROL:

A. Testing Agency: Engage a qualified testing agency to evaluate cables.

B. Factory test UTP and optical-fiber cables on reels according to TIA-568-C.1.

C. Factory test UTP cables according to TIA-568-C.2.

D. Factory test multimode optical fiber cables according to TIA-526.14-B and TIA-568-C.3.

E. Factory sweep test coaxial cables at frequencies from 5 MHz to 1 GHz. Sweep test shall test the frequency response or attenuation over frequency, of a cable by generating a voltage whose frequency is varied through the specified frequency range and graphing the results. Structural Return Loss shall be less than 20 db.

F. Cable will be considered defective if it does not pass tests and inspections.

G. Prepare test and inspection reports.

PART 3 - EXECUTION

3.01 INSTALLATION OF HANGERS AND SUPPORTS:

A. Comply with requirements in Section 26 05 29 for installation of supports for cables.

3.02 WIRING METHOD:

A. Install wiring in metal pathways and wireways.

1. Minimum conduit size shall be 3/4 inch. Control and data-transmission wiring shall not share conduits with other building wiring systems.

2. Comply with requirements in Section 28 05 00.

3. Comply with requirements in Section 27 05 36.

B. Install cable, concealed in accessible ceilings, walls, and floors when possible.

C. Wiring on Racks and within Enclosures:

1. Bundle, lace, and train conductors to terminal points with no excess and without exceeding manufacturer's limitations on bending radii, but not less than radii specified in BICSI ITSIM's "Cabling Termination Practices" chapter. Cable ties shall not be excessively tightened such that the transmission characteristics of the cable are altered.

2. Install lacing bars and distribution spools.

3. Separate power-limited and non-power-limited conductors as recommended in writing by manufacturer.

4. Install conductors parallel with or at right angles to sides and back of enclosure.

5. Connect conductors associated with intrusion system that are terminated, spliced, or interrupted in any enclosure onto terminal blocks.

6. Mark each terminal according to system's wiring diagrams.

7. Make all connections with approved crimp-on terminal spade lugs, pressure-type terminal blocks, or plug connectors.

3.03 INSTALLATION OF CONDUCTORS AND CABLES:

A. Comply with NECA 1 and NFPA 70.

B. Conductors: Size according to system manufacturer's written instructions unless otherwise indicated.

C. Do not install conductors and cables that are wet, moisture damaged, or mold damaged.

D. Install UTP, optical-fiber, and coaxial cables and connecting materials after spaces are complete and dry, and HVAC system is operating and maintaining ambient temperature and humidity conditions at occupancy levels during the remainder of the construction period.

E. General Requirements for Cabling:

1. Comply with TIA-568-C.1.

2. Comply with BICSI ITSIM, Ch. 6, "Cable Termination Practices."

3. Terminate all conductors; no cable shall contain unterminated elements. Make terminations only at indicated outlets, terminals, and cross-connect and patch panels. Leave a minimum of 6 inches of slack at outlet terminations and coil loosely into box after termination on outlet fitting.

4. Cables may not be spliced. Secure and support cables at intervals not exceeding 30 inches and not more than 6 inches from cabinets, boxes, fittings, outlets, racks, frames, and terminals.

5. Maintain minimum cable bending radius during installation and termination of cables.

6. Do not install bruised, kinked, scored, deformed, or abraded cable. Do not splice cable between termination, tap, or junction points. Remove and discard cable if damaged during installation and replace it with new cable.

7. Cold-Weather Installation: Bring cable to room temperature before dereeling. Heat lamps shall not be used for heating.

8. Pulling Cable: Comply with BICSI ITSIM, Ch. 4, "Pulling Cable." Monitor cable pull tensions. Do not exceed manufacturer's rated cable-pulling tension.

9. Riser Cable: Riser cable support intervals shall be in accordance with manufacturer's recommendations.

10. Comply with Section 27 05 00.

F. UTP Cable Installation: Install using techniques, practices, and methods that are consistent with Category 6A rating of components and that ensure Category 6A performance of completed and linked signal paths, end to end.

1. Comply with TIA-568-C.2.

2. Install 110-style IDC termination hardware unless otherwise indicated.

3. Do not untwist UTP cables more than 1/2 inch from point of termination to maintain cable geometry.

G. Optical-Fiber Cable Installation:

1. Comply with TIA-568-C.3.

2. Cable shall be terminated on connecting hardware that is rack or cabinet mounted.

H. Coaxial-Cable Installation:

1. Install outdoor connections in enclosures complying with NEMA 250, Type 4X. Install corrosion-resistant connectors with properly designed O-rings to keep out moisture.

2. Attach antenna lead-in cable to support structure at intervals not exceeding 36 inches.

3. Install indoor cables in pathway.

I. Open-Cable Installation:

1. Install cabling with horizontal and vertical cable guides in telecommunication spaces with terminating hardware and interconnection equipment.

2. Suspend copper cable not in a wireway or pathway a minimum of 8 inches above ceilings by cable supports not more than 60 inches apart. Cable supports shall be fastened to structural members or floor slabs in accordance with Section 26 05 29.

3. Cable shall not be run in contact with pipes, ducts, or other potentially damaging items. Cables shall not be run through structural members or use structural members, pipes, ducts, or equipment as a support.

J. Installation of Cable Routed Exposed under Raised Floors:

1. Install plenum-rated cable only.

2. Install cabling after the flooring system has been installed in raised floor areas.

3. Cable 72 inches long shall be neatly coiled not less than 12 inches in diameter below each feed point.

K. Separation from EMI Sources:

1. Comply with BICSI TDMM and TIA-569-C recommendations for separating unshielded copper voice and data communication cable from potential EMI sources, including electrical power lines and equipment.

2. Separation between open communication cables or cables in nonmetallic pathways and unshielded power conductors and electrical equipment shall be as follows:

   a. Electrical Equipment Rating Less Than 2 kVA: A minimum of 5 inches.

   b. Electrical Equipment Rating between 2 and 5 kVA: A minimum of 12 inches.

   c. Electrical Equipment Rating More Than 5 kVA: A minimum of 24 inches.

3. Separation between communication cables in grounded metallic pathways and unshielded power lines or electrical equipment shall be as follows:

   a. Electrical Equipment Rating Less Than 2 kVA: A minimum of 2-1/2 inches.

   b. Electrical Equipment Rating between 2 and 5 kVA: A minimum of 6 inches.

   c. Electrical Equipment Rating More Than 5 kVA: A minimum of 12 inches.

4. Separation between cables in grounded metallic pathways and power lines and electrical equipment located in grounded metallic conduits or enclosures shall be as follows:

   a. Electrical Equipment Rating Less Than 2 kVA: No requirement.

   b. Electrical Equipment Rating between 2 and 5 kVA: A minimum of 3 inches.

   c. Electrical Equipment Rating More Than 5 kVA: A minimum of 6 inches.

5. Separation between Cables and Electrical Motors and Transformers, 5 kVA or hp and Larger: A minimum of 48 inches.

6. Separation between Cables and Fluorescent Fixtures: A minimum of 5 inches.

3.04 POWER AND CONTROL-CIRCUIT CONDUCTORS:

A. 120-V Power Wiring: Install according to Section 26 05 19 unless otherwise indicated.

B. Minimum Conductor Sizes:

1. Class 1 remote-control and signal circuits, No. 14 AWG.

2. Class 2 low-energy, remote-control and signal circuits, No. 16 AWG.

3. Class 3 low-energy, remote-control, alarm and signal circuits, No. 12 AWG.

3.05 CONNECTIONS:

A. Comply with requirements in Section 28 15 00 for connecting, terminating, and identifying wires and cables.

B. Comply with requirements in Section 28 20 00 for connecting, terminating, and identifying wires and cables.

3.06 FIRESTOPPING:

A. Comply with requirements in Section 07 84 13.

B. Comply with TIA-569-C, "Firestopping" Annex A.

C. Comply with BICSI TDMM, "Firestopping Systems" Article.

3.07 GROUNDING:

A. For communication wiring, comply with J-STD-607-A and with BICSI TDMM's "Grounding, Bonding, and Electrical Protection" chapter.

B. For low-voltage wiring and cabling, comply with requirements in Section 28 05 26.

3.08 IDENTIFICATION:

A. Identify system components, wiring, and cabling complying with TIA-606-B. Comply with requirements for identification specified in Section 26 05 53.

3.09 FIELD QUALITY CONTROL:

A. Refer and comply with Division 27 requirements.

B. Testing Agency: Engage a qualified testing agency to perform tests and inspections.

C. Manufacturer's Field Service: Engage a factory-authorized service representative to test and inspect components, assemblies, and equipment installations, including connections.

D. Perform the following tests and inspections:

1. Visually inspect UTP and optical-fiber cable jacket materials for NRTL certification markings. Inspect cabling terminations to confirm color coding for pin assignments and inspect cabling connections to confirm compliance with TIA-568-C.1.

2. Visually inspect cable placement, cable termination, grounding and bonding, equipment and patch cords, and labeling of all components.

3. Test UTP cabling for DC loop resistance, shorts, opens, intermittent faults, and polarity between conductors. Test operation of shorting bars in connection blocks. Test cables after termination but not cross connection.

    a. Test instruments shall comply with or exceed applicable requirements in TIA-568-C.2. Perform tests with a tester that complies with performance requirements in "Test Instruments (Normative)" Annex, complying with measurement accuracy specified in "Measurement Accuracy (Informative)" Annex. Use only test cords and adapters that are qualified by test equipment manufacturer for channel or link test configuration.

4. Optical-Fiber Cable Tests:

    a. Test instruments shall comply with or exceed applicable requirements in TIA-568-C.1. Use only test cords and adapters that are qualified by test equipment manufacturer for channel or link test configuration.

    b. Link End-to-End Attenuation Tests:

        (1) Multimode Link Measurements: Test at 850 or 1300 nm in one direction according to TIA-526-14-B, Method B, One Reference Jumper.

        (2) Attenuation test results for links shall be less than 2.0 db. Attenuation test results shall be less than that calculated according to equation in TIA-568-C.1.

    c. Signal-to-Noise-Ratio Test: Use a field-strength meter to make a sequence of measurements at the output of the last distribution amplifier or of another agreed-on location in system. With system operating at normal levels, tune meter to the picture carrier frequency of each of the designated channels in turn and record the level. With signal removed and input to corresponding headend amplifier terminated at 75 ohms, measure the level of noise at same tuning settings. With meter correction factor added to last readings, differences from first set shall not be less than 45 db.

d. Qualitative and Quantitative Performance Tests: Demonstrate reception quality of color-television program transmissions at each user interface from each designated channel and source. Quality shall be equal or superior to that obtained with performance checks specified below, using a standard, commercial, cable-ready, color-television receiver. Level and quality of signal at each outlet and from each service and source shall comply with the following Specifications when tested according to 47 604-12 76:

(1) RF video-carrier level.

(2) Relative video-carrier level.

(3) Carrier-level stability, during 60-minute and 24-hour periods.

(4) Broadband frequency response.

(5) Channel frequency response.

(6) Carrier-to-noise ratio.

(7) RF visual signal-to-noise ratio.

(8) Antenna combiner insertion loss.

(9) Signal power splitter loss.

(10) Cable connector attenuation.

E. Document data for each measurement. Print data for submittals in a summary report that is formatted using Table 10.1 in BICSI TDMM as a guide or transfer the data from the instrument to the computer, save as text files, print, and submit.

F. End-to-end cabling will be considered defective if it does not pass tests and inspections.

G. Prepare test and inspection reports.

3.10 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

Page Intentionally Left Blank

SECTION 28 05 26

GROUNDING AND BONDING FOR ELECTRONIC SECURITY

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide grounding and bonding for electronic security as indicated and in compliance with Contract Documents.

1. Grounding conductors

2. Grounding busbars

1.02 REFERENCES:

A. ASTM International (ASTM):

1. B3: Standard Specification for Soft or Annealed Copper Wire

2. B8: Standard Specification for Concentric-Lay-Stranded Copper Conductors, Hard, Medium-Hard, or Soft

3. B33: Standard Specification for Tin-Coated Soft or Annealed Copper Wire for Electrical Purposes

B. Institute of Electrical and Electronics Engineers (IEEE):

1. 1100: Recommended Practice for Power and Grounding Electronic Equipment

C. National Electrical Contractors Association (NECA):

F. Underwriters' Laboratories, Inc. (UL):

1. 83: Standard for Safety Thermoplastic-Insulated Wires and Cables

2. 467: Standard for Safety Grounding and Bonding Equipment

3. 486A-486B: Standard for Safety Wire Connectors

1.03 DEFINITIONS:

A. Signal Ground: The ground reference point designated by manufacturer of the system that is considered to have zero voltage.

1.04 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Product Data: For each type of product.

1.05 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.06 SPARE PARTS:

A. Comply with the requirements specified in Section 01 61 00.

1.07 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

1.08 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

PART 2 - PRODUCTS

2.01 CONDUCTORS:

A. Comply with UL 486A-486B.

B. Insulated Conductors: Stranded copper wire, green or green with yellow stripe insulation, insulated for 600 V, and complying with UL 83.

1. Ground wire for custom-length equipment ground jumpers shall be No. 6 AWG, 19-strand, UL-listed, Type THHN wire.

C. Bare Copper Conductors:

1. Solid Conductors: ASTM B 3

2. Stranded Conductors: ASTM B 8

3. Tinned Conductors: ASTM B 33

4. Bonding Conductor: No. 4 or No. 6 AWG, stranded conductor

5. Bonding Jumper: Tinned-copper tape, braided conductors terminated with two-hole copper ferrules; 1-5/8 inches wide and 1/16 inch thick

2.02 CONNECTORS:

A. Irreversible connectors listed for the purpose. Listed by an NRTL as complying with NFPA 70 for specific types, sizes, and combinations of conductors and other items connected. Comply with UL 486A-486B.

B. Compression Wire Connectors: Crimp-and-compress connectors that bond to the conductor when the connector is compressed around the conductor. Comply with UL 467.

1. Electroplated tinned copper, C and H shaped.

C. Busbar Connectors: Cast silicon bronze, solderless exothermic-type mechanical connector; with a long barrel and two holes spaced on 5/8- or 1-inch centers for a two-bolt connection to the busbar.

D. Welded Connectors: Exothermic-welding kits of types recommended by kit manufacturer for materials being joined and installation conditions.

2.03 GROUNDING BUSBARS:

A. Grounding Busbars: See telecom drawings for size and location in IDF rooms.

PART 3 - EXECUTION

3.01 INSTALLATION:

A. Comply with IEEE 1100, "Recommended Practice for Power and Grounding Electronic Equipment."

1. Ground cable shields, drain conductors, and equipment to eliminate shock hazard and to minimize ground loops, common-mode returns, noise pickup, cross talk, and other impairments.

2. Bond shields and drain conductors to ground at only one point in each circuit.

B. Signal Ground:

1. For each system, establish the signal ground and label that location as such.

2. Bond the signal ground to the alternating-current (ac) power system service by connecting to one of the following listed locations, using insulated No. 6 AWG**,** stranded, Type THHN wire:

   a. Grounding bar in an electrical power panelboard if located in the same room or space as the signal ground.

   b. Telecommunications grounding busbar.

C. Comply with NECA 1.

3.02 APPLICATION:

A. Conductors: Install solid conductor for No. 8 AWG and smaller and stranded conductors for No. 6 AWG and larger unless otherwise indicated.

B. Grounding and Bonding Conductors:

1. Install in the straightest and shortest route between the origination and termination point, and no longer than required. The bend radius shall not be smaller than eight times the diameter of the conductor. No one bend may exceed 90 degrees.

2. Install without splices.

3. Support at not more than 36-inch intervals.

3.03 CONNECTIONS:

A. Stacking of conductors under a single bolt is not permitted when connecting to busbars.

B. Assemble the wire connector to the conductor, complying with manufacturer's written instructions and as follows:

1. Use crimping tool and the die specific to the connector.

2. Pretwist the conductor.

3. Apply an antioxidant compound to all bolted and compression connections.

C. Shielded Cable: Bond the shield of shielded cable to the signal ground. Comply with TIA/EIA-568-B.1 and TIA/EIA-568-B.2 when grounding screened, balanced, twisted-pair cables.

D. Rack- and Cabinet-Mounted Equipment: Bond powered equipment chassis to the cabinet or rack grounding bar. Power connection shall comply with NFPA 70; the equipment grounding conductor in the power cord of cord- and plug-connected equipment shall be considered as a supplement to bonding requirements in this Section.

3.04 FIELD QUALITY CONTROL:

A. Refer and comply also to Section 27 05 26 requirements.

B. Perform tests and inspections.

C. Tests and Inspections:

1. Inspect physical and mechanical condition. Verify tightness of accessible, bolted, electrical connections with a calibrated torque wrench according to manufacturer's written instructions.

D. Grounding system will be considered defective if it does not pass tests and inspections.

E. Prepare test and inspection reports.

3.05 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

Page Intentionally Left Blank

SECTION 28 13 00

ACCESS CONTROL SOFTWARE AND DATABASE MANAGEMENT

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide access control software and database management as indicated and in compliance with Contract Documents.

B. The Security Management System (SMS), The Access Control Software server is existing in the existing operations building.. Contractor to provide programming for new buildings.

C. Provide field devices such as card readers, alarm inputs, control points, etc. The devices shall be connected to fully distributed intelligent field controllers All connections of the field devices shall be by the contractor.

1.02 EXISTING CONDITIONS:

A. The existing access control system is manufactured by Genetec Access Control.

B. The existing system will be expanded to connect the new card readers/keypads

C. Monitoring of the access control system is provided at the operations building and is to remain operational until the new operations building is complete and functioning, control and monitoring shall then be transferred to the new operations building.

1.03 REFERENCES:

A. Institute of Electrical and Electronics Engineers (IEEE):

1. 1100: Recommended Practice for Power and Grounding Electronic Equipment

B. National Electrical Manufacturers Association (NEMA):

4. DC-07: DCS Computer Interface (CIS-2) Standard

E. Telecommunications Industry Association (TIA):

1. EIA 568-C-1: Commercial Building Telecommunications Cabling Standards - Part 1: General Requirements.

2. EIA 606-B: Administration Standard for Commercial Telecommunications Infrastructure.

F. Underwriters' Laboratories, Inc. (UL):

1. 1610: Central-Station Burglar-Alarm Units

1.04 DEFINITIONS:

A. CCTV: Closed-circuit television

B. CPU: Central processing unit

C. SMS: Security Management System

D. Credential: Data assigned to an entity and used to identify that entity.

E. GFI: Ground fault interrupter

F. Identifier: A credential card; keypad personal identification number; or code, biometric characteristic, or other unique identification entered as data into the entry-control database for the purpose of identifying an individual. Where this term is presented with an initial capital letter, this definition applies.

G. I/O: Input/Output

H. LAN: Local area network

I. Location: A Location on the network having a PC-to-controller communications link, with additional controllers at the Location connected to the PC-to-controller link with a TIA 485-A communications loop. Where this term is presented with an initial capital letter, this definition applies.

J. PC: Personal computer. Applies to the central station, workstations, and file servers.

K. PCI Bus: Peripheral Component Interconnect. A peripheral bus providing a high-speed data path between the CPU and the peripheral devices such as a monitor, disk drive, or network.

L. RAS: Remote access services

M. RF: Radio frequency

N. ROM: Read-only memory. ROM data are maintained through losses of power.

O. TCP/IP: Transport control protocol/Internet protocol incorporated into Microsoft Windows.

P. UPS: Uninterruptible power supply

Q. USB: Universal serial bus

R. WAN: Wide area network

S. WAV: The digital audio format used in Microsoft Windows

T. WMP: Windows media player

U. Wiegand: Patented magnetic principle that uses specially treated wires embedded in the credential card

V. Windows: Operating system by Microsoft Corporation

W. Workstation: A PC with software that is configured for specific, limited security-system functions.

1.05 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Product Data: For each type of product indicated. Include rated capacities, operating characteristics, and furnished specialties and accessories. Reference each product to a location on Drawings. Test and evaluation data presented in Product Data shall comply with SIA BIO-01.

C. Shop Drawings: Include plans, elevations, sections, details, and attachments to other work.

1. Diagrams for cable management system

2. System labeling schedules, including electronic copy of labeling schedules that are part of the cable and asset identification system of the software specified in Parts 2 and 3.

3. Wiring Diagrams. For power, signal, and control wiring. Show typical wiring schematics including the following:

   a. Workstation outlets, jacks, and jack assemblies

   b. Patch cords

   c. Patch panels

4. Cable Administration Drawings: As specified in "Identification" Article.

5. Battery and charger calculations for central station, workstations, and controllers.

D. Product Schedules

E. Samples: For workstation outlets, jacks, jack assemblies, and faceplates. For each exposed product and for each color and texture specified.

F. Field quality-control reports.

G. Operation and Maintenance Data: For security system to include in emergency, operation, and maintenance manuals. In addition to items specified in Section 01 78 23, include the following:

1. Microsoft Windows software documentation.

2. PC installation and operating documentation, manuals, and software for the PC and all installed peripherals. Software shall include system restore, emergency boot diskettes, and drivers for all installed hardware. Provide separately for each PC.

3. Hard copies of manufacturer's specification sheets, operating specifications, design guides, user's guides for software and hardware, and PDF files on CD-ROM of the hard-copy submittal.

4. System installation and setup guides with data forms to plan and record options and setup decisions.

5. Hard copies of all installed software programs as programmed into the system and PDF files on CD-ROM of the hard-copy submittal.

H. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Laser Printers: Three toner cassettes and one replacement drum unit.

2. Credential card blanks, ready for printing. Include enough credential cards for all personnel to be enrolled at the site plus an extra 50 percent for future use.

3. Fuses of all kinds, power and electronic, equal to 25 percent of amount installed for each size used, but no fewer than three units.

1.06 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.07 SPARE PARTS:

A. Comply with the requirements specified in Section 01 61 00.

1.08 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

B. Installer Qualifications: An employer of workers trained and approved by manufacturer.

1. Cable installer must have on staff a registered communication distribution designer certified by Building Industry Consulting Service International.

C. Source Limitations: Obtain central station, workstations, controllers, Identifier readers, and all software through one source from single manufacturer.

D. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

E. Comply with NFPA 70, "National Electrical Code."

F. Comply with SIA DC-01, SIA DC-03 and SIA DC-07.

G. Comply with UL 294.

1.09 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

B. Central Station, Workstations, and Controllers:

1. Store in temperature- and humidity-controlled environment in original manufacturer's sealed containers. Maintain ambient temperature between 50 and 85 degrees F, and not more than 80 percent relative humidity, noncondensing.

2. Open each container; verify contents against packing list; and file copy of packing list, complete with container identification, for inclusion in operation and maintenance data.

3. Save original manufacturer's containers and packing materials and deliver as directed under provisions covering extra materials.

1.10 PROJECT/SITE CONDITIONS:

A. Environmental Conditions: System shall be capable of withstanding the following environmental conditions without mechanical or electrical damage or degradation of operating capability:

1. Indoor, Controlled Environment: NEMA 250, Type 1 enclosure. System components, except the central-station control unit, installed in temperature-controlled indoor environments shall be rated for continuous operation in ambient conditions of 36 to 122 degrees F dry bulb and 20 to 90 percent relative humidity, noncondensing.

2. Indoor, Uncontrolled Environment: NEMA 250, Type 3R enclosures. System components installed in non-temperature-controlled indoor environments shall be rated for continuous operation in ambient conditions of 0 to 122 degrees F dry bulb and 20 to 90 percent relative humidity, noncondensing.

3. Outdoor Environment: NEMA 250, NEMA 250, Type 4 enclosures. System components installed in locations exposed to weather shall be rated for continuous operation in ambient conditions of minus 30 to plus 122 degrees F dry bulb and 20 to 90 percent relative humidity, condensing. Rate for continuous operation where exposed to rain as specified in NEMA 250, winds up to 85 mph and snow cover up to 24 inches thick.

4. Hazardous Environment: System components located in areas where fire or explosion hazards may exist because of flammable gases or vapors, flammable liquids, combustible dust, or ignitable fibers shall be rated, listed, and installed according to NFPA 70.

5. Corrosive Environment: For system components subjected to corrosive fumes, vapors, and wind-driven salt spray in coastal zones, provide NEMA 250, Type 6P enclosures.

PART 2 - PRODUCTS

2.01 SYSTEM DESCRIPTION:

A. The SMS shall be an integrated system that utilizes a single, industry-standard relational database management system for the storage and manipulation of related data. The SMS shall include a server with operating system and applications software, operator and administrator terminals with appropriate software, hard copy printers and fixed magnetic storage media. The security devices shall communicate with the field panels via a

dedicated cable network. The field panels shall communicate to the server via a Fast Ethernet 10/1000, TCP/IP network or a serial (RS-232, RS-485) connection.

B. The SMS shall allow for growth and scalability from a low-end or entry level system to a high end or enterprise system by increasing CPU power, memory and database. The SMS shall be modular in nature, allowing system capacities to be easily expanded without requiring major changes to system operation. All defined system data as well as historical information shall be maintained. Customizable user interfaces shall allow management of system information and activity for administrators and operators. The SMS shall include an intuitive .NET based badging solution with a WYSIWYG badge layout editor and GUI for badge design.

C. Upon any alarm generated by the access control stations, the system shall automatically display the image of the camera(s) closest to the alarm point on spot monitor next to ACS workstation.

2.02 SMS FUNCTIONALITY:

A. Partitioning: The SMS shall allow system administrators to separate the creation and viewing of objects into partitions. SMS operators shall be associated with partitions and this shall determine which objects operators have the ability to create and or view. The SMS shall support an unlimited number of partitions.

1. The SMS partitions shall include but not be limited to the following objects:

a. Personnel

b. Clearances

c. Doors

d. Controllers with all associated hardware (readers, inputs, outputs, etc.)

e. Video servers with all associated objects (cameras, tours, views, etc.)

f. Application layouts

g. Events

h. Dynamic views

i. Maps

j. Reports, forms, results

k. Holidays

l. Badge layouts

m. Queries

n. Images

2. Through the use of privileges, the SMS System Administrator shall be able to determine which objects are associated with a particular partition. These objects shall then be assigned to System Operators with the appropriate privilege.

3. The SMS shall support a super-user assigned the 'System All' privilege who shall have full access to all objects in all partitions.

4. Any operator shall have the ability to be assigned access rights to any partition. Individual Access rights shall be created and have the ability to be assigned to any users of the SMS.

5. The SMS shall allow objects to be created in any partition. The SMS shall have the ability to grant or remove permission from any object in any partition.

6. The SMS shall provide the ability to move objects from one partition to another partition without the requirement of deleting and recreating.

7. The SMS shall provide the ability to import/export any configured object.

8. The SMS shall support the display of all associated objects contained within a partition.

B. Enterprise Architecture:

1. The SMS shall provide an Enterprise Architecture, licensable option that allows you to configure multiple Satellite Application Servers (SAS) to communicate with a Master Application Server (MAS). The Master Application Server shall provide a platform for global management of the personnel, video, and access control security objects on two or more Satellite Application Servers (SAS) in an enterprise.

2. The Enterprise Architecture shall work by synchronizing each SAS system's database with the MAS database. The MAS shall contain the global data that is used across every server, such as global personnel records, global clearances, and global schedules. The global data shall be synchronized to each SAS to provide enterprise-wide security. The MAS shall be used to remotely monitor and manage controllers and video servers attached to SAS's in the enterprise, however it shall not support any directly connected controllers or video servers.

3. The MAS shall provide the capability for Central Monitoring of the entire enterprise, using the Monitoring Station application. From a Central Monitoring Station connected to the MAS, the system shall be capable of viewing events, activities, and status of every SAS in the enterprise. Alternatively, you can connect

to an individual SAS to monitor that system and its connected hardware. In addition, the MAS shall provide the ability to integrate with external sources via LDAP, XML, CSV or ODBC imports both manually or automatically through scheduled processes.

4. Each SAS shall contain database records for all connected video and access control devices, as well as local personnel, clearances, privileges, and other related data. Each SAS shall synchronize with the MAS so that SAS local data is replicated to the MAS for central management and monitoring. In addition, the MAS shall provide central reporting capability for replicated SAS objects including journal and audit transactional data.

5. All local data shall be synchronized immediately to the MAS or queued if a server is offline. All queued data shall be replicated automatically upon restoral of communication. Global data that is created or changed at the SAS/MAS shall be replicated to all locations. Journal and Audit data shall be synchronized either manually or on a configurable schedule, providing the ability to manage bandwidth usage and load balancing.

6. Operators in the enterprise architecture shall be configured as local or global. Global operators shall be subject to the user privileges as defined on each SAS.

7. The Enterprise Architecture shall support a Standalone to SAS Migration Utility that shall be used to merge a standalone SMS server into an existing SMS Enterprise site.

8. The Enterprise Architecture option shall include:

    a. Support for up to 20 SAS Systems

    b. Global Administration of Personnel and Clearances, Images, Card formats, CHUID Formats, Holidays, Personnel groups, and Operators and Privileges

    c. Centralized Reporting

    d. Central Monitoring of Events and Activities across the Enterprise

    e. Central Management of Access Card Enrollment

    f. Central Badging and Image processing

    g. Global Management of Badge Layouts

    h. Single Card Access across the Entire Enterprise

    i. Increased Scalability of Security Hardware and Video

    j. End-to-End Encryption

k. Automated Synchronization of Enterprise Security Databases

l. Central Management of Video and Hardware Resources

m. Remote Editing of Global and Local Data

C. Graphical User Interface (GUI):

1. The SMS shall employ a standard Windows graphical user interface (GUI). A mouse and keyboard shall be the primary operator interface with the system. Operator screens shall utilize all standard Windows-style functions such as drop-down menus, context menus, radio buttons, and lists, as appropriate. The interface shall utilize a 'tree structure' similar to Windows Explorer.

D. Administration Operator Interface:

1. The SMS shall employ an Administration Operator Interface to control the following:

a. Hardware (readers, inputs, outputs, video systems, door controls, CCTV, and other systems).

b. Configuration of personnel records, operators and operator privileges.

c. Graphical Maps.

d. Application Layouts.

e. Dynamic Views.

f. Queries.

g. Import/Export of objects, including images.

h. System Variables.

i. Reports (either periodic or one-time).

j. System functions (event command and control, actions, schedules).

k. Display of a list of objects in a grid that can have their values modified and respond to real-time status changes.

l. Scheduling of backups.

m. Monitoring of system settings and performance.

n. Designing of and printing of badges.

2. The GUI shall be configurable by the system administrator to control the views and access of each Monitoring Station operator.

E. Monitoring Operator Interface/Activity Monitoring:

1. The SMS shall contain a monitoring component that is capable of, among other things, displaying the current state of any object in the system. Additionally the monitoring station shall be capable of displaying a log of all activity that occurs in the system, from object state changes, to access control information. All text for events (alarms) in the system shall be configurable to be displayed in color based on the user-specified priority of the event.

2. The Monitoring Station shall be capable of showing all changes occurring to an object without requiring the associated activity messages for that object to be routed to that monitoring station. The SMS shall require the operator to have appropriate permissions to view and/or control any object.

3. The monitoring station interface shall be user-customizable. The SMS shall support the ability of the end user to create a customized application layout for the monitoring station. The monitoring station shall support multiple application layouts that can be assigned to the operators. Each application layout can have multiple panes in the same window. The panes can have multiple tabs so that different objects such as cameras and tours can be displayed in the same pane. The panes shall have the ability to include: General activity; Event (Alarm) activity; Dynamic card swipe information; Video cameras and tours; Maps; Dynamic Views; Reports; and links to external applications. Each pane shall have the ability to be moved to a specific screen.

4. The SMS monitoring station shall support a Swipe and Show Viewer. The Swipe and Show Viewer shall monitor a configurable list of Doors and shall display a portrait or multiple portraits of personnel who present an access credential at a Reader on an included Door or Elevator. The SMS shall allow multiple Swipe and Show Viewers to be added to an Application Layout. The Swipe and Show Viewer shall provide configurable image border colors that shall correspond to access transaction states (Admit, Reject etc.). The Swipe and Show Viewer shall display the date and time of the transaction, the location, area, Cardholders name and the status of the transaction. The Swipe and Show Viewer shall allow an Operator with the appropriate Privileges to perform the following functions from the Viewer:

a. View/Edit the Cardholder record

b. Perform a momentary unlock of the associated door

c. Grace the Cardholder (allow the cardholder into an APB area)

d. Perform an Area Lockout Grace of the cardholder

e. Perform an APB reset on the cardholder

5. The SMS shall support the ability to configure an Operator's Application Layouts to open in separate instances of the Monitoring Station to enhance the performance of multiple displays. Each Application Layout shall support the assignment of a monitor number. The Operator opening the Monitoring Application shall automatically open a separate instance of the Monitoring Application on each assigned Monitor. The SMS shall support up to Ten (10) assigned monitors for Application Layouts.

6. The SMS shall provide the Monitoring Operator with following functional capabilities:

   a. Shall provide a scrolling list of lines or tiles showing current activity on the system.

   b. Shall display activity in real-time as data is being transmitted by field hardware.

   c. Shall include icons that indicate the type of activity and textual description of the activity.

   d. The color of the frames of the tiles, icons, and/or text shall indicate the type or importance of the information contained therein.

   e. A series of menus, driven by drop-down or trees, shall allow the Monitoring Station operator to perform manual actions, such as “momentary door unlock” for a given door.

   f. As part of the manual action capability, the system shall provide screens or boxes that query the operator on specifics, such as start and end time, and offer guidance on performing the manual actions.

   g. Ability to view a sortable list of active alarms or events and recently active alarms or activity.

   h. A GUI that minimizes the number of operator mouse clicks or keyboard strokes.

   i. Mouse controls include “right-click” pop-ups and highlighted default selections.

   j. Objects shall be displayed to the operator based on his/her assigned operator privilege. The operator shall only be able to monitor/command those objects for which he or she has been assigned privilege.

k. When an operator logs out of a workstation and a new operator logs on, the objects displayed on the workstation screen shall by dynamically updated to display only those objects for which the new operator has privilege.

l. Allow the customization of columns as defined by the operator privilege, including:

(1) Adjusting width (on the fly or pre-programmed).

(2) Not displaying Columns (on the fly or pre-programmed)

(3) Sorting on selected columns (to follow standard Windows conventions)

m. Allow for a "freeze" function. This includes a configurable "freeze time-out" that permits an activity to be selected and temporarily prevents the display of subsequent activities which push the selected activity off the screen. A break-through event disables the freeze function. The freeze function shall provide a graphic bar where the remaining time available in the freeze timeout shall be displayed. Selecting the freeze timeout icon before the time elapses shall extend the freeze timeout to the maximum.

n. Provide Acknowledge All, Acknowledge and Clear All and Silence All buttons for events.

o. Support multiple panes for the display of events, activities, video, personnel images, and maps.

p. Display the number of active causes of an event.

q. Support the ability to attach a log message to an event, even after the event has been acknowledged.

r. Provide the ability to attach Predefined Log Messages to an event upon acknowledgement.

s. Shall allow a Monitoring Operator to select on-screen transactions (both events and system activity) and Email the transactions with a single mouse click.

7. Pre-defined Alarm Acknowledgement Messages:

a. The SMS shall provide the ability to create Predefined Log Messages. Each log message shall have a Name, Description, Label and Message Text. These messages shall be assigned to any event providing the ability to select the appropriate response that resolved the event. The SMS shall provide the ability to group multiple log messages and then assign the group to an event. Each group shall contain up to one hundred messages and each event shall

support up to one hundred messages. The SMS shall allow only users with specified operator privileges to add, modify, or delete messages or message groups. Predefined messages shall be editable by an operator with the proper privilege and may be appended as required by the operator.

b. Messages shall have the following characteristics:

(1) Message Name shall be configured with up to 500 characters

(2) Message Description shall be configured with up to 500 characters

(3) Message Label shall be configured with up to 100 characters

(4) Message Text shall be configured with up to 3000 characters

8. The SMS shall support audible alarm annunciation at operator workstations (operator configurable audio files associated with alarms).

9. The activity monitoring screen shall be capable of displaying the following features:

a. System clock

b. Date/time when the activity actually occurred and the date/time when the activity was received by the server shall be displayed (when they are different).

c. Real time event counters

d. Count of the active events

e. Count of the events requiring operator acknowledgment

f. Name of operator logged on at the workstation

g. Real-time display of the current activity on the system in chronological order

h. Acknowledge All and Silence All buttons for events

i. Manual Action command buttons

j. Pre-defined and configurable acknowledgement messages

k. Log message

l. Clear event

m. Clear group of events

n. Event action message (automatically display selected message for event)

o. Dynamic views

F. Web Client:

1. The SMS shall support a Thin Client to provide remote access to the SMS Server via a web browser. The Thin Client shall support Microsoft® Internet Explorer latest vested version and Mozilla Firefox® 3.0 or greater. The Thin Client shall support 128-bit AES encryption to the SMS Server.

2. The Thin Client shall support Single Sign-on utilizing Windows Authentication. The privileges of the SMS operator shall be propagated to the Thin Client User allowing only access to Security Objects for which the SMS Operator is authorized. The Thin Client shall provide support for Partitioning of the system and utilize the Partitions assigned to the Operator.

3. All changes made to the SMS database via the Thin Client shall be recorded in the Audit Trail Database.

4. The Thin Client shall provide Personnel Management including:

a. Shall allow the operator to create and modify personnel data (includes adding/removing clearances, schedules, and expiration dates).

b. Operator shall have the ability to enable and disable cards.

c. Operator shall have the ability to search for, edit, add, and delete Personnel records from the SMS database.

d. Search function shall allow wildcards and shall include First name, Last name, card number, and user defined text.

e. Shall support for the Auto-increment Card Number feature for Credentials created using the Web Client.

f. Shall support a Change CHUID Format button on the Credentials tab that allows you to change the CHUID format of a Credential.

g. Shall support an Auto Generate button that allows you to randomly generate a PIN for PIN-only Credentials.

h. SMS thin client shall provide a personnel image tab that includes image display, Image capture from a file or a local USB camera, and the capability to crop the Image and save it to the SMS personnel record.

5. The Thin Client shall support an Activity Monitor to provide a scrolling display of system activity. Activity shall be restricted based upon the Operator's Privilege

and Partition assignments. Display controls shall include page up, page down, and a freeze function.

6. The Thin Client shall support acknowledgement of an Event from the Event Dynamic View.

7. The Thin Client shall support for logging an Event Message from the Event Dynamic View

8. The Thin Client shall support Manual Actions to include the Locking/unlocking of doors, and the Activation/deactivation of events.

9. The Thin Client shall support the display of Dynamic Views as defined by the SMS. Dynamic Views shall provide a real time view of SMS data including Journal and Audit Trail history. Viewing of Multiple Dynamic Views shall be supported.

10. The Thin Client shall support creating, configuring, loading and saving of reports. Reports shall consist of personnel history activity or audit data. The report data shall allow sorting within the thin Client view page by any displayed field in ascending or descending order. The Thin Client shall allow reports to be saved in the following formats: XLS, CSV, XML, TXT or PDF. The operator shall have the option to save the report to a file or send it via email.

11. The Thin Client shall support Manual Action Challenges. The Manual Action Challenge shall require an operator to enter their login credentials (User name and password) when executing a manual action, such as a door unlock, from within the Thin client.

12. The Thin Client shall support the ability to query on a specific cardholder or a group of cardholders for the purpose of assigning clearances to multiple cardholders at once. Once the query is complete, the operator shall have the ability to assign a single access clearance or a group of clearances to all cardholders.

13. The Thin Client shall support the ability to display a door activity report from the web client cardholder record configuration view. In addition, it shall provide the ability to display the Activation / Expiration Date and Time for each credential assigned to a cardholder. The thin client shall display all user-defined personnel fields and the details of each assigned access clearance in a separate window.

14. The Thin Client shall support Auto-Logoff based upon inactivity. The Thin Client shall monitor user activity and shall automatically log a user out of the workstation after a user defined timeout period.

15. The Thin Client shall support the ability to assign or remove clearances to multiple cardholders simultaneously.

G. Graphic Maps:

1. The SMS shall support unlimited graphic maps and icons to be displayed on the operator workstation monitor.

2. The system shall support an operator-programmable, color graphic map display that:

   a. Shall be capable of showing the floor plan, the location of alarm devices, and alarm instructions for a facility.

   b. Shall be centralized in the system configuration and displayed on the operators' workstations.

   c. Shall allow various maps to be associated with different areas to create a hierarchy of maps.

   d. Shall support graphic maps having a resolution of 1024x768 Pixels or greater.

3. Operators shall be able to use drag-and-drop mouse technique to place dynamic system level object icons of all objects such as: cameras, video servers, inputs/outputs, events, maps, reports, dynamic views, and door/elevator icons. These dynamic object icons shall allow a system operator to perform tasks and issue commands related to the object by double-clicking on the icon.

4. The SMS shall allow the addition of new layers to the drawing (such that if the drawing must ever be reloaded due to an update of the drawing, the layer(s) created within the SMS will be added back automatically without additional reconfiguration).

5. The SMS shall be able to directly import the following file formats for the map:

   a. AutoCAD (.DWG)

   b. DXF

   c. JPEG (.JPG)

   d. PNG

6. The Maps feature shall include two operational modes: an administrative mode to allow configuring of the facility floor plans or site plans that show exterior features and a runtime mode to allow monitoring and interacting with the configured facility layouts or site plans.

H. Information Storage, Backup and Transfer:

1. All programmed information, as well as transactional history, shall be automatically stored in the database for later retrieval and backup. The SMS shall support configurations where the SMS database(s) may be installed on a hard drive on the SMS server, on an independent database server, or in an existing corporate database server.

2. The SMS shall be capable of backing up and restoring all system data and transactional history. The server shall be capable of transferring all programmed data and transactional history to CD-ROM, DVD, or Hard Drive (including networked drives).

3. The SMS shall allow activity history to be written to a database. The system shall have the capacity to store a minimum of 50 million transactions. There shall be a method of backing up the activity history on external media and then restoring and replaying it.

4. The SMS shall support AES 256-bit encrypted communications between server and user client.

5. The SMS shall support AES 256-bit encrypted communications between server and controller. The encryption shall support both local and third-party digital certificates.

I. Communication Ports:

1. The SMS shall be able to support multiple serial devices. In addition to COM1 and COM2, up to 32, additional ports may be configured through the use of a port expander or its equivalent. These serial ports may be used for connection to CCTV matrix switchers, or apC panels.

2. The SMS shall support the use of Ethernet networks as the communications path between the host computer and field devices. This communications path shall be the same network used for communications between the host server and the operator workstations. The communications between the host computer and the field devices shall be encapsulated in a TCP/IP network/transport layer.

J. Printers:

1. The SMS shall support report printing. The report printer(s) may be connected directly to the client PC or shared over a network. The SMS shall support as report printer(s) any printer for which a printer driver exists within the Windows 7, Windows 8.1 and Windows Server 2008 operating systems.

K. Software Configuration:

1. The SMS configuration tools shall utilize intelligent configuration controls. The system shall be structured so an operator is unable to perform configuration functions that are invalid based on the configuration used. The system shall support the ability to search within browser lists using filtering operators such as “begins with”, “ends with”, “contains”, etc. The system shall also allow an operator to do searches using filtering operators on any class of object in the system, both in the Administration application and the Monitoring Station application.

2. The SMS shall allow text description of all configured objects. The SMS shall allow the renaming of an existing title description without removing the sub-components of that configuration object. The SMS shall automatically remove from the system all configuration references to an object being deleted. The SMS shall automatically provide default names for all inputs, outputs, readers, and extension boards. The SMS shall clearly display which hardware objects (inputs, outputs, readers) on a controller are configured, and which are not.

3. The SMS shall provide for the configuration of templates. Templates of supported objects shall be operator-configurable to provide default values for data fields within an object class’s configuration.

4. The SMS shall support an unlimited number of groups for any object type. The SMS shall support unlimited object group definitions. In general, a group shall be usable wherever an individual object is referenced in the SMS. For example, a group may be used instead of an object when configuring a schedule/object pair in a clearance, and a group may be used instead of an object when performing a manual action to unlock a door.

5. The SMS shall generally allow any object in the system to be grouped including personnel, doors, inputs, outputs and clearances.

6. The SMS shall restrict the viewing and controlling of objects in the administration and monitoring stations via operator privileges. The SMS shall support the configuration of operator restrictions on an object class basis, and on an object-by-object basis. The SMS shall maintain a distinction between objects that are being monitored and objects that are being controlled, preventing operators from issuing object manual actions to objects for which the operator does not have manual action privileges. There shall be different levels of controls within the system for administration privileges versus monitoring privileges.

7. The SMS shall support unlimited operator accounts with unlimited definable privilege levels.

8. The SMS shall allow configuration of controllers using hierarchical tree-based navigation and context menus.

9. The SMS shall support the ability to download firmware updates to the controllers.

10. The SMS shall support the following methods for Operator authentication and authorization:

    a. Windows Single Sign-On (SSO)

    b. Basic User Authentication with locally defined user names and passwords with strong password rule enforcement.

11. The SMS shall provide an automatic client update process for quick distribution of application updates.

12. The SMS shall have context sensitive online help (at the screen level) available at any point requiring operator input.

L. Personnel Records:

1. The SMS shall provide Personnel Templates that shall eliminate repetitive data entry by pre-configuring Personnel Records with data common to all Personnel.

2. The SMS Personnel records shall provide multiple tabbed pages of personnel data containing default system and user-defined fields. The SMS shall support an unlimited number of tabs allowing an unlimited number of user-defined fields. Labels for user-defined field tabs shall be customizable by the System Administrator with the appropriate privileges. Each user-defined field shall allow a name, description and label. A default language shall be selectable by the System Administrator for the user-defined field labels.

3. User-defined fields shall be definable as Mandatory or Unique and shall support the following field types:

    a. Character

    b. Integer

    c. Logical

    d. Date/Time

    e. Date

    f. Time

    g. Enumerated List

    h. Multi Line

i. Decimal

j. Identity

4. User-defined fields shall support masking to provide consistency of data entry across all system operators. Custom masks, as well as the following predefined masks, shall be available:

a. Alphabetic

b. Alphanumeric

c. Numeric

d. Phone Number – USA

e. Zip Code

f. Zip Code +4

g. Alpha – All Caps

h. Alpha – All Lower case

M. Credentials:

1. The SMS shall support a minimum of five (5) credentials (cards) per Personnel record and shall only count Active and/or Expired Cards towards the maximum assignable Cards per Person. Cards designated as Lost, Stolen and Disabled shall not count towards the maximum assignable Cards per Person.

2. The SMS shall support the ability to define the default period of time (in Days, Hours or Years) from a Credential's Activation Date until its Expiration. The SMS shall support an override of the default Expiration time period for individual Personnel Types.

3. The SMS shall support Temporary Credentials. Temporary Credentials shall be available for general re-use without being associated to specific Personnel records. Temporary Credentials shall be assignable to visitors and can also serve as temporary replacement cards for Personnel who misplaced or forgot their regular Credentials. The SMS shall support the configuration of a default number of days for Temporary Credentials to remain active after they are created.

4. The SMS shall provide the ability to define background colors for the Active/Expired Credential Status fields in the Personnel Record.

5. The SMS shall support a system-wide setting to automatically disable Personnel Credentials that have not been used for a specified period of time. The Disable by Inactivity process shall support a user configurable daily scan time.

N. Personnel Views:

1. The SMS shall support user-defined Personnel Views. Personnel Views shall provide the ability to customize the Personnel record by adding and/or removing certain objects from the operator's view. Personnel Views shall be assignable to SMS operators via the operator's assigned privilege and shall be definable for use in the creation and/or editing of the Personnel record. All Personnel Views enabled for an operator shall be selectable from the current view to allow an operator to switch views in real time. Personnel Views shall support the following:

   a. Adding/Removing Fields (including all user-defined fields)

   b. Custom Field Labels

   c. Adding Boxes to group together common fields

   d. Adding/Removing tabs to organize fields

   e. Custom Tab Labels

   f. Customization of Tab display order

   g. Background/Foreground color control of fields and labels

O. Inputs:

1. The SMS shall monitor both supervised and unsupervised hardware inputs as well as virtual inputs such as predefined system messages. These inputs include door / elevator inputs and monitor points. The SMS shall also monitor controller inputs such as tamper, AC fail, and low battery.

2. The SMS shall have the ability to name and allow for user-defined descriptions for individual inputs, outputs, and readers as well as input and output modules.

3. There shall be three separate and distinct states for inputs, which can be defined on the input configuration screen: Disabled, Enabled / Disarmed and Enabled / Armed.

4. The SMS shall allow configuration to link the state of an input to an output. The system shall allow multiple inputs to activate a single output or group of outputs.

P. Outputs:

1. The SMS shall have outputs, also known as Control points, that associate an input or event action with a relay output. These output uses include doors / elevators, alarms and industrial control.

2. There shall be three types of outputs available: dry contact / Form C relays, wet or voltage sourced relays and Open Collectors. Outputs shall be configured such that they can be activated, deactivated or pulsed by system actions.

Q. Card and Reader Support:

1. The SMS shall be designed to support multiple card formats and card reader types.

2. The SMS shall support the following features for directly connected readers:

a. User defined card formats up to 256 bits.

b. Unlimited number of SMS card formats.

c. The ability to assign up to 10 card formats per reader.

d. The ability to show reader status on RM LCD.

e. Support Wiegand and 3x4 matrix keypads.

f. The enrollment of biometric templates to smartcards.

g. Custom CHUID FIPS201-compliant supporting full 256-bit data.

h. The SMS shall support readers that provide Wiegand signaling and magnetic signaling to include:

(1) HID card readers

R. Advanced Door Monitoring:

1. The SMS shall support Advanced Door Monitoring allowing additional monitoring inputs and lock sensing equipment at all doors. Advanced Door Monitoring shall allow integration with third-party lock release inputs, such as fire and crash bar devices, that control emergency egress.

2. Advanced Door Monitoring shall include:

a. Multiple inputs – Advanced Doors shall support up to 16 inputs.

b. Single and double-leaf doors with multiple DSM or Request To Exit (RTE) inputs.

c. Shall support Lock sensing devices – to monitor locking on magnetic bonds, bolts, and cams.

d. Integrated lock releases – to integrate door unlocking with fire, crash bar, power fail, and key switch inputs.

e. Special events and actions – to create keypad commands that lock, unlock, and secure doors for a specific time period.

f. Alarm Suppression and RTE control on a per door basis.

g. Enhanced Shunt control.

h. Grace and change timing options – to fine tune the SMS timing to avoid the effects of 'door bounce'.

i. Journal reports and Monitor Station activities – to manage the system and monitor door activity.

j. Additional Event Actions related to Advanced Doors

S. Door Configurations / Elevator Control:

1. The SMS shall allow doors to be configured to operate in any of the following access control modes:

a. Unlocked

b. No Access (Secure mode)

c. Any combination of the following, as defined by schedule, event, card only, Card entry and biometrics.

2. The SMS shall allow a door to be configured to operate using the following functions:

a. Readers shall read cards while the door is in the open position.

b. Door lock relay shall automatically lock upon the door being opened.

c. Allow for a user-defined delay relock time period.

d. Allow for a user-defined door unlock time and door held open time.

e. A separate (alternate) shunt timer for ADA flagged cardholders

f. The operator shall be able to specify a shunt expiration output to be triggered for a configurable time (in hh:mm:ss) before the expiration of the door open or alternate shunt. Can be enabled for ADA only, or all the time.

g. Allow for a user-defined door unlock and door held time, in seconds.

h. PIN-only access (keypad).

i. PIN-entry on the reader keypad shall be required during a specified schedule after a card access (unless a manual action or event has disabled PIN).

j. Card entry through keypad.

3. The SMS shall allow each door to be configured to cause a variety of events such as alarms to occur based on activity at that door.

4. The SMS shall support configuration of unlimited elevators.

5. The SMS shall support an extended unlock function initiated via two valid card presentations to a single reader or a 'double swipe'. The double swipe feature provides the ability to designate doors at which cardholders with double swipe privileges may perform an extended lock or unlock of the door. The double swipe feature shall support the following:

a. Modified reader beeper pattern to reflect the extended unlock mode.

b. Individual card access privileges to perform double swipe action.

c. Unique parameters assignable to any door.

d. Reset of a double swipe unlock (relock) via scheduled event.

e. Event activation to reflect double swipe state (Lock, Unlock).

T. Maintenance Mode:

1. The SMS shall support a Maintenance Mode to facilitate the installation, testing and maintenance of selected SMS objects. Maintenance Mode shall be used to limit information about an object displayed on the SMS Monitoring Station. An SMS System Operator, with the appropriate Privileges, shall be able to place SMS objects into Maintenance Mode. Placing an object into Maintenance Mode shall not prevent SMS actions associated with that object from occurring. Maintenance Mode shall only affect the Monitoring Application and shall allow the System Operator to:

a. Only view those objects in Maintenance Mode

b. Exclude those objects in Maintenance Mode from an Operator's view

c. View information about all System objects, including those in Maintenance Mode

2. Operator Privilege and Application Layout Filtering assignments shall determine whether or not an object in Maintenance Mode is viewable as being in Maintenance Mode on the Monitoring Station. Only Monitoring Station operators with the correct privilege and Application Layout Filtering shall be able to view objects in Maintenance Mode. Maintenance Mode shall only be reported in Journal messages when an object is placed in Maintenance Mode.

3. The following objects shall be supported in Maintenance Mode (at a minimum):

a. Controllers

b. Doors

c. Readers

d. Input/Output Modules

e. Inputs

f. Outputs

g. Elevators

h. Events

i. Areas

j. Intrusion Zones

k. Keypad Commands

U. Area Control and Antipassback:

1. The SMS shall support the ability to define Area configurations. Areas are defined as physical regions bounded by doors. An area shall consist of a room, a specific location(s) within a building, or an entire building

2. All configured areas shall have in/out access doors providing the ability to run reports showing all present cardholders in each area. There shall be no way to leave an area without presenting a credential to a reader/door.

3. The SMS shall support Global Antipassback and shall allow an area to be configured to cross multiple clusters (groups of controllers) to enforce Global Antipassback decisions.

4. The SMS shall provide the ability to run a Roll Call report. The host shall maintain a current area for each personnel record, and the time at which the area was entered (AreaAccessTime).The current area shall represent the last area entered by the cardholder based on a valid admit.

5. The SMS shall support Area control to provide the ability for tracking personnel. With this function, an operator shall obtain the current location of cardholders. Dynamic views and or reports can be generated to show specific cardholders who are present in each defined area.

6. Each cardholder's record shall provide easy access to view and maintain their current area location. This card record property will be updated as a person moves from one area to another using a valid credential.

7. The local controller shall provide the ability to manage and control the Area configuration in the event that it loses communication with the SMS system server.

8. The SMS Area configuration shall have three modes of operations: None, Antipassback, and Timed Antipassback.

9. Antipassback shall control access based on the cardholder's location. The SMS shall deny access to cardholders who are in violation of antipassback rules. In the event that a cardholder leaves an area without presenting their credential to the Out access reader/door and then tries to enter back into the area by swiping the In access reader/door, a denial of access will occur. The SMS shall provide the ability to grace individual cardholders who have violated antipassback rules. The Grace option shall also provide the ability to grace all cardholders.

10. Antipassback shall continue to be enforced during communications failure. SMS controllers shall have the ability to be clustered in a group. The master controller in the group and all other controllers within that group shall have full access to the existing antipassback information. The cluster can be configured for 'No Access' Communications Failure mode or for 'Local' Communications Failure mode.

11. Clustered controllers configured in 'Local' mode that are disconnected from the master controller shall grace all cardholders from antipassback violations. The disconnected controller shall then follow antipassback rules specific to the areas defined on that controller. If the controller does not know if a cardholder is in antipassback violation based on areas that are configured between controllers, access will be granted.

12. Clustered controllers configured in 'No Access' mode that are disconnected from the master controller mode shall not grace all cardholders from antipassback violations. All cardholders will receive a denial of access until communications is restored.

13. The SMS shall support Timed Antipassback. Areas configured for Timed Antipassback shall require a cardholder use an exit reader to exit an area. Cardholders who do not exit properly shall be required to wait for a predetermined period of time before re-entering the area.

14. The SMS shall support Pass-through Areas. Area Pass-through shall serve to restrict the length of time that Personnel can remain in an Area before being required to exit or pass through to another area. The SMS shall support a user-defined time period for the Pass-through area. Personnel Groups shall be configurable with Pass-through Restrictions and each Personnel Group shall support a separate, user-defined time period that may be different than the Area-wide time interval. Personnel Groups shall be configurable to be exempt from Pass-through Restrictions.

15. The SMS shall provide occupancy restrictions for areas. Restrictions shall be applied to individual cardholders (personnel) or user defined groups of cardholders. Areas shall be configurable to provide limits for the maximum and minimum number of personnel who can access an area at one time. It shall be possible to trigger an event based upon a violation of either of these rules. Events shall be configurable based upon the following criteria:

    a. Maximum occupancy status

    b. Minimum occupancy status

    c. Group Maximum occupancy status

    d. Group Minimum occupancy status

    e. Personnel Count (user-defined)

    f. Violation status (Antipassback entry/exit violation etc.)

16. The SMS shall support Soft occupancy restrictions for both maximum and minimum occupancy to allow reporting of violations while still allowing access to the area.

17. The SMS shall support Area Lockout. Area Lockout shall restrict or lockout certain cardholders from an area once they have accessed another area. The cardholder shall be locked out of the designated target Area or Group of Areas for a specified period of time. The maximum time period for lockout shall be five (5) days. The target locked-out Area shall be any of the following:

    a. Same Area

    b. Another Area

    c. Area group

18. The SMS shall allow a System Operator with the appropriate privileges to cancel the lockout time (lockout grace) for all or individual cardholders, thereby canceling the area lockout.

V. Intrusion Zones:

1. The SMS shall support the configuration of Intrusion Zones. An Intrusion Zone is a user-defined group of Doors and Inputs on the same local Controller that delineates a physical area. This area shall be monitored and produce an alarm during any violation of the objects associated with the Zone.

2. The local controller shall provide the ability to manage and control the Intrusion Zone in the event that it loses communication with the SMS system server.

3. The Intrusion Zone shall have 2 modes of operations: Armed or Disarmed. When an Intrusion Zone is in an armed mode, the state of the Intrusion Zone shall either be Violated or Not Violated based on the state of the inputs and doors associated with the Zone. If the Zone is violated the SMS shall provide the ability to execute any defined event(s) within the SMS.

4. The SMS shall provide the ability to display the "Ready to Arm State" of any configured Zone. The "Ready to Arm State" shall be able to be displayed from any SMS monitoring application or from a local reader with an LCD display. All off-normal points/doors shall be able to be displayed from both locations. If any point or door associated with a Zone is not in a normal state, the Zone shall show a "Not Ready to Arm State".

5. When a door is placed in a Zone, the operation of the door shall be configured based on the state of the Zone (unlocked, locked, secure). Specific doors assigned to the Intrusion Zone shall be configured as entrance or exit points for the Zone. When the Zone is being armed or disarmed, a user-definable time shall be set for exit or disarm operations. Specific readers/doors shall have the ability to be defined as arm/disarming stations.

6. The Intrusion Zone shall be configured such that when an input configured in a Zone is active, the Zone cannot be armed without executing a force arm. When a Zone is force armed, the input(s) that were in an active state shall not function as part of the Zone until they are placed back in a normal state and the Zone is disarmed and rearmed.

7. Inputs configured in a Zone shall have the ability to be configured as Controlled Inputs or Monitored Inputs. A Controlled Input shall follow the state of the Zone. If the Zone is disarmed, the Controlled Input shall be disarmed as well. A Monitored Input shall have the ability to cause a Zone violation even if the Zone is in a disarmed state.

W. Schedules:

1. The SMS shall support unlimited operator configurable schedules. Each schedule shall allow unlimited individual time intervals.

2. Each system controller shall support a minimum of 128 schedules and a minimum of 18 time intervals per schedule.

3. Each schedule shall consist of operator-defined time segments. Each time segment shall be day(s) of the week and include holidays and starting and ending times. The system shall provide grouping of days.

4. Recurring schedules shall be supported and provide hourly, daily, weekly, bi-weekly, monthly, quarterly, annual and semi-annual intervals. Recurring schedules shall support a start date and shall be configurable to end by a certain date or after a pre-defined number of occurrences.

5. Recurrence patterns shall be supported to allow:

   a. Schedule recurs every X year(s)

   b. Schedule activates on the last day of each month

   c. Schedule activates on the specified day of each month

   d. Schedule activates on the first, second, third etc. weekday of each month

X. Holidays:

1. The SMS shall support unlimited holidays.

2. The SMS shall support holiday type designations as Recurring Day of Month, Recurring Relative Monthly, Non-Recurring or Day of Week. The SMS shall allow assignment of duration to each holiday.

3. Holiday groups can be assigned to a Schedule.

Y. Time Zones:

1. The SMS shall maintain time zones to be used when configuring certain system objects. A time zone shall adhere to standard international Time Zone behavior, and the system shall support all time zones supported by the Windows OS.

2. The SMS shall allow time zones to be assigned to IP devices, controllers, CCTV matrix switchers, DVRs, and scheduled Manual Actions.

Z. Clearances:

1. The SMS shall support configuration of unlimited Clearances.

2. The controllers shall support up to 150 clearances per person.

3. The SMS shall support clearance activation and expiration date and time.

4. The SMS shall support the ability to select multiple personnel from a Dynamic View and assign clearance(s) to the selected personnel.

5. The SMS shall support the ability to select multiple personnel from a Dynamic View and remove clearance(s) from the selected personnel.

AA. Custom Clearances:

1. The SMS shall support the configuration of up to 20 Custom Clearances per Personnel record and up to 100,000 system-wide. Custom clearance shall give unique individualized access to Doors/Door Groups and Elevators/Elevator Groups during an assigned schedule. The SMS Custom Clearances shall also support the assignment of activation and expiration dates.

2. The SMS shall support a process to remove expired custom clearances from personnel records. The process shall be configured as a system-wide event action with the option to activate by schedule.

BB. Clearance Filters:

1. The SMS shall support Clearance Filters. Clearance Filters shall provide the ability to dynamically change the access rights of personnel (cardholders) or groups of personnel. Personnel with a lower Clearance Filter level than that assigned to a card reader shall be denied access to that card reader (door). Clearance Filter levels shall be assignable to card readers either manually or automatically via event logic or a time schedule.

CC. Events:

1. The SMS shall support unlimited operator configurable events, including the scheduling of events, and action-based trigger of events.

2. The system shall provide 8 configurable event priority levels with a total of 200 numbered event priorities. The system shall allow the operator to define custom colors and labels per individual priority level.

3. The system shall allow an event to be configured to:

a. Be sortable by event name, date/time, priority, state, and any other displayable information.

b. Be routed to operators by operator privileges, including support for the routing by time of day feature.

c. Require or not require operator acknowledgment.

d. Require or not require operator clearing.

e. Require or not require a log message to be entered by the system operator acknowledging the event.

f. Require or not require a log message to be entered by the system operator clearing the event.

g. Display or not display the event activation.

h. Require the object(s) causing the event activation to reset before the operator may acknowledge the event.

i. Display an operator-defined text message upon event activation.

j. Display an operator-defined text message when the event is deactivated.

k. Be associated with a map so the map opens automatically on the monitoring station when the event activates.

l. Activate a second event when the first event activates and is unacknowledged for a specified period of time.

m. Activate a second event when the first event activates, is acknowledged and is not cleared for a specified period of time.

n. Allow the operator to associate an audio wave file with the event.

o. Allow for minimum activation time and delayed activation time for events.

p. Download events to the iSTAR controllers.

q. Run imports and exports.

r. Run reports and remove report results.

4. Event Instructions:

a. Each event shall support event instructions to be displayed in the Event Details Screen. Event instructions shall support a maximum of five hundred characters and shall support website addresses, UNC addresses and local file paths.

5. Latch, Unlatch, Toggle, and Pulse for Event:

    a. The SMS shall support Event Actions and Manual Action buttons that can be used to Latch, Unlatch, Toggle, and Pulse other Events.

        (1) The SMS shall support a “Latch” Event Action which shall cause it to activate and remain activated.

        (2) The SMS shall support an “Unlatch” Event Action which shall cause it to deactivate and remain inactive.

        (3) The SMS shall support a “Toggle” Event Action which shall reverse an Event’s Latch-Unlatch state: switching a Latched Event to an Unlatched Event and vice versa.

        (4) The SMS shall support a “Pulse” Event Action which shall cause an event to activate momentarily.

6. The SMS shall allow an operator to create a copy of an existing event from within the event editor.

7. Event Assessment:

    a. The SMS shall provide an Event Assessment Feature which allows an operator to quickly view all objects associated with an event in a user defined Event Assess Application Layout.

    b. The SMS shall not require the operator to navigate away from the event assessment window to review objects associated with the event.

    c. The SMS shall provide an Event Editor “Assess Configuration” to allow an operator to configure the objects available during the assessment of an event in the Monitoring Station.

    d. The Assess Event Application Layout shall have the following capabilities:

        (1) View any documents associated with the Event.

        (2) View live video associated with the Event.

        (3) View recorded video associated with the Event.

        (4) View Event details.

        (5) View a Map associated with the Event.

        (6) View a Journal Replay of the event, based on a query associated with the Event.

(7) Use an Event Details Viewer with additional quick action buttons to process the Event.

e. Each event shall provide the ability to show the entire Event Assessment with a single mouse click via an icon.

f. The event assessment layout shall only be available for viewing by operators with appropriate privilege.

DD. Manual Action Challenge:

1. The SMS shall support Manual Action Challenges. The Manual Action Challenge shall require a SMS operator to enter their login credentials (User name and password) when executing a manual action from within the SMS.

2. The Manual Action Challenge shall be available from both the Administration and Monitoring Applications.

3. The Manual Action Challenge shall be assigned to a Privilege and the Privilege shall be assigned to the SMS operator.

EE. Document Editor:

1. The SMS shall support the ability to import multiple types of document objects to include:

a. PDF, TXT, XML, DOC, XLS, JPG, GIF, PNG, TIF

2. The SMS shall have the ability to attach these object types to the following areas:

a. Personnel records to provide additional information.

b. Events as part of the Events Assessment Feature.

c. A Guard Tour

FF. Import / Export:

1. The SMS shall provide a means for manually importing and exporting selected data in XML format. This mechanism shall support the import and export of any and all classes or types of data in the system. Specific data validation and logging requirements shall be met.

2. The system shall also support importing from CSV files.

3. The SMS shall provide an automated import mechanism (preferably XML-based). This mechanism shall support the import of most classes or types of data into the system. Specific data validation and logging requirements shall be met.

4. The SMS shall have the capability to perform automated imports from an Open Database Connectivity (ODBC) data source allowing the import of personnel data directly into the system database.

5. The system shall have the ability to connect to a directory service source via the Lightweight Directory Application Protocol (LDAP). The connection to the LDAP source shall be user-configurable directly from the SMS and shall not require custom code. The LDAP interface shall also support the automatic assignment of SMS clearances based on data contained in the LDAP record. The LDAP feature shall support the following features:

    a. LDAP server name and user-defined port number.

    b. A base distinguished name for the root of searches.

    c. A user-definable LDAP search filter to refine object search.

    d. User-defined mapping of attributes to SMS personnel fields.

    e. The use of a Distinguished Name (DN) entry for the SMS to authenticate to LDAP.

    f. Option to search all sub-levels of the directory from the base DN.

    g. Preview sample-data based on SMS LDAP import settings.

    h. Automatic roles-based SMS clearance(s) based on two fields of source data.

    i. Automatic import of directory entries from the LDAP source.

    j. Authentication via a user-definable LDAP user account and SSL.

    k. Automatic SMS clearance assignment.

6. The SMS shall provide a Data Mapping feature that provides field mapping information using the XSLT file based on the input data or an external XSLT file.

7. The SMS shall support Import and management of Operators with their respective Privilege Groups using XML and LDAP role-based templates.

GG. Objects:

1. Each object within the SMS shall be addressed by a unique operator-defined name. Object names shall be unique within object types.

2. The SMS shall provide the ability to add description text to each object definition.

HH. Reports:

1. The SMS shall support a Report Service that runs as a Windows Service. The Report Service shall operate in either 64 or 32 bit mode. The Report Service shall execute Reports that are either run on the Server by an Operator or configured to run automatically as an Event Action.

2. The SMS shall provide configurable data reports for database configuration, historical activity (Journal) and audit tracking. Pre-defined reports shall be available for download and import into the system.

3. The SMS report function shall perform the following:

    a. Create reports about any object.

    b. Create report templates to simplify report design.

    c. Run reports on demand.

    d. Save report results for sharing between different users of the application.

    e. Export reports into formats such as PDF, RTF, TXT, TIFF, Excel (XLS), and MHTML.

    f. Specify a query to select and filter the records on which to report.

    g. Specify the data fields to be included in a report.

    h. Specify a design for the report layout.

    i. Design a report form to be used as a layout for headers / footers for multiple reports.

    j. Access and use system pre-defined report forms.

    k. Select tabular, multi-line, or free form report layouts.

    l. Report on objects linked together with parent / child relations.

    m. Schedule reports to run automatically on a customized schedule.

    n. Send exported report files to the printer or to external recipients via e-mail.

4. The reporting suite shall provide an interactive user experience via any standard web browser, allowing the user to scrutinize the information without needing to print or review hard copies.

5. The reporting suite shall support connecting to one or more SMS systems. This shall provide data and reports across an enterprise solution to allow segregated reports that reflect both satellite application server data as well as master application server data.

6. The reporting suite shall allow an enterprise to share and blend data from other sources such as ERP and Time and Attendance systems to yield critical business information and reporting.

7. The reporting suite shall provide information delivery options such as email, CSV export, PDF export, XML data transfer, or database pool offerings. The suite shall also be a critical resource in system review and audit procedures such as system maintenance and performance.

8. The Reporting Suite shall:

    a. Provide Intuitive user interface and web-based reporting for SMS customers

    b. Share and blend data from other sources to yield critical business information

    c. Leverage Microsoft® Business Intelligence (BI) tools

    d. Include Reporting Service for report delivery and presentation

    e. Perform Reporting and processing from the SMS host

    f. Include Subscription options for automated delivery of reports

    g. Include Dashboard, graphical, and statistical reports, and reports customized by user

    h. Generate Reports on any PC with compatible Web browser without SMS Client software

    i. Offer and secure Data via Active Directory and SQL permissions

    j. Include Optional front end or other application integration including SharePoint

II. Dynamic Views:

1. The system shall support a grid format displayable report that will be usable to display homogeneous lists of objects within the system. This display shall be configurable both at configuration time and also at run time.

2. The Dynamic views shall have the following features:

   a. Real-time updating and display of property values.

   b. The display shall be sortable.

   c. Groupable by any number of columns.

   d. Filterable based on user selectable criteria.

   e. Printable.

   f. Can be saved as a MS Excel file from the current view.

   g. Exportable in either XML or CSV file formats.

   h. The export file shall be viewable in Excel (Excel must be installed separately).

   i. The export file shall be able to be emailed.

   j. The user shall be able to add and remove columns from the grid at runtime to enhance the user experience even if displaying a preconfigured view.

   k. The view shall be capable of pre-configuration so that repeatable displays of objects are possible.

   l. The view shall support in-place editing of properties of the object.

   m. Bulk operations shall be performed via multi-selection. The operations shall consist of (but are not limited to) setting a property to a value and deletion.

JJ. Query:

1. The SMS shall provide a Query engine to be useful for users without any knowledge of SQL or any other specific query language. It shall allow users to make requests against data sets with preconfigured relations between tables. The relations shall reflect the actual relations between database objects and the user shall be able to put conditions on any available field in the selected object type and its subordinate objects.

2. The users shall be able to construct a proper query expression selecting all available operations, column names, and table names from prompted lists. It shall eliminate the necessity to memorize any particular expression syntax. References to existing configuration objects shall also be prompted through a list of existing objects where applicable, eliminating the necessity of memorizing names. The Query feature also shall support complex logic, such as AND/OR.

3. Negative logic Queries using the new NOT IN operators.

4. The SMS shall support Query filters that perform AND/OR operations to narrow Query results. The SMS shall also support building complex query operations by use of block filters that perform AND/OR/AND NOT IN/OR NOT IN operations to further narrow Query results.

5. The SMS shall provide a Journal Query Assistant as a special method of the Query engine to query on XML fields within Journal Messages. This method shall allow the user to build queries on Journal messages. The Journal Query Assistant shall support Card Admitted, Card Rejected, Operator Login and Operator Activity message types, Area Activity, Object Changed State and Manual Action message types.

KK. Digital Video Surveillance Integration:

1. The SMS shall integrate with the video surveillance system and provide automatic call ups to the video monitor upon any and all alarms generated from the SMS system.

LL. General Purpose Interface:

1. The SMS shall support a licensable General Purpose Bi-directional Serial Interface.

2. The General Purpose Interface shall be a programmable bi-directional communication protocol that shall provide a general mode of communication between the SMS General Purpose Interface driver and a third-party device.

3. The third-party device shall send pure ASCII messages via a serial port (RS-232) or remotely via a TCP/IP port (via a Terminal Server) into the General Purpose Interface driver.

4. The SMS shall interpret messages in two ways:

5. As journal messages recorded into the SMS historical journal.

6. As any of five Monitoring Point status changes configured to trigger an SMS event.

7. The General Purpose Interface supports the following functionality:

a. Input: where the input strings are sent from the device through the Serial/Network port to the SMS Server. The General Purpose Message Protocol object is used to define and parse the information.

b. Output: where the output is an Action and requests a response from the device.

c. Poll: where the poll is an action that requires a response from the device.

MM. ID Badging Subsystem:

1. The SMS shall include an embedded ID Badging Subsystem. The ID Badging subsystem shall utilize a common database with and be an integral part of the SMS. The ID Badging Subsystem shall provide the ability to capture cardholder images and design and print user-defined badge layouts. The Badging Subsystem shall support the following capabilities:

   a. Unlimited number of badge design layouts.

   b. WYSIWYG badge designer.

   c. Background color detection in the portrait image.

   d. Threshold level selection to apply to background detection.

   e. User-defined selection of background color.

   f. User-defined selection of replacement color or transparency setting.

   g. Edge-detection setting, to aid in replacing only the selected background and not any matching color within the portrait image.

   h. Capture, import, and display portraits.

   i. Capture, import, and display signatures.

   j. Capture and display fingerprints.

   k. Insert, import, and display foreground and background images.

   l. Print two-sided badges.

   m. Encode magnetic data onto personnel badges.

   n. Insert 1D or 2D bar codes.

   o. Insert or replace color and transparent effects for image and background display.

   p. Support a variety of image formats including .bmp, .jpg, .tif, and .wmf.

   q. Custom functions using the Expression builder.

   r. Multiple images per cardholder.

s. Diagonal and Square borders. Each type of border shall support a user-defined width and height setting, and individual color settings for each border side.

t. Proper Case (first letter in string is set to uppercase, all other characters set to lowercase).

u. Year display (four- or two-digit).

v. Month display (full or abbreviated name, or numeric).

w. Day display (full or abbreviated name, or week/month numeric).

x. Hour display (12 or 24 hour format).

y. Minute display.

z. Second display.

NN. Smart Card / Proximity Card Enrollment:

1. The SMS shall provide a smart card enrollment feature as part of the ID Badging Subsystem. The smart card enrollment feature shall allow a user to enroll MIFARE, iCLASS or DESFire cards utilizing a USB wedge reader or a Manufacturer-approved badge printer.

2. The SMS shall provide a proximity card enrollment feature as part of the ID Badging Subsystem. The proximity enrollment feature shall allow a user to enroll the card number of proximity cards on a Fargo HDP 5000 printer that is equipped with an OMINKEY CardMan 5x25 encoder.

3. The ID Badging Subsystem shall support the creation of Smart Card Templates to define the smart card configuration. Templates shall be used to define the data transfer between the physical card and the Personnel Record. Templates shall define the card type as MIFARE, iCLASS or DESFire. When programming a card, the system shall be able to read and write to all relevant data such as personnel fields, card fields or card formats. The Badging Subsystem shall provide the ability to Enroll MIFARE, iCLASS or DESFire. The Badging Subsystem shall provide the ability to Program and Enroll MIFARE.

4. Templates shall also be utilized to define the Security Keys needed to access the data on the smart card. Templates shall be assignable to the enrollment device (wedge reader or printer).

5. The ID Badging Subsystem shall support both the enrollment (reading of data from the card) and programming (writing of data to the card) for MIFARE cards. The ID Badging Subsystem shall support the enrollment of DESFire cards and shall support Card Serial Number data only. The ID Badging Subsystem shall

support the enrollment of iCLASS cards and shall support Card Serial Number data only.

OO. System Parameters:

1. The Security Management System (SMS) shall have a minimum capacity of:

   a. 250,000 Global Personnel Records

   b. 16 online readers

   c. 64 online inputs

   d. 64 online outputs

   e. 7,000 credentials

   f. 6 simultaneous Clients

   g. 1 Badging Client

2. The SMS shall have a maximum capacity of:

   a. 16 online readers

   b. 2,500+ online readers

   c. 10,000+ online inputs

   d. 10,000+ online outputs

   e. 500,000 credentials

   f. 10 Simultaneous Clients (Additional clients may be added to the license up to 256)

   g. 2 Badging Clients (Additional clients may be added to the license)

3. The SMS shall support a Master Application Server (Enterprise Architecture) with maximum capacity of:

   a. 250,000 Global Personnel Records

   b. 10 Simultaneous Clients (Additional clients may be added to the license)

   c. 2 Badging Clients (Additional clients may be added to the license)

4. The SMS shall support both application and web client connections. The system shall allow the user to define the number of administration/monitoring client connections. This prevents web clients from using these reserved connections.

PART 3 - EXECUTION

3.01 EXAMINATION:

A. Examine pathway elements intended for cables. Check raceways, cable trays, and other elements for compliance with space allocations, installation tolerances, hazards to cable installation, and other conditions affecting installation.

B. Examine roughing-in for LAN and control cable conduit systems to PCs, controllers, card readers, and other cable-connected devices to verify actual locations of conduit and back boxes before device installation.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 PREPARATION:

A. Comply with recommendations in SIA CP-01.

B. Comply with TIA/EIA 606-B, "Administration Standard for Commercial Telecommunications Infrastructure."

C. Product Schedules: Obtain detailed product schedules from manufacturer of access-control system or develop product schedules to suit Project. Fill in all data available from Project plans and specifications and publish as Product Schedules for review and approval.

1. Record setup data for control station and workstations.

2. For each Location, record setup of controller features and access requirements.

3. Propose start and stop times for time zones and holidays and match up access levels for doors.

4. Set up groups, facility codes, linking, and list inputs and outputs for each controller.

5. Assign action message names and compose messages.

6. Set up alarms. Establish interlocks between alarms, intruder detection, and video surveillance features.

7. Prepare and install alarm graphic maps.

8. Develop user-defined fields.

9. Develop screen layout formats.

10. Propose setups for guard tours and key control.

11. Discuss badge layout options; design badges.

12. Complete system diagnostics and operation verification.

13. Prepare a specific plan for system testing, startup, and demonstration.

14. Develop acceptance test concept and, on approval, develop specifics of the test.

15. Develop cable and asset-management system details; input data from construction documents.

D. In meetings with Architect and Owner, present Product Schedules and review, adjust, and prepare final setup documents. Use approved, final Product Schedules to set up system software.

3.03 GROUNDING:

A. Comply with Section 28 05 26.

B. Comply with IEEE 1100, "Recommended Practice for Power and Grounding Electronic Equipment."

C. Ground cable shields, drain conductors, and equipment to eliminate shock hazard and to minimize ground loops, common-mode returns, noise pickup, cross talk, and other impairments.

D. Bond shields and drain conductors to ground at only one point in each circuit.

E. Signal Ground:

1. Terminal: Locate in each equipment room and wiring closet; isolate from power system and equipment grounding.

2. Bus: Mount on wall of main equipment room with standoff insulators.

3. Backbone Cable: Extend from signal ground bus to signal ground terminal in each equipment room and wiring closet.

3.04 INSTALLATION:

A. Push Buttons: Where multiple push buttons are housed within a single switch enclosure, they shall be stacked vertically with each push-button switch labeled with 1/4-inch-high

text and symbols as required. Push-button switches shall be connected to the controller associated with the portal to which they are applied, and shall operate the appropriate electric strike, electric bolt, or other facility release device.

B. Install card readers, keypads, push buttons, and biometric readers.

3.05 SYSTEM SOFTWARE AND HARDWARE:

A. Develop, install, and test software and hardware, and perform database tests for the complete and proper operation of systems involved. Assign software license to Owner.

3.06 FIELD QUALITY CONTROL:

A. Perform Tests and Inspections.

1. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect components, assemblies, and equipment installations, including connections, and to assist in testing.

B. Tests and Inspections:

1. LAN Cable Procedures: Inspect for physical damage and test each conductor signal path for continuity and shorts. Use Fluke DSX cable analyzer series . Test for faulty connectors, splices, and terminations. Test according to TIA/EIA 568-C.1, "Commercial Building Telecommunications Cabling Standards - Part 1: General Requirements." Link performance for UTP cables must comply with minimum criteria in TIA/EIA 568-C.1.

2. Test each circuit and component of each system. Tests shall include, but are not limited to, measurements of power-supply output under maximum load, signal loop resistance, and leakage to ground where applicable. System components with battery backup shall be operated on battery power for a period of not less than 10 percent of the calculated battery operating time. Provide special equipment and software if testing requires special or dedicated equipment.

3. Operational Test: After installation of cables and connectors, demonstrate product capability and compliance with requirements. Test each signal path for end-to-end performance from each end of all pairs installed. Remove temporary connections when tests have been satisfactorily completed.

C. Devices and circuits will be considered defective if they do not pass tests and inspections.

D. Prepare test and inspection reports.

3.07 STARTUP SERVICE:

A. Engage a factory-authorized service representative to supervise and assist with startup service.

1. Complete installation and startup checks according to approved procedures that were developed in "Preparation" Article and with manufacturer's written instructions.

2. Enroll and prepare badges and access cards for Owner's operators, management, and security personnel.

3.08 PROTECTION:

A. Maintain strict security during the installation of equipment and software. Rooms housing the control station, and workstations that have been powered up shall be locked and secured with an activated burglar alarm and access-control system reporting to a central station complying with UL 1610, "Central-Station Burglar-Alarm Units," during periods when a qualified operator in the employ of Contractor is not present.

3.09 DEMONSTRATION:

A. Train Owner's maintenance personnel to adjust, operate, and maintain security access system. Provide a minimum of 40 hours for training.

B. Develop separate training modules for the following:

1. Computer system administration personnel to manage and repair the LAN and databases and to update and maintain software.

2. Operators who prepare and input credentials to man the control station and workstations and to enroll personnel.

3. Security personnel

4. Hardware maintenance personnel

5. Corporate management

3.10 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 28 15 00

ACCESS CONTROL HARDWARE DEVICES

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide access control hardware devices as indicated and in compliance with Contract Documents.

1. The Security Management System (SMS), Access Control Software server is existing and provided by owner, relocated with existing server. Contractor to provide programming for new building.

2. The workstations located in dispatch and the CCTV rooms are to be provided and installed by contractor, provide licenses and software and programming for these workstations.

3. Field devices such as card readers, alarm inputs, control points, etc. shall be connected to fully distributed intelligent field controllers All devices and connections of the field devices shall be by the contractor.

1.02 EXISTING CONDITIONS:

A. The access control system software is existing, manufactured by Hirsch and shall be used in the new buildings.

B. The fiber infrastructure is being provided by others.

C. The Contractor is to provide access control panels and tie into the existing Hirsch Velocity system.

D. Security contractor to shall coordinate with owner the requirements to interface the existing system.

E. Security Contractor to provide and install all field devices including but not limited to, card readers, access control panels etc.

2. 2017: Standard for Safety General-Purpose Signaling Devices and Systems

3. 60950-1: Standard for Safety Information Technology Equipment – Safety – Part 1: General Requirements

1.04 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Delegated Design Submittals: For each device, equipment or appurtenance provide written certification from Professional Engineer licensed in the State of Utah stating that supports systems and anchorage for equipment have been designed according to the requirements of Section 1613 of the building codes of Utah, Salt Lake City and ASCE/SEI 7, and in accordance with Specification 01 41 20. Submit calculations stamped by a Professional Engineer licensed in the State of Utah for support systems and anchorage for wind, seismic, and all other pertinent loads.

1.05 DEFINITIONS:

A. CCTV: Closed-circuit television

B. CPU: Central processing unit

C. SMS: Security Management System

D. Credential: Data assigned to an entity and used to identify that entity

E. GFI: Ground fault interrupter

F. Identifier: A credential card; keypad personal identification number; or code, biometric characteristic, or other unique identification entered as data into the entry-control database for the purpose of identifying an individual. Where this term is presented with an initial capital letter, this definition applies.

G. I/O: Input/Output

H. LAN: Local area network

I. Location: A Location on the network having a PC-to-controller communications link, with additional controllers at the Location connected to the PC-to-controller link with a TIA 485-A communications loop. Where this term is presented with an initial capital letter, this definition applies.

J. PC: Personal computer. Applies to the central station, workstations, and file servers.

K. PCI Bus: Peripheral Component Interconnect. A peripheral bus providing a high-speed data path between the CPU and the peripheral devices such as a monitor, disk drive, or network.

L. RAS: Remote access services

M. RF: Radio frequency

N. ROM: Read-only memory. ROM data are maintained through losses of power.

O. TCP/IP: Transport control protocol/Internet protocol incorporated into Microsoft Windows.

P. UPS: Uninterruptible power supply

Q. USB: Universal serial bus

R. WAN: Wide area network

S. WAV: The digital audio format used in Microsoft Windows

T. WMP: Windows media player

U. Wiegand: Patented magnetic principle that uses specially treated wires embedded in the credential card.

V. Windows: Operating system by Microsoft Corporation.

W. Workstation: A PC with software that is configured for specific, limited security-system functions.

1.06 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Product Data: For each type of product indicated. Include rated capacities, operating characteristics, and furnished specialties and accessories. Reference each product to a location on Drawings. Test and evaluation data presented in Product Data shall comply with SIA BIO-01.

C. Shop Drawings: For access control. Include plans, elevations, sections, details, and attachments to other work.

1. Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.

2. Functional Block Diagram: Show single-line interconnections between components for signal transmission and control. Show cable types and sizes.

3. Dimensioned plan and elevations of equipment racks, control panels, and consoles. Show access and workspace requirements.

4. UPS: Sizing calculations.

5. Wiring Diagrams: For power, signal, and control wiring.

D. Design Data: Include an equipment list consisting of every piece of equipment by model number, manufacturer, serial number, location, and date of original installation. Add pretesting record of each piece of equipment, listing name of person testing, date of test,

set points of adjustments, name and description of the view of preset positions, description of alarms, and description of unit output responses to an alarm.

E. Samples: For workstation outlets, jacks, jack assemblies, and faceplates. For each exposed product and for each color and texture specified.

F. Field quality-control reports.

G. Operation and Maintenance Data: For security system to include in emergency, operation, and maintenance manuals. In addition to items specified in Section 01 78 23, include the following:

1. Microsoft Windows software documentation.

2. PC installation and operating documentation, manuals, and software for the PC and all installed peripherals. Software shall include system restore, emergency boot diskettes, and drivers for all installed hardware. Provide separately for each PC.

3. Hard copies of manufacturer's specification sheets, operating specifications, design guides, user's guides for software and hardware, and PDF files on CD-ROM of the hard-copy submittal.

4. System installation and setup guides with data forms to plan and record options and setup decisions.

H. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Credential card blanks, ready for printing. Include enough credential cards for all personnel to be enrolled at the site plus an extra 50 percent for future use.

2. Fuses of all kinds, power and electronic, equal to 25 percent of amount installed for each size used, but no fewer than three units.

3. Two controller/interface board of each type used

4. Two card readers each type used.

1.07 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.08 SPARE PARTS:

A. Comply with the requirements specified in Section 01 61 00.

1.09 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

B. Installer Qualifications: An employer of workers trained and approved by manufacturer.

1. Cable installer must have on staff a registered communication distribution designer certified by Building Industry Consulting Service International.

C. Source Limitations: Obtain central station, workstations, controllers, Identifier readers, and all software through one source from single manufacturer.

D. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

E. Comply with NFPA 70, "National Electrical Code."

F. Comply with SIA DC-01, SIA DC-03 and SIA DC-07.

G. Comply with UL 294.

1.10 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

B. Central Station, Workstations, and Controllers:

1. Store in temperature- and humidity-controlled environment in original manufacturer's sealed containers. Maintain ambient temperature between 50 and 85 degrees F, and not more than 80 percent relative humidity, noncondensing.

2. Open each container; verify contents against packing list; and file copy of packing list, complete with container identification, for inclusion in operation and maintenance data.

3. Save original manufacturer's containers and packing materials and deliver as directed under provisions covering extra materials.

1.11 PROJECT/SITE CONDITIONS:

A. Environmental Conditions: System shall be capable of withstanding the following environmental conditions without mechanical or electrical damage or degradation of operating capability:

1. Indoor, Controlled Environment: NEMA 250, Type 1 enclosure. System components, except the central-station control unit, installed in temperature-controlled indoor environments shall be rated for continuous operation in ambient

conditions of 36 to 122 degrees F dry bulb and 20 to 90 percent relative humidity, noncondensing.

2. Indoor, Uncontrolled Environment: NEMA 250, Type 3R enclosures. System components installed in non-temperature-controlled indoor environments shall be rated for continuous operation in ambient conditions of 0 to 122 degrees F dry bulb and 20 to 90 percent relative humidity, noncondensing.

3. Outdoor Environment: NEMA 250, Type 4 enclosures. System components installed in locations exposed to weather shall be rated for continuous operation in ambient conditions of minus 30 to plus 122 degrees F dry bulb and 20 to 90 percent relative humidity, condensing. Rate for continuous operation where exposed to rain as specified in NEMA 250, winds up to 85 mph and snow cover up to 24 inches thick.

4. Hazardous Environment: System components located in areas where fire or explosion hazards may exist because of flammable gases or vapors, flammable liquids, combustible dust, or ignitable fibers shall be rated, listed, and installed according to NFPA 70.

5. Corrosive Environment: For system components subjected to corrosive fumes, vapors, and wind-driven salt spray in coastal zones, provide NEMA 250, Type 6P enclosures.

PART 2 - PRODUCTS

2.01 EQUIPMENT:

A. Due to the project schedule, it is expected that any specifications given for current technology will be outmoded at the time of procurement. Provide a high performance PC based Security workstations/server compatible with the SMS. The workstations/servers shall to be equipped with the latest generation of processor and graphics technology, large storage capacity with redundancy, the most current operating system, and Ethernet connectivity minimum configuration of the PC or PCs running the SMS.

B. Server Requirements: The Server is existing and shall be reused

2.02 CLIENT WORKSTATIONS:

A. The SMS client workstations are existing and shall be reused.

2.03 BADGING STATION:

A. The SMS badging workstation is existing and is to be reused.

2.04 CONTROLLER:

A. The SMS shall support Hirsch controller compatible with the Velocity SMS

2.05 CLUSTERING:

A. The SMS shall support a user-defined grouping of controllers defined as a cluster. controllers within a cluster shall be able to communicate in a peer-to-peer scheme should the SMS server lose communication with the cluster.

B. Clustering shall support the following features:

1. Assignment of Master controllers for cluster communication to the SMS server

2. Primary and backup communication paths to the SMS server

3. Up to 16 controllers per cluster

4. Logical event linking between controllers in a cluster independent of SMS server communication

5. Asynchronous communication via TCP/IP (Polled devices shall not be acceptable)

6. Encrypted communications

C. Edge FIPS 140-2 and 197 (AES) Encryption – The SMS shall support the qualification of the Edge controller at FIPS 140-2 which meets the necessary physical, operational, and cryptographic requirements for the National Institute of Standards (NIST). The Edge communicates with the host and other cluster members using FIPS 197 (AES) 256 bits.

2.06 CARD READER:

A. Card Reader shall be a multiclass type reader capable of the following:

1. 125 kHz contactless cards supported: HID Prox®, Indala® Prox, Dorado® Prox, and EM Prox legacy contactless credentials

2. 13.56 MHz contactless smart cards supported: iCLASS Seos® , iCLASS SE, iCLASS®, MIFARE® Classic, and MIFARE DESFire®EV1

3. Protocol: Open Supervised Device Protocol (OSDP) mode Wiegand or Clock & Data modes

4. Shall be HID multiclass SE RP40/SE RP10

2.07 ACCESS CARDS:

A. Provide 100 ICLASS SE cards, coordinate with owner for model.

PART 3 - EXECUTION

3.01 EXAMINATION:

A. Examine pathway elements intended for cables. Check raceways, cable trays, and other elements for compliance with space allocations, installation tolerances, hazards to cable installation, and other conditions affecting installation.

B. Examine roughing-in for LAN and control cable conduit systems to PCs, controllers, card readers, and other cable-connected devices to verify actual locations of conduit and back boxes before device installation.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 PREPARATION:

A. Comply with recommendations in SIA CP-01.

B. Comply with TIA/EIA 606-B, "Administration Standard for Commercial Telecommunications Infrastructure."

C. Product Schedules: Obtain detailed product schedules from manufacturer of access-control system or develop product schedules to suit Project. Fill in all data available from Project plans and specifications and publish as Product Schedules for review and approval.

1. Record setup data for control station and workstations.

2. For each Location, record setup of controller features and access requirements.

3. Propose start and stop times for time zones and holidays and match up access levels for doors.

4. Set up groups, facility codes, linking, and list inputs and outputs for each controller.

5. Assign action message names and compose messages.

6. Set up alarms. Establish interlocks between alarms, intruder detection, and video surveillance features.

7. Prepare and install alarm graphic maps.

8. Develop user-defined fields.

9. Develop screen layout formats.

10. Propose setups for guard tours and key control.

11. Discuss badge layout options; design badges.

12. Complete system diagnostics and operation verification.

13. Prepare a specific plan for system testing, startup, and demonstration.

14. Develop acceptance test concept and, on approval, develop specifics of the test.

15. Develop cable and asset-management system details; input data from construction documents.

D. In meetings with Architect and Owner, present Product Schedules and review, adjust, and prepare final setup documents. Use approved, final Product Schedules to set up system software.

3.03 CABLING:

A. Comply with NECA 1, "Good Workmanship in Electrical Construction."

B. Install cables and wiring according to requirements in Section 28 05 13.

C. Wiring Method: Install wiring in raceway and cable tray except within consoles, cabinets, desks, and counters. Conceal raceway and wiring except in unfinished spaces.

D. Install LAN cables using techniques, practices, and methods that are consistent with Category 6A rating of components and fiber-optic rating of components, and that ensure Category 6A and fiber-optic performance of completed and linked signal paths, end to end. Adhere to TIA-568 and BICSI standards to cabling installation.

E. Boxes and enclosures containing security-system components or cabling, and which are easily accessible to employees or to the public, shall be provided with a lock. Boxes above ceiling level in occupied areas of the building shall not be considered accessible. Junction boxes and small device enclosures below ceiling level and easily accessible to employees or the public shall be covered with a suitable cover plate and secured with tamperproof screws.

F. Install end-of-line resistors at the field device location and not at the controller or panel location.

G. Comply with TIA 569-D, "Commercial Building Standard for Telecommunications Pathways and Spaces."

H. Cable application requirements are minimum requirements and shall be exceeded if recommended or required by manufacturer of system hardware.

I. TIA 232-F Cabling: Install at a maximum distance of 50 feet

J. TIA 485-A Cabling: Install at a maximum distance of 4000 feet.

K. Card Readers and Keypads:

1. Install number of conductor pairs recommended by manufacturer for the functions specified.

2. Unless manufacturer recommends larger conductors, install No. 22 AWG wire if maximum distance from controller to the reader is 250 feet, and install No. 20 AWG wire if maximum distance is 500 feet.

3. For greater distances, install "extender" or "repeater" modules recommended by manufacturer of the controller.

4. Install minimum No. 18 AWG shielded cable to readers and keypads that draw 50 mA or more.

L. Install minimum No. 16 AWG cable from controller to electrically powered locks.

M. Install minimum No. 18 AWG ac power wire from transformer to controller, with a maximum distance of 25 feet.

3.04 GROUNDING:

A. Comply with Section 28 05 26.

B. Comply with IEEE 1100, "Recommended Practice for Power and Grounding Electronic Equipment."

C. Ground cable shields, drain conductors, and equipment to eliminate shock hazard and to minimize ground loops, common-mode returns, noise pickup, cross talk, and other impairments.

D. Bond shields and drain conductors to ground at only one point in each circuit.

E. Signal Ground:

1. Terminal: Locate in each equipment room and wiring closet; isolate from power system and equipment grounding.

2. Bus: Mount on wall of main equipment room with standoff insulators.

3. Backbone Cable: Extend from signal ground bus to signal ground terminal in each equipment room and wiring closet.

3.05 INSTALLATION:

A. Push Buttons: Where multiple push buttons are housed within a single switch enclosure, they shall be stacked vertically with each push-button switch labeled with 1/4-inch-high text and symbols as required. Push-button switches shall be connected to the controller

associated with the portal to which they are applied, and shall operate the appropriate electric strike, electric bolt, or other facility release device.

B. Install card readers, keypads, push buttons, and biometric readers.

3.06 IDENTIFICATION:

A. In addition to requirements in this article, comply with applicable requirements in TIA/EIA 606-A.

B. Label each terminal strip and screw terminal in each cabinet, rack, or panel.

1. All wiring conductors connected to terminal strips shall be individually numbered, and each cable or wiring group being extended from a panel or cabinet to a building-mounted device shall be identified with the name and number of the particular device as shown.

2. Each wire connected to building-mounted devices is not required to be numbered at the device if the color of the wire is consistent with the associated wire connected and numbered within the panel or cabinet.

C. At completion, cable and asset management software shall reflect record drawing conditions.

3.07 SYSTEM SOFTWARE AND HARDWARE:

A. Develop, install, and test software and hardware, and perform database tests for the complete and proper operation of systems involved. Assign software license to Owner.

3.08 FIELD QUALITY CONTROL:

A. Perform Tests and Inspections:

1. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect components, assemblies, and equipment installations, including connections, and to assist in testing.

B. Tests and Inspections:

1. Refer and comply to Division 27 requirements

2. LAN Cable Procedures: Inspect for physical damage and test each conductor signal path for continuity and shorts. Use Fluke DSX cable analyzer series. Test for faulty connectors, splices, and terminations. Test according to TIA/EIA 568-C.1, "Commercial Building Telecommunications Cabling Standards - Part 1: General Requirements." Link performance for UTP cables must comply with minimum criteria in TIA/EIA 568-C.1.

3. Test each circuit and component of each system. Tests shall include, but are not limited to, measurements of power-supply output under maximum load, signal loop resistance, and leakage to ground where applicable. System components with battery backup shall be operated on battery power for a period of not less than 10 percent of the calculated battery operating time. Provide special equipment and software if testing requires special or dedicated equipment.

4. Operational Test: After installation of cables and connectors, demonstrate product capability and compliance with requirements. Test each signal path for end-to-end performance from each end of all pairs installed. Remove temporary connections when tests have been satisfactorily completed.

C. Devices and circuits will be considered defective if they do not pass tests and inspections.

D. Prepare test and inspection reports.

3.09 STARTUP SERVICE:

A. Engage a factory-authorized service representative to supervise and assist with startup service.

1. Complete installation and startup checks according to approved procedures that were developed in "Preparation" Article and with manufacturer's written instructions.

2. Enroll and prepare badges and access cards for Owner's operators, management, and security personnel.

3.10 PROTECTION:

A. Maintain strict security during the installation of equipment and software. Rooms housing the control station, and workstations that have been powered up shall be locked and secured with an activated burglar alarm and access-control system reporting to a central station complying with UL 1610, "Central-Station Burglar-Alarm Units," or to owners SOC during periods when a qualified operator in the employ of Contractor is not present.

3.11 DEMONSTRATION:

A. Train Owner's maintenance personnel to adjust, operate, and maintain security access system. Provide a minimum of 40 hours for training.

B. Develop separate training modules for the following:

1. Computer system administration personnel to manage and repair the LAN and databases and to update and maintain software.

2. Operators who prepare and input credentials to man the control station and workstations and to enroll personnel.

3. Security personnel

4. Hardware maintenance personnel

5. Corporate management

3.12 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 28 20 00

VIDEO SURVEILLANCE SYSTEM

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide video surveillance system consisting of cameras, data transmission wiring, as indicated and in compliance with Contract Documents.

B. Video surveillance system shall be integrated with monitoring and control system specified in Section 28 13 00, which specifies systems integration.

1.02 REFERENCES:

A. EN 50581: Technical documentation for the assessment of electrical and electronic products with respect to the restriction of hazardous substances

B. International Electrotechnical Commission (IEC):

1. 60950: Information Technology Equipment

2. 62262: Degrees of Protection Provided by Enclosures for Electrical Equipment Against External Mechanical Impacts

C. National Electrical Contractors Association (NECA):

1. 1: Standard for Good Workmanship in Electrical Construction

D. National Electrical Manufacturers Association (NEMA):

1. 250: Enclosures for Electrical Equipment (1000 Volts Maximum)

E. National Fire Protection Association (NFPA):

1. 70: National Electrical Code.

1.03 EXISTING CONDITIONS:

A. The Video Surveillance system will be an extension of the existing SLCWRF system. Milestone is the installed Video Management System (VMS)

B. The VMS will change to the new Genetec standard VMS. The Genetec VMS will be provided at the new operations building when completed. The use of the Milestone VMS is to be utilized until the new Genetec VMS is provided and programmed.

C. The fiber infrastructure is provided by others into the new building Security/IT/Telecom room located on first floor. Security contractor to provide all fibers from the FDU to electronic security equipment.

D. The Contractor will provide new headend end equipment into the new building,

E. Security contractor to shall coordinate with owner the requirements to interface the existing system.

F. Security Contractor to provide and install all field devices including but not limited to, cameras, power supplies, mounts etc.

G. Integrate existing cameras in to the new video system. Route cameras to nearest network switch and connect. Coordinate with owner for required cameras.

1.04 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Delegated Design Submittals: For each device, equipment or appurtenance provide written certification from Professional Engineer licensed in the State of Utah stating that supports systems and anchorage for equipment have been designed according to the requirements of Section 1613 of the building codes of Utah, Salt Lake City and ASCE/SEI 7, and in accordance with Specification 01 41 20. Submit calculations stamped by a Professional Engineer licensed in the State of Utah for support systems and anchorage for wind, seismic, and all other pertinent loads.

C. Product Data: For each type of product indicated. Include dimensions and data on features, performance, electrical characteristics, ratings, and finishes.

D. Shop Drawings: For video surveillance. Include plans, elevations, sections, details, and attachments to other work.

1. Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.

2. Functional Block Diagram: Show single-line interconnections between components for signal transmission and control. Show cable types and sizes.

3. Dimensioned plan and elevations of equipment racks, control panels, and consoles. Show access and workspace requirements.

4. UPS: Sizing calculations.

5. Wiring Diagrams: For power, signal, and control wiring.

E. Design Data: Include an equipment list consisting of every piece of equipment by model number, manufacturer, serial number, location, and date of original installation. Add pretesting record of each piece of equipment, listing name of person testing, date of test, set points of adjustments, name and description of the view of preset positions, description of alarms, and description of unit output responses to an alarm.

F. Field quality-control reports.

G. Product Warranty: Sample of special warranty.

H. Operation and Maintenance Data: For cameras, power supplies, infrared illuminators, monitors, videotape recorders, digital video recorders, video switches, and control-station components to include in emergency, operation, and maintenance manuals. In addition to items specified in Section 01 78 23, include the following:

1. Lists of spare parts and replacement components recommended to be stored at the site for ready access.

1.05 DEFINITIONS:

A. AGC: Automatic gain control

B. BNC: Bayonet Neill-Concelman - type of connector

C. B/W: Black and white

D. CCD: Charge-coupled device

E. FTP: File transfer protocol

F. IP: Internet protocol

G. LAN: Local area network

H. MPEG: Moving picture experts group

I. NTSC: National Television System Committee

J. PC: Personal computer

K. PTZ: Pan-tilt-zoom

L. RAID: Redundant array of independent disks

M. TCP: Transmission control protocol - connects hosts on the Internet

N. UPS: Uninterruptible power supply

O. WAN: Wide area network

1.06 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.07 SPARE PARTS:

A. Comply with the requirements specified in Section 01 61 00.

1.08 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

C. Comply with NECA 1.

D. Comply with NFPA 70.

E. Electronic data exchange between video surveillance system with an access-control system shall comply with SIA TVAC.

1.09 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

1.10 PROJECT/SITE CONDITIONS:

A. Environmental Conditions: Capable of withstanding the following environmental conditions without mechanical or electrical damage or degradation of operating capability:

1. Control Station: Rated for continuous operation in ambient temperatures of 60 to 85 degrees F and a relative humidity of 20 to 80 percent, noncondensing.

2. Interior, Controlled Environment: System components, except central-station control unit, installed in temperature-controlled interior environments shall be rated for continuous operation in ambient temperatures of 36 to 122 degrees F dry bulb and 20 to 90 percent relative humidity, noncondensing. Use NEMA 250, Type 1 enclosures.

3. Interior, Uncontrolled Environment: System components installed in non-temperature-controlled interior environments shall be rated for continuous operation in ambient temperatures of 0 to 122 degrees F dry bulb and 20 to

90 percent relative humidity, noncondensing. Use NEMA 250, Type 3R enclosures.

4. Exterior Environment: System components installed in locations exposed to weather shall be rated for continuous operation in ambient temperatures of minus 30 to plus 122 degrees F dry bulb and 20 to 90 percent relative humidity, condensing. Rate for continuous operation when exposed to rain as specified in NEMA 250, winds up to 85 mph and snow cover up to 24 inches thick. Use NEMA 250, Type 4 enclosures.

5. Hazardous Environment: System components located in areas where fire or explosion hazards may exist because of flammable gases or vapors, flammable liquids, combustible dust, or ignitable fibers shall be rated, listed, and installed according to NFPA 70.

6. Corrosive Environment: System components subject to corrosive fumes, vapors, and wind-driven salt spray in coastal zones. Use NEMA 250, Type 6P enclosures.

7. Security Environment: Camera housing for use in high-risk areas where surveillance equipment may be subject to physical violence.

1.11 WARRANTY:

A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components of cameras, equipment related to camera operation, and control-station equipment that fail in materials or workmanship within specified warranty period.

1. Warranty Period: Two years from date of Substantial Completion.

PART 2 - PRODUCTS

2.01 SYSTEM REQUIREMENTS:

A. Video-signal format shall comply with NTSC standards.

B. Surge Protection: Protect components from voltage surges originating external to equipment housing and entering through power, communication, signal, control, or sensing leads. Include surge protection for external wiring of each conductor's entry connection to components.

1. Minimum Protection for Power Connections 120 V and More: Auxiliary panel suppressors complying with requirements in Section 26 43 13.

2. Minimum Protection for Communication, Signal, Control, and Low-Voltage Power Connections: Comply with requirements in Section 26 43 13 as recommended by manufacturer for type of line being protected.

C. Tamper Protection: Tamper switches on enclosures, control units, cabinets, and other system components shall initiate a tamper-alarm signal when unit is opened or partially disassembled. Control-station, control-unit alarm display shall identify tamper alarms and indicate locations.

D. Upon any alarm generated by the access control stations, the system shall automatically display the image of the camera(s) closest to the alarm point on spot monitor next to ACS workstation.

2.02 VIDEO MANAGEMENT SYSTEM (VMS):

A. Genetec Enterprise System

2.03 VMS SYSTEM (BASE) SERVER:

A. Server shall meet the following requirements:

1. CPU: Intel® Xeon®, (Quad Core or better) or Intel® Core™ i5 or better if running on a workstation

2. RAM: Minimum 8 GB

3. Hard Drive: Minimum 500 GB, more for large systems utilizing extensive video database Bookmarking

4. Operating System 64-bit:

a. Windows 10 (Professional and Enterprise)

b. Windows Server® 2012 (Standard, Datacenter)

c. Windows Server® 2016 (Standard, Datacenter)

d. Software: Microsoft, .NET 4.0 Framework, .NET 4.6.2

5. Framework and Internet Information Services (IIS) 6.0 or newer, Microsoft SQL Express 2014 or Microsoft SQL Server 2012, 2014 and 2016.

2.04 VIDEO CLIENT WORKSTATIONS:

A. Workstation shall meet the following requirements:

1. CPU – Intel Core i5™ or better

2. RAM – 8 GB minimum (16 GB or more recommended)

3. Operating Systems (all 64-bit):

   a. Windows® 10 (Professional and Enterprise)

   b. Software – DirectX 9.0 or newer, Microsoft .NET 4.6.2 Framework

   c. Graphics Adapter – PCI-Express, minimum 256 MB RAM, Direct 3D supported

2.05 1080P COLOR DOME CAMERA:

A. Camera:

   1. Camera Image sensor: Progressive scan RGB CMOS 1/3 inch

   2. Lens Varifocal, 3.0–10.5 mm, F1.4, Horizontal field of view: 92 degrees–34 degrees, Vertical field of view: 50 degrees–20 degrees

   3. Remote focus and zoom, P-Iris control, IR corrected

   4. Day and night Automatically removable infrared-cut filter

B. Minimum illumination: HDTV 1080p 25/30 fps with WDR - forensic capture and Lightfinder:

   1. Color: 0.15 lux at 50 IRE, F1.4

   2. B/W: 0.03 lux at 50 IRE, F1.4

C. HDTV 1080p 50/60 fps:

   1. Color: 0.3 lux at 50 IRE, F1.4

   2. B/W: 0.06 lux at 50 IRE, F1.4

D. Shutter time 1/66500 s to 1 s

E. Camera angle adjustment: Pan plus or minus 180 degrees, tilt minus 5 to plus 85 degrees, rotation plus or minus 95 degrees

F. Video compression: H.264 Baseline, Main and High Profile (MPEG-4 Part 10/AVC) Motion JPEG

G. Resolution: 1920x1080 to 160x90

H. Frame rate With WDR: 25/30 fps with power line frequency 50/60 Hertz

I. Without WDR: 50/60 fps with power line frequency 50/60 Hertz

J. Video Streaming:

1. Multiple, individually configurable streams in H.264 and Motion JPEG

2. Axis Zipstream technology in H.264

3. Controllable frame rate and bandwidth

4. VBR/MBR H.264

K. Multi-view Streaming: 2 individually cropped out view areas

L. Pan/Tilt/Zoom: Digital PTZ, preset positions

M. Image Settings:

1. Compression, color, brightness, sharpness, contrast, local contrast, white balance, exposure control (including automatic gain control), exposure zones, fine tuning of behavior at different light levels, WDR - forensic capture: up to 120 dB depending on scene, text and image overlay, mirroring of images, privacy masks

2. Rotation: 0 degrees, 90 degrees, 180 degrees, 270 degrees, including Corridor Format

N. Network:

1. Security Password protection, IP address filtering, HTTPSa encryption, IEEE 802.1Xa network access control, Digest authentication, User access log, Centralized Certificate Management

2. Supported protocols: IPv4/v6, HTTP, HTTPSa, SSL/TLSa, QoS Layer 3 DiffServ, FTP, CIFS/SMB, SMTP, Bonjour, UPnPTM, SNMP v1/v2c/v3(MIB-II), DNS, DynDNS, NTP, RTSP, RTP, SRTP, SFTP, TCP, UDP, IGMP, RTCP, ICMP, DHCP, ARP, SOCKS, SSH, LLDP

2.06 180 DEGREE COLOR CAMERA:

A. Camera:

1. Camera Image sensor 4 x 1/2.8 inches progressive scan RGB CMOS

2. Lens Varifocal, 2.8–6 mm, F2.0

3. 4x1080p capture mode:

a. Horizontal field of view: 108°–54°

b. Vertical field of view: 57°–30°

B. Minimum illumination Color: 0.3 lux, F2.0

C. Shutter time: 720p: 1/28000 s to 2 s, 1080p: 1/22500 s to 2 s

D. Video compression: H.264 (MPEG-4 Part 10/AVC) Baseline, Main and High Profiles Motion JPEG

E. Resolution 4 x 1920x1080 (1080p) to 160x90, Quad view 1920x1440 to 480x270

F. Frame Rate:

1. Up to 50/60 Hertz with 720p capture mode

2. Up to 50/60 Hertz with 1080p capture mode

G. Video Streaming:

1. Multiple, individually configurable streams in H.264 and Motion JPEG

2. Axis Zipstream technology in H.264

3. Controllable frame rate and bandwidth

4. VBR/MBR H.264

H. Image settings: Color, brightness, sharpness, contrast, white balance, exposure control, exposure zone, fine tuning of behavior at low light, rotation: 0 degrees, 90 degrees, 180 degrees, 270 degrees including Corridor Format, text and image overlay, privacy mask, Local contrast.

I. Camera angle adjustment: Pan plus or minus 90 degrees, Tilt 28 degrees-92 degrees, Rotate plus or minus 90 degrees.

J. Network:

1. IP address: One IP address for all channels

2. Security Password protection, IP address filtering, HTTPSa encryption, IEEE 802.1Xa network access control, digest authentication, user access log, centralized certificate management

3. Supported protocols: IPv4/v6, HTTP, HTTPSa, SSL/TLSa, QoS Layer 3 DiffServ, FTP, CIFS/SMB, SMTP, Bonjour, UPnPTM, SNMP v1/v2c/v3 (MIB-II), DNS, DynDNS, NTP, RTSP, RTP, SFTP, TCP, UDP, IGMP, RTCP, ICMP, DHCP, ARP, SOCKS, SSH

2.07 PTZ CAMERA:

A. Camera:

1. Camera image sensor: Progressive scan CMOS 1/2.8 inches

2. Lens: 4.3–129 mm, F1.6–4.7, Horizontal field of view: 65.6 degrees–2.0 degrees, Vertical field of view: 39.0 degrees–1.2 degrees Autofocus, auto-iris

3. Day and night: Automatically removable infrared-cut filter

B. Minimum Illumination:

1. Color: 0.2 lux at 30 IRE F1.6

2. B/W: 0.01 lux at 30 IRE F1.6

3. Color: 0.25 lux at 50 IRE F1.6

4. B/W: 0.02 lux at 50 IRE F1.6

5. Shutter time: 1/66500 to 2 s

C. Pan/Tilt/Zoom:

1. Pan: 360° endless, 0.1°/s–350°/s

2. Tilt: 180 degrees, 0.1°/s–350°/s

3. 30x optical zoom and 12x digital zoom, total 360x zoom, 256 preset positions, e-flip, limited guard tour, control queue, on-screen directional indicator, set new pan 0 degrees, focus window, speed zoom, focus recall

D. Video Compression:

1. H.264 (MPEG-4 Part 10/AVC) Baseline, Main and High Profiles Motion JPEG

E. Resolution 1920x1080 (HDTV 1080p) to 320x180

F. Frame Rate:

1. Up to 50/60 Hertz in 1080p

2. Up to 50/60 Hertz in 720p

G. Video Streaming:

1. Multiple, individually configurable streams in H.264 and Motion JPEG

2. Controllable frame rate and bandwidth

3. Axis Zipstream technology in H.264 VBR/MBR H.264

H. Image settings: Compression, Color, Brightness, Sharpness, Contrast, Local contrast, White balance, Exposure control, Exposure zones, Automatic backlight compensation, Fine tuning of behavior at low light, 120 dB WDR - Forensic Capture, Manual shutter time, Text and image overlay, 20 individual 3D privacy masks, Image freeze on PTZ, Electronic Image Stabilization

I. Network:

1. Security Password protection, IP address filtering, HTTPSa encryption, IEEE 802.1Xa network access control, Digest authentication, User access log, Centralized certificate management

2. Supported protocols: IPv4/v6, HTTP, HTTPSa, SSL/TLSa, QoS Layer 3 DiffServ, FTP, SFTP, CIFS/SMB, SMTP, Bonjour, UPnPTM, SNMP v1/v2c/v3 (MIB-II), DNS, DynDNS, NTP, RTSP, RTP, SRTP, TCP, UDP, IGMP, RTCP, ICMP, DHCP, ARP, SOCKS, SSH, NTCIP, LLDP

2.08 CAMERA PARAPET MOUNT:

A. Minimum requirements:

1. Casing NEMA 4X- and IK10-rated impact resistant aluminum mount

a. Color: White NCS S 1002-B

2. Cable Routing:

a. Back: Cable hole

b. Side: Cable conduit holes M25 3/4 inch

3. Maximum load 22 pounds

4. Mounting option Parapet and wall

5. Environment Indoor / Outdoor

6. Approvals:

a. IEC/EN/UL 60950-1

b. IEC/EN/UL 60950-22

c. IEC 62262 IK10

d. NEMA 250 Type 4X*

e. EN 50581

f. *Corrosion protection

7. Dimensions :

a. Collapsed arm: 39.6 x 30.1 inches

b. Expanded arm: 39.6 x 40.7 inches

8. Weight: 13 pounds

9. Included accessories:

a. Installation Guide

b. Pull-string

10. Optional accessories:

a. AXIS T91D62 Adapter Mounting Bracket

b. AXIS ACI Conduit Adapters

c. AXIS T91B52 Extension Pipes 0.98/3.2 feet

d. AXIS Bird Control Spike

e. Network Cable Coupler IP66

11. Shall be AXIS T94A01D

2.09 POWER SUPPLIES:

A. Low-voltage power supplies matched for voltage and current requirements of cameras and accessories, and of type as recommended by manufacturer of camera and lens.

1. Enclosure: NEMA 250, Type 1.

2.10 CAMERA-SUPPORTING EQUIPMENT:

A. Minimum Load Rating: Rated for load in excess of the total weight supported times a minimum safety factor of two.

B. Pan Units: Motorized automatic-scanning units arranged to provide remote-controlled manual and automatic camera panning action and equipped with matching mounting brackets.

1. Scanning Operation: Silent, smooth, and positive.

2. Stops: Adjustable without disassembly, to limit the scanning arc.

C. Pan-and-Tilt Units: Motorized units arranged to provide remote-controlled aiming of cameras with smooth and silent operation and equipped with matching mounting brackets.

1. Panning Rotation: 0 to 355 degrees, with adjustable stops.

2. Tilt Movement: 90 degrees, plus or minus 5 degrees, with adjustable stops.

3. Speed: 12 degrees per second in both horizontal and vertical planes.

4. Wiring: Factory prewired for camera and zoom lens functions and pan-and-tilt power and control.

5. Built-in encoders or potentiometers for position feedback**,** and thermostat-controlled heater.

6. Pan-and-tilt unit shall be available with preset positioning capability to recall the position of a specific scene.

D. Mounting Brackets for Fixed Cameras: Type matched to items supported and mounting conditions. Include manual pan-and-tilt adjustment.

E. Protective Housings for Fixed and Movable Cameras: Steel enclosures with internal camera mounting and connecting provisions that are matched to camera/lens combination and mounting and installing arrangement of camera to be housed.

2.11 MONITORS:

A. 24 inch Color Monitor:

1. Display Type: LED

2. Brightness: 250cd/m2

3. Max. Resolution:

4. VGA(D-SUB): 1,920 x 1,080

5. BNC(CVBS): 600TVL

6. Contrast Ratio: 1,000 : 1

7. Aspect Ratio: 16 : 9

8. Viewing Angle (H/V): 170 degrees / 160 degrees

9. Display Color: 16.7 million

10. Response Time: 5 ms

11. Video System: NTSC / PAL

12. Panel Life: 30,000 hours

13. Filter Type: 3D comb filter

14. RGB Connector: 1 Analogue RGB 15-pin D-sub, Input Signal 0.7 Vp-p, plus or minus 5 percent

15. HDMI Connector: 1 HDMI input (Type A connector)

2.12 NETWORK VIDEO RECORDER AND DEVICE MANAGER:

A. Recorder and device manager shall meet the following requirements:

1. CPU: Intel Core i7-4930K @ 3.40GHz or Intel Xeon E5-2640 v3 @ 2.60GHz

2. RAM: 8 GB (16 GB or more recommended)

3. Available hard disk space: min. 50 GB and additional storage space for image recordings HDD with 7200 RPM minimum

4. Network: Minimum Gigabit Ethernet Connection

5. Operating Systems (all 64-bit):

a. Windows 10 (Professional and Enterprise)

b. Windows Server® 2012 (Standard, Datacenter)

c. Windows Server® 2016 with Desktop Experience

d. (Standard, Datacenter)

B. Network Video Recorder (NVR) equipment is required for the storage of video images. The NVR will consist of a device with minimum recording/storage specifications of 15 frames per second (FPS), 80 pixels per foot or better resolution at scene target and RAID 6 to capture minimum of 30 days of recorded surveillance. The interview room camera shall be 30 FPS. The Contractor will determine and document the capacity of the

NVR. The Contractor shall provide a Video solution with a minimum of 20 percent free channels to allow cameras to be added in the future.

1. Coordinate with owner to match existing equipment

2.13 IP VIDEO SYSTEMS:

A. Description:

1. System shall provide high-quality delivery and processing of IP-based video, audio, and control data using standard Ethernet-based networks.

2. System shall have seamless integration of all video surveillance and control functions.

3. Graphical user interface software shall manage all IP-based video matrix switching and camera control functions, two-way audio communication, alarm monitoring and control, and recording and archive/retrieval management. IP system shall also be capable of integrating into larger system environments.

4. System design shall include all necessary compression software for high-performance, dual-stream, MPEG-2/MPEG-4 video. Unit shall provide connections for all video cameras, camera PTZ control data, bidirectional audio, discreet sensor inputs, and control system outputs.

5. All camera signals shall be compressed, encoded, and delivered onto the network for processing and control by the IP video-management software.

6. Camera system units shall be ruggedly built and designed for extreme adverse environments, complying with NEMA Type environmental standards.

7. Encoder/decoder combinations shall place video, audio, and data network stream that can be managed from multiple workstations on the user's LAN or WAN.

8. All system interconnect cables, workstation PCs, PTZ joysticks, and network intermediate devices shall be provided for full performance of specified system.

2.14 SECURITY NETWORK SWITCHES:

A. Switches shall provide network paths for all Electronic Security Systems components

B. Use Layer 3 switches on the edge and at the core with the required buffer size such that the system shall operate as specified for the overall video system functionality. All switches must be set up with multicasting.

C. Edge Switches:

1. Provide enterprise-class stackable Layer 3 edge switches with 24 or 48 ports in compact 1U form factor.

2. Provide 24 or 48 port POE+ switches as required with 10/100/1000 ports.

3. Provide dual fiber optic uplinks at each switch location. Uplinks to be 10 Gigabit Ethernet.

4. Provide SFP's as required to dual home to fiber optic core switches.

5. Optional hot swappable onboard load sharing redundant power supply capability.

6. Support automatic QOS, VLANS and auto-negotiation on all ports.

7. Layer 3 routing support for static or dynamic routing using OSPF, RIP, or BGP.

8. High availability stacking with hitless failover and hot insertion/removal of stacked units.

9. Model: Cisco 3850 series

D. Core Switches:

1. Provide data center class layer 3 switches supporting redundant load sharing hot swappable power supplies and fan trays.

2. Provide 10 Gigabit SFP Fiber ports to support all edge switches.

3. Optional Redundant power supply.

4. Support automatic QOS, VLANS and auto-negotiation on all ports. Full support for private, port based, protocol based, and MAC based VLANS. Auto-negotiated supported on all ports.

5. Layer 3 routing support for static or dynamic routing using OSPF, RIP, or BGP.

6. Model: Cisco 6880 series

PART 3 - EXECUTION

3.01 EXAMINATION:

A. Examine pathway elements intended for cables. Check raceways and other elements for compliance with space allocations, installation tolerance, hazards to camera installation, and other conditions affecting installation.

B. Examine roughing-in for LAN, WAN, and IP network before device installation.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 WIRING:

A. Comply with requirements in Section 26 05 33.

3.03 FIELD QUALITY CONTROL:

A. Testing Agency: Engage a qualified testing agency to perform tests and inspections.

B. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect, test, and adjust components, assemblies, and equipment installations, including connections.

C. Perform Tests and Inspections.

1. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect components, assemblies, and equipment installations, including connections, and to assist in testing.

D. Tests and Inspections:

1. Inspection: Verify that units and controls are properly installed, connected, and labeled, and that interconnecting wires and terminals are identified.

2. Pretesting: Align and adjust system and pretest components, wiring, and functions to verify that they comply with specified requirements. Conduct tests at varying lighting levels, including day and night scenes as applicable. Prepare video-surveillance equipment for acceptance and operational testing as follows:

a. Prepare equipment list described in "Informational Submittals" Article.

b. Verify operation of auto-iris lenses.

c. Set back-focus of fixed focal length lenses. At focus set to infinity, simulate nighttime lighting conditions by using a dark glass filter of a density that produces a clear image. Adjust until image is in focus with and without the filter.

d. Set back-focus of zoom lenses. At focus set to infinity, simulate nighttime lighting conditions by using a dark glass filter of a density that produces a clear image. Additionally, set zoom to full wide angle and aim camera at an object 50 to 75 feet away. Adjust until image is in focus from full wide angle to full telephoto, with the filter in place.

e. Set and name all preset positions; consult Owner's personnel.

f. Set sensitivity of motion detection.

g. Connect and verify responses to alarms.

h. Verify operation of control-station equipment.

3. Test Schedule: Schedule tests after pretesting has been successfully completed and system has been in normal functional operation for at least 14 days. Provide a minimum of 10 days' notice of test schedule.

4. Operational Tests: Perform operational system tests to verify that system complies with Specifications. Include all modes of system operation. Test equipment for proper operation in all functional modes.

E. Video surveillance system will be considered defective if it does not pass tests and inspections.

F. Prepare test and inspection reports.

3.04 ADJUSTING:

A. Occupancy Adjustments: When requested within 12 months of date of Substantial Completion, provide on-site assistance in adjusting system to suit actual occupied conditions. Provide up to two visits to Project during other-than-normal occupancy hours for this purpose. Tasks shall include, but are not limited to, the following:

1. Check cable connections.

2. Check proper operation of cameras and lenses. Verify operation of auto-iris lenses and adjust back-focus as needed.

3. Adjust all preset positions; consult Owner's personnel.

4. Recommend changes to cameras, lenses, and associated equipment to improve Owner's use of video surveillance system.

5. Provide a written report of adjustments and recommendations.

3.05 CLEANING:

A. Clean installed items using methods and materials recommended in writing by manufacturer.

B. Clean video-surveillance-system components, including camera-housing windows, lenses, and monitor screens.

3.06 DEMONSTRATION:

A. Train Owner's maintenance personnel to adjust, operate, and maintain video-surveillance equipment.

3.07 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

Page Intentionally Left Blank

SECTION 28 31 00

FIRE DETECTION AND ALARM

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide fire detection and alarm as indicated and in compliance with Contract Documents.

B. Provide, test, and place into operating condition an electrically operated, microprocessor based, FM Global Approved, four-wire, analog/addressable, electrically supervised fire detection and evacuation system as indicated and specified.

C. The System shall include, but not be limited to: Fire Alarm Control Panel (FACP) (or panels required for each building), remote Annunciator Command Center (ACC), power supplies and fire alarm initiating and notification devices including addressable monitor and control modules.

D. The fire alarm system shall include conduit, wire, fittings, and accessories required to provide a complete operating system.

E. Connect fire alarm control panels in a local area network via twisted pair cable for data communication with other areas. Display local information at each network node and the entire network monitored at the network remote annunciator panel.

F. All charges and fees required by the local Authority having jurisdiction (AHJ) to inspect the installation and implement fire alarm notification are to be included by the Contractor under this section at no additional cost to the Owner.

F. State and Local Building Codes.

1.03 SYSTEM DESCRIPTION:

A. Type of System:

1. Fire Alarm System: The fire alarm system shall operate as a low voltage analog/addressable type system and shall automatically initiate fire alarm signals whenever any manual or automatic fire detecting devices are placed into an alarm mode. The system shall indicate areas of alarm and sound local alarms. Initiating loops and notification loops shall be wired as four-wire class B Circuits. Initiating loops and notification loops shall be complete with necessary switches, meters, relays, pilot lights, surge arresters and addressable modules as required. A minimum of one thermal cut-out or fuse and surge arrestor for every notification circuit shall be provided.

2. The system shall be capable of operating with a single break or ground fault condition in the initiating or alarm sounding circuits.

3. Evacuation Alarms: Coded evacuation alarm: A fire alarm signal shall be employed for notifying the occupants to evacuate.

4. Trouble Signals: During abnormal conditions such as an open wire or a ground fault, or where both conditions occur at one point, the system shall be capable of automatically transmitting clear, intelligible trouble signals.

5. Power Supply for the System: A dedicated branch-circuit for supplying power to the alarm system shall be provided for the Fire Alarm Control Panel (FACP). The branch circuits shall be automatically energized from an auxiliary electrical power system during failures of the normal power supply. Provide battery backup power consisting of rechargeable, sealed type storage batteries and battery charger.

6. The system shall interface to HVAC system and other building systems as shown on the Contract Drawings and required by applicable codes to provide all required monitoring and control functions.

B. Sequence of Operation:

1. When a fire-alarm condition is detected by one of the system initiating devices, the following functions shall immediately occur:

   a. Automatic programs assigned to the alarm point shall be executed and the associated indicating devices and relays activated.

   b. Fire-alarm notification devices in the building shall operate.

   c. An exterior strobe at the building in alarm shall energize and the fire alarm notification devices in only that building shall operate.

   d. The system alarm on the Fire Alarm Control Panel and Remote Annunciator Command Center will indicate condition.

   e. The alarm shall be signaled automatically to the local Central Station Monitoring System

   f. Shutdown of HVAC equipment and associated exhaust and pressurization operations to be initiated.

2. When a trouble condition is detected by one of the system initiating or indicating circuits, the following functions shall immediately occur:

   a. System Trouble will be indicted on FACP and Annunciator Command Center.

   b. A local trouble-sounding device in the FACP and Annunciator Command Control shall be activated. This sound shall be distinct from the alarm sound.

   c. The appropriate message will appear on the LCD display at the FACP and Annunciator Command Center.

1.04 SUBMITTALS

A. Submit the following shop drawings in accordance with Section 01 33 00.

1. Copy of this specification section with addenda and all referenced specification sections with addenda check-mark each paragraph to indicate specification compliance or indicate deviation and reason for deviation.

a. Failure to include a copy of the marked-up specification sections will result in return of the entire submittal with no further review and consideration.

2. Installer and system supplier qualifications and list of three similar projects with name and phone number of contact person.

3. Complete list of equipment and materials, including manufacturer's descriptive and technical literature, catalog cuts. Shop drawings shall contain complete conduit riser diagrams, wiring diagrams, and schematic diagrams for the equipment furnished. Riser diagrams shall identify cable sizes and quantities, equipment layout, and any other details required to demonstrate that the system has been coordinated and will properly function as a unit.

4. Manufacturer’s printed installation instructions.

5. Battery capacity calculations to demonstrate that the battery size selected is a minimum of 125 percent of the calculated requirement. Calculation to include supervisory power requirements for all equipment, and alarm power requirements for all equipment.

6. Wiring diagrams from the fire alarm system integrator or supplier differentiating clearly between factory and field installed wiring. Include diagrams for equipment and for system with all terminals and interconnections identified. Identify all diagrams to be specific to this project and distinguish between field and factory wiring.

7. Verify that each duct detector is listed for complete range of air velocity, temperature, and humidity possible when air-handling system is operating.

8. Provide control wiring diagrams for fire-alarm interface to HVAC; coordinate location of duct detectors and access to them.

B. Spare Parts Data:

1. After approval of the list of shop drawings, and not later than six months prior to the date of substantial completion, furnish copies of spare parts data for each different item of materials and equipment specified. The data shall include a complete list of parts and supplies with current unit prices and source of supply, a list of supplies that are either normally furnished at no extra cost with the purchase of the

equipment, or specified to be furnished in accordance with paragraph Special Tools and Spare Parts and a list of additional items recommended by the manufacturer to assure efficient operation for a period of 120 days.

C. Operating and Maintenance Instruction Manuals:

1. At end of project, submit operating instruction manuals as specified in Section 01 78 23, outlining the step-by-step procedures required for system startup and operation shall be furnished. The instructions shall include the manufacturer's name, model number, service manual parts list and brief description of all equipment and their basic operating features.

2. Maintenance instructions manuals outlining maintenance procedures shall be furnished. The manual shall include a troubleshooting guide listing possible breakdown and repairs and a simplified connection wiring diagram for the system as installed. Provide the names, addresses, and telephone numbers of service organizations that provide technical assistance and carry stock of repair parts for the system to be furnished.

3. Performance Test Reports: Upon completion of the installed system, submit in booklet form field tests performed to prove compliance with the specified performance criteria. Each test report shall indicate the final position of controls.

D. Submit Certificate of Compliance, signed by manufacturers of fire alarm system components certifying that their products comply with specified requirements.

E. Submission to Authorities Having Jurisdiction: In addition to routine submission of the above material, make an identical submission to the authorities having jurisdiction. Include copies of annotated Contract Drawings as needed to depict component locations to facilitate review. Upon receipt of comments from the authorities having jurisdiction, submit them for review. Resubmit if required to make clarifications or revisions to obtain approval.

1.05 SPARE PARTS:

A. Comply with the requirements specified in Section 01 61 00.

B. Provide one spare FACP mother board and 10 percent or a minimum of 2 devices of the total devices provided for this Contract as listed below.

1. Pull Stations

2. Manual Pull Stations

3. Weatherproof Smoke Detectors

4. Photoelectric Smoke Detectors

5. Thermal Detectors, 135 degrees F

6. Thermal Detectors, 190 degrees F

7. Alarm Audible Devices

8. Alarm Strobes

C. Three sets of special tools necessary for the maintenance of the equipment shall be furnished. Two spare sets of fuses of each type and size required and five spare lamps for each type shall be furnished. Spare parts shall be listed on submittal list.

1.06 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

B. Standard Products: Material and equipment shall be the latest standard products of a single manufacturer regularly engaged in the manufacture of the product for the 5 years as a minimum.

C. Qualifications of the installer before commencing work: Submit information demonstrating that the supplier has successfully installed fire alarm systems of the same scope, type and design as specified.

1. Submit copies of all required Licenses and Bonds as required in the State having jurisdiction.

2. Employ on staff a minimum of one full time NICET level 2 Technicians or a professional engineer.

3. Certify that the completed system conforms with FM Global standards upon completion of the installation.

4. Ongoing maintenance and testing shall be provided to the Owner under a maintenance contract to maintain the FM Global Approval.

D. Nameplates: The components of equipment shall have the manufacturer's name, address, type or style, and catalog number on a plate securely attached to the equipment.

E. Tags: Tags with stamped identification number shall be furnished for keys and locks. Tags shall be furnished to identify cable and conduit runs, wiring circuits, and all spare parts furnished for Authority's stock to maintain the system.

F. Keys and Locks: All locks shall be keyed alike.

G. Verification of Dimensions: Become familiar with details of the work and verify dimensions in the field.

H. Compliance: The fire detection and internal alarm system shall be configured in accordance with NFPA 72. The equipment furnished shall be compatible and be FM Global approved or listed by a nationally recognized testing laboratory in accordance with the applicable NFPA standards.

I. Accessibility: Enclosures shall be provided with ample gutter space to allow proper clearance between the enclosure and live parts of the panel equipment. If more than one modular unit is required to form a control panel, the units shall be installed in a single cabinet large enough to accommodate all units, and allow ample gutter space for interconnections of panels and field wires.

J. Verify conduit size and wire quantity, size, and type are suitable for the equipment supplied. Review the proper installation of each type of device with the equipment supplier.

K. Review selected arrangement with local fire authority for conformance with local and state requirements.

L. On-Site Technician Services:

1. Provide the services of a representative or technician certified by the manufacturer of the system, experienced in the installation and operation of the type of system provided.

2. The representative shall be licensed in the State if required by law.

3. The technician shall supervise installation, software documentation, adjustment, preliminary testing, final testing and certification of the system, and Underwriters Laboratories listing certification requirements.

4. The technician shall provide the required instruction to the Owner’s personnel in the system operation, maintenance and programming.

5. Provide services of the manufacturer's service representative during installation, startup and testing, for a period of three working days plus travel where a working day is equivalent to 8 hours.

1.07 DELIVERY, STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

B. Equipment placed into storage shall be protected from the weather, humidity and temperature variations, dirt, dust, and other contaminants.

1.08 SEISMIC DESIGN REQUIRMENTS:

A. Conform to the requirements indicated on the structural drawings and as specified in Section 01 41 20.

B. It shall be the responsibility of the manufacturer and supplier along with the Electrical Contractor to conform to the seismic design requirements for this project and for the work of this specification section.

PART 2 - PRODUCTS

2.01 MANUFACTURERS:

A. A single manufacturer shall be used throughout all buildings on site.

B. Notifier

C. Honeywell Gamewell

D. SimplexGrinnell

E. Fike

F. Siemens

2.02 MATERIAL AND EQUIPMENT:

A. General Product Description:

1. Each Fire-Alarm Control Panel (FACP) shall be capable of fire detection, equipment supervision and control, alarm management, and historical data collection and archiving. The system components shall be FM Global approved.

B. Communications:

1. The FACP shall have sufficient memory to support its operating system and databases including:

a. Fire Management

b. Alarm Management

c. Historical/Trend Data

d. Maintenance Support Applications

e. Custom Processes

f. Operator I/O

2. Communication Ports: Provide data communication ports for simultaneous operation of devices such as industry standard printers, programming terminal, PC, transponder and annunciator.

3. Integrated On-Line Diagnostics: The FACP shall continuously perform self-diagnostics, communication diagnostics and diagnostics on all subsidiary equipment.

4. Surge and Transient Protection: Isolation shall be provided at all field point terminations to suppress induced voltage transients where required. Surge arrestors shall provide protection from all non-signal electrical surges that could cause damage to the equipment. Line surge arrestors shall be isolated from the electrical circuitry that they are protecting.

C. System Software Features:

1. Provide software to form a complete operating system as described in this specification shall be provided.

2. The software programs specified in this section shall be provided as an integral part of the panel and shall not be dependent upon any higher level computer for execution.

3. Alarm Management: Alarm management shall be provided to monitor, buffer, and direct alarm reports to operator devices and memory files. The control unit shall have capability of performing alarm analysis and signaling. At no time shall the panel's ability to report alarms be affected by operator activity.

4. Status Change Report: All alarm or point change reports shall include the point's English language description, and the time and date of occurrence.

5. Prioritization: The user shall be able to define the specific system reaction for each point. Alarms shall be prioritized to minimize nuisance reporting and to speed operator response to critical alarms. A minimum of three priority levels shall be provided.

6. Report Routing: Alarm reports shall be archived for future recall.

7. Alarm Messages: In addition to the point's description and the time and date, the user shall be able to print, display or store a custom alarm message to more fully describe the alarm condition or direct operator response.

8. The FACP shall be capable of storing a library of at least 900 events.

9. History Mode:

a. The system shall be able to store and display at least 900 system events that have occurred in a non-volatile buffer memory. Display of these events shall be accomplished on-site through the use of the front control panel indicators and switches.

10. Field Configurable:

    a. The system shall be fully configurable and expandable without the need for EPROM programmers. All configurations shall be accomplished through downloading of programs from a computer. Reconfiguration shall not require knowledge of any programming languages or require any special training. All programs shall be stored in non-volatile memory. Entry into program mode shall require a special key and a special password entered into the front panel.

D. Analog Device Interface:

1. The Analog Device Interface will be capable of supporting devices as indicated on drawings with 25 percent spare slots for future devices.

2. The analog addressable device interface shall contain its own microprocessor control.

3. The analog addressable device interface shall communicate and provide power to all devices on its loop over a single pair of wires. The fire-alarm system shall function as a Class B system.

4. The analog interface board shall receive analog information from intelligent detectors and shall process this information to determine normal, alarm, or trouble conditions. The analog information may also be used for automatic test and determination of maintenance requirements.

5. Communication with connected devices shall be performed every 5 seconds or less. Average time to detect an alarm shall be less than 10 seconds (longer for alarm verification detectors).

E. Notification Appliance Circuit:

1. The FACP shall provide supervised Class B notification circuits as indicated on drawings with 50 percent spare capacity for future devices. The circuit capacity shall be 2.0 amperes maximum per circuit, maximum of 8.0 amperes from the FACP's power supply. If a short-circuit trouble occurs on one of the circuits it will not affect the operation of the remaining circuits.

F. Function Relays:

1. The FACP shall provide of Form "C" relay contacts, quantity as required, rated at 2 A at 120 VAC. These relays may be programmed to activate on alarm from any initiating zone or any combination of initiating zones, analog devices or addressable modules.

G. Central Processing Unit (CPU):

1. The CPU shall communicate with the operator interface, LCD display, LED display and control other modules in the panel. Removal, disconnection or failure of any control panel shall be detected and reported by the Central Processing Unit.

2. The CPU shall contain and execute all control-by-event programs for specific action to be taken if a fire situation is detected in the system. Such control-by-event programs shall be held in non-volatile programmable memory, and shall not be lost even if system primary and secondary power failure occurs. The CPU shall also provide a real time clock for time annotation on the display and remote optional printer.

H. Operator Display:

1. The operator display shall provide controls and indicators used by the system operator. The display shall contain, and display as needed, custom alphanumeric message for all intelligent detectors and addressable modules. Such message information shall be stored in programmable non-volatile memory.

2. The display board shall provide an 80-character alphanumeric Liquid Crystal Display (LCD). It shall also 24 LEDs for system indication such as AC POWER; SYSTEM ALARM; SYSTEM TROUBLE; ACKNOWLEDGE; SIGNAL SILENCE, etc.

3. Factory programmable system indications and keys shall be available for unique functions. Keys shall be referred to as “Hot Keys”.

4. The Display Interface shall provide a 15-key touch keypad with control capability to command all system functions, and entry of any numeric information. The keypad shall include means to enter a minimum of two different passwords to prevent unauthorized manual control.

5. Ground fault indication shall be displayed on a system and initiating zone basis.

I. Communications Ports:

1. The system shall provide the following interfaces:

a. One port for remote annunciator command center.

b. One port for central station communication.

c. One port for service and field programming.

d. One port for Printer.

J. Mechanical Design:

1. The Fire Alarm Control Panel (FACP) shall be housed in a cabinet designed for mounting recessed or directly to a wall or vertical surface. The back box and door shall be constructed with provisions for electrical conduit connections. The door shall provide a key lock and shall include an opening for viewing.

2. The FACP shall be modular in structure for ease of installation and maintenance.

K. One Person Test Feature: The control unit shall include a special one person test feature, which will allow a single person to test all initiating devices and indicating appliance in a system without returning to the panel to reset the system. A special password shall be required to enter the test mode. The service-technician shall be able to re-select the initiating and indicating circuits that are to be included in the one person test mode. The Walk-Test shall include a special audible indication that a trouble has been detected on an analog device, for the service-technician to check proper system wiring.

L. Provide addressable monitor modules to interface manual FACP to stations and other non-addressable detection components as required. The modules shall be capable of being mounted in a 4 x 4 x 2 1/8 inch junction box.

M. Provide addressable control modules to interface FACP to fire alarm reporting panel, audible and visual devices and other control components as required. The modules shall be capable of being mounted in a 4 x 4 x 2 1/8 inch junction box.

N. Fire-Alarm Initiating Devices:

1. Addressable Devices: All addressable detectors shall:

a. Provide a test means whereby they will simulate an alarm condition and report that condition to the FACP. Such a test may be initiated at the detector itself, by activating a magnetic switch, or may be activated remotely on command from the control panel.

b. Provide address-setting means on the detector head using switches. The detectors shall also store an internal identifying code which the FACP shall use to identify the type of detector.

c. Provide dual alarm and power LEDs. Both LEDs shall flash under normal conditions, indicating that the detector is operational and in regular communication with the control panel. Both LEDs may be placed into steady illumination by the control panel, indicating that an alarm condition has been detected. An output connection shall also be provided in the base to connect an external remote alarm LED.

2. Addressable pull stations shall, on command from the control panel, send data to the panel representing the state of the manual switch and the addressable

communication module status. They shall use a key operated test-reset lock, and shall be designed so that after actual emergency operation, they cannot be restored to normal use except by the use of a key. Operated stations shall have a positive, visual indication of operation and utilize a key type reset. Manual stations shall be constructed of Lexan with clearly visible operating instructions provided on the cover. The word FIRE shall appear on the front of the stations in raised letters, 1.75 inch or larger. Mount stations inside a red, weatherproof enclosure with a clear polycarbonate hinged front cover where station is indicated on the drawings as NEMA 4, NEMA 4X and hazardous areas including Class I, Division 1 and 2.

3. Analog/Addressable Area Photoelectric Smoke Detectors: Photoelectric Smoke Detectors shall use the photoelectric principle to measure smoke density and shall, on command from the control panel send data to the panel representing the analog level of smoke density. These addressable detectors shall connect with two wires to one of the control addressable input circuits.

4. Analog/Addressable Thermal Detectors: Thermal detectors shall use an electronic sensor to respond to temperatures exceeding 135 degrees F or 190 degrees F as noted on the plans. Sensing elements shall be replaced without removing the detector base. The detector shall, on command from the control panel, send data to the panel representing the analog temperature level. These addressable detectors shall connect with two wires to one of the control addressable input circuits.

5. Each detector shall be provided with a steel mounting plate, and the entire unit shall mount on a double gang electrical box.

6. Analog/Addressable Duct Smoke Detectors:

   a. Photoelectric-type, duct-mounted smoke detector.

   b. The detectors shall, on command from the control panel, send data to the panel representing the analog level of smoke intensity.

7. Provide devices suitable for the area classifications as indicated on the Contract Drawings (i.e., NEMA 1, NEMA 4, NEMA 4X, and NEMA 7 (Class I, Division 1 or 2) NEMA 4X, etc.).

8. Where located in a chemically corrosive environment, all fire alarm initiating devices shall be corrosive resistant.

O. Fire Alarm Indicating Devices:

1. Visual appliances shall be installed as shown on the drawings in accordance with the requirements of FM Global and NFPA 72. Where multiple visual signals are

visible from any location, circuitry shall be incorporated for the synchronization of the flash rate.

a. FM Global approved for Emergency Devices for Hearing Impaired in all public mode installations.

b. Strobes shall meet FM Global approved flash rate.

c. Visual signals shall incorporate a Xenon flashtube enclosed in a rugged Lexan lens or equivalent with solid state circuitry.

d. The strobe intensity shall be rated per FM Global.

e. The strobes shall be available for semi-flush or surface mounting and in conjunction with audible signals as required.

2. Audible Devices: Audible evacuation signals shall be provided meeting the following requirements:

a. Audible Notification appliance shall be electronic and use solid state components.

b. Each electronic signal shall provide four field selectable alarm tones. The tones shall consist of: slow hoop, continuous, temporal or interrupted.

c. The device shall provide UL dBA measurement at 10 feet shall be a minimum of 85 dBA for separately mounted audible signals.

d. The device shall have provisions for standard reverse polarity type supervision and in/out field wiring using terminals that accept 14 AWG wiring.

e. Combination audiovisual alarm horns shall have a high intensity flashing light and alarm horn as an integral unit. Both audio and visual components shall operate from the 24 volt dc polarized indicating circuits. The horn assembly shall be housed in a rugged, die-cast enclosure, and the electronic light source shall be sealed in silicone and protected by a Lexan lens. The word FIRE shall appear on the lens. Audiovisual alarm devices shall meet the requirements of visual appliances and alarm horns above. Single and/or dual projectors shall be supplied as shown on the plans.

3. Where located in a chemically corrosive environment, all fire alarm indicating devices shall be corrosive resistant.

P. Power Supply:

1. The power supply for the FACP and fire alarm peripherals shall be integral to the FACP. The power supply shall provide FACP and peripheral power needs.

2. Positive-temperature-coefficient thermistors, circuit breakers, or other over-current protection shall be provided on all power outputs.

3. Input power shall be 120 VAC, 60 Hertz. The power supply shall provide internal batteries and charger. Internal battery capacity shall be sized as required to meet system requirements.

4. The main power supply shall provide a battery charging circuit consisting of a fully automatic standby battery charger, rate compensated, capable of maintaining battery in fully charged state and be capable of recharging batteries to 70 percent of alarm capacity within 12 hours. Provide for normal operation of entire system for 24 hours with power remaining to sound alarms for 5 minutes for detection-only systems, fixed extinguishing, suppression system controls, and other fire alarm signaling equipment. For remote stations, provide battery capacity to operate for 60 hours followed by 5 minutes of alarm in accordance with NFPA 72B. Alarm control panels for automatic release of preaction or deluge sprinkler systems to have 90 hours of secondary power followed by 10 minutes of release power and alarm operations.

5. Provide charger with the following supervised functions: circuit protection for shorts, open, disconnected or reversed polarity battery connection, supervision or protection of high or low voltage, overcharging and charger failure. Automatic load shedding or battery disconnect on deep discharge to prevent battery damage.

6. Batteries shall be 24 volt, rechargeable, gelled electrolyte, totally sealed, fully charged with al interconnections ready for service, maintenance free, long-life.

Q. Wiring within Cabinets, Enclosures, Boxes, Junction Boxes, and Fittings:

1. Provide wiring installed in a neat and workmanlike manner and installed parallel with or at right angles to the sides and back of any box, enclosure, or cabinet.

2. Conductors which are terminated, spliced, or otherwise interrupted in any enclosure, cabinet, mounting, or junction box shall be connected to terminal blocks.

3. Mark each terminal in accordance with the wiring diagrams of the system.

4. Make connections with approved pressure type terminal blocks, which are securely mounted.

5. The use of wire nuts or similar devices shall be prohibited.

R. Terminal Cabinets:

1. Provide a terminal cabinet at the base of any circuit riser, and where indicated on the drawings.

2. Terminal size shall be appropriate for the size of the wiring to be connected.

3. Conductor terminations shall be labeled and a drawing containing conductors, their labels, their circuits, and their interconnection shall be permanently mounted in the terminal cabinet.

4. Minimum size is 8 inch high by 8 inch.

S. Alarm Wiring:

1. Signaling line circuits and initiating device circuit field wiring shall be copper, 18 AWG size conductors at a minimum.

2. Notification appliance circuit conductors, that contain audible alarm devices, shall be solid copper 14 AWG size conductors at a minimum.

3. Where a voice evacuation system is specified, speaker circuits shall be copper 16 AWG size conductors at a minimum.

4. Wire size shall be sufficient to prevent voltage drop problems.

5. Power wiring, operating at 120 VAC minimum shall be 12 AWG solid copper having similar insulation.

6. Provide all wiring in rigid metal conduit

T. Conductor Terminations:

1. Labeling of conductors at terminal blocks in terminal cabinets, FACP, and remote fire alarm control units shall be provided at each conductor connection.

2. Each conductor or cable shall have a shrink-wrap label to provide a unique and specific designation.

3. Each terminal cabinet, FACP, and fire alarm control unit shall contain a laminated drawing which indicates each conductor, its label, circuit, and terminal.

4. The laminated drawing shall be neat, using 12 point lettering minimum size, and mounted within each cabinet, panel, or unit so that it does not interfere with the wiring or terminals.

5. Maintain existing color code scheme where connecting to existing equipment.

U. Wiring to Station Fire Alarm Circuit:

1. Wiring from the master fire alarm box to the state telegraphic fire alarm circuit shall be a two-conductor 10 AWG type UF cable in conduit.

V. Remote Annunciator Command Center:

1. The remote Annunciator Command Center (ACC) shall be an 80 (4 x 20) character back-lit LCD type capable of displaying up to 3200 point messages. The remote annunciator shall have the capability of driving up to 576 LEDs for future graphic notification. They shall be sixteen switch inputs that can be used for various system functions; lamp test, trouble silence, general alarm, scroll, system reset, network reset, etc. All fire-alarm controls shall be operational from the Annunciator Command Center.

2. The ACC shall have non-volatile memory. Annunciators which rely on the FACP for memory will not be accepted.

3. The ACC shall be surface mounted with switches located with a locked panel, and easily visible through a glass or plastic viewing plate. Panel door shall have a keyed lock identical to the lock on the fire alarm control panel (FACP).

PART 3 - EXECUTION

3.01 INSTALLATION:

A. Install fire alarm system as indicated on the drawings, in accordance with the manufacturer's diagrams and printed instructions, except where otherwise indicated.

1. Wiring: Wiring for systems shall be installed in conduit. Ruse existing fire alarm conduit system where applicable; otherwise, provide conduit as specified in Section 26 05 33. Where located in a chemically corrosive environment, corrosive resistant conduit shall be used.

2. Station loops shall be arranged to permit disconnecting and bypassing the system at the base of each riser. External wiring between the control panel and the stations and horns/lights shall connect to terminal strips in accessible locked cabinets. Connections to the terminal strips shall be made with terminal spade lugs or with approved type terminal blocks. Terminal cabinets shall be installed at each point where a station circuit riser originates or any point along a circuit where a tap is made. The conductors for the fire alarm system shall not be installed in conduits, junction boxes, or outlet boxes with conductors of lighting and power systems. The sum of the cross-sectional areas of individual conductors shall not exceed 40 percent of the interior cross-sectional area of the conduit. Gutter space to accommodate all necessary wiring shall be provided.

3. Panels: Panel enclosures shall comply with the requirements of FM Global. Enclosures having doors over 48 inch in height shall be provided with a three-point catch and lock; all other doors shall contain a cabinet type cylinder lock. Inserts shall be blind fastened so that no screws show on the panel front. Where located in

a chemically corrosive environment, panel shall be located in a NEMA 4X enclosure.

4. Detectors: Detectors shall be installed in accordance with manufacturer's printed instructions.

5. Provide complete wiring and conduit between all equipment. Devices shall be mounted upon UL listed boxes. Wiring splices and transposing or changing of colors will not be permitted.

6. Junction boxes shall be painted red and labeled as “Fire Alarm System” with decal or approved markings.

7. Firm Alarm control systems and equipment shall be connected to separate dedicated branch circuits, sized as required for proper service. Circuits shall be labeled “FIRE ALARM.”

8. Review the design drawings and perform a walk-through of all areas with the AHJ.

3.02 PERMITS AND CERTIFICATIONS:

A. Obtain required local permits.

1. Provide FM Global certification of the installation.

3.03 FIELD TESTING:

A. Notify the AHJ and the Owner 30 days before the performance and acceptance tests are to be conducted. The tests shall be performed in the presence of the Owner or his authorized representative. Furnish instruments and personnel required for the tests. Tests shall be conducted for the following:

1. Verify that the system is free of grounds or open circuits. Wiring runs shall be tested for continuity, short circuits and grounds before system is energized. The FACP shall indicate when a ground or open circuit exists.

2. Alarm initiating devices shall be observed and logged for correct zone and sensitivity. These devices and their bases shall be tagged with adhesive tags located in an area not visible when installed, showing the initials of the installing technician and date.

3. Verify that all strobes, audible devices, pull stations, transmitters, automatic detectors and supervisory devices are functioning as specified.

a. Strobes shall deliver the correct foot-candle. Audible devices shall delivery the correct sound pressure levels decibels of the specified device.

b. Stations shall close the circuits specified and deliver specified alarm codes. Verify central station receives alarm.

c. Automatic detectors shall actuate the specified zones when the appropriate fire or smoke conditions are generated. The detectors shall be exposed to actual smoke used to simulate this test on each and every smoke detector as located in the building; no other test will be accepted.

d. Panels and supervisory devices shall display and control functions as specified. Loss of AC system power shall also be tested.

e. Close each sprinkler system valve and verify proper supervisory alarm.

f. Verify activation of all water flow switches.

B. System tests to be performed under the supervision of a qualified representative and the AHJ.

C. Perform all tests to verify the correction of defects found in the initial testing. If testing identifies system modifications are required to accomplish the required operation, perform work at no additional cost to the Owner and retest the system.

D. Perform an acceptance test on 100% of the system as described in the checklist in Table 1 of FM Global Property Loss Prevention Data Sheet 5-40, Fire Alarm Systems. Have all testing performed by qualified service people and only after the building owner and authority having jurisdiction (AHJ) have been notified and output circuits have been disabled.

E. Furnish training as follows:

1. Training in the receipt, handling and acknowledgment of alarms

2. Training in the system operation including manual control of output functions from the system control panel

3. Training in the testing of the system

3.04 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

Page Intentionally Left Blank

SECTION 28 33 34

COMBUSTIBLE GAS DETECTION SYSTEM

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide a combustible gas detection system as indicated and in compliance with Contract Documents.

B. This section includes materials, installation, and testing of calibrated field-mounted combustible gas detectors and monitors, including alarms, sample pumps, calibration kits, and stainless steel gas sampling tubing.

1.02 REFERENCES:

A. National Fire Protection Association (NFPA):

1. 820: Standard for Fire Protection in Wastewater Treatment and Collection Facilities.

1.03 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Submit certified dimensional drawings and catalog cuts for each size and type of instrument, cabinet, and alarm beacon. Catalog cuts are to be highlighted to define specific materials of construction and specified features.

C. Submit installation, operation and maintenance manuals, and wiring diagrams.

1.04 SPARE PARTS:

A. Comply with the requirements specified in Section 01 61 00.

B. Provide one spare detector and new, unused, calibration gas kit.

1.05 MANUFACTURER'S SERVICES:

A. Provide equipment manufacturer's services at the jobsite for the minimum labor days listed below, travel time excluded:

B. One labor day to check the installation and advise during start-up, testing, and adjustment of the equipment.

C. One-half labor day to instruct the Owner's personnel in the operation and maintenance of the equipment.

PART 2 - PRODUCTS

2.01 MANUFACTURER:

A. The combustible gas detection system shall be manufactured by MSA Instruments.

2.02 COMBUSTIBLE GAS DETECTOR:

A. The combustible gas detector shall be the catalytic-bead type designed to measure concentrations of combustible gases. The detector calibration shall be based on methane with an adjustable range of 0 percent to 100 percent of the Lower Explosive Limit (LEL), a maximum zero drift of plus or minus 1 percent of full scale per week, and a repeatability of plus or minus 1 percent of full scale. The detector shall be resistant to hydrogen sulfide in concentrations up to 100 ppm. The detector shall be FM and UL listed.

B. Mount the detector and its electronics in a cast aluminum, NEMA 4 enclosure, meeting FM Class 1, Division 1, Group C and D requirements. Detector shall operate on voltage up to 14 volt DC.

C. The detector head, with the catalytic bead, shall be removable and replaceable without replacement of electronics. Detector life shall be guaranteed for two years of continuous operation, minimum.

2.03 COMBUSTIBLE GAS MONITOR:

A. Connect the monitor to each detector by 3-wire shielded cable in conduit. The signal from the detector to the monitor shall be 4 to 20 mA.

B. The monitor shall be capable of monitoring two combustible gas detectors and gas sample pump. Equip with separate three-digit LED readouts for each detector, displaying a direct readout of 0 percent to 99.9 percent of the LEL. Provide a minimum of two separate adjustable alarm set point levels for each detector. Set points shall operate user interface relays that are Form C, single pole, double throw with contacts rated for 5 ampere resistive load at 120 volt AC. Provide a trouble relay to indicate trouble when there is a system power loss, a signal loss from a sensor, a control module malfunction, or a loss of flow to the detector.

C. Provide a local flashing warning light to operate for any alarm condition. Mount the warning light above the monitor panel. Unit shall flash a minimum of 60 cycles per minute with red Lexan lamp cover and a copper-free aluminum body or stainless steel housing. Benjamin Model KL-4111-12 or Crouse Hinds Model VDAS/R/012.

D. Provide the monitor with terminals for output of each detector's 4 to 20 mA signal and alarm contacts.

E. The front panel of the monitor shall incorporate push-button switches that will permit the following operations:

1. Display combustible gas concentration

2. Adjustment of alarm set points

3. Alarm reset

4. Temporary alarm disable

5. Relay reset

6. Lamp test

F. The monitor shall operate on 115 volt AC and be enclosed in a NEMA 4X enclosure for mounting on a wall surface. Access door shall be hinged and shall have a shatterproof window to allow viewing of meters and indicator lights.

2.04 GAS SAMPLING SYSTEM:

A. The gas sampling system shall draw a gas sample from the wet well through the detector using a direct-current electric pump. The pump shall provide a flow rate of 1 cubic foot per hour through the tubing shown in the drawings. Equip the system with a flow switch that will signal when flow is interrupted.

B. Mount the gas sampling system in a NEMA 4X enclosure with exterior wall mounting lugs. Mount a flowmeter to indicate the flow rate without opening the enclosure. Provide a valve and tee for test gas calibration.

2.05 GAS SAMPLE TUBING:

A. The gas sample tubing shall be 1/4-inch outside diameter, Type 316 stainless steel tubing with a minimum wall thickness of 0.028 inch. Fittings shall be Swagelok type as manufactured by Crawford Fitting Company. Tubing bends shall be long sweep made with tubing bending tools. Make bends greater than 45 degrees using fittings. Use flexible tubing from the wet well up to the junction box at grade. Flexible tubing shall be Tygon inner-braid, 1/4-inch inside diameter, rated at 100 psig at 70 degrees F, Ryan Herco No. B-44-4X.

2.06 COMBUSTIBLE GAS CALIBRATION KIT:

A. The combustible gas calibration kit shall provide flow-type calibration for methane in air at 50 percent LEL. Flow rate shall be preset, not to exceed 2 scfh, and shall provide a minimum of two, 3.6-liter gas cylinders.

B. The kit shall include a carrying case, gas cylinder regulator, hose, and adapter for gas detectors.

PART 3 - EXECUTION

3.01 INSTALLATION:

A. Install components per manufacturer's recommendations, with the detectors, sample pumps, monitor, and beacon located in close proximity. Install monitor above the sample points. Install tubing such that there are no low points between the monitor and the sample points.

3.02 TESTING:

A. Test tubing using nitrogen or oil-free compressed air. Test for leakage at 50 psig for one hour prior to connection to the detector. No leakage is acceptable during test. Repair leaks and retest until tubing installation is pressure tight.

B. After units have been energized and functions completely checked, set combustible gas alarm signals at 20 percent and 50 percent of LEL. Label detector for "HIGH" and "LOW" sample locations.

C. Inject calibration gas at wet well end of sample tubing to demonstrate operation of system to the Owner.

3.03 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 28 33 36

HYDROGEN SULFIDE GAS DETECTION SYSTEM

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide a hydrogen sulfide gas detection system as indicated and in compliance with Contract Documents.

B. This section includes materials, installation, and testing of calibrated field-mounted hydrogen sulfide gas detectors, monitors, alarms, and calibration kits.

1.02 REFERENCES:

A. National Fire Protection Association (NFPA):

1. 820: Standard for Fire Protection in Wastewater Treatment and Collection Facilities

1.03 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Submit certified dimensional drawings and catalog cuts for each size and type of instrument, cabinet, and alarm beacon. Catalog cuts are to be highlighted to define specific materials of construction and specified features.

C. Submit installation, operation, and maintenance manuals and wiring diagrams.

1.04 MANUFACTURER'S SERVICES:

A. Provide equipment manufacturer's services at the jobsite for the minimum labor days listed below, travel time excluded:

B. One-half labor day to check the installation and advise during start-up, testing, and adjustment of the equipment.

C. One-half labor day to instruct the Owner's personnel in the operation and maintenance of the equipment.

1.05 SPARE PARTS:

A. Provide to the Owner necessary spare parts of components required to maintain the system. Prior to final acceptance of work, provide a spare parts listing of necessary spare

parts and quantities for review by the Owner's Representative. The spare parts shall include the following minimum requirements:

MINIMUM SPARE PARTS LIST	
Part Description	**Quantity**
Transmitter	1 each
Sensor	1 each

PART 2 - PRODUCTS

2.01 HYDROGEN SULFIDE GAS DETECTOR:

A. The hydrogen sulfide gas detector shall be the electrochemical type designed to measure concentrations of hydrogen sulfide. The detector shall have an adjustable range of 0 to 50 ppm hydrogen sulfide, a maximum zero drift of plus or minus 5 percent of span per year, a maximum span drift of plus or minus 10 percent per year, and a repeatability of plus or minus 1 percent of full scale. The detector shall be UL and FM listed.

B. Calibration of the hydrogen sulfide gas detector shall not require opening the transmitter enclosure or declassification of the area.

C. House the detector and its electronics in a Type 316 stainless steel NEMA 4 enclosure, UL approved for Class 1, Division 1, Group B hazardous locations.

D. The detector head, with the electrochemical bead cell, shall be removable and replaceable without replacement of electronics, without the need to open the sensor housing, and without the need to declassify the area. The detector head shall be “smart” and shall store all calibration data and sensor identification data, such as type of gas monitored and range. Upon installation into the housing, this data shall be recognized and uploaded into the transmitter electronics. This shall allow sensors to be bench calibrated then taken to the field and installed. Detector life shall be guaranteed for one year of continuous operation, minimum.

2.02 HYDROGEN SULFIDE GAS TRANSMITTERS:

A. The gas concentration shall be continuously displayed in engineering units at the integrally mounted local display.

B. The transmitter shall be capable of storing and displaying average, minimum, and maximum gas concentrations over selected periods of time.

C. The transmitter shall give an indication of when sensor is nearing the end of its useful life by means of the front panel LCD. Indication that the sensor is nearing its useful life shall be based on the sensor output, not on the time the sensor has been in service.

D. The transmitter shall have the following internal relays for remote alarm annunciation:

1. Gas concentration medium

2. Gas concentration high

3. Gas concentration high-high

4. Fault relay

E. The three gas concentration alarm relays shall have normally open and normally closed contacts. The relays shall be energized as long as the gas concentration exceeds the set points adjustable with a hand-held controller.

F. Normally open contact of the fault relay shall be open (relay energized) during normal operation. The relay shall operate in steady mode and in pulsed mode.

1. Steady Mode: Relay shall be de-energized when any of the following occurs:

a. Gas sensor is disconnected

b. Transmitter internal problem

c. Power off

2. Pulsed Mode: Relay shall be de-energized for five seconds every minute when any of the following occurs:

a. Under-range reading on the display

b. Improper calibration

G. The transmitter shall be housed in a NEMA 4X enclosure.

H. Provide a dc power supply with the appropriate voltage and amperage levels to power the required transmitters.

2.03 HYDROGEN SULFIDE GAS CALIBRATION KIT:

A. The gas calibration kit shall provide flow-type calibration for 40 ppm hydrogen sulfide in nitrogen. Flow rate shall be preset, not to exceed 0.25 liter per minute.

B. Provide a gas cylinder capable of providing 57 liters of calibration gas.

C. The kit shall include a carrying case, gas cylinder regulator, hose, adapter for gas detectors, and infrared nonintrusive controller.

2.04 HYDROGEN SULFIDE GAS DETECTION SYSTEM MANUFACTURERS:

A. The hydrogen sulfide gas detection systems shall be the UltimaX Gas Monitor as manufactured by Mine Safety Appliances.

B. Deliver to the Owner the required spare parts upon final acceptance of the work. The spare parts shall not be used as replacement parts during the guarantee period.

PART 3 - EXECUTION

3.01 INSTALLATION:

A. Install components per manufacturer's recommendations.

3.02 FIELD TESTING:

A. After units have been energized and functions completely checked, set hydrogen sulfide alarm set points at 10 and 20 ppm.

3.03 CONTRACT CLOSEOUT:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

DIVISION 31

EARTHWORK

Page Intentionally Left Blank

SECTION 31 05 19.13

GEOTEXTILES

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide geotextiles as indicated and in compliance with Contract Documents.

1.02 REFERENCES:

A. American Association of State Highway and Transportation Officials (AASHTO):

1. M288: Standard Specifications for Geotextile Specification for Highway Applications

1.03 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Manufacturer's product data sheet and recommended installation instructions.

1.04 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.05 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

1.06 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

1.07 PACKAGING, SHIPPING, AND STORING:

A. Protect the geotextile from direct sunlight, chemicals, mud, dirt, and debris during shipment and storage.

B. Labeling and Tagging:

1. Identify each package by a tag or label securely affixed to the outside of the roll on at least one end.

2. Provide the following required information on the tag:

a. Name of the geotextile manufacturer.

b. Brand name of the product, width, length, and package weight of geotextile.

PART 2 - PRODUCTS

2.01 SILT FENCE GEOTEXTILE:

A. Conforming to AASHTO M288.

2.02 EROSION CONTROL GEOTEXTILE:

A. Conforming to AASHTO M288.

2.03 DRAINAGE GEOTEXTILE:

A. Class 1 non-woven drainage geotextile according to AASHTO M288.

2.04 SEPARATION GEOTEXTILE:

A. Class I fabric according to AASHTO M288 with Apparent Opening Size of 0.60 mm maximum average roll value.

2.05 STABILIZATION GEOTEXTILE:

A. Class I fabric according to AASHTO M288 with Apparent Opening Size of 0.43 mm maximum average roll value.

2.06 WEED BARRIER GEOTEXTILE:

A. Woven, needle-punched, polypropylene, 5.0 oz, weed barrier geotextile designed for commercial use.

2.07 TEMPORARY SLOPE REINFORCEMENT GEOTEXTILE:

A. TENCATE RS280i geogrid or approved equal.

PART 3 - EXECUTION

3.01 GENERAL:

A. Place geotextile on areas that are smooth and free of projections or depressions.

1. Do not drag the geotextile across the subgrade.

2. Roll geotextile out as smoothly as possible in the direction of vehicle travel.

B. Do not operate construction equipment or traffic directly on geotextile.

C. Cover the geotextile with indicated cover material as soon as possible when placed for construction.

1. Do not leave uncovered for more than five days.

D. Place cover material on the geotextile in a manner that the geotextile is not torn, punctured, or shifted.

1. Use at least a 6 inch thick cover layer or twice the maximum aggregate size, whichever is thicker.

2. Do not end-dump cover material directly on the geotextile except as a starter course.

E. Limit construction vehicles in size and mass so rutting in the initial layer above the geotextile is not more than 3 inches deep or half the layer thickness, whichever is less.

1. Do not turn vehicles on the first layer.

3.02 INSTALL SILT FENCE GEOTEXTILE:

A. Conforming to AASHTO D6462.

3.03 INSTALL EROSION CONTROL GEOTEXTILE:

A. Install at locations shown.

B. Overlap the geotextile at least 2 feet at all longitudinal and transverse joints or sew the geotextile unless otherwise specified.

C. Place overlapped geotextile so that the upstream sheet overlaps the downstream sheets.

D. Overlap each sheet over the next downhill sheet for placement on slopes.

E. Anchor the geotextile using key trenches or aprons at the crests and toes of the slope.

F. Repair: Place patch over damaged area and extend 3 feet beyond the perimeter of the tear or damage.

3.04 INSTALL DRAINAGE GEOTEXTILE:

A. Install at locations shown.

B. Place and secure geotextile to provide direct contact against the excavated surface.

C. Overlap successive sheets of geotextile at least 1 foot (applies to Early Works Package 2 only) or 2 feet in the down-gradient direction of flow.

D. Overlap geotextile at least 1 foot at the top of the trench, where applicable.

E. Place fill beginning with the sheets overlapped above subsequent sheets to hold geotextile in place.

F. Repair: Place patch over damaged area and extend 3 feet beyond the perimeter of the tear or damage.

3.05 INSTALL SEPARATION GEOTEXTILE:

A. Install for pavement sections or other applications at locations shown.

B. Overlap the geotextile at least 1 foot (applies to Early Works Package 2 only) and 2 feet at all longitudinal and transverse joints or sew the geotextile unless otherwise specified.

C. Repair: Place patch over damaged area and extend 3 feet beyond the perimeter of the tear or damage.

D. Place fill, beginning with the sheets overlapped, above subsequent sheets to hold geotextile in place.

E. Use pins 18 inches long to help secure the geotextile during installation.

3.06 INSTALL STABILIZATION GEOTEXTILE:

A. Install stabilization geotextile at locations shown.

B. Overlap the geotextile at least 2 feet at all longitudinal and transverse joints or sew the geotextile unless otherwise specified.

C. Overlap each sheet over the next downhill sheet for placement on slopes.

D. Repair: Place patch over damaged area and extend 3 feet beyond the perimeter of the tear or damage.

E. Place fill to hold geotextile in place beginning with the sheets overlapped above subsequent sheets.

F. Use pins 18 inches long to help secure the geotextile during installation.

G. The requirements for combined drainage and stabilization geotextile for the underdrain systems at the Biological Nutrient Removal facility, Primary and Secondary Clarifiers, and Thickeners are addressed in Section 31 34 19.

3.07 INSTALL WEED BARRIER GEOTEXTILE:

A. Preparation:

1. Remove sharp objects, large stones, and undesirable vegetation.

2. Cut an “X” over each plant and push geotextile under plant base if placing geotextile over an existing bed.

3. Roll geotextile over soil and cut an “X” for each plant hole if placing over a new bed.

4. Fold excess geotextile under and cover with specified landscaping materials.

B. Surface Cover:

1. Provide at least 4 inches of cover on all areas on the geotextile.

2. Increase thickness of cover material over geotextile to three times the diameter of the largest rock material if using large landscape rock.

3. Do not leave any portion of geotextile exposed to direct sunlight.

C. Repair:

1. Repair immediately if damaged.

2. Place patch over damaged area and extend 3 feet beyond the perimeter of the tear or damage.

D. Maintenance:

1. Maintain surfaces and supply additional landscape materials where necessary including areas affected by erosion.

3.08 INSTALL TEMPORARY STABILIZATION GEOTEXTILE:

A. Install stabilization geotextile at locations shown for surcharge slope stabilization.

B. Place the geotextile on the subgrade or fill as shown, before placing the barrier. Place the barrier. Place fill behind the barrier to the elevation shown. Wrap the barrier and place the geotextile on the compacted fill behind the barrier before placing additional fill.

C. Overlap the geotextile at least 2 feet laterally or sew the geotextile unless otherwise specified.

D. Repair: Place patch over damaged area and extend 3 feet beyond the perimeter of the tear or damage.

3.09 SEW:

A. Perform sewing as specified in AASHTO M288, Appendix, Seaming.

3.10 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 31 10 00

SITE CLEARING

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide site clearing as indicated and in compliance with Contract Documents.

B. Section Includes:

1. Clearing and grubbing.

2. Removal of debris related to clearing and grubbing operations.

1.02 DEFINITIONS:

A. Caliper: Instrument used to measure tree diameter.

B. Clearing: Removal and disposal of above ground, i.e., trees, shrubs, bushes, and other vegetation, items defined herein.

C. Grubbing: Removal and disposal of below-ground items defined herein.

D. Stripping: Removal and stock piling of all soil material containing sod, grass, or other vegetation and topsoil as defined herein.

1.03 SUBMITTALS:

A. Submit the following in accordance with Section 01 33 00.

1. Permits

a. Copy of Notice of Intent submitted to the State of Utah, Department of Environmental Quality, Division of Water Quality

2. Certificates

a. Copy of herbicide label bearing EPA registration number.

b. Copy of Arborist Certification

1.04 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

B. Permits:

1. Obtain Land Disturbance Permit from an accepted Erosion and Sediment Control Plan. See General Conditions for additional requirements. Submit copy of permit to Engineer.

C. Certifications:

1. Certified Arborist: All tree pruning, tree repair, and tree removal shall be performed by competent workers, under the supervision of an arborist holding certification from the International Society of Arboriculture (ISA) or equivalent education and experience.

1.05 DELIVERY STORAGE AND HANDLING:

A. Herbicide: Comply with Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) – Title 7 U.S.C. Section 136. Submit copy of herbicide label, bearing EPA registration number.

1.06 SITE CONDITIONS:

A. Existing facilities, structures, and utilities are shown in accordance with available surveys and record drawings. The indicated locations of underground utilities and structures are approximate. Other utilities may exist which are not indicated.

PART 2 - PRODUCTS

2.01 ACCESSORIES:

A. Herbicide: Registered EPA Pesticide.

PART 3 - EXECUTION

3.01 EXAMINATION:

A. Verify survey benchmarks and intended elevations for the Work are as indicated.

B. Verify temporary erosion and sediment control measures are installed before commencing with any other work at the site.

C. Verify location and existence of all underground utilities and structures by contacting utility owners, as required by law. Go to “Call Before You Dig” to receive state-specific information. Access this information by dialing 811 or 1-800-662-4111 or going to www.bluestakes.org.

D. Provide 72-hour notice to existing utility owners, prior to beginning construction.

E. Contact utility companies and authorities to make arrangements for handling and disposal of utilities encountered during construction.

3.02 PREPARATION:

A. Site clearing activities may be performed prior to placement of preload fill, or after removal of preload fill, at the contractor's discretion, as long as permitting, protection, preloading, construction, and any other time sensitive activities are performed per the project schedule.

B. Protect bench marks, survey control points, and existing structures to remain from damage or displacement.

C. Protect trees and vegetation to remain. Do not cut or injure trees and vegetation outside easement lines and outside designated clearing areas.

D. Protect all underground utilities and structures that are to remain. If damage occurs, immediately notify the utility owner within the hour.

E. Protect site features to remain from damage by construction equipment and vehicular traffic.

F. Identify waste and salvage area(s) for stockpiling of removed materials.

3.03 RESTORATION:

A. Existing surfaces, features, utilities, or structures that are to remain but are damaged during construction shall be restored to at least the condition in which they were found immediately before work began, unless noted otherwise. Repair immediately any damage done to tree crowns or root systems. Cutting to be done by licensed arborist. Paint cuts over 1-inch in diameter with a tree dressing or paint specifically designed for this purpose.

B. Restore damaged utilities to the satisfaction of the utility owner.

C. Restore damaged private property to the satisfaction of the property owner.

3.04 CLEARING:

A. Remove and dispose of off-site:

1. Trees, snags, brush, shrubs, downed timber, decayed wood, and other vegetative growth.

2. Rocks, tiles, lumps of concrete, trash piles, debris, refuse, and rubbish. Remove all evidence of their presence from the surface.

B. Clear ground within limits of work, unless otherwise noted.

C. Manual cutting of trees, stumps, and stubs during clearing shall be as close to ground surface as practicable but no higher than 6 inches above ground for small trees (8 inches or less), and not higher than 12 inches above ground for larger trees (greater than 8 inches).

D. Obey all federal, state and local regulations and guidance regarding the cutting, burning, and disposal of diseased trees and vegetation.

3.05 GRUBBING:

A. Remove and dispose of all stumps, buried logs, matted roots, roots larger than 2 inches, and organic materials off site.

B. Roots larger than 2 inches in diameter shall be removed to a depth of 12 inches, and roots larger than 1/2-inches in diameter to a depth of 6 inches.

C. Areas designated to receive pavement or structures shall be grubbed a depth of 18 inches. Measure depths of cut from existing ground surface or proposed finished grade, whichever is lower.

D. Apply herbicide to remaining roots and vegetation to inhibit growth.

E. Depressions made by grubbing shall be filled with suitable material and compacted to conform to original adjacent grade.

F. Do not grub areas within drip line of trees to remain to avoid damage to roots.

3.06 STRIPPING:

A. Soil material containing sod, grass, or other vegetation and topsoil shall be removed to a minimum depth of twelve (12) inches from all areas to receive fill from the area within lines 5 feet outside all foundation walls, over all trenches, and from beneath pavement and curb and gutter areas. The stripped material shall be deposited in such locations as are acceptable to Engineer.

3.07 TREE AND SHRUB REMOVAL:

A. Remove trees and shrubs within permanent and temporary easement by felling or cutting individual vegetation and grubbing.

3.08 TREE AND SHRUB PROTECTION:

A. Protect and prune indicated trees and shrubs within the clearing limits.

3.09 PRUNING:

A. Trim dead branches 1-1/2-inches or more in diameter and branches to heights and in a manner as indicated. Neatly cut limbs and branches close to the bole of the tree or main branches. Paint cuts more than 1-1/4-inches in diameter tree wound paint.

3.10 BURNING:

A. Burning is not permitted on site.

3.11 CLEANING:

A. Promptly dispose of excess and unsuitable material off site.

B. Remove debris, junk, and trash from site.

C. Leave site in clean condition, ready for subsequent work.

D. Clean up spillage and wind-blown debris before entering public or private property, adjacent to site.

END OF SECTION

Page Intentionally Left Blank

SECTION 31 22 00

GRADING

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide grading as indicated and in compliance with Contract Documents.

B. Section Includes:

1. Rough grading

2. Finish grading

3. Stockpiling of topsoil and subsoil

4. Disposal of unsuitable and excess materials

1.02 DEFINITIONS:

A. Unsuitable Material: Defined in Section 31 23 00.

B. Foundation Influence Zone (under foundations, pavements, or sidewalks): Area below base bounded by 1/2H:1V slope extending outward from 1 feet beyond outer edges.

C. Utility Influence Zone (around piping or ducts): Area below with limits bounded by perpendicular line, 6 inches below pipe or duct with a 1/2H:1V slope extending outward from that line, 1 feet beyond the edge of pipe or duct.

1.03 SUBMITTALS:

A. Submit in accordance with Section 01 33 00.

1.04 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

1.05 SITE CONDITIONS:

A. Existing Conditions:

1. See Section 01 14 14 for additional requirements.

2. Verify location of existing underground utilities and structures by contacting utility owners, as required by law. Go to “Call Before You Dig” to receive state-

specific information. Access this information by dialing 811 or going to http://call811.com/state-specific.aspx.

B. Geotechnical Report: The report has been provided separately and is for information only. Logs of borings are included in the report and indicate conditions encountered only at test boring locations. Nothing in the contract documents shall be construed as guarantee that other materials will not be encountered or that proportion of materials will not vary from proportions shown on the logs of test borings.

PART 2 - PRODUCTS

(Not Used)

PART 3 - EXECUTION

3.01 EXAMINATION:

A. Verify survey benchmarks and intended elevations for the work are as indicated.

B. Verify temporary erosion and sediment control measures are installed before commencing with any other work at the site.

C. Immediately notify the Engineer if suspected hazardous materials are encountered and cease operations in that area.

D. Identify areas loosened by frost action, softened by flooding or weather, or containing unsuitable material.

3.02 PREPARATION:

A. Remove material loosened by frost action, softened by flooding or weather, or containing unsuitable material. Replace and compact to same requirements as for specified fill in Section 31 23 00.

B. Identify required lines, levels, grades, and datum.

C. Stake and flag locations of known utilities.

D. Locate, identify, and protect from damage all above- and below-ground utilities to remain.

E. Notify utility owner prior to removal or relocation of utility. See Section 01 11 00 and Section 01 50 00 for notification requirements.

F. When necessary to excavate through roots of trees or vegetation to remain – perform work by hand and cut roots with sharp axe.

3.03 ROUGH GRADING:

A. Topsoil Removal and Stockpiling:

1. Strip 6 inches or more of topsoil from areas that are to be excavated, landscaped, or graded.

2. Separate organic matter (e.g. root zones) from topsoil. Dispose of organic material off-site.

3. Do not strip topsoil while wet.

4. Stockpile excavated topsoil on site. Do not mix topsoil with foreign materials.

B. Subsoil Removal and Stockpiling:

1. Remove subsoil, including undocumented fill material, from areas that are to be excavated, landscaped, or graded.

2. Remove surcharge material at sole direction of geotechnical engineer of record and shall be removed in uniform layers.

3. Do not remove wet subsoil unless it is subsequently processed to obtain optimum moisture content.

4. Stockpile suitable subsoil on-site.

C. Provide for free drainage of construction site.

D. Benching Slopes: Horizontally bench existing slopes greater than 4H:1V to key fill material to slope for firm bearing.

E. Stability: Replace damaged or displaced subsoil to same requirements as for specified fill in Section 31 23 00.

F. Disc level surfaces.

G. Rough grade site to achieve lines and grades indicated with allowances for imported fill thicknesses.

H. Provide positive drainage away from buildings and structures by sloping minimum of 2.4 inches over 10 feet on impervious surfaces or 6 inches over 10 feet.

3.04 FINISH GRADING:

A. Before finish grading:

1. Verify subgrade is contoured and compacted.

2. Verify backfill has been inspected.

B. Fine grade to eliminate uneven areas and depressions. Follow profiles and contours of subgrade and bring to finish grade as indicated.

3.05 STOCKPILING:

A. Location: As indicated or directed. Do not locate stockpiles over existing or new utilities unless directed.

B. Height: 8 feet maximum

C. Slope: 2H:1V, maximum

D. Drainage: Grade to prevent standing water

E. Provide erosion and sediment control around downhill-side of stockpile perimeter.

F. Immediately stabilize dormant stockpiles within 7 days with tackifier. Stockpiles and portions of stockpiles that will not be actively used for at least 30 days shall be considered dormant.

3.06 EXCESS MATERIAL:

A. Excess grading material, suitable for backfilling or site grading, that is not necessary to complete the work at the project site belongs to the Owner and shall be delivered to an off-site designated location within 1 mile from project site or on-site as directed by the Engineer.

B. Dispose off-site, unsuitable materials and excess materials not received by Owner.

3.07 TOLERANCES:

A. Subgrade:

1. Elevation: 2 inches, from required elevation

2. Grade: 1 inch per 10 feet

B. Finish Grade:

1. Elevation: 1/2 inch, from required elevation

3.08 FIELD QUALITY CONTROL:

A. See Section 31 23 00 for compaction and testing requirements.

3.09 CLEANING:

A. See Section 01 14 14 and Section 01 74 23 for additional requirements.

B. Remove unused stockpiles, grade area to prevent standing water, protect from erosion, and stabilize.

C. Leave site clean and raked, ready to receive landscaping.

3.10 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

B. Submit existing utility location information as part of record drawings. Include ticket numbers and original information from utility owners.

END OF SECTION

Page Intentionally Left Blank

SECTION 31 23 00

EXCAVATION AND FILL

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide excavation and fill as indicated and in compliance with Contract Documents.

B. Section includes:

1. Excavation and fill for: Foundations, structures, and pavement; site drainage, structures, and features.

2. Embankments.

3. Controlled fill using materials from imported and on-site sources.

4. Soil and aggregate materials.

5. Compaction and testing.

1.02 REFERENCES:

C. Occupational Safety and Health Administration (OSHA) Standards and Regulations:

1. 29 CFR 1926, Subpart P: Safety and Health Regulations for Construction, Excavations.

1.03 DEFINITIONS

A. Percent Compaction or Compaction Density: The field dry density of compacted material, expressed as a percentage of the maximum dry density.

B. Field Dry Density or Field Density: In-place density as determined by ASTM D1556 (Sand Cone Method), ASTM D2167 (Rubber Balloon Method), or ASTM D6938 (Nuclear Method).

C. Maximum Dry Density: Laboratory density as determined by ASTM D698 (Standard Proctor) or ASTM D1557 (Modified Proctor) and occurring at the optimum moisture content of the material being tested.

1.04 SUBMITTALS:

A. Submit the following in accordance with Section 01 33 00.

1. Gradation analysis.

2. Materials Sources: Name of source, location, date of sample, sieve analysis, and laboratory compaction characteristics.

3. Test and Evaluation Reports:

a. Field density testing reports: Provide results from field density testing of prepared subgrade and compacted fill.

b. Grain-size analysis.

c. Laboratory compaction characteristics of soils.

d. Water content.

1.05 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.06 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

B. Sustainability Standards Certifications.

C. Testing will be provided by the Owner as specified. Contractor shall be responsible for cost of testing and inspection conducted as a result of non-conforming work.

D. Protect excavations by shoring, bracing, sheet piling, underpinning or other methods required to prevent cave-in of loose soil. Protection shall be in accordance with OSHA 29 CFR 1926, Subpart P.

1.07 DELIVERY STORAGE AND HANDLING:

A. Geotextile Fabric:

1. See AASHTO 288 and Section 31 34 19.

1.08 SITE CONDITIONS:

A. Existing Conditions:

1. The contractor shall be prepared to excavate and work with very soft clay subgrade soils, loose flowing sands, sands, and wet conditions.

2. Nothing in the contract documents shall be construed as guarantee that other materials will not be encountered or that proportion of materials will not vary from proportions shown on the logs of test borings.

PART 2 - PRODUCTS

2.01 FILL MATERIALS:

A. Suitable Material: Material from on-site excavation and permitted off-site sources that meets all of the specified requirements for its intended use and is not unsuitable. Wet subgrade material which meets other requirements for suitable material is suitable.

B. Unsuitable Material: Material that fails to meet requirements for suitable materials; or contains any of the following:

1. Organic clay, organic silt, or peat; as defined in ASTM D2487.

2. Vegetation, wood, roots, leaves, and organic, degradable material.

3. Stones or rock fragments over 6 inches in any dimension.

4. Porous biodegradable matter, excavated pavement, construction debris, rubbish, or refuse.

5. Ice, snow, frost, or frozen soil particles.

C. Untreated Base Course: Refer to APWA 2017 Standard Specifications Section 32 11 23 Grade 1-1/2 Untreated Base Course.

D. Granular Borrow: Refer to APWA 2017 Standard Specifications Section 31 05 13 Common Fill.

E. Free Draining Granular Backfill: Refer to UDOT 2017 Standard Specifications Section 02056 Embankment, Borrow, and Backfill.

F. General Fill:

1. Material shall consist of well graded material meeting the following gradation and plastic index should be equal to or less than 6.

Sieve Size	Percent Passing
2-inch	100
3/4 inch	90 – 100
3/8 inch	70 – 90
No. 4	55 – 70
No. 10	40 – 60

Sieve Size	Percent Passing
No. 40	20 – 50
No. 200	0 – 25

G. Structural Fill:

1. Material shall consist of well graded granular material meeting the following gradation, have a plastic index equal to or less than 6, and CBR greater than 50 at 0.2 inches.

Sieve Size	Percent Passing
2-inch	100
1 inch	80 – 100
3/4 inch	70 – 80
1/2 inch	60 – 70
3/8 inch	40 – 65
No. 4	30 – 50
No. 10	20 – 40
No. 40	10 – 30
No. 200	0 – 15

H. Lightweight Structural Fill:

1. Material shall have LA abrasion (ASTM C131) less than 31 percent and a soundness loss (ASTM C88) of 1 percent or less.

2. Natural Scoria

a. Material shall consist of natural scoria aggregate that is chemically inert, durable, and conforms to the requirements of ASTM C330 but meeting the following gradation.

Sieve Size	Percent Passing
1 inch	80 – 100
3/8 inch	40 – 100
No. 4	10 – 70
No. 10	0 – 40
No. 40	0 – 25
No. 200	0 – 15

3. Expanded Shale, Slate, or Clay Aggregate:

a. Material shall consist of expanded shale, slate, or clay aggregate that is chemically inert, durable, and conforms to the requirements of ASTM C330 but meeting the following gradation.

Sieve Size	Percent Passing
1 inch	100
3/8 inch	80 – 100
No. 4	10 – 70
No. 10	0 – 30
No. 40	0 – 15
No. 200	0 – 8

2.02 EQUIPMENT:

A. Compaction equipment shall be capable of consistently achieving the specified compaction requirements.

PART 3 - EXECUTION

3.01 EXAMINATION:

A. Verify that dewatering support systems are in place before commencing with excavation.

B. Verify that excavation safety and support systems meeting the requirements of OSHA 29 CFR 1926, Subpart P are in place before commencing with excavation.

1. Minimum slopes for laying back excavations or materials are contained in OSHA 29 CFR 1926, Subpart P; Appendices A and B.

2. Minimum requirements for shoring and bracing are contained in OSHA 29 CFR 1926, Subpart P; Appendix C.

C. Verify that fill materials submittals have been accepted by Engineer before commencing with work requiring the use of these materials.

D. Verify that erosion and sediment control measures are in place and functioning properly.

E. Immediately notify the Engineer if unexpected subsurface facilities or suspected hazardous materials are encountered during excavation. Discontinue affected work in area until notified to resume work.

F. HydroVac Pot-Holing:

1. Comply with the requirements in Section 01 14 14 and Section 02 32 19.

2. Pot-Hole using Hydro Vac to field verify the locations of existing underground utilities at crossings and at tie-in points before ordering materials or commencing excavation. Immediately notify the Engineer if conflicts are encountered.

3.02 PREPARATION:

A. Underpin adjacent structures that could be damaged by excavation work.

B. Cut pavement with saw or pneumatic tools to prevent damage to remaining pavement. Dispose of large pieces of demolished pavement before proceeding with excavation.

C. Remove subsurface structures and related obstructions.

D. Remove boulders within excavation limits.

3.03 PROTECTION OF IN-PLACE CONDITIONS:

A. Comply with the requirements specified in Section 01 14 14 and Section 02 01 20.

B. Support and protect from damage – existing pipes, poles, wires, fences, curbs, property line markers, and other features or structures which must be preserved in place to avoid being temporarily or permanently relocated.

C. Excavation Near Existing Structures:

1. Discontinue digging by machinery when excavation approaches pipes, conduits, or other underground structures. Continue excavation by use of hand tools. Include such manual excavation in work to be done when incidental to normal excavation and under items involving normal excavation.

2. Excavate test pits near, or at intersection with, existing utilities or underground structures to determine the exact location of existing features.

D. Excavation Near Private Property:

1. Record existing condition of features on adjacent property by means of dated photographs or cameras. Provide construction photographs according to Section 01 32 33.

2. Enclose uncut tree trunks adjacent to work in wooden boxes of such height necessary to protect tree from injury due to piled material, equipment, or operations. Operate excavating machinery and cranes so as to prevent injury to overhanging branches and limbs.

3. Protect cultivated hedges, shrubs, and plants which would otherwise be damaged by the work.

4. Where protection of vegetation is not possible, dig up, temporarily transplant, and maintain. After active construction operations in the area have ceased, transplant vegetation to the original positions and provide water and nursery care until growth is re-established.

5. Do not use or operate tractors, bulldozers, or other power-operated equipment on paved surfaces. Provide protection on pavement if construction traffic is unavoidable.

3.04 RESTORATION:

A. Restore private property and structures promptly. Begin restoration work within 24 hours of when damage occurred.

B. Existing surfaces, features, or utilities that are to remain but are damaged during construction shall be repaired or replaced to at least the condition in which they were found immediately before work began, unless noted otherwise.

C. Damaged Trees to Remain: Cut all damaged branches, limbs, and roots smoothly and neatly without splitting or crushing. Neatly trim, cut the injured portions and cover with an application of grafting wax or tree healing paint. Replace damaged trees which subsequently die or continue to show lack of growth due to damage.

D. Cultivated Vegetation: Includes, but is not limited to: hedges, shrubs, and plants. Vegetation that is damaged shall be replaced with equal kind and of the same quality after construction activities in the area are complete.

3.05 EXCAVATION:

A. Excavate to accommodate new structures and construction operations.

B. Excavate to lines and grades necessary to provide finish grades.

C. Excavations that are not shored and deeper than 4 feet shall meet the requirements of OSHA 29 CFR 1926.

D. Workers shall have an adequate means of exit from excavations that are 4 feet or greater in depth. The means of exit shall not require more than 25 feet of lateral travel.

E. Establish limits of excavation to allow adequate working space for installing forms and for safety of personnel.

F. Carry out program of excavation, dewatering, and excavation support systems to eliminate possibility of undermining or disturbing foundations of existing structures or the work.

G. Preserve material below and beyond the lines of excavations.

H. Locate stockpiled excavated material away from edge of excavations per OSHA 29 CFR 1926 to prevent cave-ins or bank slides.

I. Excavate for depressed mat foundations so that adjacent sections of foundation mat will rest on structural fill or drain materials.

J. Control and lower groundwater as needed for excavation.

K. Perform over-excavation as needed for work in soft clayey soils and as approved by the Engineer. Backfill of over-excavation shall be performed in accordance with Paragraph 3.08.P.

3.06 SUBGRADE PREPARATION:

A. Where vegetation or topsoil or both are present, clear as specified in Section 31 10 00. Contractor shall remove surcharge material from all work areas in accordance with Section 31 22 00.

B. Excavate and shape subgrade to line, grade, and cross section shown in the drawings. The subgrade shall be considered to extend over the full width of the fill lift.

C. Where the subgrade consists of predominantly fine-grained soil, excavate using a smooth cutting blade to minimize disturbance to the native subgrade soil left in place. After excavation, do not disturb the native subgrade soil. Do not run any equipment over the subgrade or separation fabric before placing the first lift of fill. Consult the Engineer prior to placement of overlying materials. Over-excavation and replacement may be required to prepare firm and unyielding subgrade using fill materials and methods described in Section 3.08.

D. The exposed surface shall be examined by the Engineer to determine that the proper bearing material has been exposed.

E. Where the subgrade consists of predominantly non-plastic, granular soils, scarify and recompact the top 6 inches of subgrade. Recompact the top 6 inches of subgrade to a minimum of 95 percent of the maximum dry density based on Modified Proctor (ASTM D1557 or AASHTO T180). Remove soft material identified during the subgrade preparation, replace with the overlying material and recompact to a minimum of 95 percent of the maximum dry density using Modified Proctor (ASTM D1557 or AASHTO T180).

F. Control and lower groundwater as needed for subgrade preparation.

3.07 UNAUTHORIZED EXCAVATION:

A. Contractor is responsible for backfilling unauthorized excavations with material selected by the Engineer. Unauthorized Excavation consists of removal or loosening of materials beyond indicated subgrade elevations or dimensions without specific directions of the Engineer.

3.08 FILL:

A. Fill to lines and grades necessary to provide finish grades. Limit loose lift thickness to 8 inches, except where specified elsewhere. Do not place fill until the Engineer has approved the subgrade for fill placement.

B. Use a placement method that does not disturb or damage other work or existing features. Keep construction vehicles and end-dumped material off of geotextiles until a minimum thickness of 18 inches of material has been placed.

C. Moisture condition fill materials as needed to obtain compaction and moisture requirements specified herein.

D. Provide for drainage so that surface water from rain and snowmelt, can be managed without impacting construction. At the contractor's discretion, the drainage measures may include existing granular fill, imported drainage layer, drainage pipe(s), drains, synthetic drainage materials, drainage ditches, sloping ground surface, other methods, or any combination of these. Install temporary dewatering sumps in low areas during filling operations as shown on the plans. Install additional sumps if needed to drain the drainage layer.

E. Provide surface grading and working pad, as needed, for installation of wick drains in the areas shown on the project drawings.

F. Control and lower groundwater as needed for fill placement.

G. Begin filling in lowest section of work area. Grade surface of fill approximately horizontal but provide with sufficient longitudinal and transverse slope to allow for runoff of surface water from every point.

H. Reduce moisture content of fill material, if necessary, in source area by aerating it during warm and dry atmospheric conditions. A large disc harrow with two to three foot diameter disks may be required for working soil in a drying operation.

I. Compact uniformly throughout. Keep fill surfaces sufficiently smooth and free from humps and hollows to allow for proper and uniform compaction. Do not permit hauling equipment to follow a single track on the same lift but direct equipment to spread out to prevent over compaction in localized areas. Take care in obtaining thorough compaction at edges of fill.

J. Slightly slope surface of fill to ensure drainage during periods of wet weather. Do not place fill while moderate or heavy rain is falling or after a rain-storm until the Engineer considers conditions satisfactory. During such periods and upon suspension of filling operations for periods in excess of 12 hours, roll smooth the surface of fill using a smooth wheel static roller to prevent excessive absorption of rainfall and surface moisture. Prior to resuming compaction operations, remove muddy material off surface to expose firm, compacted material, as determined by the Engineer.

K. When fill is placed against an earlier fill or against in-situ material under and around structures, including around piping beneath structures or embankments, slope junction between two sections of fill at 3 to 1 (horizontal to vertical). Bench edge of existing fill in steps 12 inches high and 36 inches wide to 24 inches high by 72 inches wide against which to place and compact the new fill. Ensure that rolling extends over junction between fills.

L. Remove debris, remove loose material, scarify, and recompact previously placed fill which has become desiccated or littered with debris.

M. After spreading each loose lift to the required thickness and adjusting its moisture content, roll with sufficient number of passes to obtain the required compaction. One pass is defined as the required number of successive trips which by means of sufficient overlap will insure complete coverage and uniform compaction of an entire lift. Do not make additional passes until previous pass has been completed.

N. Remove material and replace work if material fails testing requirements after repeated attempts to compact.

O. Placing Fill on Firm Subgrade:

1. Transport materials and deposit them by means of spreading equipment on the subgrade or prior lift. Place the lifts so that when compacted they will be true to the grades or levels required. Make such adjustments in placing procedures or equipment to obtain true grades, minimize segregation and degradation, reduce or increase moisture content, and assure an acceptable placement.

2. Spread and compact the material to the required density in one or more lifts, as specified below, and of such width and thickness that, after compacting, the finished material will conform to the required grade and cross section. Spread the material for each separate lift over the full length and width of the section to be compacted before placing the succeeding lifts. Stagger longitudinal and transverse joints a minimum of 12 inches in each succeeding lift.

3. Place material in lifts with maximum loose thicknesses of 8 inches. Compact all the fill, including the edges of fill areas to meet specified density requirements.

4. For Roadways:

a. After testing the blended and flattened windrow of aggregate base or gravel material mixed on the subgrade or prior lift, spread it uniformly as specified above over the full length and width of the section to be compacted. Do this spreading in such a manner as to prevent segregation of the mixture.

P. Bridging Zone - Placing Fill on Relatively Soft (medium stiff, soft or very soft) Subgrade:

1. Do not allow any equipment directly on the subgrade or geotextile fabric. Do not allow haul, spreading, or compaction equipment to cause rutting, pumping or other disturbance to the subgrade.

2. Place a minimum of 18 inches of fill on the geotextile fabric ahead of any equipment. Use low-ground pressure equipment or a light weight skid steer for spreading as conditions dictate.

3. Keep all haul trucks off the fill until the full thickness of the fill lift is in place and compacted.

4. Place the first 18-inch lift of fill before attempting to compact. If vibratory compaction causes the subgrade to soften and pump, turn off vibration and static roll. If static rolling continues to cause pumping, Stop all compaction activity and wait for the following day to resume. Place an additional lift of fill, 8 inches maximum loose thickness before again attempting compaction. If attempts to compact still result in disturbance or pumping, contact the engineer.

5. Spread and compact the remaining fill to the required density in one or more lifts, as specified below, and of such width and thickness that, after compacting, the finished fill will conform to the required grade and cross section. Spread the material for each separate lift for the full width and length of the area to be compacted before placing the succeeding lifts. Stagger longitudinal and transverse joints a minimum of 12 inches in each succeeding lift.

6. Place the remaining fill material in maximum loose thicknesses of 8 inches. Compact all the fill, including the edges of fill areas to meet specified density requirements.

7. Overexcavation and backfill may be required to prepare a firm and unyielding surface suitable to support foundations as determined by the Engineer and as shown on the plans. Backfill materials may consist of General Fill in non-structural applications, Structural Fill below foundations, or Free Draining Granular Backfill Borrow. Coordinate with the Engineer on all overexcavation and backfill.

8. Overexcavation and bridging may be required to prepare a firm and unyielding surface or stable working platform suitable to support compacted structural fill, compacted general fill, underdrains, and foundations as determined by the Engineer and as shown on the plans. Bridging materials may consist of General Fill, Structural Fill, or Drain Gravel. Coordinate with the Engineer on all overexcavation and bridging.

9. Geotextiles may be used for bridging activities at the preference of the contractor as allowed in Sections 31 34 19 and 31 23 19.

Q. Placing Fill over Prepared Subgrade:

1. Place Fill in uniformly thick lifts with a maximum loose thickness of 8 inches.

R. Placing Lightweight Structural Fill over Prepared Subgrade:

1. Place geotextile on prepared subgrade, up the sides of excavation. Place over the top of the lightweight fill after fill placement.

2. Place the lightweight fill in uniformly thick lifts with a maximum loose thickness of 8 inches.

3. Place lightweight fill at sufficient moisture content to meet compaction requirement while remaining below the maximum allowable average compacted moist in-place density.

4. Compact the lightweight fill with smooth-drum vibratory equipment having an operating weight no heavier than 12 tons. Take necessary measures to avoid crushing the aggregate. If crushing occurs, remove the damaged material and make adjustments to the compaction equipment, lift thickness, and/or the number of passes.

S. Rolling and Compaction: Begin rolling and compaction at the outer edges of the surfacing and continue toward the center. Compact each lift until the specified density is achieved. Maintain the surface of each lift during the compaction operations to provide a uniform texture, with the aggregates remaining firmly keyed. Apply water uniformly over the base materials during compaction in the amount necessary for proper compaction.

3.09 COMPACTION:

A. Compact to density specified and indicated for various types of material. Control moisture content of material being placed as specified.

B. Subgrade: Where scarification is required, compact to a minimum of 90 percent of maximum dry density using Modified Proctor (ASTM D1557 or AASHTO T180). Moisture condition and compact material within 2 percentage points of the optimum moisture content as determined by Modified Proctor (ASTM D1557 or AASHTO T180).

C. Granular Borrow: Compact to a minimum of 95 percent of maximum dry density using Modified Proctor (ASTM D1557 or AASHTO T180). Moisture condition and compact material within 2 percentage points of the optimum moisture content as determined by Modified Proctor (ASTM D1557 or AASHTO T180).

D. Untreated Base Course: Compact to a minimum of 95 percent of maximum dry density using Modified Proctor (ASTM D1557 or AASHTO T180). Moisture condition and compact material within 2 percentage points of the optimum moisture content as determined by Modified Proctor (ASTM D1557 or AASHTO T180).

E. General Fill: Compact to a minimum of 95 percent of maximum dry density using Modified Proctor (ASTM D1557 or AASHTO T180). Moisture condition and compact material within 2 percentage points of the optimum moisture content as determined by Modified Proctor (ASTM D1557 or AASHTO T180).

F. Free Draining Granular Backfill Borrow: Where required, compact to a minimum of 90 percent of maximum dry density using Modified Proctor (ASTM D1557 or AASHTO T180).

G. Structural Fill: Compact to a minimum of 95 percent of maximum dry density using Modified Proctor (ASTM D1557 or AASHTO T180). Moisture condition and compact material within 2 percentage points of the optimum moisture content as determined by Modified Proctor (ASTM D1557 or AASHTO T180).

H. Lightweight Structural Fill:

1. Scoria:

a. Provide an in-place density within plus or minus 5 pcf of the result of a One Point Proctor (a modification of ASTM D698) tested at the moisture content of the sample to the approval of the Engineer, but no more than 75 pcf.

(1) Modification of ASTM D698: The lightweight aggregate shall be placed in three layers in a standard 0.5 cubic foot bucket, with each layer compacted by 25 blows from a 5.5 pound hammer dropped from a distance of 12 inches. The aggregate is compacted at the received moisture content and may not be reused for testing.

2. Expanded Shale, Slate, or Clay Aggregate:

a. Do not add moisture to expanded aggregate unless specifically approved by the Engineer. Cover stockpiles and keep covered during periods of precipitation. Do not place expanded shale below high groundwater elevation.

b. Provide an in-place density within plus or minus 5 pcf of the result of a One Point Proctor (a modification of ASTM D698) tested at the moisture content of the sample to the approval of the Engineer.

(1) Modification of ASTM D698: The lightweight aggregate shall be placed in three layers in a standard 0.5 cubic foot bucket, with each layer compacted by 25 blows from a 5.5 pound hammer dropped from a distance of 12 inches. The aggregate is compacted at the received moisture content and may not be reused for testing.

3. Use a nuclear density gage in the direct transmission method to test the density of the compacted production material. Wherever possible, extend the densometer

probe a minimum of 10 inches. Do not use backscatter to evaluate the density of the compacted material.

4. Provide a small test pad with the dimensions 20 foot by 20 foot to determine the required number of passes and moisture content to provide the required moist density without crushing the particles.

5. Compaction shall be with smooth drum vibratory roller at low amplitude. Avoid crushing the aggregate. Reduce the number of passes or switch to lighter equipment if crushing occurs.

3.10 FIELD QUALITY CONTROL:

A. See Section 01 45 00 for general requirements for field inspection and testing.

B. Perform inspection at least once daily to confirm lift thickness and compaction effort for entire fill area.

C. Perform particle size distribution and gradation analyses using ASTM D6913 and following standard practices in ASTM D421. Perform 1 test for every source and submit results to Engineer for acceptance. Repeat the moisture density test for every 1,000 cubic yard of material used.

D. Perform field density testing in accordance with ASTM D6938.

E. Evaluate field density test results in relation to maximum dry density as determined by testing material in accordance with the compaction criteria listed in Section 3.09.

F. Perform tests in accordance with ASTM D4318 to determine Liquid Limit, Plastic Limit and Plasticity Index and submit test results to Engineer for acceptance. Minimum of one test per 1,000 cubic yard of soil for use as fill material and whenever classification of material is in doubt as determined by the Engineer.

G. Location of field density and post-compaction gradation tests shall be as recommended by the Engineer.

H. In the event compacted material does not meet specified in-place density, re-compact material and re-test area until specified results are obtained.

I. Frequency of field density tests: 1 per lift for every 200 linear feet of roadway. 1 per lift every 1,000 square feet below structures with a minimum of three tests for a given fill lift. 1 per lift every 10,000 square feet for preload fills of all types.

3.11 ADJUSTING:

A. Shrinkage:

1. Build fill or backfill to a height above finished grade which will, in the opinion of the Engineer, allow for the shrinkage or consolidation of material. Initially, provide at all points, an excess of at least one percent of total height of backfill measured from stripped surface to top of finished surface.

2. Supply specified materials to build up low places when embankment or backfill settles below the finished grade at any time before package substantial completion.

3.12 TOLERANCES:

A. Construct finished surfaces to plus or minus and 1/2 inch of the elevations indicated.

B. Grade areas of cut and fill and material layer thicknesses to plus or minus 0.20 foot of the grades indicated.

C. Complete embankment edges to plus or minus 6 inches of the slope lines indicated.

D. Provide the Engineer with adequate survey information to verify compliance with above tolerances.

E. The minimum radial thickness of drain gravel around perforated drainpipes shall be 12 inches, and the minimum perpendicular thickness of filter sand below, above, and adjacent to drain gravel shall be 18 inches, unless noted or shown otherwise on drawings.

3.13 PROTECTION:

A. Formulate excavation, backfilling, and filling schedule and procedures to eliminate possibility of undermining or disturbing foundations of partially and completed structures, pipelines and embankments or existing structures and pipelines.

END OF SECTION

SECTION 31 23 19

DEWATERING

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide dewatering as indicated and in compliance with Contract Documents.

B. Design, furnish, operate, maintain, and remove temporary dewatering systems to control groundwater and surface water to maintain stable, undisturbed subgrades, and permit work to be performed under dry and stable conditions. Work to be done as part of dewatering includes, but is not limited to:

1. Lower the groundwater level

2. Lower hydrostatic pressure

3. Prevent and control surface water from entering the excavation during construction

4. Implement erosion control measures for disposing of discharge water

5. Provide groundwater recharging systems as specified and as indicated.

6. Provide and monitor observation wells and geotechnical instrumentation as specified and indicated.

C. Groundwater within the excavation area shall be lowered to at least 2 feet below the lowest excavation levels as specified and as indicated. Dewatering for the shaft construction is not mandatory if the Contractor selects to utilize a positive-sealed support system and it is submitted and approved by Engineer.

D. Common dewatering methods include, but are not limited to, sump pumping, deep wells, well points, vacuum well points, vacuum-assisted sealed deep wells, sealed jet educator wells or combinations thereof.

E. The Contractor is responsible for obtaining and following all required local, state, and federal discharge permits. Coordinate with the Owner for the location of the discharge and the allowable discharge rates and required effluent limits.

F. Discharge in accordance with the discharge permit, in accordance with 40 CFR Part 122, and all other applicable federal, state, and local rules and regulations.

1. Discharge Limits for the Water Reclamation Facility are identified in Table 31 23 19-1.

TABLE 31 23 19-1 – WASTEWATER DISCHARGE LOCAL LIMITS
SALT LAKE CITY WATER RECLAMATION FACILITY

POLLUTANT OF CONCERN (POC)		Local Limit	
METAL POLLUTANTS	Arsenic (As)	0.2	mg/L
	Cadmium (Cd)	0.2	mg/L
	Chromium (Cr)	5.0	mg/L
	Copper (Cu)	6.2	mg/L
	Lead (Pb)	1.5	mg/L
	Mercury (Hg)	0.2	mg/L
	Molybdenum (Mo)	0.8	mg/L
	Nickel (Ni)	1.4	mg/L
	Selenium (Se)	1.0	mg/L
	Silver (Ag)	--	--
	Zinc (Zn)	12.0	mg/L
ORGANIC/ CONVENTIONAL POLLUTANTS	Biochemical Oxygen Demand (BOD)	11,000	mg/L
	Total Suspended Solids (TSS)	7,200	mg/L
	Chemical Oxygen Demand (COD)	--	--
	Biodegradable Oil and Grease	500	mg/L
	Petroleum, Non-biodegradable Oil	100	mg/L
	pH (range)	≥ 5.0 and ≤11.0	standard units

NOTES:

mg/L – milligrams per liter

pH is an instantaneous limit. All other Local Limits are expressed as a daily maximum

G. Sample and test water quality for the constituents identified in Table 31 23 19-1. Samples shall be tested by an independent certified water quality testing laboratory. Sampling and testing shall follow current standards and protocols identified by the Salt Lake City Water Reclamation Facility and/or as required by the independent water quality testing laboratory. Continuously monitor common constituents' concentration levels using field instruments to provide timely notification if a specified constituent level is exceeded. If discharging water back into the existing Salt Lake City Influent Pump Station Influent it must pass through a Baker Tank prior to discharge.

H. Comply with all applicable environmental protection laws and requirements in operation of the dewatering system.

1.02 REFERENCES:

A. Code of Federal Regulations, Title 40 – Protection of Environment (CFR):

1. 40 CFR Part 122: EPA Administered Permit Programs: The National Pollutant Discharge Elimination System.

B. Salt Lake City Ordinances.

1. Title 17 Public Services

C. Section 31 23 00

1.03 SUBMITTALS:

A. Submit the following in accordance with Section 01 33 00.

1. Qualification of the Contractor's own dewatering specialist or subcontracted firm's qualifications a minimum of 4 weeks prior to dewatering work. The submittal shall include, but not be limited to:

a. Qualifications of specialist or firm responsible for dewatering system design.

b. Qualifications of specialist's or firm's field representative who will oversee the installation, operation, and maintenance of dewatering systems.

2. Submit a dewatering plan, and, if applicable, a groundwater recharge plan at least two weeks prior to start of dewatering work. Do not submit design calculations. The review will be only for the information of the Owner and third parties for an overall understanding of the project relating to access, maintenance of existing facilities and proper utilization of the site. The Contractor shall remain responsible for the adequacy and safety of the means, methods, and sequencing of construction. The plan shall include the following items as a minimum:

a. Dewatering plan and details stamped and signed by a Registered Professional Engineer licensed in the State of Utah.

b. Certificate of Design: Refer to Section 01 33 00.

c. A list of equipment including, but not limited to, pumps, prime movers, and standby equipment.

d. Detailed description of dewatering, maintenance, and system removal procedures.

e. Monitoring plan and details, including, but not limited to, number, depth and locations of observation wells (minimum of two or as noted on drawings if more than two), and geotechnical instruments such as settlement markers

(reference points on structures; minimum of two per structure within the zone of influence as measured by the piezometers) and piezometers (as needed to determine the zone of influence), and frequency of reading the monitoring devices. Locations and screened interval elevations of piezometer / observation wells shall be submitted to the Engineer for approval.

f. Erosion and sedimentation control measures, and methods for disposal of pumped water.

g. List of all applicable laws, regulations, rules, and codes to which dewatering design conforms.

h. List of assumptions made for design of dewatering and for groundwater recharge systems, including but not limited to design groundwater levels, soil stratigraphy, permeabilities, and duration of pumping and or recharge.

3. Measurement records consisting of observation well and piezometer groundwater depths / elevations and other geotechnical instrumentation readings within one day of monitoring.

4. A modified dewatering plan within 24 hours, if open pumping from sumps and ditches results in subgrade uplift (heaving), boils, loss of fines or softening of the ground.

1.04 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

B. Dewatering: Employ the services of a dewatering specialist or firm having the following qualifications:

1. Have completed at least 5 successful dewatering projects of equal size and complexity and with equal systems within the last 5 years.

2. Retain the services of a Registered Professional Engineer (in the state where the project is located) having a minimum of 5 years' experience in the design of well points, deep wells, recharge systems, or equal systems.

3. Retain the services of a field representative having a minimum of 5 years' experience in installation of well points, deep wells, recharge systems, or equal systems.

C. If subgrade soils are disturbed or become unstable due to dewatering operation or an inadequate dewatering system, notify the Engineer, stabilize the subgrade, and modify system to perform as specified.

D. Notify the Engineer immediately if settlement or movement is detected on structures. If the settlement or movement is deemed by the Engineer to be related to the dewatering,

take actions to protect the adjacent structures and submit a modified dewatering plan to the Engineer within 24 hours. Implement the modified plan and repair damage incurred to adjacent structures.

E. Immediately notify the Engineer if oil or other hazardous materials are encountered after dewatering begins.

1.05 HYDRAULIC UPLIFT OF STRUCTURES:

A. The Contractor shall be responsible for the protection of all structures against hydraulic uplift until such structures have been accepted finally by the Owner.

B. In this regard, the Contractor is advised that all tanks when completed are designed to resist hydraulic uplift from groundwater up to the elevation indicated on the structural drawings when the structure is completed. The concrete slab bottoms shall be placed in the dry, with the use of wellpoints or other dewatering means to keep the water elevation sufficiently low to carry on the work. For the shafts appurtenant to the tunnel construction, the invert can be placed using a tremie-method approach.

C. Buildings with basements are designed to resist hydraulic uplift from groundwater against the weight of the completed structure, including all masonry, and structural steel frames.

1.06 PRECAUTIONS AGAINST HYDROSTATIC UPLIFT DURING CONSTRUCTION:

A. Maintain a low groundwater elevation in accordance with this specification, i.e., 2 feet below bottom of excavations in the vicinity of the structures until they are complete. In case of extremely high groundwater during construction of the structures, it may be necessary to flood excavations and / or the partially completed structures to counteract hydraulic uplift forces.

1.07 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

1.08 SITE CONDITIONS:

A. Subsurface Conditions: Refer to Geotechnical reports.

PART 2 - PRODUCTS

2.01 MATERIALS:

A. Provide settlement markers, piezometers and other geotechnical instruments in accordance with the submitted dewatering plan or as specified.

B. Provide casings, well screens, piping, fittings, pumps, temporary power and other items required for dewatering system. Provide and maintain sufficient standby system

components onsite as recommended by Contractor's dewatering designer and approved by Engineer.

C. Provide sand and gravel filter around the well screen. Wrapping geotextile fabric directly around the well screen shall not be allowed.

D. Provide sand filter around the well / wellpoint screens designed to reduce sand concentrations in the well / wellpoint discharge to 5 ppm by volume or less.

E. When deep wells, wellpoints, vacuum-assisted sealed deep wells, sealed jet eductor wells or vacuum wellpoints are used, provide pumping units capable of maintaining high vacuum and handling large volumes of air and water at the same time.

F. Provide backup dewatering equipment in the event of breakdown. Equipment shall consist of pumps, hoses, discharge pipe, and fittings and be stored onsite. Provide at least 1 standby pump for every 4 pumps used.

G. Provide on-site standby generators for dewatering systems connected to commercial electric power. Provide automatic switching so that Generators start automatically start in the event of a power failure and are designed to provide at least 110 percent of the continuous power required by the dewatering system. If appropriate provide time delays to stagger restarts of motors to limit aggregate inrush current loads. Provide adequate winterization of generators if operation is required during cold weather. Provide standby fuel tanks with appropriate spill containment measures that are connected to generators with sufficient fuel capacity to operate the dewatering system(s) for at least 48 hours following a power outage.

H. Test automatic starting and generating equipment quarterly by switching to standby power and running the system for at least one hour.

I. Provide and maintain erosion and sedimentation control devices as indicated or specified and in accordance with the dewatering plan.

J. Provide temporary pipes, hoses, flumes, or channels for conveying discharge water to the discharge location(s).

K. Provide cement grout having a water cement mix of 11.3 gallons per 94.5-pound cement bag.

3.01 INSTALLATION:

A. Execution of earth excavation, installing earth retention systems, and dewatering shall not commence until the related submittals have been reviewed by the Engineer with all Engineer's comments satisfactorily addressed and the geotechnical instrumentation has been installed.

B. Provide and maintain dewatering system in accordance with the dewatering plan.

C. Carry out dewatering program in such a manner as to prevent undermining or disturbing foundations of existing structures or of work ongoing or previously completed.

D. Do not excavate until the dewatering system is operational.

E. Unless otherwise specified, continue dewatering uninterrupted until all structures, pipes, and appurtenances below groundwater level have been completed such that they will not be floated or otherwise damaged by an increase in groundwater elevation.

F. Discontinue open pumping from sumps and ditches when such pumping results in subgrade uplift, boils, loss of fines, softening of the ground, or instability of the slopes. Modify dewatering plan and submit revised plan to the Engineer for acceptance.

G. Where subgrade materials are disturbed or become unstable due to dewatering operations, remove and replace the materials in accordance with Section 31 23 00.

H. Dewatering Discharge:

1. Install sand filters in conjunction with well points and deep wells to prevent the migration of fines from the existing soil during the dewatering operation. Pump test all wells and 10 percent of wellpoints for sanding for a minimum of 15 minutes each, and if tests indicate excessive sand is produced (greater than 5 ppm by volume), replace sanding wells and/or wellpoints.

2. Measure sand content of discharge using a Rossum centrifugal sand tester or equal and limit sand concentration to less than 5 ppm by volume. Perform tests in the presence of the Engineer in accordance with the testing equipment manufacturer's recommendations.

3. Convey pumped or drained water to discharge location(s) as coordinated with the Engineer and Owner without interference to other work, damage to pavement, other surfaces, or property.

4. Provide valves in the discharge lines on both sides of equipment traffic crossings.

5. The Engineer reserves the right to sample discharge water at any time.

6. Immediately notify the Engineer if contaminated groundwater is suspected / encountered. Do not pump water found to be contaminated with oil or other hazardous material to the discharge locations.

I. Monitoring Devices and Records:

1. Install, maintain, monitor, and take readings from the observation wells, piezometers, and geotechnical instruments in accordance with the dewatering plan.

2. Install settlement markers on structures within the zone of influence for dewatering a distance equal to twice the depth of the excavation, from the closest edge of the excavation. Measure settlements to an accuracy of ±0.01 ft (1/8-inch).

3. For all excavations the zone of influence shall be defined by the actual cone of dewatering influence corresponding to a radius to zero drawdown.

4. If dewatering is planned, submit a comprehensive workplan that covers the instrumentation and monitoring plan and submit for approval. Include alarms and alert levels in plan with appropriate actions for each.

J. Install and maintain erosion/sedimentation control devices at the point of discharge as indicated or specified and in accordance with the dewatering plan.

K. Removal:

1. Do not remove dewatering system without approval of the Engineer.

2. Backfill and compact sumps or ditches with screened gravel or crushed stone wrapped with geotextile fabric in accordance with Section 31 23 00.

3. All dewatering wells shall be abandoned upon completion of the work, and completely backfilled with cement grout.

3.02 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 31 23 33

TRENCHING AND BACKFILL

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide trenching and backfill as indicated and in compliance with Contract Documents.

B. Section includes:

1. Trench excavation width and safety.

2. Backfill materials and placement.

3. Utility identification using marking tape and trace wire

4. Soil and aggregate materials.

5. Compaction and testing.

1.02 REFERENCES:

D. Occupational Safety and Health Administration (OSHA) Standards and Regulations:

1. 29 CFR 1926, Subpart P: Safety and Health Regulations for Construction, Excavations.

1.03 CLASSIFICATION OF EXCAVATION:

A. Excavation is not classified.

1.04 DEFINITIONS:

A. Percent Compaction, or Compaction Density: The field dry density of compacted material, expressed as a percentage of the maximum dry density.

B. Field Dry Density or Field Density: In-place density as determined by ASTM D6938 (Nuclear Method).

C. Maximum Dry Density: Laboratory density as determined by ASTM D1557 (Modified Proctor used for cohesive soils) and occurring at the optimum moisture content of the soil being tested. Similarly, the laboratory density is determined by ASTM D4253 and D4254 for non-cohesive soils.

D. Pipe Embedment: Comprised of the following or combination thereof:

1. Foundation: Required only when the native trench bottom does not provide a firm working platform or the necessary uniform and stable support for the install pipe.

2. Bedding: Placed directly underneath the pipe and brings the trench bottom to grade. Provides a firm, stable, and uniform support of the pipe.

3. Haunching: From bottom of pipe to springline.

4. Initial Backfill or Pipe Zone Backfill: From top of bedding or foundation to 12 inches above top of pipe, unless noted otherwise.

5. Final Backfill or Trench Backfill: Above the initial backfill to a level below that required for the trench restoration area.

6. Backfill: Includes initial and final backfill.

1.05 SUBMITTALS:

A. Submit the following in accordance with Section 01 33 00.

1. Temporary excavation and shoring drawings for worker protection in accordance with the General Conditions.

2. Gradation analysis.

3. Dewatering plan including disposition of groundwater.

4. Manufacturer's catalog data and a sample of filter fabric with manufacturer's installation instructions and details.

5. Materials Sources: Name of source, location, date of sample, sieve analysis, and laboratory compaction characteristics.

6. Test and Evaluation Reports:

a. Field density testing reports: Provide results from field density testing of prepared subgrade and compacted fill.

b. Grain-size analysis.

c. Laboratory compaction characteristics of soils.

d. Water content.

7. Geotextile:

a. At least two weeks prior to shipment, submit manufacturer's certificate of compliance and physical property data sheet indicating that requirements for materials and manufacture are in conformance as specified.

b. For informational purposes only, submit manufacturer’s printed installation instructions.

8. Compaction method and removal sequence of shoring.

B. Submit Excavation Support Systems plan per Section 31 50 00.

1.06 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.07 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

B. Sustainability Standards Certifications.

C. Sample backfill materials in accordance with ASTM D75.

D. Testing will be provided by the Owner as specified. Contractor shall be responsible for cost of testing and inspection conducted as a result of non-conforming work.

E. Protect excavations by shoring, bracing, sheet piling, underpinning or other methods required to prevent cave-in of loose soil. Protection shall be in accordance with OSHA 29 CFR 1926, Subpart P.

1.08 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

B. Provide geotextile fabric in rolls wrapped with protective covering to protect geotextile fabric from mud, dirt, dust, and debris. Label each roll of geotextile fabric with number or symbol to identify production run.

C. Protect geotextile fabric from sunlight during transportation and storage. Do not leave geotextile fabric exposed to sunlight for more than two weeks during installation operations.

1.09 SITE CONDITIONS:

A. Existing Conditions:

1. Geotechnical Report: The report has been provided, is for information only, and is not part of the contract documents. Logs of borings are included in the report and indicate conditions encountered only at test boring locations. Nothing in the contract documents shall be construed as guarantee that other materials will not be encountered or that proportion of materials will not vary from proportions shown on the logs of test borings.

PART 2 - PRODUCTS

2.01 BACKFILL MATERIALS:

A. Suitable Material: Material from on-site excavated fill and/or permitted off-site sources that meets all of the specified requirements for its intended use and is not unsuitable. Wet subgrade material which meets other requirements for suitable material is suitable.

B. Unsuitable Material: Material that fails to meet requirements for suitable materials; or contains any of the following:

1. Organic clay, organic silt, or peat; as defined in ASTM D2487 and visually determined in ASTM D2488.

2. Vegetation, wood, roots, leaves, and organic, degradable material.

3. Stones or rock fragments over 3 inches in any dimension.

4. Porous biodegradable matter, excavated pavement, construction debris, rubbish, or refuse.

5. Ice, snow, frost, or frozen soil particles.

C. Stabilization Material: Stabilization material shall consist of hard, durable particles of stone or gravel, screened or crushed to the required size and gradation. The material shall be free from vegetation matter, lumps or balls of clay, or other deleterious matter and shall conform to the following gradation when tested in accordance with AASHTO T 27 or ASTM C 136.

1. Coarse material shall be crushed or washed and fine material shall be wasted to meet the grading requirements set forth below. Note that if stabilization material is required, an 8 oz. non-woven filter fabric shall be placed between the stabilization material and the pipe zone material.

2. Coarse aggregate, retained on the No. 4 sieve, shall have a percentage of wear not greater than 40 percent when tested by the Los Angeles Test, AASHTO T-96 or ASTM C131.

Sieve Size	Percent Passing By Weight
2 inch	100
1-1/2 inch	10 to 50
3/4 inch	0 to 25
No. 4	0 to 10
No. 200	0 to 3

D. Force Mains 3/4-inch Drain Rock (Lower) Pipe Zone: Provide open-graded, hard, durable crushed rock, wrapped in geotextile (free of clay lumps, organics and other deleterious matter) and meeting ASTM C33 Coarse Aggregate Size Number 67 and the gradation below per ASTM C136:

Sieve Size	Percent Passing By Weight
1 inch	100
3/4 inch	90-100
3/8 inch	20 to 55
No. 4	0 to 10
No. 200	0 to 3

1. Geotextile wrap (atop this material) may be discontinued beneath and between force mains (see typical force mains trench section).

2. Where Drawings require it (i.e. Sta 30+00 to 41+00), omit "Force Mains Dense Cohesive (Upper) Pipe Zone, and provide instead ¾-inch Drain Rock to the top of pipe zone and provide 4-inch HDPE perforated drains in geotextile sock (at 100-ft intervals) across bottom full width of trench (see force mains trench section at liquefiable layer).

E. Force Mains Dense Cohesive (Upper, except as noted above) Pipe Zone: Provide a homogenous, dense (137 lbs/cu ft min), cohesive, processed mixture of rock particles and fines with sufficient fines to thoroughly bind material together when compacted. UDOT Standard Spec 02721 road base complies, but also other homogenous mixtures with more fines. Obtain Engineer approval of samples and source if UDOT road base is not used. Non-homogenous mixtures of rock and fines are NOT acceptable. Mixture shall be free of organics and other deleterious matter.

1. Material available for Contractor use, which should meet this specification, has been stockpiled beside the Work Limits from Sta 27+00 to 33+00 (see Drawing 0100-R310).

F. 3/4-inch Minus Well Graded Pipe Zone Fill for RCP: Select material shall consist of 3/4-inch minus, well-graded import material, shall be free from vegetative matter, or other deleterious matter, and shall meet manufacturer's recommendations for the type of pipe installed. The 3/4 inch Minus Pipe Zone Material shall be capable of meeting the compaction requirements. "Squeegee" or any other flowable material shall not be permitted.

Sieve Size	Percent Passing By Weight
1 inch	100
3/4 inch	95 to 100
1/2 inch	25 to 60
No. 4	5 to 25
No. 8	0 to 10
No. 200	0 to 5

G. 1-inch Untreated Base Course for Bedding and Pipe Zone Material for PVC, HDPE, glass fiber reinforced (GFRP), and Ductile Iron Pipe shall meet the requirements in APWA Section 32 11 23 Grade 1.

H. Native Trench Backfill: Trench backfill may consist of native fill material meeting soils classifications A-1, A-2 or A-3 (A-1-a for Granular Borrow material) of AASHTO M145, with a maximum particle size no greater than 3-inches in any dimension and shall be capable of meeting the compaction requirements. Trench backfill shall be non-plastic. Trench backfill shall be free from alkali, salt, petroleum products, vegetative matter or other deleterious matter, slag, cinders, ashes and rubbish or other material that in the opinion of the Engineer may be objectionable or deleterious. "Squeegee" or any other flowable material shall not be permitted.

I. Imported Granular Trench Backfill: Where native materials are unable to achieve satisfactory compaction or meet the required soils classification, imported granular trench backfill shall be used and shall consist of imported materials meeting soils classifications A-1, A-2 or A-3 (A-1-a for Granular Borrow material) of AASHTO M145 and shall be non-plastic. Maximum particle size for backfill shall be no greater than 3 inches. Imported granular trench backfill shall be capable of meeting the compaction requirements.

J. Granular Trench Backfill (HDPE Pipe): Class I or Class II in accordance with ASTM D2774; except that (dual 48-inch, +/-1-mile long) HDPE force mains from IPS have pipe zone per paragraphs D and E above, and trench zone per paragraph H above.

2.02 EQUIPMENT:

A. Compaction equipment shall be capable of consistently achieving the specified compaction requirements.

2.03 UTILITY IDENTIFICATION:

A. Trace Wire: Continuous, single-strand copper wire, insulated, maximum 12 AWG. Tracer wire is not required on plant and storm drain lines.

B. Marking Tape: Use type specifically manufactured for marking and locating underground utilities. Acid- and alkali-resistant polyethylene film, 6 inches wide with minimum thickness of 0.004 inch, minimum strength of 1,750 psi lengthwise and 1,500 psi crosswise. Provide tape manufactured with foil core at least 0.35-mil thick to enable detection by metal detection when tape is buried up to 3 feet deep. Tape shall bear continuous printed inscription describing specific utility. Tape color shall be as follows:

1. Electric conduits, duct banks, and cable: Red.

2. Potable water systems: Blue.

3. Non-potable water (NPW) systems: Purple.

4. Gas, oil, dangerous materials: Yellow.

5. Telephone, CCTW, fire communications: Orange.

6. Sanitary sewer systems (forcemains only): Green.

PART 3 - EXECUTION

3.01 EXAMINATION:

A. Verify that dewatering systems are in place before commencing with excavation.

B. Verify that excavation safety and support systems meeting the requirements of OSHA 29 CFR 1926, Subpart P are in place before commencing with excavation.

1. Minimum slopes for laying back excavations or materials are contained in OSHA 29 CFR 1926, Subpart P; Appendices A and B.

2. Minimum requirements for shoring and bracing are contained in OSHA 29 CFR 1926, Subpart P; Appendix C.

C. Verify that fill materials submittals have been accepted by Engineer before commencing with work requiring the use of these materials.

D. Verify that erosion and sediment control measures are in place and functioning properly.

E. Immediately notify the Engineer if unexpected subsurface facilities or suspected hazardous materials are encountered during excavation. Discontinue affected work in area until notified to resume work.

3.02 PREPARATION:

A. Underpin adjacent structures that could be damaged by excavation work.

B. Cut pavement with saw or pneumatic tools to prevent damage to remaining pavement. Dispose of large pieces of demolished pavement before proceeding with excavation.

3.03 PROTECTION OF IN-PLACE CONDITIONS:

A. Comply with the requirements specified in Section 01 14 14.

B. Support and protect from damage – existing pipes, poles, wires, fences, curbs, property line markers, and other features or structures which must be preserved in place to avoid being temporarily or permanently relocated.

C. Excavation Near Existing Structures:

1. Discontinue digging by machinery when excavation approaches pipes, conduits, or other underground structures. Continue excavation by use of hand tools. Include such manual excavation in work to be done when incidental to normal excavation and under items involving normal excavation.

D. Excavation Near Private Property:

1. Record existing condition of features on adjacent property by means of dated photographs or cameras.

2. Enclose uncut tree trunks adjacent to work in wooden boxes of such height necessary to protect tree from injury due to piled material, equipment, or operations. Operate excavating machinery and cranes so as to prevent injury to overhanging branches and limbs.

3. Protect cultivated hedges, shrubs, and plants which would otherwise be damaged by the work.

4. Where protection of vegetation is not possible, dig up, temporarily transplant, and maintain. After active construction operations in the area have ceased, transplant vegetation to the original positions and provide water and nursery care until growth is re-established.

5. Do not use or operate tractors, bulldozers, or other power-operated equipment on paved surfaces. Provide protection on pavement or tracks if construction traffic is unavoidable.

3.04 RESTORATION:

A. Restore private property and structures promptly. Begin restoration work within 24 hours of when damage occurred.

B. Existing surfaces, features, or utilities that are to remain but are damaged during construction shall be repaired or replaced to at least the condition in which they were found immediately before work began, unless noted otherwise.

C. Damaged Trees to Remain: Cut all damaged branches, limbs, and roots smoothly and neatly without splitting or crushing. Neatly trim, cut the injured portions and cover with an application of grafting wax or tree healing paint. Replace damaged trees which subsequently die or continue to show lack of growth due to damage**,** one year after substantial completion.

D. Cultivated Vegetation: Includes, but is not limited to: hedges, shrubs, and plants. Vegetation that is damaged shall be replaced with equal kind and of at least the quality before work began.

3.05 TRENCH EXCAVATION:

A. Provide dewatering system to allow for working conditions in dry, stable soil. Properly dispose of water to avoid damage to property and in accordance with laws and regulations. Lower groundwater table prior to excavation and keep a minimum of 24 inches below lowest excavation subgrade until structure has sufficient strength to withstand soil and water pressures.

B. Sheet and brace trenches, excavations, and adjacent structures to comply with laws and regulations and to provide protection of life, property, and the Work. Where close sheeting is necessary, drive to prevent adjacent soil from entering excavation. Remove close sheeting only when removal would not damage property or the Work. Sheeting left in place shall be cut off 18 inches below ground surface.

C. Preserve material below and beyond the lines of excavations.

D. Locate stockpiled excavated material at least 3 feet from edge of excavations to prevent cave-ins or bank slides.

3.06 AUTHORIZED OVER-EXCAVATION:

A. Remove rock for a depth of 6 inches and backfill with bedding material.

3.07 UNAUTHORIZED EXCAVATION:

A. Contractor is responsible for backfilling unauthorized excavations with material selected by the Engineer. Unauthorized Excavation consists of removal or loosening of materials beyond indicated subgrade elevations or dimensions without specific directions of the Engineer.

3.08 BACKFILL:

A. Fill to lines and grades necessary to provide finish grades.

B. Use a placement method that does not disturb or damage other work or existing features.

C. Maintain fill materials within 3 percent of optimum moisture, to attain required compaction density.

D. Place and compact material in equal continuous layers.

E. Maximum compacted depth is 6 inches for aggregate materials and 8 inches for soil materials, unless noted otherwise. For deep trenches, deeper than 20 feet, maximum compacted depth shall be 6 inches for all materials.

F. Flexible Pipe

1. The haunch area shall be completely filled and free of voids. Shovel and compact material evenly on both sides of pipe in lifts not more than 4 inches.

2. Above the haunch area place the material in lifts not exceeding 6 inches.

G. Before placing IPS force mains, survey compacted drain rock bedding surface (to be bottom CL of both force mains) at 25-foot intervals and obtain Engineer approval of same. Limit thermal induced vertical undulation of HDPE pipe during backfilling. Submit how Contractor will keep HDPE pipe bottom within 1/2-inch vertically of design grade.

3.09 COMPACTION:

A. Compact to density specified and indicated for various types of material. Control moisture content of material being placed as specified, or if not specified - at a level slightly lower than optimum.

B. Compaction Density: Provide trench backfill densities according to Table 31 23 33-1. The values listed are minimum percentages, unless noted otherwise.

Table 31 23 33-1

Area	Percentage of Maximum Dry Density as defined by ASTM D1557 (Modified Proctor)
Trench Granular Backfill (under pavement, slabs)	96
Trench Granular Backfill (under structures or within 25 feet of structures)	96
Trench Backfill (below granular backfill borrow)	95
Trench Backfill (under exterior concrete slab and sidewalks)	95
Trench Backfill (in open or grassed areas)	90
Pipe Zone and Bedding (cohesive)	95% per ASTM D1557
Pipe Zone and Bedding (non-cohesive)*	*80% per ASTM D4253 and D4254
*Compact bottom of force mains pipe zone (non cohesive 3/4" drain rock) to 80% relative density per ASTM D4253 and D4254, which is nearly same compaction effort required to compact top of force mains pipe zone (cohesive material) to 95% per ASTM D1557.	

3.10 UTILITY IDENTIFICATION:

A. Install marking tape over all site utilities, 12 inches above pipe zone.

B. Install trace wire at top center; pull wire taut to remove any slack; secure tracer wire to pipe at 10 foot intervals, maximum.

C. Extend trace wire to utility boxes, maintenance holes and junctions to allow for connection to subsurface location equipment.

3.11 FIELD QUALITY CONTROL:

A. See Section 01 45 00 for general requirements for field inspection and testing.

B. Compaction shall be deemed to comply with the specifications when no more than 1 test of any 3 consecutive tests falls below the specified relative compaction. The one test shall be no more than 3 percentage points below the specified compaction. The Contractor shall pay the costs for any retesting or additional testing of work not conforming to the specifications.

C. Where compaction tests indicate a failure to meet the specified compaction, the Owner will take additional tests every 50 feet in each direction until the extent of the failing area is identified. Rework the entire failed area until the specified compaction has been achieved.

D. Perform particle size distribution and gradation analyses using ASTM D422 and following standard practices in ASTM D421. Perform 1 test for every source and submit results to Engineer for acceptance. Repeat the moisture density test for every 5,000 cubic yards of material used.

E. Perform field density testing in accordance with ASTM D6938.

F. Evaluate cohesive soils field density test results in relation to maximum dry density as determined by testing material in accordance with ASTM D1557 (Modified Proctor).

G. Perform tests in accordance with ASTM D4318 to determine Liquid Limit, Plastic Limit and Plasticity Index and submit test results to Engineer for acceptance. Minimum of one test per 5,000 cubic yards of soil for use as fill material and whenever classification of material is in doubt as determined by the Engineer.

H. Location of field density tests shall be mutually acceptable to testing laboratory and the Engineer.

I. Frequency of field density tests:

Table 31 23 33-2	
Area	**Minimum Frequency**
Trench (Structural Areas)	1 per lift for each 200 linear feet of trench
Trench (Non-Structural Areas)	1 per lift for each 250 linear feet of trench
Regardless of the minimum testing frequency specified, field density tests shall be performed by the Contractor in sufficient number for the Contractor's quality control purposes to ensure that specified density is obtained.	

3.12 ADJUSTING:

A. Shrinkage:

1. Backfill to a height above finished grade which will allow for the shrinkage or consolidation of material. Initially, provide at all points, an excess of at least one percent of total height of backfill measured from stripped surface to top of finished surface.

2. Supply specified materials and build up low places, without additional cost if embankment or backfilling settles so as to be below the indicated level for proposed finished surface at any time before final acceptance of the work.

3.13 PROTECTION:

A. Formulate excavation, backfilling, and filling schedule and procedures to eliminate possibility of undermining or disturbing foundations of partially and completed structures, pipelines and embankments or existing structures and pipelines.

3.14 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

Page Intentionally Left Blank

SECTION 31 34 19

GROUND STABILIZATION WITH GEOSYNTHETICS

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide ground stabilization with geosynthetics as indicated and in compliance with Contract Documents.

1.02 REFERENCES:

A. American Association of State and Highway Transportation Officials (AASHTO):

1. M288: Standard Specification for Geotextile Specification for Highway Applications

B. ASTM International (ASTM):

C. Geosynthetic Institute (GSI):

1. GRI GG4a: Determination of the Long-Term Design Strength of Stiff Geogrids

2. GRI GG4b: Determination of the Long-Term Design Strength of Flexible Geogrids

1.03 QUALITY ASSURANCE:

A. Provide in accordance with Section 01 45 00.

B. General:

1. Producer of geosynthetics to maintain competent laboratory at point of manufacture to ensure quality control in accordance with ASTM testing procedures. Laboratory to maintain records of quality control results.

1.04 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00 prior to start of excavation. Submittal shall be approved by the Engineer prior to start of excavation.

1. Product Data:

a. Manufacturer's Certification of Product Conformance

(1) Test results of geotextile physical properties.

(2) Affidavit certifying that the raw and roll material test results submitted are accurate and meet the requirements of the Project specifications.

(3) A sample of the material to be provided as part of the certification submittal.

b. Geotextile Deployment Information

(1) Manufacturer's installation recommendations for geotextile fabric/geogrid.

(a) Submit Manufacturer's printed installation instructions (for informational purposes only).

(2) Geotextile layout plan along with anchorage and joint details, overlaps, sequencing, and installation procedures.

(a) If using overlap to connect geogrids in the field, provide for review prior to field installation the calculations used to support the use of any overlap connection.

1.05 DELIVERY, STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

B. Deliver fabric/geogrid to Project site in such quantities and at such times to ensure continuity of installation.

C. Provide geotextile fabric in rolls wrapped with protective covering to protect geotextile fabric from mud, dirt, dust, and debris. Label each roll of geotextile fabric with number or symbol to identify production run.

D. Store material in accordance with ASTM D4873 and Manufacturer's recommendations and protect material from exposure to direct sunlight and damage by construction activities.

E. Do not leave deployed geotextile exposed to sunlight for more than 5 days during installation operations.

F. Handle and unload geogrid rolls by hand, or with load carrying straps, a fork lift with a stinger bar, or an axial bar assembly. Geotextile rolls shall not be dragged, lifted by one end, lifted by cables or chains, or dropped to the ground.

G. During shipping and storage, protect the fabric from direct sunlight, ultraviolet rays, temperature greater than 140 degrees F, mud dirt, dust, and debris. To the extent possible, keep the fabric wrapped in a heavy-duty protective covering.

H. Schedule the work so that the fabric is covered or otherwise protected within 30 days after it is placed. Failure to comply with this requirement shall require replacement of the fabric

PART 2 - PRODUCTS

2.01 MATERIAL:

A. Geotextile Fabric:

1. Physical property requirements of nonwoven geotextile fabrics are as follows:

Offsite IPS - Nonwoven Geotextile Properties			
Property	Test Method	Units	Value
Permittivity	ASTM D4491	sec -1	0.05 (min.)
Apparent Opening Size (AOS or O95)	ASTM D4751	mm	0.21
Ultraviolet Stability	ASTM D4355	Percent	50 (min.)

2. Refer to Section 31 23 19 for additional requirements. For other uses, refer to Section 31 05 19.13.

3. Class 1 fabric according to AASHTO M288.

4. Geotextile fabric strength properties shall be in accordance with AASHTO M288.

B. Manufacturing quality control testing shall be performed at a frequency of one test per 50,000 square feet of manufactured material to evaluate the material's physical properties.

1. A sample of the manufactured material shall be submitted to the Contractor's Independent Testing Laboratory for duplicate testing.

2. Samples not satisfying the specifications shall result in rejection of the applicable rolls.

C. Dewatering Base Course Material:

1. Placed and compacted base course material shall comply with Section 31 23 00 requirements.

D. Bridging Zone Materials:

1. Placed bridging materials shall comply with Section 31 23 00 requirements.

PART 3 - EXECUTION

3.01 SURFACE PREPARATION:

A. Perform excavation in accordance with Section 31 23 00. Install in accordance with AASHTO M288, Appendices A1 and A3, except as modified below.

B. Remove surface protrusions, debris, sharp objects, trees, stumps, or large roots during excavation. Do not operate equipment on excavated surface.

C. Dewatering: Grade smooth and compact the subgrade prior to base course material placement.

1. Subgrade shall be dry and well drained with no standing water or puddles.

D. Dewatering: Place materials to the widths and depths indicated on the contract drawings and compact in accordance with Section 31 23 00.

E. Place bridging materials as indicated on the contract drawings. No compaction of the first 18 inches of bridging material is allowed. See Section 31 23 00 for additional information.

F. Prior to placement of bridging, areas on which geotextile is to be placed shall have a uniform slope and be reasonably smooth, free from mounds and windrows, and free of any debris or projections which could damage the fabric to be placed on it. Loosely lay the material (do not stretch it). Support the fabric at all times to maintain its intended position.

G. If there is any fabric damage or displaced before fabric placement or during fabric placement, replace or repair it.

3.02 GEOTEXTILE FABRIC DEPLOYMENT:

A. Installation of Geotextile Fabric:

1. Dewatering: The geotextile shall be placed on the prepared surface at the locations and to the dimensions shown on the construction drawings.

2. The geotextile shall be placed on the prepared surface at the locations and to the dimensions shown on the construction drawings.

3. Install geotextile in accordance with the Manufacturer's written instructions.

4. The geotextile shall be placed loosely, but without wrinkles and creases. Apply temporary ballast to prevent movement and wind damage.

5. Seams shall be overlapped a minimum of 24 inches when unsewn and 6 inches when sewn, or as indicated in the Manufacturer's instructions.

   a. If sewn, the seam efficiency shall be equal to or greater than 75 percent of the grab tensile strength of fabric when tested wet using ASTM D1683.

   b. Thread used in sewing shall be of same or greater durability than fabric material.

6. The condition of the deployed geotextile shall be inspected by the Engineer before cover placement,

3.03 FILL PLACEMENT OVER GEOTEXTILES:

A. Place material on geotextile beginning at the outer edge of the geotextile covered area.

B. To prevent tearing, crushing or shifting of geotextile, keep tire and track mounted construction vehicles and end-dumped material off the geotextile cover until minimum of 18 inches of has been placed in accordance with Section 31 23 00.

C. Materials shall be placed in lifts and compacted in accordance with Section 31 23 00.

D. Materials shall be placed, spread, and compacted in such a manner that minimizes wrinkles, distortions or movement of the geotextile and pumping of the subgrade in accordance with Section 31 23 00.

3.04 FIELD QUALITY CONTROL:

A. Repair or replace damaged fabric/geogrid.

1. Torn fabric may be patched in place by placing fabric over tear.

   a. Dimensions of patch shall meet lap requirements.

   b. Secure to prevent base course material from causing lap separation.

2. Any geogrid damaged during installation shall be replaced by the Contractor at no additional cost to the Owner.

END OF SECTION

Page Intentionally Left Blank

SECTION 31 50 00

EXCAVATION SUPPORT SYSTEMS

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide excavation support systems as indicated and in compliance with Contract Documents.

B. Design, furnish and install excavation support systems to maintain lateral support, prevent loss of ground, limit soil movements to acceptable limits and protect from damage existing and proposed improvements including pipelines, utilities, structures, roadways, railroads and other facilities.

C. The requirement of specified excavation support systems in areas indicated on the drawings does not relieve the Contractor from the responsibility of furnishing and installing proper temporary excavation support systems in other areas.

D. Common types of excavation support system include, but are not limited to; singular or multiple stages comprised of cantilevered or internally braced soldier piles and lagging, steel sheetpile wall, timber sheetpile wall, trench box, or combinations thereof. Trench box temporary excavation support system is only acceptable for pipe or utility trench excavations approved by the Engineer. Temporary unsupported open cut excavation with stable sloping sides is allowed where applicable.

E. Extraction of steel sheetpile wall, timber sheetpile wall, or solider piles are not permitted unless approved in writing by Engineer and designer of shoring system. Designer of shoring system shall certify that no adverse effects to permanent construction will be caused by removal of shoring system.

F. Wherever the word "sheeting" is used in this section or on the contract drawings, it shall be in reference to any type of excavation support system specified except trench box.

G. Construction of the excavation support systems shall not disturb the existing structures or the completed proposed structures. Damage to such structures shall be repaired at Contractor’s expense.

H. Adjacent structures are those that are bear upon soils above the proposed excavation depth and within a distance equal to twice the total depth of the excavation away from the closest edge of the excavation. Monitor and protect adjacent structures as specified and indicated.

I. Vibration monitoring for excavation support systems shall be performed as specified in Section 02 32 14.

J. Construction operations not to exceed specified noise limits in permits.

K. Bear the entire cost and responsibility of correcting any failure, damages, subsidence, upheaval or cave-ins as a result of improper installation, maintenance or design of the excavation support systems. Pay for all claims, costs and damages that arise as a result of the Work performed at Contractor's expense.

1.03 SUBMITTALS

A. Submit the following in accordance with Section 01 33 00.

1. Submit the following qualifications four (4) weeks prior to the construction:

a. Qualifications of Contractor's excavation support system designer as specified in Paragraph 1.04.G.

b. Qualifications of Contractor's excavation support system installer as specified in Paragraph 1.04.H.

c. Qualifications of Contractor's independent tieback testing laboratory as specified in Paragraph 1.04.I, if a tieback system is utilized.

d. Qualifications of Contractor's excavation support system installation supervisor as specified in Paragraph 1.04.J.

e. Qualifications of vacuum excavation subcontractor as specified in Paragraph 1.04.F, if DMPs for utilities are utilized.

2. Submit an excavation support plan stamped and signed by a Registered Professional Engineer in the State of Utah at least two weeks prior to start of the construction. Do not submit design calculations. The review will be only for the information of the Owner and third parties for an overall understanding of the project relating to access, maintenance of existing facilities and proper utilization of the site. The Contractor remains responsible for the adequacy and safety of the means, methods and sequencing of construction. The plan shall include the following items as a minimum:

a. Proposed excavation support system(s), details, location, layout, depths, extent of different types of support relative to existing features and the permanent structures to be constructed, and methods and sequence of installation and removal.

b. Certificate of Design: Refer to Section 01 33 00.

c. A list of all design assumptions, including safety factors used for the excavation support system(s) and all lateral pressures used for each system.

d. If utilizing a tieback system, include tieback installation procedures and criteria for acceptance of tiebacks for performance and proof tests. Submit the tieback testing results to the Engineer for information only.

e. Requirements of dewatering during the construction.

f. Minimum lateral distance from the edge of the excavation support system for use for vehicles, construction equipment, and stockpiled construction and excavated materials.

g. List of equipment used for installing the excavation support systems.

h. Monitoring schedule, installation procedures and location plans for vibration/noise monitoring, geotechnical instrumentation (deformation monitoring points and inclinometers) and observation wells/piezometers to monitor ground, excavation support system, adjacent structures and groundwater fluctuation during the entire construction period.

3. Submit a Construction Contingency Plan specifying the methods and procedures to maintain excavation support system stability if the allowable movement of the adjacent ground and adjacent structures is exceeded. Include movement thresholds that trigger review and/or remediation measures to be implemented.

4. Monitoring data within one (1) day of data collection from vibration and noise recording equipment, observation wells, deformation monitoring points and offset lines. Data shall include:

a. Horizontal and vertical movements of geotechnical instruments and groundwater readings.

b. New movements since the initial readings of the geotechnical instruments.

c. Weekly summary in tabular and graphic form at the end of each week.

d. A schematic plan of excavation and/or relevant construction activities at the time of monitoring.

5. For excavation support systems left in place, submit the following as-built information prior to backfilling and covering the excavation support systems:

a. Survey locations of the excavation support systems, including coordinates of the ends and points of change in direction.

b. Type of the excavation support system.

c. Elevations of top and bottom of the excavation support systems left in place.

1.04 QUALITY ASSURANCE:

A. Provide in accordance with Section 01 45 00.

B. Conform to the requirements of the OSHA Standards and Interpretations: "Part 1926 Subpart P - Excavation, Trenching, and Shoring".

C. Construction operations to conform to noise regulations provided in the Noise Control Plan and this Section.

D. Retain the services of an independent vibration consulting firm meeting the requirements as specified in Section 02 32 14.

E. The peak particle velocity for pile driving, or other vibration-inducing operations, shall meet the requirements as specified in Section 02 32 14.

F. If utilizing deformation monitoring points (DMPs) for utilities, vacuum excavation shall be performed by subcontractor having five (5) years of experience in non-destructive vacuum excavation methods for utilities.

G. Prepare design, including calculations and drawings, under the direction of a Professional Engineer registered in the State of Utah and having the following qualifications:

1. Not less than ten (10) years' experience in the design of specific excavation support systems to be used.

2. Completed not less than five (5) successful excavation support system projects of equal type, size, and complexity within the last five (5) years.

H. Excavation Support System Installer's Qualifications:

1. Not less than three (3) year experience in the installation of similar types and equal complexity as the proposed system.

2. Completed not less than three (3) successful excavation support systems of similar type and equal complexity as the proposed system.

I. If utilizing a tieback system, employ an independent testing laboratory to test the tieback system with the following qualifications:

1. Be accredited by the American Association of State Highway and Transportation Officials (AASHTO) Accreditation Program.

2. Employ personnel conducting testing who are trained in the methods and procedures to test and monitor tieback systems of similar type and equal complexity, as the proposed system.

3. Have not less than five (5) years' experience in testing of tieback systems of similar type and equal complexity as the proposed system.

4. Have successfully tested at least three (3) tieback systems of similar type and equal complexity as the proposed system.

J. Install all excavation support systems under the supervision of a supervisor having the following qualifications:

1. Not less than five (5) years' experience in installation of systems of similar type and equal complexity as the proposed system.

2. Completed at least five (5) successful excavation support systems of similar type and equal complexity as the proposed system.

K. All welding shall be performed in accordance with AWS D1.1.

1.05 DESIGN CRITERIA:

A. Design of excavation support systems shall meet the following minimum requirements:

1. Support systems shall be designed for earth pressures, hydrostatic pressure, equipment, temporary stockpiles, construction loads, roadways, railroads, and other surcharge loads.

2. Design a bracing system to provide sufficient reaction to maintain stability.

3. Limit movement of ground adjacent to the excavation support system to be within the allowable ground deformation as specified.

4. Design the embedment depth below bottom of excavation to minimize lateral and vertical earth movements and provide bottom stability. Toe of braced temporary excavation support systems shall not be less than 5 feet below the bottom of the excavation.

5. Design excavation support systems to withstand an additional 2 feet of excavation below proposed bottom of excavation without redesign except for the addition of lagging and/or bracing.

6. Maximum width of pipe trench excavation shall be as indicated on the drawings.

7. Do not cast permanent structure walls directly against excavation support walls.

8. The design location of the excavation support wall shall be determined such that the installed wall and bracing system components are all located outside the limits of the permanent structure. Construction tolerances (e.g. wall verticality) shall be considered in determining the plan location.

1.06 DELIVERY, STORAGE AND HANDLING:

A. Provide in accordance with APWA Sections 01 66 00 and as specified.

B. Store sheeting and bracing materials to prevent sagging which would produce permanent deformation. Keep concentrated loads which occur during stacking or lifting below the level which would produce permanent deformation of the material.

1.07 PROJECT CONDITIONS:

A. Subsurface Conditions: Refer to Section 00 21 13.

PART 2 - PRODUCTS

2.01 MATERIALS:

A. Structural Steel: All soldier piles, wales, rakers, struts, wedges, plates, waterstop and accessory steel shapes shall conform to ASTM A36.

B. Steel Sheet Piling: ASTM A572, continuous interlocking type.

C. Timber Lagging Left in Place: Pressured treated per AWPA standards.

D. Tieback Tendons: Tieback tendons shall be high strength steel wire strand cables conforming to ASTM A416, or bars conforming to ASTM A722. Splicing of individual cables shall not be permitted.

E. Raker Ties: ASTM A615 Grade 60.

F. Cement Grout Materials and Admixtures For Tieback Anchorages: Grout cube strength shall be a minimum 3500 psi at 7 days and 5000 psi at 28 days.

G. Concrete: Section 03 30 00.

H. Tamping tools adapted for backfilling voids after removal of the excavation support system.

I. Provide specific trench box sizes for each pipe and utility excavation with structural capacity of retaining soil types as described in OSHA's 29 CFR Part 1926 Subpart P.

2.02 EQUIPMENT:

A. Install shoring to required depth with suitable equipment for installation of shoring materials. Equipment can include vibratory hammers, impact hammers, hydraulic push-in tools, drills or other equipment that meets vibration and noise requirements.

PART 3 - EXECUTION

3.01 INSTALLATION:

A. Installation of the excavation support systems shall not commence until the related earth excavation and dewatering submittals have been reviewed by the Engineer with all Engineer's comments satisfactorily addressed.

B. Install excavation support systems in accordance with the excavation support plan.

C. If utilizing a tieback system, all performance and proof tests shall be conducted in the presence of the Engineer. Testing performed without the Engineer present is considered invalid. Repeat testing in the Engineer's presence at Contractor's expense.

D. Do not drive sheeting within 100 feet (30 m) of concrete less than seven (7) days old.

E. Carry out program of excavation support in such a manner as to prevent undermining or disturbing foundations of existing structures of Work ongoing or previously completed.

F. Bottom of the trench box excavation support system shall be above the pipe invert prior to installing the pipe.

G. Install and read geotechnical instrumentation in accordance with the excavation support plan. Notify the Engineer immediately if any geotechnical instrumentation is damaged. Repair or replace damaged geotechnical instrumentation at the sole option of the Engineer and at Contractor's expense.

H. Continuously monitor movements of the ground adjacent to excavation support systems and adjacent structures. In events of the measured movements approaching or exceeding the allowable movements, take immediate steps to arrest further movement by revising procedures such as providing supplementary bracing, filling voids behind the trench box, supporting utilities or other measures (Construction Contingency Plan).

I. Notify utility owners if existing utilities interfere with the excavation support system. Modify the existing utility with the utility owner's permission or have the utility owner make the modifications at Contractor's expense.

3.02 GROUND DEFORMATION ADJACENT TO EXCAVATION SUPPORT SYSTEMS:

A. Allowable Vertical (heave/settlement) and Lateral Movements: 2 inches maximum for the trench box excavation support system, and 1 inch maximum for other types of excavation support systems at any location behind the excavation support system.

B. Monitoring personnel shall use a procedure for reading and recording geotechnical instrumentation data which compares the current reading to the last reading during data collection to eliminate spurious readings.

C. Plot the observed ground deformation readings versus time. Annotate the plots with construction loading and excavation events having an impact on the readings. Evaluate plots by means of secondary rate-of-change plots to provide early warning of accelerating ground movements.

D. Notify the Engineer when the allowable ground deformation is exceeded.

E. Implement Construction Contingency Plan under direction of the temporary excavation support system designer and the Engineer.

3.03 REMOVAL OF EXCAVATION SUPPORT SYSTEMS:

A. Sheeting shall be left in place unless otherwise indicated.

B. When indicated, remove the excavation support system without endangering the constructed or adjacent structures, utilities, or property. Immediately backfill all voids left or caused by withdrawal of excavation support systems with bank-run gravel, screened gravel or select borrow by tamping with tools specifically adapted for that purpose.

C. When tiebacks are used, release tension in tiebacks as the excavation is backfilled. Do not leave tensioned tieback in place at the completion of the Work.

D. The excavation support system left-in-place shall be cut-off a minimum of 2 feet below the bottom of the next higher foundation level or a minimum of 5 feet below finished grade.

E. Conduct survey of the locations and final cut-off elevations of the excavation support systems left in place.

3.04 CONTRACT CLOSEOUT:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 32 12 00

FLEXIBLE PAVING

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide flexible paving as indicated and in compliance with Contract Documents.

1. Scope includes:

a. Aggregate base course (Untreated Base Course)

b. Asphalt concrete pavement

B. Salt Lake City Department of Public Utilities follows the requirements of the American Public Works Association (APWA) Utah Chapter – 2017 Standards and Specifications. Follow the APWA Specifications as modified herein

C. Survey, remove and rebuild all existing flexible paving disturbed by construction including that described in Force Mains Drawing from Station 36+00 to 45+30.

1.02 REFERENCES:

A. American Association of State Highway and Transportation Officials (AASHTO):

1. M147: Standard Specification for Materials for Aggregate and Soil-Aggregate Subbase, Base, and Surface Courses.

2. T89: Standard Method of Test for Determining the Liquid Limit of Soils.

3. T90: Standard Method of Test for Determining the Plastic Limit and Plasticity Index of Soils.

4. T99: Standard Method of Test for Moisture-Density Relations of Soils Using a 2.5-kg (5.5-lb) Rammer and a 305-mm (12-in.) Drop.

B. ASTM International (ASTM):

1. C125: Standard Terminology Relating to Concrete and Concrete Aggregates.

2. D242: Standard Specification for Mineral Filler For Bituminous Paving Mixtures.

3. D977: Standard Specification for Emulsified Asphalt.

4. D2027: Standard Specification for Cutback Asphalt (Medium-Curing Type).

5. D6373: Standard Specification for Performance Graded Asphalt Binder.

C. American Public Works Association – Utah Chapter (APWA):

1. APWA Specifications: 2017 Standards and Specifications

1.03 DEFINITIONS:

A. Gravel: Coarse aggregate resulting from natural disintegration and abrasion of rock or processing of weakly bound conglomerate.

B. Crushed Gravel: The product resulting from the artificial crushing of gravel with substantially all fragments having at least one face resulting from fracture.

C. Crushed Stone: The product resulting from the artificial crushing of rocks, boulders, or large cobblestones, substantially all faces of which have resulted from the crushing operation.

1.04 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

1. Aggregate Base Course: Submit Untreated Base Course (UTBC) submittals per APWA Section 32 11 23.

2. Pavement Material: Submit bituminous concrete hot mix asphalt (HMA) submittals per APWA Section 32 11 05.

3. Tack Coat: Submit asphaltic materials per APWA Section 32 12 13.13.

4. Prime Coat: Submit asphaltic materials per APWA Section 32 12 13.19.

B. Test Results:

1. Base course testing results.

2. Asphalt pavement testing results.

1.05 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.06 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

B. Codes and Standards: Comply with the latest edition of State highway or transportation department standard specifications, APWA 2017 Standards and Specifications, and with Salt Lake City regulations.

1.07 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

B. Transport bituminous mixtures in covered trucks whenever:

1. Rainy weather, or

2. Air temperature is less than 60 degrees F.

C. Adjust weight, type, capacity, haul routes, and method of operation of hauling vehicles so that:

1. No damage results to existing streets, subgrade or base course, and

2. Noise and air pollution levels are not noticeably increased along selected haul route.

D. Haul routes through residential areas shall be avoided.

1.08 PROJECT CONDITIONS:

A. Weather Limitations: Apply prime and tack coats when ambient temperature is above 50 degrees F, and when temperature has not been below 35 degrees F for 12 hours immediately prior to application. Do not apply when base is wet or contains an excess of moisture.

PART 2 - PRODUCTS

2.01 AGGREGATE MATERIALS:

A. According to AASHTO M147, unless noted otherwise.

B. Aggregate, including blended filler, shall have:

1. Liquid limit (LL) of not more than 25 as determined by AASHTO T89.

2. Plasticity index (PI) of not more than 6 as determined by AASHTO T90.

C. Remove oversized material by screening or crushing to required sizes.

D. Filler for Blending:

1. Use filler for meeting gradation requirements or for satisfactory binding of material. Uniformly blend with base course material at screening plant.

2. Obtain material from sources accepted by Engineer.

3. Material shall be free of agglomerations or lumps, and contain no more than 15 percent of material retained on No. 4 sieve.

2.02 AGGREGATE BASE COURSE:

A. Aggregate Base Course shall be Untreated Base Course (UTBC) per APWA Section 32 11 23.

B. Gradation: Grade 1-1/2 per Table 4 – Master Grading Bands, APWA Section 32 11 23.

2.03 PAVEMENT MATERIALS:

A. Provide Hot Mix Asphalt (HMA) materials in accordance with APWA Section 32 11 05 Bituminous Concrete as modified below.

B. Crushed stone, crushed gravel, slag, sand, or combination per Table 3, Road Class III per APWA Section 32 11 05.

C. Mineral Filler: Rock or slag dust, hydraulic cement, or other inert material complying with ASTM D242.

D. Aggregate: APWA DM-1/2 per Table 5 per APWA Section 32 11 05.

E. Reclaimed Asphalt Pavement (RAP): Allowed up to 25 percent by weight of RAP or binder, whichever is lesser, with no change in specified binder grade.

F. Asphaltic Materials:

1. Prime Coat: APWA Specifications, Section 32 12 13.19.

2. Tack Coat: APWA Specifications, Section 32 12 13.13.

3. Asphalt Cement:

a. Performance Grade: ASTM D6373

(1) PG 58-28

4. Prime Coat: Cut-back asphalt type; ASTM D2027 MC-30, MC-70 or MC-250.

5. Tack Coat: Emulsified asphalt; ASTM D977 or D2397; SS-1, SS-1h, CSS-1 or CSS-1h, diluted with one part water to one part emulsified asphalt.

2.04 ACCESSORIES:

A. Herbicide:

1. Provide herbicide in accordance with APWA Section 31 31 19.

2. Manufacturers:

b. Agsurf Corporation

c. Bayer

d. Dow Chemical U.S.A.

e. E.I. DuPont De Nemours & Co., Inc.

f. FMC Corporation

2. Commercial chemical for weed control, registered by Environmental Protection Agency (EPA).

3. Provide granular, liquid, or wettable powder form.

PART 3 - EXECUTION

3.01 EXAMINATION:

A. Check subgrade as to soundness, outline, and contour.

3.02 SUBGRADE PREPARATION:

A. Preparation shall be in accordance with APWA Section 32 12 16.13.

B. Scrape down subgrade bumps and irregularities to obtain smooth, even surface.

C. Proof roll

D. Remove and replace soft or spongy areas as specified in Section 31 23 00.

3.03 PAVEMENT PREPARATION:

A. Remove loose material from compacted base course immediately before applying herbicide treatment or prime coat.

B. If base course becomes rutted, loose or uneven due delays in placing subsequent courses then proof roll prepared surface to check for unstable areas. Provide additional compaction or remove unstable areas, backfill and compact. Do not begin paving work until deficient areas have been re-graded and corrected and are ready to receive paving.

C. Herbicide Treatment: Apply chemical weed control agent in compliance with manufacturer's recommended dosage and application instructions.

D. Prime Coat: Apply primer in accordance with APWA Section 32 12 13.19.

1. Apply at rate of 0.10 to 0.50 gallons per square yard over compacted subgrade.

2. Apply material to penetrate and seal, but not flood, surface.

3. Cure and dry as long as necessary to attain penetration and evaporation of volatile.

E. Tack Coat: Apply tack coat in accordance with APWA Section 32 12 13.13.

1. Apply to contact surfaces of previously constructed asphalt or Portland cement concrete and surfaces abutting or projecting into asphalt concrete pavement.

2. Distribute at rate of 0.05 to 0.15 gallons per square yard of surface.

3. Allow to dry until at proper condition to receive paving.

4. Exercise care in applying bituminous materials to avoid smearing of adjoining concrete surfaces. Remove and clean damaged surfaces.

3.04 BASE COURSE INSTALLATION:

A. Placements of UTBC shall be per APWA Section 32 11 23 as modified as follows.

B. Place materials when surface is dry and atmospheric temperature is above 40 degrees F.

C. Construct in two or more layers of approximate equal lifts; maximum compacted lift is 6 inches.

D. Deposit material on foundation or previously placed layer to minimize segregation and facilitate spreading to uniform layer.

E. Place and spread each layer to thickness, width, and contour.

F. Compact each layer before proceeding to subsequent layers. Compact to 95 percent of maximum dry density, unless noted otherwise.

G. Prior to and during compaction shape material and maintain to dimensions and contour. Keep surface of each layer true and smooth.

3.05 PLACING MIX:

A. Place asphalt pavement in accordance with APWA Section 32 12 16.13.

B. Place in strips not less than 10 feet wide, unless otherwise acceptable to Engineer.

C. After first strip has been placed and rolled, place succeeding strips and extend rolling to overlap previous strips.

D. Grade Control: Establish and maintain required lines and elevations to within 3/8 inches.

E. Joints: Make joints between old and new pavements, or between successive days' work, to ensure continuous bond between adjoining work. Construct joints to have same texture, density, and smoothness as other sections of asphalt concrete course. Clean contact surfaces and apply tack coat.

3.06 ROLLING:

A. General: Begin rolling when mixture will bear roller weight without excessive displacement. Compact mixture with hot hand tampers or vibrating plate compactors in areas inaccessible to rollers.

B. Breakdown Rolling: Accomplish breakdown or initial rolling immediately following rolling of joints and outside edge. Check surface after breakdown rolling, and repair displaced areas by loosening and filling, if required, with hot material.

C. Second Rolling: Follow breakdown rolling as soon as possible, while mixture is hot. Continue second rolling until mixture has been thoroughly compacted.

D. Finish Rolling: Perform finish rolling while mixture is still warm enough for removal of roller marks. Continue rolling until roller marks are eliminated and course has attained maximum density.

E. Patching: Remove and replace paving areas mixed with foreign materials and defective areas. Cut-out such areas and fill with fresh, hot asphalt concrete. Compact by rolling to maximum surface density and smoothness.

3.07 FIELD QUALITY CONTROL:

A. Base Course Testing:

1. Optimum Moisture Content and Maximum Density: Comply with AASHTO T99, Method C, with replacement of fraction of aggregate retained on 3/4 inch sieve. Replace with No. 4 to 3/4 inch material.

B. Pavement Testing:

1. General: Test in-place asphalt concrete courses for compliance with requirements for thickness and surface smoothness. Repair or remove and replace unacceptable paving.

2. Thickness Tolerances: In-place compacted thickness will not be acceptable if exceeding following allowable variation from required thickness:

a. Base Course Thickness: Less than 1/4-inches, plus or minus.

b. Surface Course Thickness: Less than 1/4-inches, plus or minus.

3. Surface Smoothness Tolerances: Test finished surface of each asphalt concrete course for smoothness, using 10-foot straightedge applied parallel with, and at right angles to centerline of paved area. Surfaces will not be acceptable if exceeding following tolerances for smoothness.

a. Binder Course: 1/4-inches.

b. Surface Course: 1/8-inches.

c. Crowned Surfaces: Test with crowned template centered and at right angle to crown. Maximum allowable variance from template, 1/4 inches.

d. Profile and Section: Variation from true shall not exceed +/- 3/8-inches.

3.08 PROTECTION:

A. After final rolling:

1. Do not permit vehicular traffic on pavement until it has cooled and hardened.

2. Protect paving from traffic until mixture has cooled enough not to become marked.

3.09 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 32 13 00

RIGID PAVING

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Section includes:

1. Provide rigid paving as indicated and in compliance with Contract Documents.

1.02 REFERENCES:

A. American Concrete Institute (ACI):

10. C1315: Standard Specification for Liquid Membrane-Forming Compounds Having Special Properties for Curing and Sealing Concrete.

11. C1602: Standard Specification for Mixing Water Used in the Production of Hydraulic Cement Concrete.

12. D1751: Standard Specification for Preformed Expansion Joint Filler for Concrete Paving and Structural Construction (Non-extruding and Resilient Bituminous Types).

13. D5249: Standard Specification for Backer Material for Use with Cold- and Hot-Applied Joint Sealants in Portland-Cement Concrete and Asphalt Joints

14. D6690: Standard Specification for Joint and Crack Sealants, Hot Applied, for Concrete and Asphalt Pavements.

D. UDOT Specifications: 2017 Standard Specifications For Road and Bridge Construction

1.03 DEFINITIONS:

A. Cold Weather: Refer to ACI 306R. A period when for more than three successive days the average daily outdoor temperature drops below 40 degrees F. The average daily temperature is the average of the highest and lowest temperature during the period from midnight to midnight. When temperatures above 50 degrees F occur during more than half of any 24-hour duration, the period shall no longer be regarded as cold weather.

B. Hot Weather: Refer to ACI 305R. Any combination of the following conditions that tend to impair the quality of freshly mixed or hardened concrete by accelerating the rate of moisture loss and rate of cement hydration, or otherwise resulting in detrimental results.

1. High ambient temperature

2. High concrete temperature

3. Low relative humidity

4. Wind velocity

5. Solar radiation

1.04 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

1. Concrete: Aggregate, cement, and admixtures product data

2. Joint material product data

3. Compound product data

4. Concrete test results

1.05 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.06 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

B. Work shall conform to all requirements of ACI 330.1 published by the American Concrete Institute, Fannington Hills, Michigan, except as modified by these contract documents.

1.07 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

PART 2 - PRODUCTS

2.01 MATERIALS:

A. Aggregate Base: Minimum 12 inches thick, unless noted otherwise.

1. Aggregate: APWA Specifications, Grade 3/4

2.02 CONCRETE FORMWORK:

A. Forms: Section 03 10 00.

1. Forms shall be made of steel or wood or other material capable of supporting concrete and mechanical concrete placing equipment that is sufficiently rigid to maintain the specified tolerances.

2. Forms shall be clean and free of dirt, rust, and hardened concrete.

2.03 CONCRETE:

A. Concrete: APWA Specification Section 03 30 04, Class 4000, with 0.44 maximum water-cement ratio.

1. Cement: Portland cement, ASTM C150 Type V, with tricalcium aluminate content not to exceed 8 percent.

2. Strength: Minimum compressive strength of 4,000 psi at 28 days.

3. Aggregate: ASTM C33 physical properties; nominal maximum size, 1 inch.

4. Admixtures:

a. Air Entrainment: ASTM C260 to provide air content (at delivery) between 5.0 to 7.5 percent as measured by ASTM C138, ASTM C173, or ASTM C231.

b. Water Reducing: ASTM C494, Type D, slump 4-1/2 inches for non-vibrated placement.

B. Water: Clean, non-staining, and not detrimental to concrete per ASTM C11602.

C. Thickness: 6 inches minimum or as indicated.

2.04 CONCRETE REINFORCEMENT:

A. Reinforcing Steel: Section 03 21 00

1. Tie Bar: Grade 60 or higher deformed billet steel bars, epoxy coated.

2. Dowel Bar: Grade 60 or high billet steel, epoxy coated with plastic expansion cap on one (1) end.

3. Chair and Basket Assemblies: Plastic chairs. Epoxy coated Grade 60 billet steel bar basket assemblies.

4. Hook Bolts: Galvanized ASTM A307, Grade A steel, nuts and shaft internally and externally threaded.

2.05 CONCRETE FINISHES:

A. See Section 03 35 00 for additional requirements.

B. Float (non-steel) and heavy broom finish.

2.06 JOINTS:

A. Expansion Joint Filler: APWA Specifications, 32 13 73.

1. Expansion Joint Filler: F1 Sheet

2. Contraction Joint Filler (Backer Rod): Type 1 round, ASTM D5249

3. Contraction Joint Sealer: HAS1, HAS4, or CAS6

2.07 ACCESSORIES:

A. Curing Compound: Type II Class A or B, white pigmented liquid membrane forming compound, ASTM C1315.

1. Manufacturers:

a. BASF; MasterKure CC 1315WB

b. W.R. Meadows; 2200 – White Anti-Spall Compound:

1. Compound shall be composed of 50 percent boiled linseed oil and 50 percent commercial grade kerosene or mineral spirits, by volume. Commercially prepared linseed oil mixtures are acceptable provided they are non-emulsified mixtures which are specifically for protection from de-icing chemicals.

PART 3 - EXECUTION

3.01 EXAMINATION:

A. Do not place pavement on frozen subgrade.

3.02 PREPARATION:

A. Excavate and shape subgrade to line, grade, and cross-section.

B. Remove all soft subgrade material encountered while compacting and backfill with aggregate base.

C. Repeat fine grading and compaction of subgrade areas which have been subjected to vehicular construction traffic and equipment.

D. Moisten aggregate base immediately before placing concrete to minimize absorption of water from fresh concrete.

E. Provide concrete surfaces that are clean and dry - free of oil, dirt or foreign materials immediately before application of compounds or painting.

3.03 COMPACTION:

A. Refer to Section 31 23 00 for additional compaction requirements.

B. Moisture: Maintain moisture content for Subgrade and Aggregate Base that is 3 percent of optimum moisture to attain required compaction density.

C. Subgrade: Compact top 12 inches to 95 percent of maximum dry density, unless noted otherwise.

D. Aggregate Base: Compact to 95 percent of maximum dry density, unless noted otherwise.

3.04 FORMWORK:

A. Set, align, and brace forms so that the pavement will meet the tolerances specified.

B. Apply form release agent to inside face of forms before placing concrete greater than 5 inches thick.

C. The edge of previously placed concrete may be used as a form. Do not apply form release agent to previously placed concrete, unless prevention of bond between the new and the old concrete is desired.

3.05 PLACING CONCRETE:

A. Place concrete on uniform subgrade.

B. Consolidate and strike off to proper elevation.

C. Place concrete continuously to prevent formation of “cold joints”.

D. Where placing operations stop, install bulkhead to form straight joint.

E. Texture pavement surface with broom.

F. Follow recommendations in ACI 305R when concreting during hot weather.

G. Follow recommendations in ACI 306R when concreting during cold weather.

3.06 JOINTS:

A. Joint pavement with full depth expansion joints as indicated on the drawings. Provide evenly spaced contraction joints between expansion joints per the requirements below.

B. Joint Spacing: 20 feet, maximum

C. Make contraction joints by sawing, tooling or installing insert with no exceptions noted to depth of 2 inches.

D. Cut saw joints as soon as possible without raveling concrete edges.

E. Install full depth expansion joints using 1/2-inch thick joint material around castings and where pavement abuts structures and where indicated on the Drawings.

3.07 REPAIR/RESTORATION:

A. Repair damaged work by replacing with new pavement to the nearest construction isolation joint.

3.08 FINISHING:

A. Float: Use magnesium or aluminum hand floats or power floats with slip on float shoes after concrete has stiffened to point where 1/4-inch maximum indentation can be imparted by normal foot pressure. Do not use combination blades for floating.

B. Float finish shall result in uniform smooth granular texture.

C. After floating, check slab tolerances with 10-foot straightedge. Fill low spots with fresh concrete.

D. Do not sprinkle with dry cement or add water.

E. Broom Finish:

1. Heavy Broom Finish: Use steel wire or stiff coarse fiber broom while concrete is still soft enough to produce deep scouring.

2. Texture parallel to travel direction of pavement

3. Texture shall be reviewed by Engineer

3.09 TOLERANCES:

A. Construct pavement to comply with the following tolerances:

1. Elevation: 3/4 inch

2. Thickness: plus 3/8 inch, minus 1/4-inch

3. Surface: In any direction, the gap below a 10-foot unleveled straightedge resting on high spots shall not exceed 1/2-inch.

B. Joint reinforcement: Tie bars-alignment of tie bar end relative to line perpendicular to edge of pavement: 1/2-inch per foot of tie bars.

C. Dowels:

1. Lateral alignment and spacing: 1 inch

2. Vertical alignment: 1/4-inch

3. Alignment of dowel bar end relative to line perpendicular to edge of pavement: 1/4-inch per foot of dowel

D. Joint Spacing:

1. Contraction joint depth (slab thickness): plus 1/4-inch, minus 0 inch

2. Joint width: plus 1/8-inch, minus 0 inch

3.10 FIELD QUALITY CONTROL:

A. Refer to Section 31 23 00 for compaction and testing requirements.

B. Submit compaction test results to Engineer for review.

C. Concrete Testing: Section 03 30 00. Maintain records of placed concrete including: record date, location of pour, quantity, air temperature, and test samples taken. Submit test results to Engineer for acceptance.

D. Defective Concrete: As defined in Section 03 30 00.

3.11 PAINTING AND STRIPING:

A. Paint pavement markings and striping after concrete or asphalt has cured for at least 14 days.

B. Protect markings from traffic until completely dry to prevent tracking.

3.12 PROTECTION:

A. Protect concrete from damage and replace if damage occurs.

B. Protect pavement from traffic for a minimum of 1 week of ambient temperatures above 40 degrees F.

C. Do not open the pavement to vehicular traffic until the in-place compressive strength is at least 3000 psi or until the pavement is accepted by the Engineer for opening to traffic.

D. Anti-Spall Compound:

1. Apply compound no sooner than 28 days after placement of concrete.

2. Spray two coats, allowing for first coat to completely dry.

3. Minimum spray rates shall be: 40 square yards per gallon (first application) and 60 square yards per gallon (second application)

3.13 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

Page Intentionally Left Blank

SECTION 32 17 23

PAVEMENT MARKING

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide pavement marking as indicated and in compliance with Contract Documents.

1.02 REFERENCES:

A. Military and Government Specs & Standards (Naval Publications and Form Center (NPFC):

1. TT-P-1952F: Paint, Traffic and Airfield Marking, Waterborne

2. FS 595B: Colors Used in Government Procurement

B. American Standards for Testing of Materials (ASTM):

2. D1644: Standard Test Methods for Nonvolatile Content of Varnishes

3. D2805: Standard Test Method for Hiding Power of Paints by Reflectometry

4. D3723: Standard Test Method for Measuring Neutron Fluence and Average Energy from 3H(d,n) 4He Neutron Generators by Radioactivation Techniques

5. D3960: Standard Practice for Determining Volatile Organic Compound (VOC) Content of Paints and Related Coatings

6. D5381: Standard Guide for X-Ray Fluorescence (XRF) Spectroscopy of Pigments and Extenders

7. E1347: Standard Test Method for Color and Color-Difference Measurement by Tristimulus Colorimetry

1.03 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Test Results:

1. Provide test reports of material supplied.

1.04 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.05 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

1.06 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

B. Furnish paint in sealed containers that legibly indicate at time of use designated name, formula or specification number, batch number, color, date of manufacturer, manufacturer's name, formulation number, and directions.

PART 2 - PRODUCTS

2.01 PAINT:

A. FS TT-P-1952F, Type II.

B. Paint shall be homogeneous, easily stirred to smooth consistency, and show no hard settlement or other objectionable characteristics during storage period of 6 months.

C. Paint shall meet the requirements for Acrylic Water Based Paint as specified in Table 32 17 23-1 below.

Table 32 17 23-1

Property	White	Yellow	Blue	Red	Test
Pigment – Percent by weight, minimum	60 - 62	60 - 62	60 - 62	60 - 62	ASTM D3723
Total Solids – Percent by weight, minimum	77 +/-2	77 +/-2	77 +/-2	77 +/-2	ASTM D1644
Nonvolatile Vehicle – Percent by weight vehicle, minimum	42 +/-2	42 +/-2	42 +/-2	42 +/-2	ASTM D3723 ASTM D1644
Viscosity, KU at 77 degrees F	80-110	80-110	80-100	80-110	ASTM D562
Volatile Organic Content (VOC) – g/L, maximum	<100	<100	<100	<100	ASTM D3960
Color Definition	#37925	#33538	#35180	#31136	FS 595B
Directional Reflectance, minimum	85 percent	NA	NA	NA	ASTM E1347
Dry Opacity – minimum (5 mils wet)	0.92	0.92	0.92	0.92	ASTM D2805

D. Traffic Pickup Time: Paint may not smear or track 10 minutes after application using standard application equipment, at the mil thickness required, and with an ambient shaded temperature of at least 50 degrees F.

E. Additional Requirements

1. Free of lead, chromium, and other related heavy metals. Refer to ASTM D5381.

2. Refer to ASTM D5381 for tests used to verify paint samples meet ASTM requirements.

F. Manufacturers:

1. Allstates Coatings Co.

2. Swarco Colorado Paint Company II, LLC

3. SealMaster

PART 3 - EXECUTION

3.01 APPLICATION EQUIPMENT:

A. Machines, tools, and equipment used in performance of work shall be capable of applying stripe widths indicated, at paint coverage rate specified, and of even uniform thickness with clear-cut edges.

B. Paint Applicator:

1. Traffic Line Paint Applicator:

a. Self-propelled or mobile-drawn pneumatic spraying machine with suitable arrangements of atomizing nozzles and controls to obtain specified results.

b. Speed during application of not less than 5 mph.

c. Spray mechanism tanks with air-driven mechanical agitators.

d. Equip with quick-action valves conveniently located, and include necessary pressure regulator and gauges in full view and reach of operator.

e. Provide paint strainers in supply lines to ensure freedom from residue and foreign matter that may cause malfunction of spray guns.

2. Provide pneumatic spray guns for application of paint for letters, handicapped symbols, and hand application of paint in areas where mobile paint applicator cannot be used.

C. Provide stencils for handicapped symbols and letters.

D. Sandblasting Equipment:

1. Includes air compressor, hoses, and nozzles of size and capacity as required for cleaning surfaces to be painted.

2. Compressor shall be capable of furnishing not less than 150 cfm of air at pressure of not less than 90 psi at nozzle for each nozzle used.

3.02 PREPARATION:

A. Cure pavement surfaces for period of not less than 30 days before application of marking materials.

B. Clean surfaces to be marked before application of paint.

C. Remove dust, dirt, and other granular surface deposits by sweeping, blowing with compressed air, rinsing with water or combination of these methods as required.

D. Remove rubber deposits and other coatings adhering to pavement with scrapers, wire brushed, sandblasting, approved chemicals or mechanical abrasion.

3.03 APPLICATION:

A. Apply paint pneumatically.

B. Apply evenly to clean, dry surfaces of pavement at rate producing initial (wet) thickness of 15 mils, and only when air and pavement temperatures are above 50 degrees F and less than 90 degrees F. Do not apply when the relative humidity exceeds 85 percent or when the temperature falls below the dew point. Maintain paint temperature within these same limits.

C. Provide guidelines and templates as necessary to control paint application. Special precautions shall be taken in marking letters and handicapped symbols. Edges of markings shall be sharply outlined.

D. Maximum drying time requirements of paint will be enforced to prevent undue softening of bitumen and pickup, displacement or discoloration by tires of traffic. If there is deficiency in drying of markings, discontinue painting operations until cause of slow drying is determined and corrected.

E. Protect markings from traffic until dry to prevent tracking.

3.04 CLEANING:

A. At completion of work, remove rubbish, debris, equipment, and excess material from site. Clean adjoining surfaces soiled by and during this work.

3.05 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

Page Intentionally Left Blank

SECTION 32 31 13

CHAIN LINK FENCES AND GATES

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Section includes:

1. Chain link fence framework, fabric, and accessories.

2. Excavation for post bases.

3. Manual gates and related hardware.

4. Electric Gate Operators. All new electric gate operators shall be from a single manufacturer for all vehicular swing and slide gates on the project.

1.02 REFERENCES:

A. American Association of State Highway and Transportation Officials (AASHTO):

1. M181: Standard Specification for Chain-Link Fence.

B. ASTM International (ASTM):

14. F1184: Standard Specification for Industrial and Commercial Horizontal Slide Gates.

15. F1379: Standard Terminology Relating to Barbed Tape

16. F2200: Specification for Automated Vehicular Gate Construction

17. F2611: Standard Guide for the Design and Construction of Chain Link Security Fencing

18. F3000: Standard Specification for Polymer Privacy Insert Slats for Chain Link Fabric and Privacy Chain Link Fabric Manufactured Containing Pre-Installed Privacy Slats

C. Underwriters Laboratories (UL):

1. UL325: Automatic Operators: Door, Gate, Louver and Window

1.03 SUBMITTALS:

A. Submit the following in accordance with Section 01 33 00.

1. Submit Manufacturer's specifications, drawings, details and fence layout with appurtenances.

2. Submit two samples of fencing materials. Mark or tag each sample and submit 30 days prior to erection of fence.

3. Submit certified test reports with results of tests for fence finish.

4. Submit shop drawings, samples and certificates simultaneously as one complete package.

1.04 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.05 SPARE PARTS:

A. Comply with the requirements specified in Section 01 61 00.

B. Provide spare parts that are identical to and interchangeable with similar parts installed.

1. Gate Hinges (4)

2. Tension Turn buckles (5)

3. Post Caps (5)

4. Tension Band (4)

5. Brace Band (4)

6. Privacy Slats (provide a minimum to cover 10 linear feet of fence)

C. Provide a list of recommended spare parts for the first year of operation and for the first five years of operation, including a price list and location of the nearest facility from which all spare parts can be obtained.

1.06 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

1.07 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

PART 2 - PRODUCTS

2.01 SYSTEM DESCRIPTION:

A. Provide chain link fence in accordance with AASHTO M181; Fabric: Type I Class D fabric coating (ASTM A392 Class 2); Posts: Grade 1; Tension wire: Type I, Class 3 coating (ASTM A 824 Type II, Class 5).

B. Provide framework, fabric, accessories and gates in accordance with ASTM F567.

C. Fence heights as indicated with top rail, bottom tension wire, and three strands of barbed wire projecting outward at top.

D. Gates:

1. Industrial and Commercial:

a. Provide swing gates in accordance with ASTM F900.

b. Provide horizontal cantilever slide gates in accordance with ASTM F1184.

2.02 FENCING MANUFACTURERS:

A. Framework, posts, rails, pipe for gates:

1. Wheatland Tube Co.

2. Master Halco, Inc.

3. Southwestern Wire, Inc.

2.03 FENCE FABRIC:

A. Galvanized steel chain-link fabric conforming to ASTM A392, with Class 2 zinc coating (2.0 ounces of zinc per square foot of uncoated wire surface); Fabric woven in 2-inch mesh from No. 9 gage wire in a 6 feet height with twisted top and barbed selvages bottom.

2.04 BARBED WIRE AND SUPPORT ARMS:

A. Galvanized-steel barbed wire consisting of three strands of twisted No. 12-1/2 gage wires with 4-point barbs spaced 5 inches apart and conforming to ASTM A121, with Type Z, Class 3 zinc coating (minimum of 0.8 ounces of zinc coating over each square foot of uncoated wire surface for No. 12-1/2 gage wire).

B. Barbed Wire Arms: In compliance with F626, pressed steel galvanized after fabrication, minimum zinc coating of 1.2 ounces per square foot. Type I support arms projecting outward, from top of posts, at 45 degrees and capable of withstanding 250 pounds downward pull on outermost end of arm, without failure. Arms with provision for attachment of three strands of evenly spaced barbed wire and integral with post top weather caps with holes for passage of top rail at intermediate posts.

2.05 TENSION WIRE:

A. Metallic Coated Steel Marcelled Tension Wire: 7-gauge marcelled wire complying with ASTM A824, Type II zinc coated, ASMT A817 Class 5 – 2.0 ounces per square foot.

2.06 TIE WIRES AND HOG RINGS:

A. Tie Wire and Hog Rings: Galvanized minimum zinc coating 1.2 ounces per square foot, 6-gauge steel wire in compliance with ASMT F626.

2.07 LINE POSTS:

A. Schedule 40 standard weight pipe in accordance with ASTM F1083, 2.0 ounce per square foot hot dip galvanized zinc exterior and 2.0 ounce per square foot hot dip

galvanized zinc interior coating, minimum 2-3/8-inch outside diameter, intermediate strength grade (minimum yield strength 50,000 psi).

2.08 END, CORNER, AND PULL POSTS:

A. Schedule 40 standard weight pipe in accordance with ASTM F1083, 2.0 ounce per square foot hot dip galvanized zinc exterior and 2.0 ounce per square foot hot dip galvanized zinc interior coating, minimum 2-7/8-inch outside diameter, intermediate strength grade (minimum yield strength 50,000 psi).

2.09 SWING GATES:

A. Swing Gates: Galvanized steel pipe welded fabrication in compliance with ASTM F900. Gate frame members 1.90-inch OD, ASTM F1083 schedule 40 galvanized steel pipes. Frame members spaced no greater than 8 feet apart vertically and horizontally. Welded joints protected by applying zinc-rich paint in accordance with ASTM Practice A780. Positive locking gate latch, pressed steel galvanized after fabrication. Galvanized malleable iron or heavy gauge pressed steel post and frame hinges. Provide lockable drop bar and gate holdbacks with double gates. Match fabric to that of the fence system. Gateposts per ASTM F1083 schedule 40 galvanized steel pipe, minimum weight 3.65 pounds per foot for gates up to 4 feet wide, 5.79 pounds per foot for gates over 4 feet to 10 feet wide and 9.11 pounds per foot for gates over 10 feet to 18 feet wide. Gatepost diameter as indicated on the Drawings.

2.10 HORIZONTAL SLIDE GATES:

A. Cantilever Slide Gates: In compliance with ASTM F1184 Type II.

1. Class 1 – External Roller Design: Horizontal top and bottom steel pipe “track” members to be 2-3/8 inch OD. Vertical and internal members, 1,900-inch OD in compliance with ASTM F1083 schedule 40 galvanized steel pipes. Gate frame to be fabricated by welding, vertical and horizontal members installed no greater than 8 feet apart. Welded joints are to be protected by applying zinc-rich paint in accordance with ASTM Practice A780. Gates designed to open or close by applying an initial pull force no greater than 40 pounds. Match chain link fabric to that of the fence system. Positive locking pressed steel latch, galvanized after fabrication. Galvanized steel drop bars provided with double gates. Gateposts, 4-inch OD schedule 40 pipe per ASTM F1083. Provide safety protective guards for the top and bottom external rollers following ASTM F1184 guidelines.

B. Electrically operated horizontal slide gates must be manufactured and installed to comply with the safety requirements of ASTM F2200 and UL 325.

2.11 RAILINGS:

A. Schedule 40 standard weight pipe in accordance with ASTM F1083, 2.0 ounce per square foot hot dip galvanized zinc exterior and 2.0 ounce per square foot hot dip

galvanized zinc interior coating 1-5/8 inch outside diameter steel pipe with minimum weight of 2.27 lb/ft for top railing and railings for top middle and bottom braces between terminal posts and adjacent line posts.

2.12 TRUSS ROD:

A. In compliance with ASTM F626, 3/8 inch diameter steel rod, minimum zinc coating 1.2 ounces per square foot, capable of withstanding tension of 2,000 pounds, diagonal truss braces between terminal and adjacent line posts and for gate framework.

2.13 FITTINGS:

A. Heavy-duty malleable iron or pressed steel fittings of suitable size to produce strong construction.

2.14 STRETCHER BARS (TENSION BARS):

A. In compliance with ASTM F626. Galvanized steel one-piece full length of fabric height. Minimum zinc coating of 1.2 ounces per square foot. Flat bars with minimum cross section dimensions of 3/16-inch by 3/4 inch, secured with bar bands of minimum 11-gage sheet steel, spaced approximately 15 inches on centers and bolted with 3/8-inch diameter bolts, for attaching fabric to terminal posts.

2.15 ELECTRIC GATE OPERATOR:

A. Manufacturers:

1. Liftmaster SL595UL Elite Series

2. Linear OSCO GSLG-A Series

3. Doorking DKS 9200 Series

B. Contractor shall size the motor based on the width and weight of the gate to be operated. Gate operator shall be UL listed and meet all current safety requirements. Electric gate operator to consist of and/or meet the following minimum requirements:

1. Enclosed reversing, minimum 1 horsepower motor, 460 volts, 3-phase.

2. Heavy gauge steel frame for pad mounting.

3. All-weather hinged cover with provision for padlocking.

4. Adjustable safety friction clutch.

5. Adjustable limit switches, rotary type.

6. Magnetic solenoid locking brake.

7. Emergency disconnect for manual operation in case of power failure.

8. Magnetic reversing starter (size "1" contactor type) with overload and undervoltage protection.

9. Factory pre-wired electrical system.

10. Permanent lubricated heavy-duty bearings and heavy-duty roller chain.

C. Electric gate operator to be located as indicated. Operator to have parallel three-button illuminated control stations ("OPEN," "STOP," and "CLOSE").

D. Provide 24VDC power supply for access control panel, to derive power from unswitched electrical feed to gate operator. Provide fuses to protect both supply and load sides of the 24VDC power supply. Seal entries on both interior and exterior conduit between enclosures. A self-limiting transformer is an acceptable alternative to fusing where listed for the purpose. Size power supply for power requirement of access control panel provided.

E. Power Supply is to be in a UL 508 listed enclosure or integral to the UL/NRT listed gate actuator enclosure as a manufacturer provide feature.

F. Provide electrical conduit, switches, wiring, and connections specified under the applicable electrical sections of Division 26.

2.16 CONCRETE FOOTINGS:

A. Section 03 30 00, Class A concrete.

2.17 GROUT:

A. One-part Portland cement and three parts of clean, sharp, well-graded sand with minimum water for proper workability for posts set in solid rock.

2.18 ACCESSORIES:

A. Steel pipe dimensions and weights: ASTM A53, Schedule 40. Dimensions specified are nominal pipe sizes.

B. Dimensions and weight tolerances: Plus or minus 5 percent.

C. Zinc Coating: Minimum 2.0 ounces per square foot.

D. Provide posts with tops of same material, and designed to fit securely over post and carry top rail. Carry apron around outside of post at base of top fitting.

E. Ferrous metal fittings, posts, fence, gate framework, and accessories galvanized with heavy coating of 2.0 ounces/square foot pure zinc spelter per square foot or surface area

to be coated. Use hot-dip process. Thinner zinc coatings, electro-galvanizing, zinc paint or cold galvanizing compounds not used as substitute for hot-dipped galvanized finish not acceptable.

F. Fabricate and weld before hot-dip galvanizing. Weld conforming to American Welding Society standards.

G. Hot-dip galvanized gate frame, after welding, if bolted or riveted corner fittings not used.

H. Single and double leaf swing gates with center bolt, center stop, and automatic backstops.

I. Cantilever sliding (rolling type) gate complete with latch, stop, keeper, rollers, heavy duty roller track, and 3 strands of barbed wire installed vertically above fabric and electrically operated.

2.19 PRIVACY SLATS:

A. Privacy Slats: Slats to be manufactured from a combination of color pigments, quality high density virgin polyethylene and ultraviolet inhibitors, having a 25-year limited warranty against either color fading or breakage of slats and locking-channel used under normal climactic extremes experienced in Utah. Color shall be Forest Green. Slats shall be standard PDS self-locking type using horizontal bottom channel locking system. Privacy slats shall provide minimum 90% privacy and meet the requirements of ASTM F3000.

B. Manufacturers

1. Master Halco, Inc.

2. Pexco, LLC

3. SlatSource by Privacy Link

PART 3 - EXECUTION

3.01 EXAMINATION:

A. Examine conditions under which fence and gates are to be installed. Notify Engineer, in writing, of improper conditions of work.

B. Do not proceed with work until unsatisfactory conditions have been corrected.

C. Verify measurements at site.

D. Check location of underground work to make sure fence footings clear utilities and drainage work.

E. Do not install fence until final grading is complete and finish elevations are established.

F. Do not drive equipment on areas to be landscaped, except as accepted by Engineer. Areas not accessible from roads shall be protected with heavy wood planking. Remove barricades and protection at completion of project. Repair damaged landscape surfaces.

3.02 INSTALLATION:

A. Footings:

1. Vertical sides to minimize up-lift. Dispose of excavated material in accordance with Section 01 74 23.

2. Rod and compact concrete around posts. Slope top of footings above level of adjacent grade, and trowel finish.

3. Size:

a. 10 inches minimum diameter, plus outside dimension of post.

b. Set corner, end, pull, and gate posts 42 inches into concrete.

c. Set line posts set 36 inches into concrete.

d. Total depth of concrete 6 inches greater than required for post embedment.

4. Time of Set: 48 hours before rails are erected or before fabric is applied or stretched.

B. Framing:

1. Install line posts not more than 10 feet apart.

2. Install pull posts not more than 500 feet apart where a straight run of fence exceeds 500 feet and where fence line changes direction by more than 15 degrees but less than 30 degrees.

3. Install corner posts where the fence line changes direction by more than 30 degrees.

4. Set posts in concrete footings, plumb and true to line.

5. Brace and truss end, pull, corner, and gate posts to adjacent line posts. Provide brace to match top rail spaced midway between top rail and tension wire and extending to adjacent line posts. Provide brace to match top rail spaced midway

between top rail and tension wire and extending to adjacent line post. Truss diagonally with 5/16-inch diameter tension rod with turnbuckle.

6. Fasten top rail to end, pull, gate and corner posts. Pass top rail through fittings of line posts.

7. Provide expansion and contraction joints in top rail for each 100 linear feet of fence.

8. Fasten bottom tension wire to end, pull, gate, corner, and line posts.

9. Maximum area of unbraced fence shall not exceed 1,500 square feet.

10. Install fencing on top of concrete structures with suitable galvanized flange casings and galvanized anchor bolts as accepted by Engineer.

C. Fabric:

1. Place fabric on outside of posts and stretch to avoid bulging or buckling.

2. Fasten at line posts, top rail, and bottom tension wire with aluminum or zinc PVC coated ties. Space ties not more than 15 inches apart on line posts and not more than 24 inches apart on rail and tension wire.

3. Fasten at terminal posts at intervals not exceeding 15 inches using flat or beveled galvanized steel bands with 5/16-inch x 1-1/4 inch galvanized carriage bolts and nuts.

4. Make tie connections on interior side of fence.

5. Provide steel angle metal closures where finished ground surface is more than two inches below bottom tension wire. Bolt steel angle to fence posts, and install reinforcing rods and bracing members as accepted. Install rods of accepted length vertically. Where drainage ditches cross fence line, provide concrete ditch lining and steel reinforcing bar grill.

6. Install three strands of barbed wire on each extension arm of line fence and at top of each gate. Pull wires taut and fasten at each support.

7. Install barbed wire on extension arms as indicated. Pull each wire taut, and make entire assembly secure Attach wire to end, corner, pull, and gate posts with wire stretching bands.

8. Install gates plumb, level, and secure for full width of opening and hardware adjusted for smooth operation.

9. Electrical Ground where a power line carrying more than 600 volts passes over fence, install ground rod at nearest point directly below each point of crossing.

10. Privacy slats: Install and lock in privacy slats in the fabric in accordance with manufacturer’s instructions.

3.03 ELECTRIC GATE OPERATOR INSTALLATION:

A. The Electric Gate Operator shall be installed in accordance with the manufacturer's written instructions.

3.04 ACCESS CONTROL PANEL POWER SUPPLY

A. Field test voltage of power supply and assure power supply does not switch nor reverse polarity in normal operation before connecting to Access Control Panel.

B. Provide bonding and 10-foot x 3/4-inch (nominal) copper-clad ground rod at gate operator and use bare #4 copper (minimum) conductors to bond to:

1. Power supply load-side neutral.

2. Gate Operator Chassis.

3. Gate Operator Power Conduit's insulated ground wire.

3.05 REPAIR:

A. Remove and replace fencing which is improperly located or is not true to line, grade and plumb within tolerances as indicated.

3.06 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

Page Intentionally Left Blank

SECTION 32 32 16

PRECAST MODULAR BLOCK RETAINING WALLS

PART 1 - GENERAL

1.01 DESCRIPTION:

A. This Section includes furnishing all materials and labor required for the design and construction of a precast concrete modular block (PMB) retaining wall with or without geosynthetic reinforcement. Precast modular block retaining wall blocks under this section shall be cast utilizing a wet-cast concrete mix and exhibit a final handling weight in excess of 1,000 pounds per unit.

B. Scope of Work: The work shall consist of furnishing materials, labor, equipment and supervision for the construction of a precast modular block (PMB) retaining wall structure in accordance with the requirements of this section and in acceptable conformity with the lines, grades, design and dimensions shown in the project site plans.

1.03 DEFINITIONS:

A. Precast Modular Block (PMB) Unit: Concrete, modular facing block provided by an authorized manufacturer.

B. Geogrid: A geosynthetic material manufactured of high tensile materials specifically for the purpose of reinforcing and creating a structural soil mass.

C. Drainage Aggregate: Clean, crushed rock located within and immediately behind PMB units to facilitate drainage and avoid compaction in close proximity to PMB wall units.

D. Reinforced Soil: Soil zone extending from the Drainage aggregate zone to the back of the embedded geogrid.

E. Foundation Soil: Soil zone immediately beneath the retaining wall facing units, the wall leveling pad and the reinforced soil zone.

F. Retained Soil: Soil immediately behind retaining wall facing and drainage aggregate for modular gravity structures or behind the reinforced soil for wall that utilize geogrid.

G. Construction Drawings: Approved final plan for construction prepared and stamped by the wall design engineer licensed to practice in the state where the retaining wall is located.

1.04 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Product Data. At least 14 days prior to construction, the Contractor shall submit the retaining wall product submittal package to the Engineer for review and approval. The submittal package shall include technical specifications and product data from the manufacturer for the following:

1. Precast Modular Block System brochure, product data, and installation instructions.

2. Manufacturer's test reports certifying that the PMB units manufactured at their production facility meet the requirements of this specification and the requirements of the Construction Drawings.

C. Contractor shall submit two sets of the Construction Drawings for all retaining walls on the project.

1. The design shall be prepared by a Professional Engineer licensed to practice in the State of Utah.

2. The design shall be per NCMA Design Guidelines for Segmental Retaining Walls, or the AASHTO Standard Specifications for Highway Bridges, whichever is applicable as determined by the retaining wall design engineer.

3. Construction Drawings shall include:

a. The retaining wall layout and retaining wall heights.

b. Proper placement, lengths and types of geogrid reinforcement where necessary.

c. Typical wall sections.

d. Types, locations and properties of all drainage materials, appurtenances and special installation requirements not covered in this specification.

e. Retaining wall elevation views.

f. Any soils information or testing conducted in addition to that included within the project drawings and specifications.

g. Design assumptions.

4. If geogrid reinforcement is required in the final engineered construction drawings, submit manufacturer's product literature, product testing reports and a twelve inch or larger sample of each type to be used in wall construction.

5. Submit gradation reports for aggregates used for the wall leveling pad, unit / drainage fill and for select reinforced fill if required in the final engineered wall design.

6. All submittals must be provided and reviewed prior to the start of retaining wall construction.

7. Drainage Pipe, if required.

8. Geotextile

A. Installer Qualification Data. At least 14 days prior to construction, the Contractor shall submit the qualifications of the business entity responsible for installation of the retaining wall, the Retaining Wall Installation Contractor, per the requirements of this section.

1.05 ADMINISTRATIVE REQUIREMENTS:

A. Preconstruction Meeting. The General Contractor shall schedule a preconstruction meeting at the project site prior to commencement of retaining wall construction. Participation in the preconstruction meeting shall be required of the General Contractor, Retaining Wall Design Engineer, Retaining Wall Installation Contractor, Grading Contractor and Engineer. The General Contractor shall provide notification to all parties at least 10 calendar days prior to the meeting.

1. Preconstruction Meeting Agenda:

a. The Retaining Wall Design Engineer shall explain all aspects of the retaining wall construction drawings.

b. The Retaining Wall Design Engineer shall explain the required bearing capacity of soil below the retaining wall structure and the shear strength of in-situ soils assumed in the retaining wall design to the Engineer.

c. The Retaining Wall Design Engineer shall explain the required shear strength of fill soil in the reinforced, retained and foundation zones of the retaining wall to the Engineer.

d. The Retaining Wall Design Engineer shall explain any measures required for coordination of the installation of utilities or other obstructions in the reinforced or retained fill zones of the retaining wall.

e. The Retaining Wall Installation Contractor shall explain all excavation needs, site access and material staging area requirements to the General Contractor and Grading Contractor.

1.06 CONSTRUCTION SHOP DRAWINGS PREPARATION

A. The Retaining Wall Design Engineer shall coordinate the retaining wall construction shop drawing preparation with the project Civil Engineer and project Geotechnical Engineer. The General Contractor shall furnish the Retaining Wall Design Engineer the following project information required to prepare the construction shop drawings. This information shall include, but is not limited to, the following:

1. Current versions of the site, grading, drainage, utility, erosion control, landscape, and irrigation plans;

2. electronic CAD file of the civil site plans listed in (1);

3. report of geotechnical investigation and all addenda and supplemental reports;

4. recommendations of the project Geotechnical Engineer regarding effective stress shear strength and total stress shear strength (when applicable) parameters for in-situ soils in the vicinity of the proposed retaining wall(s) and for any fill soil that may potentially be used as backfill in retained and/or foundation zones of the retaining wall.

B. The Retaining Wall Design Engineer shall provide the Engineer with a certificate of professional liability insurance verifying the minimum coverage limits of $1 million per claim and $1 million aggregate.

C. Design of the precast modular block retaining wall shall satisfy the requirements of this section. Where local design or building code requirements exceed these specifications, the local requirements shall also be satisfied.

D. The Retaining Wall Design Engineer shall note any exceptions to the requirements of this section by listing them at the bottom right corner of the first page of the construction shop drawings.

E. Approval or rejection of the exceptions taken by the Retaining Wall Engineer will be made in writing as directed by the Engineer.

F. The precast modular block design, except as noted herein, shall be based upon AASHTO Load and Resistance Factor Design (LRFD) methodology.

G. In the event that a conflict is discovered between these specifications and a reasonable interpretation of the design specifications and methods referenced in paragraph F above, these specifications shall prevail.

H. Soil Shear Parameters. The Retaining Wall Design Engineer shall prepare the construction shop drawings based upon soil shear strength parameters from the available project data and the recommendations of the project Geotechnical Engineer. If insufficient data exists to develop the retaining wall design, the Retaining Wall Design Engineer shall communicate the specific deficiency of the project information or data to the Owner in writing.

I. Allowable bearing pressure requirements for each retaining wall shall be clearly shown on the construction drawings.

J. Global Stability. Overall (global) stability shall be evaluated in accordance with the principals of limit equilibrium analysis as set forth in FHWA-NHI-10-024 Volume I and FHWA-NHI-10-025 Volume II GEC 11 Design of Mechanically Stabilized Earth Walls and Reinforced Soil Slopes. The minimum factors of safety shall be as follows:

1. Normal Service (Static): 1.4

2. Seismic: 1.1

3. Rapid Drawdown (if applicable): 1.2

K. Seismic Stability. Seismic loading shall be evaluated in accordance with AASHTO Load and Resistance Factor Design (LRFD).

1.07 PERFORMANCE REQUIREMENTS:

A. Basis of Design: Design of segmental retaining walls is based on products indicated. If comparable products of other manufacturers are proposed, provide engineering design for proposed products, including comprehensive engineering analysis by a qualified and registered professional engineer in State of Utah, using performance requirements and design criteria indicated.

B. Delegated Design: Design segmental retaining walls, including comprehensive engineering analysis by a qualified and registered professional engineer in State of Utah, using performance requirements and design criteria indicated.

C. Structural Performance: Engineering design shall be based on the following loads and be according to the current version of AASHTO LRFD Standard Specification for Highway Bridges.

1. Gravity loads due to soil pressures resulting from grades and sloped backfill indicated.

2. Superimposed loads (surcharge) indicated on Drawings.

D. Seismic Performance: Engineering design shall be based on the following loads and factors and be according to the current version of AASHTO LRFD Standard Specification for Highway Bridges.

1. Gravity loads due to soil pressures resulting from grades indicated.

2. Superimposed loads (surcharge) indicated on Drawings.

3. Horizontal Peak Ground Acceleration (A) for Project: 0.62g.

1.08 PRECONSTRUCTION TESTING:

A. Preconstruction Testing Service: Engage a qualified testing agency to perform the following preconstruction testing:

1. Test soil reinforcement and backfill materials for pullout resistance according to ASTM D6706.

2. Test soil reinforcement and backfill materials for coefficient of friction according to ASTM D5321.

1.09 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.10 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

B. Prepare design, including calculations and drawings, under the direction of a Professional Engineer registered in State of Utah and having the following qualifications:

1. Not less than ten (10) years' experience in the design of precast modular block retaining wall systems.

2. Completed not less than five (5) successful segmental retaining wall systems for projects of equal type.

C. Testing Agency Qualifications: Qualified according to ASTM E329 for testing indicated.

D. Mockups: Build mockups to verify selections made under sample submittals and to demonstrate aesthetic effects.

1. Build mockup of segmental retaining wall approximately 72 inches long by not less than 36 inches high above finished grade at front of wall.

a. Include typical soil reinforcement.

b. Include typical base and cap or finished top construction.

c. Include backfill to typical finished grades at both sides of wall.

d. Include typical end construction at one end of mockup.

e. Include 36-inch return at 1 end of mockup, with typical corner construction.

2. Approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion.

E. Preinstallation Conference: Conduct conference at Project site.

1. Review methods and procedures related to segmental retaining walls including, but not limited to, the following:

a. Structural load limitations.

b. Construction schedule. Verify availability of materials, Installer's personnel, equipment, and facilities needed to make progress and avoid delays.

F. Retaining Wall Installation Contractor Qualifications. In order to demonstrate basic competence in the construction of precast modular block walls, the Retaining Wall Installation Contractor shall document compliance with the following:

1. Experience.

a. Construction experience with a minimum of 30,000 square feet of the proposed precast modular block retaining wall system.

b. Construction of at least ten (10) precast modular block (large block) retaining wall structures within the past three (3) years.

c. Construction of at least 50,000 square feet of precast modular block (large block) retaining walls within the past three (3) years.

2. Retaining Wall Installation Contractor experience documentation for each qualifying project shall include:

a. Name and location

b. Date (month and year) of construction completion

c. Contact information of Owner or General Contractor

d. Type (trade name) of precast modular block system built

e. Maximum height of the wall constructed

f. Face area of the wall

3. In lieu of the requirements set forth in items 1 and 2 above, the Retaining Wall Installation Contractor must be a certified Precast Modular Block Retaining Wall Installation Contractor as demonstrated by satisfactory completion of a certified precast modular block retaining wall installation training program administered by the precast modular block manufacturer.

G. Retaining Wall Design Engineer Qualifications and Statement of Experience. The Retaining Wall Design Engineer shall submit a written statement affirming that he or she has the following minimum qualifications and experience.

1. The Retaining Wall Design Engineer shall be licensed to practice in the State of Utah.

2. The Retaining Wall Design Engineer shall be independently capable of performing all internal and external stability analyses, including those for seismic loading, compound stability, rapid draw-down and deep-seated, global modes of failure.

3. The Retaining Wall Design Engineer shall affirm in writing that he or she has personally supervised the design of the retaining walls for the project, that the design considers all the requirements listed above and that he or she accepts responsibility as the design engineer of record for the retaining walls constructed on the project.

4. The Retaining Wall Design Engineer shall affirm in writing that he or she has personally designed in excess of 100,000 face square feet of modular block earth retaining walls within the previous three (3) years.

5. In lieu of these specific requirements, the engineer may submit alternate documentation demonstrating competency in Precast Modular Block retaining wall design.

H. The Owner reserves the right to reject the design services of any engineer or engineering firm who, in the sole opinion of the Owner, does not possess the requisite experience or qualifications.

1.11 QUALITY CONTROL:

A. Comply with the requirements specified in Section 01 45 00.

B. The Engineer shall review all submittals for materials, design, Retaining Wall Design Engineer qualifications and the Retaining Wall Installation Contractor qualifications.

C. The General Contractor shall retain the services of an Inspection Engineer who is experienced with the construction of precast modular block retaining wall structures to perform inspection and testing. The cost of inspection shall be the responsibility of the General Contractor. Inspection shall be continuous throughout the construction of the retaining walls.

D. The Inspection Engineer shall perform the following duties:

1. Inspect the construction of the precast modular block structure for conformance with construction shop drawings and the requirements of this specification.

2. Verify that soil or aggregate fill placed and compacted in the reinforced, retained and foundation zones of the retaining wall conforms with requirements of this section and exhibits the shear strength parameters specified by the Retaining Wall Design Engineer.

3. Verify that the shear strength of the in-situ soil assumed by the Retaining Wall Design Engineer is appropriate.

4. Inspect and document soil compaction in accordance with these specifications:

    a. Required dry unit weight

    b. Actual dry unit weight

    c. Allowable moisture content

    d. Actual moisture content

    e. Pass/fail assessment

    f. Test location – wall station number

    g. Test elevation

    h. Distance of test location behind the wall face

5. Verify that all excavated slopes in the vicinity of the retaining wall are bench-cut as directed by the project Geotechnical Engineer.

6. Notify the Retaining Wall Installation Contractor of any deficiencies in the retaining wall construction and provide the Retaining Wall Installation Contractor a reasonable opportunity to correct the deficiency.

7. Notify the General Contractor, Owner and Retaining Wall Design Engineer of any construction deficiencies that have not been corrected timely.

8. Document all inspection results.

9. Test compacted density and moisture content of the retained backfill with the following frequency:

   a. At least once every 1,000 square feet (in plan) per 9-inch vertical lift, and

   b. At least once per every 18 inches of vertical wall construction.

E. The General Contractor's engagement of the Inspection Engineer does not relieve the Retaining Wall Installation Contractor of responsibility to construct the proposed retaining wall in accordance with the approved construction shop drawings and these specifications.

F. The Retaining Wall Installation Contractor shall inspect the on-site grades and excavations prior to construction and notify the Retaining Wall Design Engineer and General Contractor if on-site conditions differ from the elevations and grading conditions depicted in the retaining wall construction shop drawings.

1.12 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

B. The Retaining Wall Installation Contractor shall inspect the materials upon delivery to ensure that the proper type, grade and color of materials have been delivered.

C. The Retaining Wall Installation Contractor shall store and handle all materials in accordance with the manufacturer's recommendations as specified herein and in a manner that prevents deterioration or damage due to moisture, temperature changes, contaminants, corrosion, breaking, chipping, UV exposure or other causes. Damaged materials shall not be incorporated into the work.

D. Retaining wall units shall be stored in a location and manner that protects against excessive weathering and damage.

E. Contractor shall prevent PMB units from excessive soiling and coming in contact with substances which may stain or adhere to the finished visual surfaces of the unit.

F. Store geosynthetics in manufacturer's original packaging with labels intact and in accordance with ASTM D4873. Store and handle geosynthetics to prevent deterioration or damage due to sunlight, chemicals, flames, temperatures above 160 degrees F or below 32 degrees F, and other conditions that might damage them. Verify identification of geosynthetics before using and examine them for defects as material is placed.

G. Precast Modular Blocks

1. Precast modular blocks shall be stored in an area with positive drainage away from the blocks. Be careful to protect the block from mud and excessive chipping and breakage. Precast modular blocks shall not be stacked more than three (3) units high in the storage area.

H. Drainage Aggregate and Backfill Stockpiles

1. Drainage aggregate or backfill material shall not be piled over unstable slopes or areas of the project site with buried utilities.

2. Drainage aggregate and/or reinforced fill material shall not be staged where it may become mixed with or contaminated by poor draining fine-grained soils such as clay or silt.

PART 2 - PRODUCTS

2.02 PRECAST MODULAR BLOCK (PMB) RETAINING WALL UNITS:

A. Concrete Units: All units shall be wet-cast precast modular retaining wall units conforming to ASTM C1776.

B. All units for the project shall be obtained from the same manufacturer. The manufacturer shall be licensed and authorized to produce the retaining wall units by the precast modular block system patent holder/licensor and shall document compliance with the published quality control standards of the proprietary precast modular block system licensor for the previous three (3) years or the total time the manufacturer has been licensed, whichever is less.

C. Concrete used in the production of the precast modular block units shall be first-purpose, fresh concrete. It shall not consist of returned, reconstituted, surplus or waste concrete. It shall be an original production mix meeting the requirements of ASTM C94 and exhibit the properties as shown in the following table:

Table 32 32 16-1
Concrete Mix Properties

Freeze Thaw Exposure Class[1]	Minimum 28-Day Compressive Strength[2]	Maximum Water Cement Ratio	Nominal Maximum Aggregate Size	Aggregate Class Designation[3]	Air Content[4]
Moderate	4,000 psi (27.6 MPa)	0.45	1 inch (25 mm)	3M	4.5% +/- 1.5%
Severe	4,000 psi (27.6 MPa)	0.45	1 inch (25 mm)	3S	6.0% +/- 1.5%
Very Severe	4,500 psi (30.0 MPa)	0.40	1 inch (25 mm)	4S	6.0% +/- 1.5%
Maximum Water-Soluble Chloride Ion (Cl^-) Content in Concrete, Percent by Weight of Cement[5,6]					0.15
Maximum Chloride as Cl^- Concentration in Mixing Water, Parts Per Million					1000
Maximum Percentage of Total Cementitious Materials By Weight [7,9] (Very Severe Exposure Class Only):					
Fly Ash or Other Pozzolans Conforming to ASTM C618					25
Slag Conforming to ASTM C989					50
Silica Fume Conforming to ASTM C1240					10
Total of Fly Ash or Other Pozzolans, Slag, and Silica Fume[8]					50
Total of Fly Ash or Other Pozzolans and Silica Fume[8]					35
Alkali-Aggregate Reactivity Mitigation per ACI 201					
Slump (Conventional Concrete) per ASTM C143[10]				5 inches +/- 1½ inches (125 mm +/- 40 mm)	
Slump Flow (Self-Consolidating Concrete) per ASTM C1611				18 inches – 32 inches (450 mm – 800 mm)	

NOTES:

(1) Exposure class is as described in ACI 318. "Moderate" describes concrete that is exposed to freezing and thawing cycles and occasional exposure to moisture. "Severe" describes concrete that is exposed to freezing and thawing cycles and in continuous contact with moisture. "Very Severe" describes concrete that is exposed to freezing and thawing cycles and in continuous contact with moisture and exposed to deicing chemicals. Exposure class should be specified by owner/purchaser prior to order placement.
(2) Test method ASTM C39.
(3) Defined in ASTM C33 Table 3 *Limits for Deleterious Substances and Physical Property Requirements of Coarse Aggregates for Concrete*.
(4) Test method ASTM C231.
(5) Test method ASTM C1218 at age between 28 and 42 days.
(6) Where used in high sulfate environments or where alkali-silica reactivity is an issue, water soluble chloride shall be limited to no more than trace amounts (from impurities in concrete-making components, not intended constituents.)
(7) The total cementitious material also includes ASTM C150, C595, C845, C1157 cement. The maximum percentages shall include:
- (a) Fly ash or other pozzolans in type IP, blended cement, ASTM C595, or ASTM C1157.
- (b) Slag used in the manufacture of an IS blended cement, ASTM C595, or ASTM C1157.
- (c) Silica fume, ASTM C1240, present in a blended cement.

(8) Fly ash or other pozzolans and silica fume shall constitute no more than 25 and 10 percent, respectively, of the total weight of the cementitious materials.
(9) Prescriptive limits shown may be waived for concrete mixes that demonstrate excellent freeze/thaw durability in a detailed and current testing program.
(10) Slump may be increased by a high-range water-reducing admixture.

D. Each concrete block shall be cast in a single continuous pour without cold joints.

E. Depth of units should be as per the Construction Drawings and shall range from 24 inches to 84-inches.

F. Individual block units shall have a nominal height of between 16 to 18 inches.

G. Exterior dimensions of the face shall be 46-inch to 48-inch for full units.

H. Units shall maintain tolerances of +/- 3/16-inch of height and +/- 1/2-inch of width.

I. Special shape units should be obtained and used where indicated on the final engineered construction drawings.

J. PMB unit face texture shall be ReCon Limestone, ReCon Granite, RediRock Limestone, or RediRock Kingston.

1. Manufacturers:

a. Redi-Rock Retaining Wall Systems

b. ReCon Wall Systems, Inc.

2.03 GEOGRID REINFORCEMENT:

A. Geosynthetic reinforcement shall be high tensile geogrid or geotextile manufactured specifically for soil reinforcement applications.

1. Construction Drawings shall indicate the type, strength, location and lengths of reinforcement used.

2. The geosynthetic manufacturer shall provide all relevant testing to the wall design engineer for incorporation in the wall design and shall be included in the submittal for the Construction Drawings.

3. No substitutions of geosynthetic shall be allowed that was not evaluated in the Construction Drawings.

B. Constructability Requirements. Geogrid design embedment length shall be measured from the back of the precast modular block facing unit and shall be consistent for the entire height of a given retaining wall section.

C. Geogrid shall be positively connected to every precast modular block unit. Design coverage ratio, Rc, as calculated in accordance with AASHTO LRFD Bridge Design Specifications Figure 11.10.6.4.1-2 shall not exceed 0.50.

D. Preapproved Geogrid Reinforcement Products.

1. Miragrid XT Geogrids as manufactured by TenCate Geosynthetics.

2.04 GEOTEXTILE:

A. Nonwoven geotextile fabric shall be placed as indicated on the retaining wall construction shop drawings. Additionally, the nonwoven geotextile fabric shall be placed in the v-shaped joint between adjacent block units on the same course. The nonwoven geotextile fabric shall meet the requirements Class 3 construction survivability in accordance with AASHTO M 288.

B. Preapproved Nonwoven Geotextile Products:

1. Mirafi 140N

2. Propex Geotex 451

3. Skaps GT-142

4. Thrace-Linq 140EX

5. Carthage Mills FX-40HS

6. Stratatex ST 142

2.05 DRAINAGE AGGREGATE AND WALL INFILL:

A. Drainage aggregate (and wall infill for retaining walls designed as modular gravity structures) shall be a durable crushed stone conforming to No. 57 size per ASTM C33 with the following particle-size distribution requirements per ASTM D422:

U.S. Standard Sieve Size	Passing
1 – 1-1/2 inches	100
1 inch	95-100
1/2 inch	25-60
No. 4	0-10
No. 8	0-2

2.06 REINFORCED FILL:

A. Material used as reinforced backfill material in the reinforced zone (if applicable) shall be a granular fill material meeting the requirements of USCS soil type GW, GP, SW or SP per ASTM D2487 or alternatively by AASHTO Group Classification A-1-a or A-3 per AASHTO M 145. The backfill shall exhibit a minimum effective internal angle of friction, ϕ = 34 degrees at a maximum 2 percent shear strain and meet the following particle-size distribution requirements per ASTM D422.

U.S. Standard Sieve Size	Passing
3/4 inch	100
No. 4	0-100
No. 40	0-60
No. 200	0-15

B. The reinforced backfill material shall be free of sod, peat, roots or other organic or deleterious matter including, but not limited to, ice, snow or frozen soils. Materials passing the No. 40 sieve shall have a liquid limit less than 25 and plasticity index less than 6 per ASTM D4318. Organic content in the backfill material shall be less than 1 percent per AASHTO T-267 and the pH of the backfill material shall be between 5 and 8.

C. Soundness. The reinforced backfill material shall exhibit a magnesium sulfate soundness loss of less than 30 percent after four (4) cycles, or sodium sulfate soundness loss of less than 15 percent after five (5) cycles as measured in accordance with AASHTO T-104.

D. Reinforced backfill shall not be comprised of crushed or recycled concrete, recycled asphalt, bottom ash, shale or any other material that may degrade, creep or experience a loss in shear strength or a change in pH over time.

2.07 LEVELING PAD:

A. The precast modular block units shall be placed on a leveling pad constructed from crushed stone or unreinforced concrete. The leveling pad shall be constructed to the dimensions and limits shown on the retaining wall design drawings prepared by the Retaining Wall Design Engineer.

B. Crushed stone used for construction of a granular leveling pad shall meet the requirements of the drainage aggregate and wall infill in Paragraph 2.04 or a preapproved alternate material.

C. Concrete used for construction of an unreinforced concrete leveling pad shall satisfy the criteria for AASHTO Class B. The concrete should be cured a minimum of 12 hours prior to placement of the precast modular block wall retaining units and exhibit a minimum 28-day compressive strength of 2,500 psi.

2.08 DRAINAGE:

A. Drainage Pipe:

1. Drainage collection pipe shall be a 4 inch diameter, 3-hole perforated, HDPE pipe with a minimum pipe stiffness of 22 psi per ASTM D2412.

2. The drainage pipe shall be manufactured in accordance with ASTM D1248 for HDPE pipe and fittings.

B. Preapproved Drainage Pipe Products:

1. ADS 3000 Triple Wall pipe as manufactured by Advanced Drainage Systems.

2.09 UNIT ADHESIVES:

A. Adhesive shall be a premium, construction grade suitable for concrete and exterior applications.

2.10 FINISHES:

A. Retaining wall color shall be left in natural (as-cast) concrete color.

PART 3 - EXECUTION

3.01 GENERAL:

A. All work shall be performed in accordance with OSHA safety standards, state and local building codes and manufacturer’s requirements.

B. The General Contractor is responsible for the location and protection of all existing underground utilities. Any new utilities proposed for installation in the vicinity of the retaining wall, shall be installed concurrent with retaining wall construction. The General Contractor shall coordinate the work of subcontractors affected by this requirement.

C. New utilities installed below the retaining wall shall be backfilled and compacted to a minimum of 98% maximum dry density per ASTM D698 standard proctor.

D. The General Contractor is responsible to ensure that safe excavations and embankments are maintained throughout the course of the project.

E. All work shall be inspected by the Inspection Engineer as directed by the Owner.

F. General: Place units according to NCMA's "Segmental Retaining Wall Installation Guide" and segmental retaining wall unit manufacturer's written instructions.

3.02 EXAMINATION:

A. Examine areas and conditions, with Installer present, for compliance with requirements for excavation tolerances, condition of subgrades, and other conditions affecting short-term and long-term performance of segmental retaining walls.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.03 PREPARATION:

A. Fill Soil:

1. The Inspection Engineer shall verify that reinforced backfill placed in the reinforced soil zone satisfies the criteria of this section.

2. The Inspection Engineer shall verify that any fill soil installed in the foundation and retained soil zones of the retaining wall satisfies the specification of the Retaining Wall Design Engineer as shown on the Contract Drawings.

B. Excavation:

1. The Grading Contractor shall excavate to the lines and grades required for construction of the precast modular block retaining wall as shown on the construction drawings. The Grading Contractor shall minimize over-excavation. Excavation support, if required, shall be the responsibility of the Grading Contractor.

2. Over-excavated soil shall be replaced with compacted fill in conformance with the specifications of the Retaining Wall Design Engineer.

3. Embankment excavations shall be bench cut as directed by the project Geotechnical Engineer and inspected by the Inspection Engineer for compliance.

C. Foundation Preparation:

1. Prior to construction of the precast modular block retaining wall, the leveling pad area and undercut zone (if applicable) shall be cleared and grubbed. All topsoil, brush, frozen soil and organic material shall be removed. Additional foundation soils found to be unsatisfactory beyond the specified undercut limits shall be undercut and replaced with approved fill as directed by the project Geotechnical Engineer. The Inspection Engineer shall ensure that the undercut limits are consistent with the requirements of the project Geotechnical Engineer and that all soil fill material is properly compacted according project specifications. The Inspection Engineer shall document the volume of undercut and replacement.

2. Following excavation for the leveling pad and undercut zone (if applicable), the Inspection Engineer shall evaluate the in-situ soil in the foundation and retained soil zones.

a. The Inspection Engineer shall verify that the shear strength of the in-situ soil assumed by the Retaining Wall Design Engineer is appropriate. The Inspection Engineer shall immediately stop work and notify the Owner if the in-situ shear strength is found to be inconsistent with the retaining wall design assumptions.

b. The Inspection Engineer shall verify that the foundation soil exhibits sufficient ultimate bearing capacity to satisfy the requirements indicated on the retaining wall construction shop drawings.

D. Leveling Pad:

1. The leveling pad shall be constructed to provide a level, hard surface on which to place the first course of precast modular block units. The leveling pad shall be placed in the dimensions shown on the retaining wall construction drawings and extend to the limits indicated.

2. Crushed Stone Leveling Pad. Crushed stone shall be placed in uniform maximum lifts of 6-inches. The crushed stone shall be compacted by a minimum of 3 passes of a vibratory compactor capable of exerting 2,000 pounds of centrifugal force and to the satisfaction of the Inspection Engineer.

3. Unreinforced Concrete Leveling Pad. The concrete shall be placed in the same dimensions as those required for the crushed stone leveling pad. The Retaining Wall Installation Contractor shall erect proper forms as required to ensure the accurate placement of the concrete leveling pad according to the retaining wall construction drawings.

3.04 PRECAST MODULAR BLOCK WALL SYSTEM INSTALLATION:

A. The precast modular block structure shall be constructed in accordance with the construction drawings, these specifications and the recommendations of the retaining wall system component manufacturers. Where conflicts exist between the manufacturer's recommendations and these specifications, these specifications shall prevail.

B. Drainage components. Pipe, geotextile and drainage aggregate shall be installed as shown on the construction shop drawings.

C. Precast Modular Block Installation:

1. The first course of block units shall be placed with the front face edges tightly abutted together on the prepared leveling pad at the locations and elevations shown on the construction drawings. The Retaining Wall Installation Contractor shall take special care to ensure that the bottom course of block units are in full contact with the leveling pad, are set level and true and are properly aligned according to the locations shown on the construction drawings.

2. Backfill shall be placed in front of the bottom course of blocks prior to placement of subsequent block courses. Nonwoven geotextile fabric shall be placed in the V-shaped joints between adjacent blocks. Drainage aggregate shall be placed in the V-shaped joints between adjacent blocks to a minimum distance of 12 inches behind the block unit.

3. Drainage aggregate shall be placed in 9 inch maximum lifts and compacted by a minimum of three (3) passes of a vibratory plate compactor capable exerting a minimum of 2,000 pounds of centrifugal force.

4. Unit core fill shall be placed in the precast modular block unit vertical core slot. The core fill shall completely fill the slot to the level of the top of the block unit. The top of the block unit shall be broom-cleaned prior to placement of subsequent block courses. No additional courses of precast modular blocks may be stacked before the unit core fill is installed in the blocks on the course below.

5. Base course blocks for gravity wall designs (without geosynthetic soil reinforcement) may be furnished without vertical core slots. If so, disregard item 4 above, for the base course blocks in this application.

6. Nonwoven geotextile fabric shall be placed between the drainage aggregate and the retained soil (gravity wall design) or between the drainage aggregate and the reinforced fill (reinforced wall design) as required on the retaining wall construction drawings.

7. Subsequent courses of block units shall be installed with a running bond (half block horizontal course-to-course offset). With the exception of 90 degree corner units, the shear channel of the upper block shall be fully engaged with the shear knobs of the block course below. The upper block course shall be pushed forward to fully engage the interface shear key between the blocks and to ensure consistent face batter and wall alignment. Geogrid, drainage aggregate, unit core fill, geotextile and properly compacted backfill shall be complete and in-place for each course of block units before the next course of blocks is stacked.

8. The elevation of retained soil fill shall not be less than 1 block course below the elevation of the reinforced backfill throughout the construction of the retaining wall.

9. If included as part of the precast modular block wall design, cap units shall be secured with an adhesive in accordance with the precast modular block manufacturer's recommendation.

D. Geogrid Reinforcement Installation (if required):

1. Geogrid reinforcement shall be installed at the locations and elevations shown on the construction drawings on level fill compacted to the requirements of this specification.

2. Continuous 12 inches wide strips of geogrid reinforcement shall be passed completely through the vertical core slot of the precast modular block unit and extended to the embedment length shown on the construction plans. The strips shall be staked or anchored as necessary to maintain a taut condition.

3. Reinforcement length (L) of the geogrid reinforcement is measured from the back of the precast modular block unit. The cut length (Lc) is two times the reinforcement length plus additional length through the block facing unit. The cut length is calculated as follows:

   Lc = 2*L + 3 ft (2*L + 0.9 m) (28" (710 mm) block unit)

   Lc = 2*L + 5 ft (2*L + 1.5 m) (41" (1030 mm) block unit)

4. The geogrid strip shall be continuous throughout its entire length and may not be spliced. The geogrid shall be furnished in nominal, prefabricated roll widths of 12 inches, plus or minus 1/2 inch. No field modification of the geogrid roll width shall be permitted.

5. Neither rubber tire nor track vehicles may operate directly on the geogrid. Construction vehicle traffic in the reinforced zone shall be limited to speeds of less than 5 mph once a minimum of 9 inches of compacted fill has been placed over the geogrid reinforcement. Sudden braking and turning of construction vehicles in the reinforced zone shall be avoided.

E. Construction Tolerance. Allowable construction tolerance of the retaining wall shall be as follows:

1. Deviation from the design batter and horizontal alignment, when measured along a 10-feet straight wall section, shall not exceed 3/4 inches.

2. Deviation from the overall design batter shall not exceed 1/2 inch per 10-feet of wall height.

3. The maximum allowable offset (horizontal bulge) of the face in any precast modular block joint shall be 1/2 inch.

4. The base of the precast modular block wall excavation shall be within 2 inches of the staked elevations, unless otherwise approved by the Inspection Engineer.

5. Differential vertical settlement of the face shall not exceed 1-foot along any 200-feet of wall length.

6. The maximum allowable vertical displacement of the face in any precast modular block joint shall be 1/2 inch.

7. The wall face shall be placed within 2 inches of the horizontal location staked.

3.05 WALL INFILL AND REINFORCED BACKFILL PLACEMENT:

A. Backfill material placed immediately behind the drainage aggregate shall be compacted as follows:

1. 98 percent of maximum dry density at plus or minus 2 percent optimum moisture content per ASTM D698 standard proctor or 85 percent relative density per ASTM D4254.

B. Compactive effort within 3-feet of the back of the precast modular blocks should be accomplished with walk-behind compactors. Compaction in this zone shall be within 95 percent of maximum dry density as measured in accordance with ASTM D698 standard proctor or 80 percent relative density per ASTM D 4254. Heavy equipment should not be operated within 3-feet of the back of the precast modular blocks.

C. Backfill material shall be installed in lifts that do not exceed a compacted thickness of 9-inches.

D. At the end of each work day, the Retaining Wall Installation Contractor shall grade the surface of the last lift of the granular wall infill to a 3 percent, plus or minus 1 percent slope away from the precast modular block wall face and compact it.

E. The General Contractor shall direct the Grading Contractor to protect the precast modular block wall structure against surface water runoff at all times through the use of berms, diversion ditches, silt fence, temporary drains and/or any other necessary measures to prevent soil staining of the wall face, scour of the retaining wall foundation or erosion of the reinforced backfill or wall infill.

3.06 OBSTRUCTIONS IN THE INFILL AND REINFORCED FILL ZONE:

A. The Retaining Wall Installation Contractor shall make all required allowances for obstructions behind and through the wall face in accordance with the approved construction shop drawings.

B. Should unplanned obstructions become apparent for which the approved construction shop drawings do not account, the affected portion of the wall shall not be constructed until the Retaining Wall Design Engineer can appropriately address the required procedures for construction of the wall section in question.

3.07 COMPLETION:

A. For walls supporting unpaved areas, a minimum of 12-inch of compacted, low-permeability fill shall be placed over the granular wall infill zone of the precast modular block retaining wall structure. The adjacent retained soil shall be graded to prevent ponding of water behind the completed retaining wall.

B. For retaining walls with crest slopes of 5H:1V or steeper, silt fence shall be installed along the wall crest immediately following construction. The silt fence shall be located 3-feet to 4-feet behind the uppermost precast modular block unit. The crest slope above the wall shall be immediately seeded to establish vegetation. The General Contractor shall ensure that the seeded slope receives adequate irrigation and erosion protection to support germination and growth.

C. The General Contractor shall confirm that the as-built precast modular block wall geometries conform to the requirements of this section. The General Contractor shall notify the Owner of any deviations.

3.08 CONSTRUCTION TOLERANCES:

A. Variation from Level: For bed-joint lines along walls, do not exceed 1-1/4 inches in 10 feet, 3 inches maximum.

B. Variation from Indicated Batter: For slope of wall face, do not vary from indicated slope by more than 1-1/4 inches in 10 feet.

C. Variation from Indicated Wall Line: For walls indicated as straight, do not vary from straight line by more than 1-1/4 inches in 10 feet.

3.09 FIELD QUALITY CONTROL:

A. Comply with requirements in Section 31 22 00 for field quality control.

1. In each compacted backfill layer, perform at least 1 field in-place compaction test for each 100 feet or less of segmental retaining wall length.

2. In each compacted backfill layer, perform at least 1 field in-place compaction test for each 24 inches of fill depth and each 50 feet or less of segmental retaining wall length.

3.10 ADJUSTING:

A. Remove and replace retaining wall construction of the following descriptions:

1. Broken, chipped, stained, or otherwise damaged units. Units may be repaired if Engineer approves methods and results.

2. Segmental retaining walls that do not match approved Samples and mockups.

3. Segmental retaining walls that do not comply with other requirements indicated.

B. Replace units so segmental retaining wall matches approved Samples and mockups, complies with other requirements, and shows no evidence of replacement.

3.11 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

Page Intentionally Left Blank

SECTION 32 90 10

PLANTING

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide for establishment of permanent vegetation.

B. Provide topsoiling, fertilizing, seeding, sodding, planting and related work as indicated and specified to reestablish grass within the golf course fairways and tee boxes.

C. Repairing existing areas damaged by Work.

1.02 REFERENCES:

A. Comply with American National Standards Institute (ANSI) Z60.1-2004 American Standard for Nursery Stock.

B. ASTM International (ASTM):

1. D5268: Standard Specification for Topsoil Used for Landscaping Purposes.

2. D5435: Standard Test Method for Plant Growth and Food Chain Protection.

1.03 SUBMITTALS:

A. Product Data:

1. List indicating source of sod material to be provided, at least 4 weeks prior to installation. Include list naming seeds, coverage, and supplier's name, address and phone number.

2. Product Data, rates of application, and anticipated uses of pesticides, herbicides, fertilizers and fumigants.

3. Certificates concerning seed mixture, purity, germinating value, and crop year identification.

4. Maintenance and installation instructions, including top soil preparation, watering intervals, and maintenance instructions.

5. Planting plan.

B. Certify invoice or order plants for each shipment free of disease, mold, and insect pests. Submit certificates to Engineer.

C. Miscellaneous:

1. Prior to end of maintenance period, furnish 2 copies of typed maintenance instructions recommending procedures to be established by Owner for maintenance of landscape Work for one year.

2. Inspection certificates required by federal, state or other governing agency shall accompany each shipment.

3. Shop drawings showing locations and depths of agronomic soil samples collected.

D. Submit in accordance with Section 01 33 00.

1.04 QUALITY ASSURANCE:

A. Planting Plan

1. Contractor shall develop and submit a planting plan which includes areas which sod installation will take place, proposed thickness of topsoil under sod, time of year of installation, maintenance requirements, installation methods and growing requirements.

2. Plan shall clearly show limits of sod installation including all disturbed fairways, and tee boxes.

B. Inspection:

1. Engineer may inspect sod material at nursery/farm. Such inspection shall be in addition to inspection at Site.

2. Upon delivery and before planting, Engineer will inspect sod. Sod must not be dried out and must be free of mold, fungus, and other pests.

3. Inspection and approval is for quality, size, and variety only, and in no way impairs right of rejection for failure to meet other requirements during progress of Work.

4. Contractor shall be present during required inspections or as may be required by Engineer.

C. Source Quality Control:

1. Certification: Landscape materials shall be from stock inspected and certified by authorized governmental agencies. Material shall comply with governmental regulations prevailing at supply source and project. Investigate sources of supply and make assurances that plants will be supplied as indicated in the Planting Plan in sizes, variety and quality noted and specified before submitting bid. Substitution of species must be approved in writing prior to bidding. Ensure that materials can be procured depending on the time of year. Failure to take this precaution will not

relieve responsibility for furnishing and installing plant material in accordance with Contract requirements and without additional expense to Owner.

2. Plant material shall comply with State of Utah and federal laws with respect to inspection for plant diseases and insect infestation.

3. Contractor will furnish two copies of written maintenance, instructions for maintenance and care of installed plants and lawn areas.

4. Notify Engineer at least 48 hours in advance of all planned planting operations and identify specific material and its location. Plant material must not be dried out and must free of mold, fungus, or other pests.

5. Furnish suitable quantities of water, hose and appurtenances.

6. Provide topsoil that complies with ASTM 5268 – Standard Specification for Topsoil Used for Landscaping Purposes.

7. Begin maintenance immediately after planting.

8. Repair or replace sodded areas, which in judgment of Engineer, have not survived and grown in a satisfactory manner, for a period of 1 year after date of acceptance.

9. Provide as specified seedings or plantings replacements of the same type and size as specified.

1.05 DELIVERY STORAGE AND HANDLING:

A. Delivery:

1. Schedule shipping to minimize on-site storage of materials.

2. Plant Material: Take precautions in accordance with best trade practices to ensure arrival of plant material at Site in good condition and without injury. Cover plants to prevent freezing, drying, transit injury, or other exposure that may be harmful. During shipment, plants shall not be bent, stacked, or bound in manner that damages bark, breaks branches, deforms root balls, or destroys natural shape.

3. Fertilizer: Deliver fertilizer to site in original, unopened containers bearing weight, manufacturer's guaranteed chemical analysis, name, trade name, trademark, and conformance to state law.

4. Notify Engineer 48 hrs before delivery of plant material.

5. Each shipment shall be accompanied by invoice showing sizes and varieties included.

a. Provide copy of invoice to Engineer upon delivery of plant material.

6. Deliver topsoil in an unfrozen and non-muddy condition

1.06 PROJECT/SITE CONDITIONS:

A. Inspection:

1. Prior to beginning Work, Contractor shall examine and verify acceptability of Site for conditions under which Work will be performed. Do not proceed with Work until unsatisfactory conditions have been corrected.

2. Starting Work constitutes acceptance of conditions under which Work is to be performed. After such acceptances, Contractor shall be responsible for correcting unsatisfactory and defective Work resulting from such unsatisfactory conditions.

3. Remove invasive species, if applicable, in accordance with scope of work, water permits, and/or wetland/stream restoration plans

B. Utilities:

1. On-site sources of water will be provided by Owner.

C. Plant when weather and soil conditions are suitable in accordance with industry practices.

D. Protection:

1. Replace, repair, re-stake or replant lawn or plantings which are damaged.

2. If planting after lawn installation, protect lawn areas, and repair damage resulting from planting operations.

3. Where planting occurs in close proximity to other site improvements, protect features prior to commencing Work. Any items damaged due to planting operations shall be repaired to their original condition.

1.07 WARRANTY:

A. During 1 year correction period, replace sod which has died, or are in dying condition, or which has failed to flourish so its usefulness or appearance has been impaired.

1. Replacement and Damages:

a. Decisions of Engineer and Owner for required replacements are final and binding upon Contractor.

b. Contractor is responsible for repairing damage to property caused by defective workmanship and materials.

2. Exclusions:

a. Contractor is not liable for replacement cost of plants damaged by deicing compounds, fertilizers, pesticides or other materials not specified in Contract Documents or not applied by Contractor, by relocating or removal by others, by acts of God, or by vandalism, and losses due to curtailment of water by local authorities.

3. Inspection of Maintenance:

a. During correction period, Contractor shall, once per month**,** inspect watering, cultivation, and other maintenance operations by Owner, and notify Owner of methods, practices or operations considered unsatisfactory and not in accordance with good horticultural practices.

b. Failure of Contractor to inspect or report shall be construed as acceptance of Owner's maintenance operations, and Contractor shall not claim or assert defects which may later develop are result of such methods or practices or operations.

c. Owner will notify Contractor when maintenance is to be performed so Contractor may observe maintenance procedures.

PART 2 - PRODUCTS

2.01 PLANTS:

A. General:

1. Provide plants in accordance with ANSI Standard for Nursery Stock, Designation Z60.1-2004.

2. Plant material shall be nursery grown unless otherwise specified or approved in writing by Engineer. Plants shall have been grown within same hardiness zone as Project site or acclimated to conditions of same hardiness zone for minimum of 2 growing seasons. Hardiness zones shall conform to "Zones of Plant Hardiness" as provided by U.S. Department of Agriculture.

3. Unless specifically noted otherwise, plants shall be of selected specimen quality; have normal habit of growth; and be sound, healthy, vigorous plants with well developed root systems. Plants shall be free of disease, insect pests, their eggs or larvae, and injuries.

2.02 SOD:

A. Established, nursery grown Kentucky Bluegrass sod, vigorous, well rooted, healthy turf, free from disease, insect pests, weeds, other grasses, stones, and any other harmful or deleterious matter.

B. Sod harvested by machine at uniform soil thickness of approximately 1 inch but not less than 3/4-inch. Measurement for thickness excludes top growth and thatch. Prevent tearing, breaking, drying or any other damage.

C. Sod shall be provided in large rolls to eliminate dead edges versus smaller pallet sod.

D. Products:

1. Barefoot Blue Sod, by Raft River Sod.

E. Installers:

1. Wagner Golf Works (435-503-5763)

2. Eagle Golf (810-240-7961)

3. GPS As-Built (801-557-9021)

2.03 PLANTING MATERIALS

A. Topsoil:

1. Obtained from natural well drained areas, and be fertile, friable soil, clean of undesirable materials such as plants, weeds, roots, stalks, stones, and other debris.

2. Existing topsoil may be used if Engineer determines soil is suitable and of sufficient quantity. Topsoil must meet ASTM standard 5268 Standard Specification for Topsoil Used for Landscaping Purposes.

3. Acidity range of pH 5.0 and pH 7.0 and shall contain no less than 4 percent organic matter as determined by loss on ignition of moisture free samples dried at 212 degrees F.

B. Water

1. Obtain from golf course existing system.

PART 3 - EXECUTION

3.01 PREPARATION:

A. Do not install plantings where depth of soil over underground construction, obstructions or rock is insufficient to accommodate roots or where pockets in rock or impervious soil require drainage.

1. Where such conditions are encountered in excavation planting areas and where stone, boulders or other obstruction cannot be broken or removed by hand methods and where trees to be planted are under overhead wires, alternate locations for planting may be designated by Engineer.

2. Dispose of excavated material not suitable for backfilling off-site.

3. If drainage problems are encountered detrimental to growth of specified plant material, notify Engineer of conditions before proceeding with Work.

3.02 INSTALLATION:

Topsoil/Finish Grading:

1. Do not place or work topsoil in frozen or muddy condition.

2. Finish grade is established final grade. Grades not otherwise indicated are uniform levels or slopes between points where elevations given or between such points and existing finished grades.

3. Where Drawings show existing grades of landscaped areas are not to be changed or if new grade is less than 4 inches above existing grades, remove enough material to allow placement of 4 inches new topsoil, unless existing topsoil to required depth is undisturbed and of equal or better quality than topsoil specified. In latter case, existing topsoil may be left in-place, using enough new topsoil to bring these areas up to grade.

B. Preparation:

1. Planting Season: Conform to planting seasons.

2. Preparation of Planting Areas: Cover surrounding turf (if existing) to protect turfed areas that are to be trucked or hauled over and upon which soil is to be temporarily stocked.

3. Stake or paint locations of plants and outlines of bed. Engineer will approve locations before excavation starts. Make adjustments in locations and outlines as required. If pits or areas for planting are prepared and backfilled with topsoil to grade prior to commencement of lawn operations, mark so they can be readily located when planting proceeds.

3.03 CLEAN UP AND PROTECTION

A. Remove excess and waste material daily.

B. Remove soil or similar material brought onto paved areas, keeping areas broom clean.

C. Upon completion of planting, remove excess soil, stones, and debris and dispose of off-site.

D. Damage to existing landscape, pavements, or other site features as result of Work shall be repaired to its original condition.

E. Protect landscape Work and materials from damage due to landscape operations, operations by other contractors and trades, and trespassers. Maintain protection during installation and maintenance periods.

3.04 MAINTENANCE:

A. Temporary Maintenance:

1. Maintain sod material until substantial completion as defined in Paragraph 3.06. Acceptance of this specification.

2. Temporary maintenance begins immediately after each plant is installed and shall include watering, necessary cultivation, weeding, pruning, disease and insect pest control, protective spraying, resetting of plants to proper grades or upright position, restoration of damaged planting saucers, and other procedures consistent with good horticultural practice necessary to ensure normal, vigorous, and healthy growth of plantings.

3. Remove and replace dead and unacceptable plants as their condition becomes apparent.

4. Upon substantial completion, Owner assumes responsibility for sod maintenance.

3.05 REPLACEMENTS:

A. Replace sod which have died prior to substantial completion.

B. Procedure:

1. Dispose of removed sod off-site.

2. Replacements shall be supplied and installed in accordance with Specifications.

3. Restore areas damaged by replacement operations to original condition.

4. Notify Engineer at conclusion of replacement program.

5. Engineer will conduct inspection of replacements for determining final acceptance.

3.06 ACCEPTANCE:

A. Preliminary Planting Acceptance:

1. Notify Engineer at conclusion of planting operations so Engineer can determine substantial completion by field inspection.

2. Substantial completion requires:

a. Sod material conforms to Contract Documents with respect to quantity, quality, size, species, and location, except those items accepted or revised in field by Engineer.

b. Plant material shall be in healthy condition as defined under warranty.

B. Final Planting Acceptance:

1. Final planting acceptance shall be granted after completion of replacement operations required to fulfill guarantee.

2. On or about expiration of 1 yr correction period, follow-up inspection will be made to determine replacements required to be made by Contractor in accordance with provisions of these Specifications. Engineer will document findings in field report, and forward copies to Owner and Contractor. Items identified for replacement will be tagged during inspection with plastic flagging.

3. Upon completion of replacement program, Engineer will inspect to determine acceptability of required replacements. If acceptable, Engineer shall notify Contractor and Owner, in writing, of final acceptance of Work.

3.07 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

DIVISION 33

UTILITIES

Page Intentionally Left Blank

SECTION 33 01 12

PRE- AND POST-CONSTRUCTION INSPECTIONS

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide pre- and post-construction inspections on structures, buildings, utilities, roadways, and other facilities as indicated and in compliance with Contract Documents.

1.02 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Submit qualifications and experience of proposed Claims Specialist conforming to the requirements of Article 3.01.F of this Section for Owner's approval within 30 days of Notice to Proceed.

C. Submit qualifications and experience of proposed qualified specialist to perform pre and post-construction inspections conforming to the requirements of Article 3.01 of this Section for Owner's approval within 30 days of Notice to Proceed.

D. Pre-construction and post-construction inspection reports as described in Part 3.01 of this Section.

E. All pre-construction inspection reports shall be submitted to Engineer at least 30 days prior to commencement of excavation.

1.03 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.04 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

1.05 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

PART 2 - PRODUCTS

(Not Used)

PART 3 - EXECUTION

3.01 INSPECTIONS:

A. Prior to the start of construction, Contractor shall conduct pre-construction inspections. These inspections shall be done initially, and later repeated as follows:

1. Open-cut:

a. Perform pre-construction inspection for all structures, buildings, and other observable facilities located above open cut centerline.

2. Pre-construction inspections shall be undertaken by qualified specialists having at least five years of documented experience. The specialists must also be approved by the Owner's and Contractor's insurance carrier. The pre-construction inspections shall thoroughly document all existing damage or defects to both the interior and exterior of all structures, buildings, houses or facilities. The interior conditions of all portions of all structures, including all walls, partitions, floors and ceilings shall be thoroughly documented by diagrams, transcribed notes, digital video, and photographs to show the location and extent of existing damage, deterioration, and cracks, including their dimensions, extent, and other relevant features.

3. A minimum of 10 interior and 30 exterior photographs shall be taken for each structure or facility. Close-up, detailed color photographs shall be taken of all cracks, deterioration and other observable defects in the exterior or interior portions of all buildings and other property improvements including, but not limited to, retaining walls, driveways and sidewalks. All color photographic prints shall be sized at least 4 inches by 6 inches and printed on Kodak or Fuji Film Paper in glossy format. If necessary, macro lenses and flash illumination shall be used to ensure cracks and other defects are shown clearly in the photographs. Photos shall contain a scale reference and an accurate date stamp.

4. In addition to type-written reports with photographs, inspections shall also include a walk-through digital video with audio commentary for each inspected structure or improvement within the specified inspection boundaries. Audio comments shall include name(s) of inspection staff, property type, name of Owner, date and time of inspection, and comments about the condition of the observed structure. Video-audio recordings shall be made and submitted electronically with the digital report.

5. Contractor shall prepare and deliver to the Owner and Engineer prior to the start of construction at each site, three bound copies of each of the pre-construction inspections containing all field notes taken, sketches and diagrams prepared, color prints of all photographs obtained, electronic files, descriptions and reports, all signed and witnessed by those taking part in the inspection. The Owner will, upon

request, present one of these copies to the property owner or responsible party for each property or utility affected.

6. Document the locations of existing cracks in all existing structures. Install crack monitors where crack width exceeds 1/16-inch. A minimum of three (3) photographs shall be taken of each crack monitor installation.

7. As construction progresses, Contractor shall re-inspect as often as necessary in the opinion of Engineer or Owner to verify the adequacy of Contractor's construction methods for prevention of damage and to obtain sufficient evidence for use in defense against possible claims for damage from third parties.

8. Contractor shall also re-inspect all homes where homeowners claim that damage is occurring as a result of Contractor's construction operations.

9. Three copies of all data and all electronic files obtained by Contractor, from each re-inspection outlined above shall be delivered to Owner within three (3) days of the inspection. The Owner will, upon request, present one of the submitted copies to the property owner or responsible party for each property or utility affected.

B. Upon completion of all excavation work, the Contractor shall make a similar examination of properties and structures where complaints of damage have been received or damage claims have been filed. Give notice to interested parties so that they may be present during the final examinations. Records of the final examination shall be signed and distributed as the original pre-construction inspection report.

C. Any damage noted after completion of construction operations which cannot be determined from the pre-construction inspection to be a pre-existing condition (PEC) shall be presumed to have been caused by construction operations. Such damage shall be repaired promptly and completely to the property Owner's satisfaction to restore the condition of the property to that existing prior to construction.

D. Maintain pre- and post-construction inspection records for a period of not less than 3 years following final completion and acceptance of the Work. In the event of damage claims, a report shall be prepared by the Contractor on the particular structures as requested by the Engineer from those notes and photographs and submitted to the Owner.

E. Nothing contained herein shall relieve Contractor of responsibility for claims arising from his construction operations whether within or outside of the limits of the required inspection. Failure to inspect any structure, whether or not required by these Contract Documents or inadequacy of the inspections, shall not relieve Contractor of its responsibility. Contractor shall indemnify the Owner and Engineer from such claims.

F. Contractor shall engage the services of an independent Claims Specialist, being a licensed engineer and having appropriate claims experience, to evaluate any claims that may arise as a result of construction activities.

G. The Claims Specialist shall prepare a written response to the claimant within two weeks of the date of the complaint. The response letter or report shall include all supporting data that were used to evaluate the claim. Copies of all correspondence with the claimant shall be submitted to the Owner and Engineer upon responding.

H. In the event any property owner denies access for the inspection of structures and facilities within the specified limits, Contractor shall notify such property owner, by certified mail, on the intent of the inspection. If after two weeks, access is still denied, Contractor shall notify the property owner once again by certified mail, stating this is their final notification. Contractor shall submit to the Owner copies of all correspondence between Contractor and the property owner(s). The Owner, upon review of the submitted correspondence, may waive requirements set forth in Paragraph A above. However, Contractor is fully responsible for claims and damage arising from its construction operation regardless of property location and the ability to conduct Pre-Construction Inspections.

I. Engineer or the Owner may reject the Claims Specialist if there is reason to believe material ownership interests exist between the Claims Specialist and Contractor and/or the vibration specialist, and/or there exists relationships other than Contractor/ Subcontractor among the aforementioned entities, or for other reasons.

3.02 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 33 10 00

WATER UTILITIES

PART 1 - GENERAL

1.01 SUMMARY:

A. Excluded from this section are:

1. Yard process piping between structures for water or wastewater treatment plants. Refer to Division 46 for yard process piping.

2. Water utilities within 5 feet from buildings. Refer to Division 22 for plumbing piping.

1.02 DESCRIPTION:

A. Provide water utilities beyond 5 feet from buildings as indicated and in compliance with Contract Documents.

B. Section includes:

1. Pipe and fittings for site water line including domestic water line and fire water line.

2. Water line valves, fire hydrants, accessories, and appurtenances.

I. Salt Lake City Department of Public Utilities (SLCDPU)

1. SLCDPU Standard Practices for Salt Lake City Public Utilities

1.04 DEFINITIONS:

A. Appurtenances: Additional piping items as required to provide a complete piping system suitable to convey water as specified and intended. These items may or may not be specified, but are necessary to complete the piping system.

1.05 SUBMITTALS:

A. Submit the following in accordance with Section 01 33 00.

1. Pipe materials.

2. Pipe fittings.

3. Pipe couplings.

4. Pipe thrust restraint.

5. Valves.

6. Fire Hydrants.

7. Accessories.

8. Appurtenances.

B. Manufacturer's Certificate: Certify that products meet or exceed specified requirements.

C. Instructions: Provide manufacturer's installation instructions for pipe, hydrants, valves and joint restraints.

D. Field Test Reports: Provide results for hydrostatic and bacteriological tests.

E. Project Record Documents: Provide actual locations of piping mains, valves, connections, thrust restraints, and invert elevations. Identify and describe unexpected variations to subsoil conditions or discovery of uncharted utilities.

1.06 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

B. Perform Work in accordance with APWA Standard Plans and Specifications as modified by the Salt Lake City Department of Public Utilities' standards

C. Valves: Manufacturer's name, UL/FM and pressure rating marked on valve body.

D. Materials used for private fire lines shall be UL listed and approved by Factory Mutual.

E. NSF Approval: Material used in the manufacture of PVC pipe and fittings shall be approved by the National Sanitation Foundation (NSF) for conveying potable water. Pipe and fittings shall bear the NSF label.

F. Pipe and appurtenance Materials shall meet the requirements of SLCDPU Standard Practice #5.

G. Pipe bedding, trench zone, and stabilization materials shall meet the requirements of SLCDPU Standard Practice #1, Section 31 23 33, and APWA Section 32 11 23.

1.07 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

B. Deliver and store valves in shipping containers with labeling in place.

1.08 WARRANTY:

A. Provide standard product warranties for piping materials and as required by Salt Lake City Department of Public Utilities' standards.

PART 2 - PRODUCTS

2.01 MANUFACTURERS:

A. Water Pipe (PVC C-900):

1. JM Eagle

2. Diamond Plastics

3. Vinyl Tech

B. Water Pipe (Copper):

1. Mueller Streamline

2. Cerro Flow Products

3. Great Lakes Copper

C. Water Pipe (PE C-901)

1. JM Eagle

2. WL Plastics

3. IPEX

D. Valves – Provide valves manufactured by the following:

1. Gate Valves:

a. Mueller Co. (special order required for AIS compliant valves)

b. American Flow Control. (special order required for AIS compliant valves)

c. Kennedy Valve Co.

2. Corporation Stops: Mueller H-15000 (special order required for AIS compliant valves), Ford F600

E. Fire Hydrants – Provide fire hydrants manufactured by the following:

1. Mueller. (special order required for AIS compliant hydrants)

2. M&H.

3. American AVK Co.

4. Waterous. (special order required for AIS compliant hydrants)

F. Structures – Provide structures manufactured by the following:

1. Valve Boxes: Tyler 6850, D&L M-9042. (special order required for AIS compliant boxes)

2. Meter Boxes: Tyler 6150, Ford X32.

3. Mechanical Joint Restraint: EBAA Iron Megalug, Ford Meter Company, Inc.

2.02 WATER PIPE:

A. Copper Tubing: ASTM B 88, Type K, annealed.

1. Fittings: ASME B16.18, cast copper, or ASME B16.22, wrought copper.

2. Joints: Compression connection or AWS A5.8, BCuP silver braze.

3. Only lead-free solder shall be used.

4. Working Pressure: Minimum of 100 psi.

B. PVC Pipe:

1. PVC Material: ASTM D1784, Type 1, Grade 1.

a. PVC: ASTM D1784, Cell classification 12454-B.

2. PVC Pipe smaller than 3 inches in diameter:

a. Pipe: ASTM D1785, Schedule 40/80 or ASTM D2441, SDR 17 (unless noted otherwise

b. Fittings: ASTM D2467 for solvent welded joints; ASTMD 2464 for threaded joints. Match schedule and pressure rating of adjacent pipe.

c. Joints: Solvent welded or Push-on in accordance with ASTM D3139.

d. Tracer Wire: See Section 31 23 23-2.03.A for additional requirements.

e. Marking Tape: See Section 31 23 23-2.03.B for additional requirements. Magnetic detectable conductor, clear plastic covering, imprinted with “Water Service” in large letters.

3. PVC Pipe 4 through 48 inches in diameter:

a. Pipe: AWWA C900, Pressure Class 235 (DR 18).

b. Fittings: AWWA C110 or AWWA C153, ductile iron, pressure class to match adjacent pipe.

c. Bolts: MJ fitting T-bolts shall be corrosion resistant, high-strength, low-alloy steel in accordance with ANSI/AWWA C111/A21.11, manufactured by Romac (R-Blue), Birmingham Fastener, Trumbull Manufacturing (Cor-Blue) or EJ Prescott (CorTen). Buried flange bolts shall be carbon steel standard flange nuts and bolts in accordance with ASTM A307, Grade B and made to the standards of ANSI B18.2.1 manufactured by EJ Prescott, Tripac, or McMaster-Carr. Type 304 Stainless-Steel (Not Used in Contract).

d. Joints: ASTM D 3139 compression gasket ring.

e. Joint Restraints: Internal grip locking ring type, Eagle Loc900, or EBAA Iron Series 1900 for external type.

f. Tracer Wire: See Section 31 23 23-2.03.A for additional requirements.

g. Marking Tape: See Section 31 23 23-2.03.B for additional requirements. Magnetic detectable conductor, clear plastic covering, imprinted with “Water Service” in large letters.

4. Thread Lubricant:

a. Liquid: Teflon base liquid in plastic squeeze bottles. Use liquid lubricant on permanent joints.

b. Tape: Teflon base tape. Use tape on joints for valves or joints that may be disconnected often.

5. Bolting: Machine bolts and standard hexagon nuts with N.C. threads, 304 SS, unless noted otherwise.

C. Polyethylene Pipe and Tubing: For service lines only, 3 inches or less in diameter. AWWA C901 Pressure Class 200, copper tube sizes (CTS).

1. Fittings: AWWA C901, molded or fabricated, pressure class to match adjacent pipe.

2. Joints: Electrofusion joining conforming to ASTM F1290.

3. Tracer Wire: See Section 31 23 23-2.03.A for additional requirements.

4. Marking Tape: See Section 31 23 23-2.03.B for additional requirements. Magnetic detectable conductor, clear plastic covering, imprinted with "Water Service" in large letters.

2.03 VALVES:

A. Gate Valves:

1. Up to 3 Inches: 150 psi working pressure. Brass or bronze body, union bonnet, non-rising stem, inside screw, single solid wedge or disc, compression or IPS ends as noted on the drawings, extension box (for buried valves).

2. 3 Inches and Over: 150 psi working pressure. AWWA C509 or C515, Iron body, bronze trim, non-rising stem with square nut, single wedge, resilient seat, flanged or mechanical joint ends as required or noted on the drawings, control rod, extension box. Protective interior coating per AWWA C550. Gate valves

16 inches and larger to be equipped with spur or beveled gears enclosed in a seal grease case, in the horizontal position to be equipped with rollers, tracks, and scrappers.

3. UL Listed/FM Approved. Provide bonnet to accept indicator posts as indicated.

4. Provide one operating wrench of length to operate deepest valve.

5. Valves shall be counterclockwise opening.

2.04 MANUAL OPERATORS:

A. General:

1. Operator force not to exceed 40 lbf under any operating condition, including initial breakaway. Gear reduction operator when force exceeds 40 lbf.

2. Operator to be self-locking type or be equipped with self-locking device.

3. Provide position indicator on quarter-turn valves.

4. Worm and gear operators to be one-piece design worm-gears of gear bronze material. Worm hardened alloy steel with thread ground and polished. Traveling nut type operators to have threaded steel reach rods with internally threaded bronze or ductile iron nut.

B. Exposed Operator:

1. Galvanized and painted handwheels.

2. Lever operators allowed on quarter-turn valves, 8 inches and smaller.

3. Cranks on gear type operators.

4. Chain wheel operator with tiebacks, extension stem, floor stands, and other accessories to permit operation from normal operation level.

5. Valve handles to take a padlock, and wheels a chain and padlock.

C. Buried Operator:

1. Buried Operator:

2. Buried service operators on valves larger than 2-1/2 inches shall have a 2-inch AWWA operating nut. Buried operators on valves 2-inch and smaller shall have cross handle for operation by forked key. Enclose moving parts of valve and operator in housing to prevent contact with the soil.

3. Design buried service operators for quarter-turn valves to withstand 450 lbf-ft of input torque at the FULLY OPEN or FULLY CLOSED positions, grease packed and gasketed to withstand a submersion in water to 10 psi.

4. Buried valves shall have extension stems, bonnets, and valve boxes.

2.05 VALVE BOXES:

A. General: Provide cast-iron valve boxes, rated for vehicular traffic.

B. Cast-Iron Boxes: Extension type with screw-type adjustment, flared base and 3/16-inch minimum thickness of metal.

C. Cast the word "WATER" in cover. Adapt box length, without full extension, to depth of cover required over pipe at valve location.

D. Manufacturers:

1. Tyler Union 6850

2. D&L Supply M-9042 (special order required for AIS compliant boxes)

3. Olympic VBU-8310 (special order required for AIS compliant boxes)

2.06 FIRE HYDRANTS:

A. AWWA C502, UL 246, dry barrel type compression hydrant with double O-ring seals; counter-clockwise rotation to open. Protective interior coating per AWWA C550.

B. Equip with a 5-1/4 inch valve opening, 6-inch mechanical joint shoe, two 2-1/2 inch hose nozzles, and one 4-1/2 inch nozzle breakaway flange and stem coupling.

C. Provide threads on nozzles in conformance with National Standard fire-hose coupling screw-thread dimensions. Nozzles shall be replaceable.

D. Fabricate extensions in multiples of 6 inches with rod and coupling to increase barrel length.

E. Working Pressure: 150 psi.

F. Provide 1 safety flange repair kit.

G. UL Listed/FM Approved.

H. Manufacturers:

1. Waterous WB-67 (special order required for AIS compliant hydrants)

2. Mueller Centurion A-423 (special order required for AIS compliant hydrants)

3. American AVK Series 2700

2.07 BEDDING AND COVER MATERIALS:

A. As specified in Section 31 23 33 and APWA Section 31 11 23 (3/4" Untreated Base Course).

2.08 THRUST RESTRAINT:

A. Mechanical Joint Restraint: Wedge action restrained joint retainer gland devices. Mechanical joint restraint incorporated into the design of the follower gland.

B. Pipe Clamps and Tie Rods: ANSI/NFPA 24.

C. Push-On Restrained Joint Pipe: Provide joint restraint and conforming joint to AWWA C111/21.11, fabricated to be easily disassembled. Provide assembly and disassembly kits. Tie bolts shall be carbon steel and wax-tape wrap.

D. Wall Pipes: Cast or ductile iron with an intermediate wall collar, unless noted otherwise. End connections as indicated.

2.09 COUPLINGS:

A. Mechanical Couplings: Dresser Style 38, long sleeve unless shown otherwise; equivalent by Smith-Blair (special order required for AIS compliant coupling) or Baker (special order required for AIS compliant coupling). Harness when required for thrust restraint.

B. Flanged Coupling Adapters (FCA): Dresser Style 127 (2-12 inches), Dresser Style 128 (14-96 inches), equivalent by Smith Blair (special order required for all named FCAs).

C. Tapping Sleeves: Ductile- or cast-iron, split-sleeve type with flanged or grooved outlet, and with bolts, follower rings and gaskets on each end of sleeve suitable for maximum working pressure of 150 psi. Bolts shall have square heads and hexagonal nuts. Longitudinal gaskets and mechanical joints with gaskets shall be as recommended by manufacturer of sleeve.

D. Tapping Valves: Provide tapping valves that conform to gate valves, specified herein. Provide tapping valves suitable for installation with tapping sleeves and pipe used, designed for minimum water working pressure of 150 psi, and have clear waterway equal to full nominal diameter of valve.

E. Corporation Stop: Standard corporation stop thread conforming to AWWA C800 on the inlet end, with compression pattern flared tube coupling.

F. Service Stops: Water-works inverted-ground-key type, oval or round flow way, tee handle, without drain. Parts shall be bronze with female compression-pattern flared tube coupling design for hydrostatic test pressure at least 200 psi.

G. Service Clamp (Saddle):

1. Pressure rating not less than connecting pipe; double flattened strap type conforming to AWWA C800. Clamps shall have rubber gasket cemented to the body. Straps and nuts shall be stainless steel. Manufacturers for PVC pipe shall be Romac 202-NS and Ford Meter Box 202BSD. Manufacturers for HDPE pipe shall be Romac 202N-H.

H. Service Boxes: Cast iron or concrete and shall be extension service boxes of length required for depth of line, with either screw or slide-type adjustment. Boxes shall have housings of sufficient size to completely cover service stop or valve and shall be complete with identifying covers.

I. HDPE and PVC Pipe Restrained Couplings: Restrained coupling shall have end rings, center ring, bolt guides, and grippers constructed of ductile iron meeting ASTM A536, Grade 65-45-12. Grippers shall be Xylan coated for corrosion resistance. Gaskets shall be provided for sewer service and meet the requirements of ASTM D2000. Bolts and nuts shall be Type 316 stainless steel. Draw hooks shall be stainless steel and ramp runners shall be glass filled nylon. Center ring shall be fusion bonded epoxy coated. Coupling shall be rated for a working pressure of 350 psi. Restrained joint shall accommodate up to 4 degrees deflection per end.

2.10 DISINFECTION CHEMICALS:

A. Refer to Section 33 13 00.

2.11 APPURTENANCES:

A. Provide appurtenances for a complete piping system suitable for operation, and in conformance with Project Documents.

2.12 SHOP PAINTING/COATINGS:

A. Unless noted otherwise, provide standard manufacturer paint and coatings for piping, valves, hydrants, and accessories to prevent corrosion for the life of the component.

2.13 SHOP TESTING:

A. Test pipes, valves, hydrants, and applicable accessories per manufacturer requirements, and as required by referenced Standards.

PART 3 - EXECUTION

3.01 EXAMINATION:

A. Verify existing conditions.

B. Verify building service connections and municipal utility water main sizes, locations and inverts are as indicated.

3.02 PREPARATION:

A. Ream pipe and tube ends and remove burrs.

B. Remove scale and dirt, on inside and outside, before assembly.

C. Prepare pipe connections to equipment with flanges or unions.

D. Excavate pipe trench in accordance with Section 31 23 23 for work of this section. Hand trim excavation for accurate placement of pipe to elevations indicated.

3.03 WATER PIPE INSTALLATION:

A. Maintain separation of water main from sewer as follows:

1. Parallel Installation:

a. Under normal conditions water mains shall be laid at least 10 feet horizontally from a sewer or sewer manhole. The distance shall be measured edge-to-edge.

b. Under unusual conditions when local conditions prevent a horizontal separation of 10 feet the water main may be laid closer to a sewer or sewer manhole provided that:

(1) The bottom (invert) of the water main shall be at least 24 inches above the top (crown) of the sewer;

(2) Where this vertical separation cannot be obtained, the sewer shall be constructed of AWWA approved water pipe, pressure tested in place without leakage prior to backfilling; and

(3) The sewer manhole shall be of watertight construction and tested in place.

2. Crossing:

a. Under normal conditions water lines crossing sewers shall be laid to provide a separation of at least 24 inches between the bottom of the water line and the top of the sewer whenever possible.

b. Under unusual conditions when local conditions prevent a vertical separation described, the following construction shall be used:

(1) Sewers passing over or under water mains shall be constructed of AWWA approved water pipe, pressure tested in place without leakage prior to backfilling;

(2) Water lines passing under sewers shall, in addition, be protected by providing:

(a) A vertical separation of at least 24 inches between the bottom of the sewer and the top of the water line;

(b) Adequate structural support for the sewers to prevent excessive deflection of the joints and the settling on and breaking of the waterline; and

(c) That the length of the water line be centered at the point of the crossing so that joints shall equidistant and as far as possible from the sewer.

(3) No water pipes shall pass through or come in contact with any part of a sewer manhole.

B. Install pipes and structures to within tolerance of 1/2-inch of indicated elevations.

C. Install ductile iron piping and fittings to AWWA C600.

D. Install PVC piping according to AWWA M23.

E. Install fire service piping according to NFPA 24.

F. Install joint restraints on all fittings and valves. Pipe joints shall be restrained for the distances shown on the Contract Drawings and the following requirements.

1. If the distance between fittings or valves is less than 20 feet, a full pipe length shall be used, i.e., no joints between the fitting or valve.

2. A minimum of 10 feet of pipe (no joints) shall be provided on each side of the through section of all Tees.

3. Restrain all joints from a mainline branch Tee to all fire hydrants.

4. Restrain fittings and couplings and all pipe joints for 25 feet minimum from all building or structure connections or for the length indicated on the Contract Drawings.

G. Establish elevations of buried piping to ensure not less than 4 feet of cover.

H. Install trace wire continuous over top of pipe; coordinate with Section 31 23 33. Extend wire into valve boxes and adjacent to hydrants for connection to location equipment.

I. Backfill trench in accordance with Section 31 23 33.

J. Pipe bedding shall be Grade 1 - 1" UTBC per APWA Section 32 11 23 unless noted otherwise in Section 31 23 23.

3.04 VALVES AND HYDRANTS INSTALLATION:

A. Set valves on solid bearing.

B. Center and plumb valve box over valve. Set box cover flush with finished grade.

C. Set hydrants plumb and locate pumper nozzle perpendicular to roadway.

D. Provide drainage pit 36 inches square by 24 inches deep filled with No. 57 aggregate for fire hydrants. Encase elbow of fire hydrant in gravel to 6 inches above drain opening. Wrap drainage pit and gravel with filter fabric. Do not connect drain opening to sewer.

E. Paint fire hydrants in accordance with AWWA and NFPA 24; also comply with Salt Lake City Department of Public Utilities Standard.

F. Install tapping sleeves and tapping valves in accordance with manufacturer's recommendations.

G. Install valves and hydrants according to applicable AWWA Standards and NFPA 24.

3.05 DISINFECTION OF DOMESTIC WATER PIPING SYSTEM:

A. Refer to Section 33 13 00.

3.06 SERVICE CONNECTIONS:

A. Provide water service including corporation stop, copper pipe, curb stop, meter setter, and water meter and back flow preventer and sand strainer.

3.07 REPAIR/RESTORATION:

A. Repair any existing utilities/structures, or features damaged during installation of water utilities to Owner's satisfaction, and at no cost to Owner.

3.08 FIELD TESTING:

A. Perform field-testing under provisions of Section 01 45 00.

B. Hydrostatically test newly laid pipeline and valved section thereof in accordance with AWWA C600, Salt Lake City Department of Public Utilities' Standard, and NFPA 24.

C. Bacteriological testing shall be in accordance with Utah State Standard, and Salt Lake City Department of Public Utilities' Standard. One series of test shall be performed for every 2,000 feet of line. Each series shall be two samples taken at least 24 hours apart and analyzed by a Utah certified lab. The results must indicate no coliform contamination before being used. If coliform is detected, the disinfection and testing procedure shall be repeated until no coliform is detected.

3.09 FIELD PAINTING/COATINGS:

A. Repair any shop painting/coatings damaged during storage or installation to Owner's satisfaction.

B. Wax-Tape wrap all ductile iron fittings and push-on joint restraints. Install primer, void filler, and wrap per manufacturer's instructions. Manufacturer shall be Trenton or Denso. Outer wrap wax-tape with 8-mil polyethylene wrap and seal ends with 12-mil Polyken #900 tape.

3.10 ADJUSTING:

A. Coordinate with Engineer for any field adjustments. The Engineer reserves the right to reject any field adjustments.

3.11 PROTECTION:

A. Protect installed water utilities from damage throughout storage, installation, testing, and final approval.

3.12 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 33 12 13

TEMPORARY CONNECTIONS

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide temporary connections as indicated and in compliance with Contract Documents.

1. Scope:

a. Provide, disinfect, and maintain temporary potable water bypass pipe, connections, and services as indicated or required and as specified and later remove temporary facilities.

b. Have readily available sufficient additional quantity of bypass pipe, connections of suitable sizes to replace or supplement the temporary facilities in event these prove inadequate in any way.

c. Perform all appurtenant work including but not limited to excavation and backfilling, constructing ramps at driveways and other access ways, replacement of temporary and permanent pavement, restoration of public and private property.

1.02 SUBMITTALS:

A. Submit the following in accordance with Section 01 33 00.

1. Before commencing work, submit for Engineer's review and acceptance, proposed layout plan and operations schedule for installing and removing temporary bypasses, connections and services.

2. Submit for Engineer's review and acceptance, a list of materials with sizes for temporary bypass, connections and services.

3. Submit documents indicating compliance with applicable traffic control and safety requirements and indicated Maintenance of Traffic Plan for the Project.

1.03 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00 and as specified.

B. Use only materials that are suitable for potable water transmission and distribution.

C. Provide temporary connections capable of withstanding service pressure of 150 psi.

D. Take water for temporary connections from Owner's nearest available hydrants remaining in service.

1.04 SAFETY REQUIREMENTS:

A. Prevent contamination of contiguous potable water distribution system and services.

B. Coordinate and cooperate with Owner's water utility and fire department to maintain water distribution and fire protection capability.

C. Take all necessary precautions for public safety.

D. Comply with Section 01 50 00, Paragraph 1.03.C for water supply for Contractor's operations.

E. Conform to all applicable traffic control and safety requirements during temporary connections and operations. Comply with indicated Maintenance of Traffic Plan for the Project.

PART 2 - PRODUCTS

2.01 MATERIALS:

A. Provide pipe, fittings, hoses, connections, backflow preventers, and valves suitable for potable water service at 150 psi and as accepted by Engineer.

PART 3 - EXECUTION

3.01 GENERAL:

A. Furnish, install, maintain and later remove devices necessary to ensure public safety as required and as approved by the Owner. Provide backflow preventers as required by Utah Department of Environmental Quality Division of Drinking Water and Utah Administrative Code R309-105.

B. Install, operate, maintain, test, disinfect and remove temporary facilities including bypass, connections, laterals, customer services and customer connections and temporary fire hydrants as indicated on drawings, as specified and as accepted by Engineer.

C. Make installation suitable for temporary potable water service pressures to 150 psi without leakage.

D. Do not operate Owner's or user's valves, stops and hydrants without Engineer's permission for specific valves, stops and hydrants.

E. Test temporary facilities in presence of Engineer before taking Owner's water main out of service.

F. Disinfect temporary facilities to meet Engineer's acceptance and in accordance with Section 33 13 00, Paragraph 3.06 Final Flushing and Test prior to placing such temporary facilities in service.

G. Make attachments and connections to fire hydrants and fire protection systems in a manner which can be easily and quickly removed to permit use of fire hydrants and fire protection systems for firefighting purposes.

H. Notify in writing the Owner and the Owner's water utility and fire department 48 hours in advance of connecting and disconnecting temporary and permanent facilities so that representatives of Salt Lake City water department and fire department may be present at installation or removal of permanent and temporary connections and to permit Owner to inform customers and users as Owner deems necessary.

I. Do not install temporary bypass, connections and customer services across streets except as permitted by Engineer.

J. Connect to the temporary bypass water mains that are to remain in service as indicated and accepted by Engineer.

K. After water mains are returned to service, remove temporary facilities not required for remaining work and restore and clean up affected areas to the acceptance of the Engineer.

3.02 TEMPORARY BYPASS:

A. Provide bypass not less than sizes indicated on drawings and in any case not less than 2 inch diameter.

B. Lay bypass out of traveled way in manner to protect the bypass from damage.

C. Where bypass is accepted to cross streets and street intersections, lay in trench and place temporary pavement over bypass except as permitted otherwise in writing by the Engineer.

D. Where bypass crosses driveways and similar access ways to properties, construct suitable ramp to allow driving and passing over pipe except where Engineer requires bypass be laid in trench with temporary pavement over bypass.

E. Keep existing fire hydrants in service by making appropriate connections to bypass or by installing and maintaining temporary fire hydrants adjacent to each existing fire hydrant affected by work until restored to service.

F. Provide each temporary fire hydrant with individual valve control.

G. Provide temporary fire hydrants with fire hose connections compatible with existing fire hydrant hose connections as accepted by the Engineer.

H. Satisfactorily flush existing hydrants, to which bypass is connected for water supply, prior to making connections to prevent stagnant or discolored water from entering bypass.

I. If bypass proves inadequate for temporary service, replace or supplement bypass as appropriate to provide adequate temporary service, including replacement with larger diameter bypass, as accepted by the Engineer.

3.03 TEMPORARY SERVICE CONNECTIONS:

A. Furnish, install, maintain and later remove temporary service connections from the bypass to each building and service supplied by water main to be removed from service.

B. Lay temporary connections out of traveled and access ways where possible.

C. Temporary service connections ramped or in trench where directed and accepted by the Engineer.

D. Provide temporary service connections equal to or larger size than permanent service connections.

E. Install and maintain pressure regulators for temporary services where necessary.

F. Install and remove temporary service connections and back clean permanent services at times when work can be observed by the Engineer and other representatives of the Owner.

G. Coordinate and cooperate with service user, Salt Lake City water department and fire department, to assure minimum disturbance to fire protection system and other special and automated uses.

H. Make temporary service connections to user service line, sill cock, or other convenient and reasonable points and acceptable to the Engineer.

3.04 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 33 13 00

DISINFECTING OF WATER UTILITY DISTRIBUTION

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide disinfecting of water utility distribution systems as indicated and in compliance with Contract Documents.

B. Section Includes:

1. Disinfection of water mains in accordance with AWWA C651; except as modified below.

1.02 REFERENCES:

A. American Water Works Association (AWWA):

1. C651: Disinfecting Water Mains.

B. Standard Practices for Salt Lake City Public Utilities:

1. Standard Practice #4 – Flushing and De-Chlorination

2. Standard Practice #12 – Commissioning Waterlines

1.03 SEQUENCING:

A. Basic procedure for disinfecting water mains:

1. Inspecting materials to be used to ensure their integrity.

2. Preventing contaminating materials from entering the water main during storage, construction, or repair and noting potential contamination at the construction site.

3. Removing, by flushing or other means, those materials that may have entered the water main.

4. Chlorinating any residual contamination that may remain, and flushing the chlorinated water from the main.

5. Protecting the existing distribution system from backflow caused by hydrostatic pressure test and disinfection procedures.

6. Documenting that an adequate level of chlorine contacted each pipe to provide disinfection.

7. Determining the bacteriological quality by laboratory test after disinfection.

8. Final connection of the accepted new water main to the active distribution system.

1.04 SUBMITTALS:

A. Submit the following in accordance with Section 01 33 00.

1. Supervisor qualifications.

2. Equipment list.

3. De-chlorination Procedure Documentation Form (SLC Standard Practice #4), if required for pipeline flushing water disposal.

4. Disinfection Procedure Plan

1.05 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

B. Regulatory Requirements:

1. Disinfection work shall be acceptable to Utah Department of Drinking Water. If requirements of this section are in conflict with requirements of regulatory agencies, the latter shall govern.

C. Source Quality Assurance:

1. Perform Work in connection with disinfection under direction of experienced supervisor.

2. Use equipment in proper working condition and adequate for specified Work.

D. Prior to starting disinfection work, furnish detailed outline of proposed sequence of operation, manner of filling and flushing units, source and quality of water to be used, and disposal of wasted water.

E. Perform work in connection with disinfection under direction of experienced supervisor.

F. Use equipment in proper working condition and adequate for specified work. Equipment shall be specifically designed for injection of liquid and/or gas chlorine into the system.

1.06 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

1.07 PROJECT CONDITIONS:

A. Discharge of chlorinated water into watercourses or surface waters is regulated by the National Pollutant Discharge Elimination System (NPDES). Disposal of the chlorinated disinfection water and the flushing water is the Contractor's responsibility. Dechlorinate the disinfection water such that the chlorine residual is non-detectable.

PART 2 - PRODUCTS

2.01 OWNER-SUPPLIED PRODUCTS:

A. The Owner will provide potable water for the first disinfection effort. Submit request for use of water from waterlines of Owner 48 hours in advance. If bacteriological testing shows that the first disinfection effort was not successful, the Contractor will be charged, at the Owner's current rates, the cost of additional water for subsequent disinfection efforts. Contractor will be responsible for conveying the water from the source to the test site.

2.02 MATERIALS:

A. Water: Use potable water for cleaning and disinfection.

B. Chlorine: Provide in accordance with AWWA C651.

1. Liquid Chlorine: Inject with a solution feed chlorinator and a water booster pump. Follow the instructions of the chlorinator manufacturer.

2. Calcium Hypochlorite (Dry): Dissolve in water to a known concentration in a drum and pump into the pipeline at a metered rate. Tablet form calcium hypochlorite may be used only for water mains up to 12 inches in diameter and less than 2,500 feet in length.

3. Sodium Hypochlorite (Solution): Further dilute in water to desired concentration and pump into the pipeline at a metered rate.

2.03 EQUIPMENT:

A. Submit list of equipment used for disinfecting work. Equipment shall be designed specifically for chlorine injection and shall be capable of properly controlling and measuring required flow rates and dosage rates.

2.04 ACCESSORIES:

A. Chlorine Residual Test Kit: For measuring chlorine concentration, supply and use a medium range, drop count, DPD drop dilution method kit per AWWA C651, Appendix A.1. Maintain kits in good working order available for immediate test of residuals at point of sampling.

PART 3 - EXECUTION

3.01 PREPARATION:

A. Isolate new work being disinfected from system to avoid possibility of contaminating materials entering distribution system.

B. Method of disinfection for water containment devices and piping systems shall conform to AWWA C651 and SLC Standard Practice #12.

3.02 CHLORINE PREPARATION:

A. Liquid Chlorine:

1. Apply chlorine gas-water solution by means of solution feed chlorinating device or, if accepted by Engineer, dry gas may be fed directly through proper devices for regulating rate of flow and providing effective diffusion of gas into water within unit being treated.

2. Provide chlorinating devices for feeding solutions of chlorine gas that prevent backflow of water into chlorine cylinder.

B. Calcium Hypochlorite:

1. Prepare granular calcium hypochlorite as water mixture before introduction into unit. Make dry powder into paste and thin to approximately 1 percent chlorine solution.

2. To prepare chlorine solution, add 1 pound of calcium hypochlorite (65 to 70 percent available chlorine to 7-1/2 gallons of water.

3.03 PIPELINE PREPARATION:

A. After pressure and leakage tests complete, flush units thoroughly to remove foreign material.

B. Release entrapped air at high points and fill units with disinfecting agent and water to allow disinfecting agent to come in contact with interior surfaces.

C. If complete venting cannot be accomplished through available outlets, provide necessary corporation cocks and vent piping.

3.04 APPLICATION OF DISINFECTANT:

A. Point of Application:

1. Apply chlorinating agent at supply end of unit being disinfected.

2. For pipes, apply disinfectant through corporation cock installed in top of pipe.

3. Place tablets in accordance with AWWA C651.

B. Rate of Application:

1. Introduce water at controlled rate in order to regulate chlorine dosage.

2. Proportion rate of chlorine mixture flow to rate of water entering unit so chlorine dose applied produces at least 25 mg/L chlorine residual after period of 24 hours.

3. Method of determining rate of flow of water into unit being disinfected shall be accepted by Engineer.

C. Isolating Systems:

1. Keep chlorine gas-water disinfecting solution and contaminated water from flowing into units previously chlorinated and flushed.

D. Quality:

1. Retain chlorinated water in unit long enough to destroy non-spore forming bacteria.

2. Minimum retention period shall be 24 hours with chlorine residual at end of this period of not less than 25 mg/L (ppm).

E. Disinfecting Valves:

1. Operate valves and appurtenances while line or unit is being disinfected to ensure surfaces of valves are disinfected.

F. Swabbing:

1. Flush and swab pipe, fittings or valves that must be placed in service immediately with 5 percent solution of calcium hypochlorite immediately prior to assembly.

2. Secure acceptance from Engineer before using this method of disinfection.

G. Valve Operation: Performed by Owner.

3.05 DISINFECTING METHODS:

A. Continuous Feed Method:

1. Introduce potable water into the pipeline at a constant measured rate. Feed the chlorine solution into the same water at a measured rate. Proportion the two rates so that the chlorine concentration in the pipeline is maintained at a minimum concentration of 25 mg/L. Check the concentration at points downstream during the filling to ascertain that sufficient chlorine is being added.

B. Disinfection of Valves, Blind Flanges, and Appurtenances:

1. During the period that the chlorine solution is in the section of pipeline, open and close valves to obtain a chlorine residual at hydrants and other pipeline appurtenances. Swab exposed faces of valves and blind flanges prior to bolting flanges in place with a 1 percent sodium hypochlorite solution.

C. Disinfection of Connections to Existing Pipelines

1. Disinfect isolation valves, pipe, and appurtenances in accordance with AWWA C651, Section 4.7. Flush with potable water until discolored water, mud, and debris are eliminated. Swab interior of pipe and fittings with a 1 percent sodium hypochlorite solution. After disinfection, flush with potable water again until water is free of chlorine odor.

D. Disinfection of Tapping Sleeves and Line Stopping:

1. Flush exterior of pipe with potable water after removal of existing coating. Swab exterior of pipe with a 1 percent sodium hypochlorite solution. Disinfect per AWWA C651, Section 4.8. After completion of tapping and line stopping, swab interior of pipe, valves, and faces of flanges to be connected to bypass piping with a 1 percent sodium hypochlorite solution.

E. Confirmation of Residual:

1. After the chlorine solution applied by the continuous feed method has been retained in the pipeline for 24 hours, confirm that a chlorine residual of 25 mg/L minimum exists along the pipeline by sampling at air valves and other points of access, such as tapping valves.

3.06 FINAL FLUSHING AND TEST:

A. Following chlorination, flush unit or system until replacement water in system is proven to be comparable in quality to water which will enter unit or system. Follow procedures outlined in SLC Standard Practice #4.

B. Above acceptable condition of water delivered by each unit or system shall continue for at least 2 days, as demonstrated by laboratory examination of samples. Laboratory tests shall show chlorine residual, after final flushing, of less than 1 mg/L (ppm).

C. Repetition of Flushing and Testing:

1. If initial treatment results in unsatisfactory bacterial test, repeat disinfection until satisfactory results obtained.

D. Prevent entry of contaminated water into previously disinfected units or systems.

3.07 BACTERIOLOGIC TESTS:

A. Collect two sets of samples per AWWA C651, Section 5.1, from the new main at least 24-hours apart and deliver to a certified laboratory within six hours of obtaining the samples, and obtain a bacteriologic quality test to demonstrate the absence of coliform organisms in each separate section of the pipeline after chlorination and refilling. Collect at least one set of samples from every 1,200 feet of the new water main, plus one set from the end of the line and at least one set from each branch. At each connection to an existing pipeline, take two additional samples.

B. A standard heterotrophic plate count (HPC) test shall be conducted with the coliform samples. If sample results show HPC greater than 50 CFU/mL, flushing should resume and another set of HPC and coliform samples collected until no coliform are present and the HPC is less than 50 CFU/mL.

C. Repetition of Procedure: If the initial chlorination fails to produce required residuals and bacteriologic tests as outlined in SLC Standard Practice #12, repeat the chlorination and retesting until satisfactory results are obtained.

D. Test Facility Removal: After satisfactory disinfection, disinfect and replace air valves, restore the pipe coating, and complete the pipeline where temporary disinfection or test facilities were installed.

3.08 FIELD QUALITY CONTROL:

A. Owner will obtain samples for and submit to laboratory for analysis before reservoir placed in service.

B. If safe samples not obtained using above procedure, Contractor shall add additional chlorine in amounts necessary to obtain safe samples.

3.09 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

Page Intentionally Left Blank

SECTION 33 30 00

SANITARY SEWERAGE UTILITIES

PART 1 - GENERAL

1.01 SUMMARY:

A. Excluded from this section are:

1. Yard process piping between structures for water or wastewater treatment plants. Refer to Division 46 for yard process piping.

2. Water utilities within 5 feet from buildings. Refer to Division 22 for plumbing piping.

3. Force main (pressure) sanitary sewer piping. Refer to Section 40 05 33.

1.02 DESCRIPTION:

A. Provide gravity sanitary sewers and sanitary force mains beyond 5 feet from buildings to municipal sewers or other discharge system as indicated and in compliance with Contract Documents.

B. Section includes: Precast concrete maintenance holes, and cast-iron frames and covers.

1.04 DEFINITIONS:

A. Appurtenances: Additional piping items to provide a complete piping system suitable to convey wastewater as specified and intended. These items may or may not be specified, but are necessary to complete the piping system.

B. Standard Specifications: “Manual of Standard Plans and Specification – APWA Utah Chapter .

1.05 SUBMITTALS:

A. Submit the following in accordance with Section 01 33 00.

1. Pipe materials

2. Precast maintenance holes materials, dimensions, and stack drawings including pipe penetration sizes and elevations

3. Maintenance hole frame and covers

4. Pipe fittings

5. Pipe couplings

6. Pipe thrust restraint

7. Accessories

8. Appurtenances

B. Manufacturer's Certificate: Certify that products meet or exceed specified requirements.

C. Instructions: Provide manufacturer's installation instructions for pipe, valves, appurtenances, and maintenance holes.

D. Field Test Reports: Provide results for all testing performed as indicated in Subparagraph – Field Testing.

E. Project Record Documents: Provide marked-up set of drawings showing actual locations of piping, valves, connections, thrust restraints, and invert elevations. Identify and describe unexpected variations to subsoil conditions or discovery of uncharted utilities.

1.06 SPARE PARTS:

A. Comply with the requirements specified in Section 01 61 00.

B. Provide a list of recommended spare parts for the first year of operation and for the first five years of operation, including a price list and location of the nearest facility from which all spare parts can be obtained.

1.07 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

B. Perform Work in accordance with Salt Lake City Department of Public Utilities Standard Practices, APWA Utah Chapter Standard Plans and Specifications, and state and federal requirements.

C. Valves: Manufacturer’s name UL/FM**,** and pressure rating marked on valve body.

1.08 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

B. Deliver and store valves in shipping containers with labeling in place.

1.09 WARRANTY:

A. Comply with the requirements specified in Section 01 78 36.

B. Provide standard product warranties for all sanitary sewerage utility materials and as required by Salt Lake City Department of Public Utilities.

PART 2 - PRODUCTS

2.01 MANUFACTURERS:

A. Reinforced Concrete Pipe:

1. Geneva Pipe and Precast

2. Oldcastle Infrastructure

B. Plastic Pipe (PVC):

1. JM Eagle

2. Vinyltech

3. Diamond Plastics Corporation

C. Glass-Fiber Reinforced Polymer (GFRP) Pipe:

1. HOBAS

2. Flowtite

D. Precast Concrete Maintenance Hole Structures:

1. Geneva Pipe and Precast

2. Oldcastle Infrastructure

E. Precast Concrete Maintenance Hole:

1. Geneva Pipe and Precast

2. Oldcastle Infrastructure

F. Frames and Covers:

1. D&L Supply

2. East Jordan

3. Neenah Foundry

2.02 GRAVITY SANITARY SEWER PIPE:

A. Acrylonitrile-butadiene-styrene (ABS) Pipe: ASTM D2751, SDR 23.5, acrylonitrile-butadiene-styrene (ABS) material; inside nominal diameter as indicated, bell and spigot style solvent sealed joint end.

B. Polyvinyl Chloride (PVC) Pipe:

1. Pipe (4-inch through 15-inch diameter): ASTM D3034, Type PSM PVC material; minimum SDR35, nominal inside diameter as indicated.

2. Pipe (18-inch through 48-inch diameter): ASTM F679, Type PSM PVC material; minimum pipe stiffness 46 psi, nominal inside diameter as indicated.

3. End Joints: Bell and spigot per ASTM D3212.

4. Joint Device: Gasket Flexible elastomeric locked-in gasket per ASTM F477.

C. Glass-Fiber Reinforced Polymer (GFRP) Pipe:

1. Provide GFRP pipe in accordance with Section 33 30 05.

2.03 FORCE MAIN (PRESSURE) SANITARY SEWER PIPE MATERIALS:

A. Force Main (Pressure) Sewer Pipe shall be high-density polyethylene (HDPE) pressure pipe and fittings per Section 40 05 33. .

2.04 PRECAST CONCRETE MAINTENANCE HOLES:

A. Maintenance Holes shall be in accordance with section 33 95 15.

B. Maintenance Hole Steps: Steps within maintenance hole structure shall not be allowed.

2.05 MAINTENANCE HOLE FRAME AND COVERS:

A. Frame and Cover: In accordance with section 33 95 15. Lid provided with embossed lettering saying “SANITARY SEWER” or “PROCESS DRAIN” cast into cover.

2.06 BEDDING AND COVER MATERIALS:

A. As specified in Section 31 23 00.

2.07 THRUST RESTRAINT:

A. See Section 40 05 33 – High-Density Polyethylene HDPE Pressure Pipe and Fittings.

2.08 ACCESSORIES:

A. Flexible Couplings: Sleeve type elastomeric polyvinyl chloride held firmly to pipe ends by screw-tightened bands. Bands and screws Type 304 stainless steel.

2.09 APPURTENANCES:

A. Provide all necessary appurtenances for a full and complete piping system suitable for operation, and in conformance with Project Documents.

2.10 SHOP PAINTING/COATINGS:

A. Unless otherwise specified or indicated, provide standard manufacturer paint and coatings for all piping and valves to prevent corrosion for the life of the component.

2.11 SHOP TESTING:

A. Test all pipes and valves per manufacturer requirements, and as required by pertinent Standards.

B. Provide notice to the Engineer and Owner in advance of the proposed test and requirements for the test including measurements to be taken, submittal requirements, etc.

PART 3 - EXECUTION

3.01 EXAMINATION:

A. Verify that trench cut is ready to receive work and excavations, dimensions, and elevations are as indicated for sanitary sewer pipe. Verify excavation for maintenance holes to proper depth and proper placement of bedding material.

3.02 PREPARATION:

A. Sanitary sewer pipe: Hand trim excavations to required elevations. Correct over excavation with stabilization material. Remove large stones or other hard matter which could damage pipe or impede consistent backfilling or compaction.

B. Maintenance Holes: Coordinate placement of inlet and outlet pipe sleeves. Seal exterior surface of sanitary sewer maintenance holes with minimum 14-mil-thick coal tar coating.

3.03 SANITARY SEWER PIPE INSTALLATION:

A. Maintain separation of sanitary sewers pipe and water mains as indicated in Specification Section 33 10 00.

B. Install pipe, fittings, and accessories in accordance with ASTM D2321 and manufacturer's instructions. Seal joints watertight.

C. Lay pipe to slope indicated; with maximum variation from true slope of 1/8-inch in 10 feet. Lay pipe upgrade, with spigot ends pointing in direction of flow. Lay pipe to form a close concentric joint with adjoining section and to prevent sudden offsets in flow line.

D. Install bedding to depths and dimensions as indicated.

E. Backfill each section of pipe as it is laid, as specified in Section 31 23 00 and as indicated at least up to centerline, before next joint is made. Do not completely conceal or bury pipe prior to being tested for water tightness and prior to being accepted by the Engineer. Do not displace or damage pipe when compacting.

F. Clear the interior of the pipe of dirt and superfluous materials as the work progresses. Keep a suitable swab or drag in the pipe and pull it forward past each joint immediately after the jointing has been completed.

G. Keep trenches and other excavations free of water until final inspection. Do not lay pipe or construct masonry work in water. Do not allow water to rise over the work until concrete or mortar has had ample time to set.

H. Close open ends of pipe and fittings in a manner acceptable to the Engineer when the work is not in progress so that trench water, earth and other substances will not enter the pipe or fittings.

I. Handle pipe and fittings to avoid damage. Carefully inspect pipe and fittings for defects before lowering into the trench.

J. Where necessary deflect pipelines to avoid obstructions or where long-radius curves are indicated. Do not exceed the maximum deflection recommended by pipe manufacturer. Provide short sections of pipe as necessary to maintain required line.

K. Provide compatible pipe connections to each valve and to equipment. Provide unions on pipelines with welded soldered or threaded joints to allow removal of each valve and equipment without disturbing connecting pipelines. Connect different types of pipe and accessories with flexible couplings or pipe and accessories with flexible couplings or accepted transition fittings. Provide insulation fittings where ferrous pipe connects to nonferrous metallic pipe.

L. Verify invert of each existing maintenance hole prior to commencing work. Connect to each existing maintenance hole where indicated or directed. Prevent debris from entering the pipelines. The work includes all necessary concrete work, cutting and shaping of invert.

M. Repair linings, coatings and coverings damaged during construction with accepted materials equal to and compatible with original lining, coating or covering. Repair damaged galvanizing with zinc-rich paint.

N. Connect to building sanitary sewer outlet as indicated.

3.04 PRECAST CONCRETE MAINTENANCE HOLE INSTALLATION:

A. Maintain separation of sanitary sewer precast concrete maintenance holes and water mains as indicated in Specification Section 33 10 00.

B. Place precast maintenance hole sections plumb and level, adjust to correct elevation. Provide bedding material as indicated and to APWA Utah Chapter standard .

C. After maintenance hole assembly, plug lift holes with non-shrink grout.

D. Cut and fit for pipe connections.

E. Invert Channels:

1. Built up with concrete, grout, or brick and mortar covered by not less than 2 inches of mortar.

2. Smooth and semicircular, conforming to inside of adjacent sewer section.

3. Changes in direction of flow made with a smooth curve radius as large as maintenance hole size will permit.

4. Slope floor of maintenance hole outside channels, smooth and not less than 1 inch per foot nor more than 2 inches per foot.

F. Set maintenance hole frames and covers level to correct elevations.

G. Sanitary sewer drop connections: Provide where indicated. Construct drop connection as indicated and according to APWA Utah Chapter Standard.

3.05 REPAIR/RESTORATION:

A. Repair any existing utilities/structures, or features damaged during installation of sanitary sewerage utilities to Owner's satisfaction, and at no cost to Owner.

3.06 FIELD TESTING:

A. General:

1. Perform field-testing under provisions of Section 01 43 00.

2. Request inspection by Owner's Representative prior to and immediately after placing bedding.

B. Cleaning and Testing:

1. Test for Displacement of Buried Sanitary Sewers: After trench has been backfilled and compacted, after cover over pipeline has been brought to finished grade, and after debris and silt has been removed, pipelines will be tested by the Engineer, as follows: Light will be flashed between maintenance holes, or, if maintenance holes have not yet been constructed, between locations of maintenance holes, by means of flashlight or by reflecting sunlight with mirror. Correct poor alignment, displaced pipe, and other defects indicated by the Engineer.

2. Test for Deflection of PVC Sanitary Sewers

3. Measure pipelines for vertical ring deflection within 15 days after completion of backfill and at least 4 months after installation, but no later than 30 days before substantial completion of the project. Limit maximum ring deflection of pipeline under load to 5 percent of vertical internal pipe diameter. Relay or replace pipe exceeding this deflection and retest.

4. Use deflectometer that produces continuous record of pipe deflection or pull mandrel, sphere, or pin-type go/no-go device through the pipeline. Make diameter of the go/no-go device 95 percent of undeflected inside diameter of pipe.

5. Cleaning: Flush out and clean sanitary force mains of foreign matter before placing systems into operation. Use flushing velocity of 10 feet per second, minimum. Take care to prevent scale and other objectionable matter from entering piping. Properly dispose of water used for flushing.

6. Force Main Pressure Test: Per Section 40 05 33.

7. Testing of Sanitary Sewers: At such times as Engineer may direct, prove watertightness of buried sanitary sewer or portions thereof by one of the following tests. Conduct tests under supervision of the Engineer. Furnish materials, labor, and equipment required for tests and repair system until test results are satisfactory.

8. Infiltration: When, in opinion of the Engineer, trench or excavation is sufficiently saturated by groundwater or rain, tests may be made on basis of infiltration. Infiltration tests will only be allowed when hydrostatic head outside pipe is minimum of 4 feet above crown of pipe for entire length of pipe being tested. Measure flow of water at nearest downgrade maintenance hole. Make three series of measurements at intervals of not less than 1 hour, and average results. Using this average, calculate infiltration rate for 24-hour period. Infiltration rate: Not greater than 100 gallons per inch of pipe diameter per mile per day in any section of system including maintenance holes.

9. Exfiltration: When conditions are not suitable for infiltration test, subject pipe to hydrostatic head of at least 4 feet above pipe crown. Fill line until appropriate water level is obtained at selected upstream maintenance hole. Observe rate of drop at this maintenance hole for 1 hour. Leakage rate: Not to exceed maximum rate allowed for infiltration.

10. Air Test: At Contractor's option, low-pressure air test may be used instead of exfiltration test for vitrified clay, PVC, and concrete pipelines 12 inches and smaller. Perform tests in accordance with ASTM C828 for vitrified clay pipelines, UNI B6 for PVC pipelines, and ASTM C924 for concrete and ductile iron pipelines.

11. Vacuum test: For precast concrete maintenance holes 25 feet deep and less, a vacuum test may be used instead of exfiltration test. Conduct tests prior to backfilling and include joint between maintenance hole cover and frame. Plug and brace pipe openings. Draw vacuum of 10 inches of mercury. Minimum time to drop to 9 inches of mercury follows:

Table 33 30 00-1			
	Maintenance Hole Diameter in Inches		
Depth in Feet	48	60	72
Up to 10	60 sec.	75 sec.	90 sec.
10.01-15	75 sec.	90 sec.	105 sec.
15.01-25	90 sec.	105 sec.	120 sec.

12. If maintenance hole fails the test, make necessary repairs and repeat the vacuum test and repairs until maintenance hole passes test. Submit test results.

3.07 STARTUP AND TESTING:

A. Provide services of factory-trained Service Technician, specifically trained on type of equipment specified:

1. Service Technician must be present on site for all items listed below. Person-day requirements listed are exclusive of travel time, and do not relieve Contractor of the obligation to place equipment in operation as specified.

2. Comply with requirements for checkout, startup, and testing in Section 01 78 25.

3. Physical Checkout and Field Testing (Functional Completion Testing): Inspect grouting, location of anchor bolts; setting, leveling, alignment, field erection; coordination of piping, electrical and miscellaneous utility connections; certify proper installation:

   a. 1 person-day

4. Startup: Calibrate, check alignment and perform a functional test with water or process fluid. Tests to include all items specified.

   a. 1 person-day

5. Commissioning: Field performance test equipment specified.

   a. 2 person-days

3.08 FIELD PAINTING/COATINGS:

A. Repair any shop painting/coatings damaged during storage or installation to Owner's satisfaction.

3.09 ADJUSTING:

A. Coordinate with Engineer for any field adjustments. The Engineer reserves the right to reject any field adjustments.

3.10 PROTECTION:

A. Protect sanitary sewerage utilities from damage throughout storage, installation, testing, and final acceptance.

3.11 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 33 30 05
GLASS-FIBER REINFORCED POLYMER (GFRP) PIPE

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Glass-Fiber Reinforced Polymer (GFRP) Pipe for jacking installation and direct burial installation.

1.02 REFERENCES

A. ASTM International (ASTM):

1. D638: Test Method for Tensile Properties of Plastics

2. D2412: Standard Test Method for Determination of External Loading Characteristics of Plastic Pipe by Parallel-Plate Loading

3. D3262: Standard Specification for “Fiberglass” (Glass-Fiber-Reinforced Thermosetting-Resin) Sewer Pipe

4. D3681: Standard Test Method for Chemical Resistance of “Fiber glass” Pipe in a Deflected Condition

5. D4161: Standard Specification for “Fiberglass” (Glass-Fiber-Reinforced Thermosetting-Resin) Pipe Joints Using Flexible Elastomeric Seals

1.03 SUBMITTALS:

A. Submit the following in accordance with Section 01 33 00.

1. Pipe materials

2. Pipe fittings

3. Pipe couplings

4. Accessories

B. Manufacturer's Certificate: Certify that products meet or exceed specified requirements.

C. Instructions: Provide manufacturer's installation instructions for pipe.

D. Field Test Reports: Provide results for all testing performed as indicated in Subparagraph – Field Testing.

E. Project Record Documents: Provide marked-up set of drawings showing actual locations of piping, valves, connections, thrust restraints, and invert elevations. Identify and describe unexpected variations to subsoil conditions or discovery of uncharted utilities.

1.04 SPARE PARTS:

A. Comply with the requirements specified in Section 01 61 00.

1.05 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

B. Perform Work in accordance with municipality standards.

1.06 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

1.07 WARRANTY:

A. Comply with the requirements specified in Section 01 78 36.

B. Provide standard product warranties for all sanitary sewerage utility materials and as required by municipality standards.

PART 2 PRODUCTS

2.01 MATERIALS:

A. The Manning's n factor shall be a maximum of 0.009.

B. Resin Systems: The manufacturer shall use only polyester resin systems with a proven history of performance in this particular application. The historical data shall have been acquired from a composite material of similar construction and composition as the proposed product.

C. Glass Reinforcements: The reinforcing glass fibers used to manufacture the components shall be of highest quality commercial grade E-glass filaments with binder and sizing compatible with impregnating resins.

D. Additives: Resin additives, such as curing agents, pigments, dyes, fillers, thixotropic agents, etc., when used, shall not detrimentally affect the performance of the product.

E. Elastomeric Gaskets: Gaskets shall meet ASTM F477 and be supplied by qualified gasket manufacturers and be suitable for the service intended.

2.02 MANUFACTURE AND CONSTRUCTION:

A. Installation: GFRP pipes shall conform to the requirements for jacking installation and direct burial installation based on pipe size.

1. Jacking: All 85-inch nominal diameter GFRP pipes as shown on the construction drawings shall meet the jacking pipe requirements outlined in this specification.

2. Burial: All GFRP pipes smaller than 85-inch nominal diameter as shown on the construction drawings shall meet the burial pipe requirements outlined in this specification.

B. Pipes: Manufacture pipe by a casting process to result in a dense, nonporous, corrosion-resistant, consistent composite structure. The interior surface of the pipes exposed to sewer flow shall provide crack resistance and abrasion resistance. The exterior surface of the pipes shall provide UV protection to the exterior. Pipes shall be Type 1, Liner 1 or 2, Grade 1 or 3 per ASTM D3262.

1. Jacking: Pipe shall be designed to withstand the microtunneling subcontractor's jacking loads and ground conditions as presented in the Project Geotechnical Baseline Report (GBR). Detailed calculations shall be submitted to the Engineer for approval prior to its procurement/manufacture. Jacking pipe will have a x 4 SF for allowable maximum jacking load v ultimate compression load

2. Burial: Pipe shall be designed to withstand the installation method and ground conditions as presented in the Project GBR. Detailed calculations shall be submitted to the Engineer for approval prior to its procurement/manufacture.

C. Joints:

1. Jacking: Unless otherwise specified, the pipe shall be field connected with fiberglass bell – spigot type couplings, the bell will be fixed permanently to the bell end of the pipe, joints will utilize elastomeric sealing gaskets as the sole means to maintain joint water tightness. The joints must meet the performance requirements of ASTM D4161. The joint shall have approximately the same O.D. and ID of the pipe, so when the pipes are assembled, the joints are essentially flush with the pipe inside and outside surface. The joints will maintain their seal and meet all requirements outlined in this specification with a joint gap of 2 inches. Joints at tie-ins, when needed, may utilize gasket-sealed closure couplings.

2. Burial: Unless otherwise specified, the pipe shall be field connected with fiberglass sleeve couplings that utilize elastomeric sealing gaskets as the sole means to maintain joint water tightness. The joints must meet the performance requirements of ASTM D4161. Joints at tie-ins, when needed, may utilize gasket-sealed closure couplings.

D. Fittings: Flanges, elbows, reducers, tees, wyes, laterals and other fittings shall be capable of withstanding all operating conditions when installed. They may be contact molded or manufactured from mitered sections of pipe joined by glass-fiber-reinforced overlays.

2.03 DIMENSIONS

A. Diameters: The actual outside diameter of the pipes shall be in accordance with ASTM D3262. For other diameters, OD's shall be per manufacturer's literature.

B. Lengths:

1. Jacking: Pipe shall be supplied in nominal lengths of 10 feet. Actual laying length shall be nominal +1, -4 inches. At least 90 percent of the total footage of each size and class of pipe, excluding special order lengths, shall be furnished in nominal length sections.

2. Jacking pipe will be supplied with 3-inch x 2-inch NCP threaded lubrication/ grouting ports every 10 feet of pipe, ports will be equally spaced at 120 degrees around the pipe circumference

3. Direct bury pipe will be supplied and installed in 20' pipe lengths unless noted overwise on drawings.

C. Wall Thickness:

1. Jacking:

a. The minimum wall thickness, measured at the bottom of the spigot gasket groove where the wall cross-section has been reduced, is determined from the maximum jacking load. Minimum factor of safety (FoS) against jacking force shall be equal to 4 based on the straight drives for the ICST. The Contractor shall use inter-jacking stations as required to reduce the thrust needed to advance the jacking pipe through the ground to meet the minimum FoS equal to 3. In the case where pipe manufacturer's casting molds are Outside Diameter (OD) controlled, the pipe's wall thickness shall not be increased in order to increase the allowable jacking loads to meet the required FoS which would compromise the pipe's inside diameter (ID) tolerances as specified below in Provision 2.03.C.1.a.1:

(1) The ID of the jacking pipe shall have an 1/8-inch tolerance, resulting in an ID between 82.675-inches and 82.925-inches

D. End Squareness:

1. Jacking: Pipe ends shall be square to the pipe axis with a maximum tolerance of 1/16-inch.

2. Burial: Pipe ends shall be in accordance with ASTM D3262.

2.04 TESTING:

A. Pipes: Pipes shall be manufactured and tested in accordance with ASTM D3262.

B. Joints: Joints shall meet the requirements of ASTM D4161.

C. Stiffness:

1. Jacking: Minimum pipe stiffness per manufacturer design, when tested in accordance with ASTM D2412 shall normally be 140 psi minimum.

2. Direct Bury: Minimum pipe stiffness per manufacturer design when tested in accordance with ASTM D2412 shall normally be 72 psi minimum.

2.05 CUSTOMER INSPECTION:

A. The Owner or other designated representative shall be entitled to inspect pipes or witness the pipe manufacturing.

B. Manufacturer's Notification to Customer: Should the Owner request to see specific pipes during any phase of the manufacturing process, the manufacturer must provide the Owner with adequate advance notice of when and where the production of those pipes will take place.

2.06 PACKAGING, HANDLING, AND SHIPPING:

A. Packaging, handling, and shipping shall be done in accordance with the manufacturer's instructions.

PART 3 EXECUTION

3.01 INSTALLATION:

A. Installation: The installation of pipe and fittings shall be in accordance with the project plans and specifications and the manufacturer's requirements.

B. Pipe Handling: Use textile slings, other suitable materials or a forklift. Use of chains or cables is not permitted.

C. Jointing:

1. Clean ends of pipe and joint components.

2. Apply joint lubricant to the bell interior surface and the elastomeric seals. Use only lubricants approved by the pipe manufacturer.

3. Use suitable equipment and end protection to push the pipes together.

4. Do not exceed forces recommended by the manufacturer for joining or pushing pipe.

3.02 REPAIR/RESTORATION:

A. Repair any existing utilities/structures or features damaged during installation of sanitary sewerage utilities to Owner's satisfaction, and at no cost to Owner. Restore roadway trenches and patches per APWA Plan 255 and APWA Plan 256.

3.03 FIELD TESTING:

A. General:

1. Request inspection by Owner's Representative prior to placing bedding.

B. Cleaning and Testing:

1. Test for Displacement of Buried Sanitary Sewers: After trench has been backfilled and compacted, after cover over pipeline has been brought to finished grade, and after debris and silt has been removed, pipelines will be tested by the Engineer, as follows: Light will be flashed between maintenance holes, or, if maintenance holes have not yet been constructed, between locations of maintenance holes, by means of flashlight or by reflecting sunlight with mirror. Correct poor alignment, displaced pipe, and other defects indicated by the Engineer.

2. Cleaning: Flush out and clean sanitary force mains of foreign matter before placing systems into operation. Use flushing velocity of 10 feet per second, minimum or power washing as approved by Engineer. Take care to prevent scale and other objectionable matter from entering piping. Properly dispose of water used for flushing.

3. Deflection:

a. Jacking: Maximum allowable long-term deflection is 3 percent of the initial diameter.

b. Burial: Maximum allowable long-term deflection is 5 percent of the initial diameter

4. Testing of Sanitary Sewers: At such times as Engineer may direct, prove water tightness of buried sanitary sewer or portions thereof by one of the following tests. Conduct tests under supervision of the Engineer. Furnish materials, labor, and equipment required for tests and repair system until test results are satisfactory.

5. Infiltration: When, in opinion of the Engineer, trench or excavation is sufficiently saturated by groundwater or rain, tests may be made on basis of infiltration. Infiltration tests will only be allowed when hydrostatic head outside pipe is minimum of 4 feet above crown of pipe for entire length of pipe being tested. Measure flow of water at nearest downgrade maintenance hole. Make three series of measurements at intervals of not less than 1 hour, and average results. Using this average, calculate infiltration rate for 24-hour period. Infiltration rate: Not greater than 100 gallons per inch of pipe diameter per mile per day in any section of system including maintenance holes.

6. Exfiltration: When conditions are not suitable for infiltration test, subject pipe to hydrostatic head of at least 4 feet above pipe crown. Fill line until appropriate water level is obtained at selected upstream maintenance hole. Observe rate of drop at this maintenance hole for 1 hour. Leakage rate: Not to exceed maximum rate allowed for infiltration.

7. Vacuum test: For precast concrete maintenance holes 25 feet deep and less, a vacuum test may be used instead of exfiltration test. Conduct tests prior to backfilling and include joint between maintenance hole cover and frame. Plug and brace pipe openings. Draw vacuum of 10 inches of mercury. Minimum time to drop to 9 inches of mercury follows:

Table 33 30 05-1

	Maintenance Hole Diameter in Inches		
Depth in Feet	48	60	72
Up to 10	60 sec.	75 sec.	90 sec.
10.01-15	75 sec.	90 sec.	105 sec.
15.01-25	90 sec.	105 sec.	120 sec.

8. If maintenance hole fails the test, make necessary repairs and repeat the vacuum test and repairs until maintenance hole passes test. Submit test results.

3.04 FIELD PAINTING/COATINGS:

A. Repair any shop painting/coatings damaged during storage or installation to Owner's satisfaction.

3.05 ADJUSTING:

A. Coordinate with Engineer for any field adjustments. The Engineer reserves the right to reject any field adjustments.

3.06 PROTECTION:

A. Protect sanitary sewerage utilities from damage throughout storage, installation, testing, and final acceptance.

3.07 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 33 39 15

MAINTENANCE HOLES AND STRUCTURES

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide maintenance hole and structures as indicated and in compliance with Contract Documents.

B. Requirements for precast concrete vaults are provided in Section 03 48 18 – Precast Reinforced Concrete Vaults.

1.02 REFERENCES:

A. American Concrete Institute (ACI):

1. 318: Building Code Requirements for Structural Concrete

B. ASTM International (ASTM):

1. A48: Standard Specification for Gray Iron Castings

2. A123: Standard Specification for Zinc (Hot-Dip Galvanized) Coatings on Iron and Steel Products

3. A615: Standard Specification for Deformed and Plain Carbon-Steel Bars for Concrete Reinforcement.

4. C478: Standard Specification for Precast Reinforced Concrete Manhole Sections

5. C877: Standard Specification for External Sealing Bands for Concrete Pipe, Manholes, and Precast Box Sections

6. C913: Standard Specification for Precast Concrete Water and Wastewater Structures

7. C923: Standard Specification for Resilient Connectors Between Reinforced Concrete Manhole Structures, Pipes, and Laterals

8. C990: Standard Specification for Joints for Concrete Pipe, Manholes, and Precast Box Sections Using Preformed Flexible Joint Sealants

1.03 DESIGN REQUIREMENTS:

A. Equivalent Strength: Based on structural design of reinforced concrete as outlined in ACI 318.

B. Design of Lifting Devices for Precast Components: In accordance with ASTM C913.

C. Design of Joints for Precast Components: In accordance with ASTM C913; maximum leakage of 0.025 gallons per hour per foot of joint at 3 feet of head.

D. Design and install maintenance hole and structure to withstand hydrostatic uplift caused by a groundwater elevation at 3 feet below grade level. Use only the weight of the maintenance hole and structure and hold-down slab to resist hydrostatic uplift with a minimum safety factor of 1.15. Do not include side friction of soils on walls.

1.04 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

1. Shop Drawings: Indicate maintenance hole and structure locations, elevations, piping, and conduit, sizes and elevations of penetrations.

2. Product Data: Submit cover and frame construction, features, configuration, dimensions.

3. One copy of results of tests and certification reports with each shipment of materials.

4. If manufacturer's test data is inadequate or unavailable, Engineer reserves right to require cores drilled for compressive strength tests.

5. Reinforcing Steel: Certificate of compliance with specifications.

6. Cement: Certificate of compliance with specifications.

7. Aggregates: Certificate of compliance with specifications.

1.05 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.06 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

B. Perform work in accordance with American Public Works Association (APWA) standard.

C. Maintain one copy of each document on-site.

D. Manufacturer: Company specializing in manufacturing products specified in this Section with minimum three years documented experience.

E. Inspection by Engineer:

1. At site of work after delivery.

2. Reject precast concrete maintenance holes and structures at any time if it fails to meet specified requirements, even if accepted at plant.

3. Immediately remove rejected precast concrete maintenance holes and structures from site.

1.07 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

B. Comply with precast concrete manufacturer's instructions for unloading, storing and moving precast maintenance holes and structures.

C. Store precast concrete maintenance holes and structures to prevent damage to Owner's property or other public or private property. Repair property damaged from materials storage.

D. Mark each precast maintenance hole and structure by indentation or waterproof paint showing date of manufacture, manufacturer, and identifying symbols and numbers shown on Drawings to indicate its intended use.

1.08 PROJECT/SITE CONDITIONS:

A. Maintain materials and surrounding air temperatures to minimum 50 degrees F prior to, during, and 48 hours after completion of masonry work.

B. Cold Weather Requirements: ACI 530.

PART 2 - PRODUCTS

2.01 MAINTENANCE HOLES AND STRUCTURES:

A. Manufacturers:

1. Geneva Pipe and Precast, Inc.

2. Oldcastle Infrastructure, Inc.

3. Harper Precast

B. Maintenance Hole and Structure Sections: Reinforced precast concrete in accordance with ASTM C478 with butyl-rubber sealants, Conseal CS-102 or Ram-Nek RN101 in accordance with ASTM C990. Wrap exterior section joints with membrane waterproofing and exterior joint wrap meeting the requirements of ASTM C877, Type III, Marmac, Conseal CS212, or Press-Seal Corp EA-Wrap.

C. Pipe Connections: Barrel section to pipe connections shall be sealed with resilient connectors, Kor-N-Seal by Trelleborg, complying with ASTM C923. Mechanical devices shall be stainless steel.

2.02 FRAMES AND COVERS:

A. Manufacturers:

1. D&L Supply Company

2. East Jordan Iron Works (EJ)

3. Neenah Foundry

B. Product Description: Shall be non-rocking conforming to ASTM A48, Class 30B cast iron construction or ASTM A536, Grade 60-40-18 ductile iron construction. Machined flat bearing surface, removable lid; rated for AASHTO HS-20 loading, unless noted otherwise. Unless noted otherwise, covers and frames shall be 30-inches in diameter, non-vented, machined flat bearing surface, removable lid; with embossed lettering saying “STORM DRAIN” or “SANITARY SEWER” as applicable cast into cover.

C. Base Pad: Cast-in-place concrete of type specified in Section 03 30 00, leveled top surface or precast concrete base section.

2.03 CONFIGURATION:

A. Shaft Construction: Concentric with eccentric cone or flat top section; lipped male/female dry joints; sleeved to receive pipe and conduit sections.

B. Shape: Cylindrical, Square, or Rectangular, as indicated on the drawings.

C. Clear Inside Dimensions: As indicated on Drawings.

D. Design Depth: As indicated on Drawings.

E. Clear Cover Opening: 30 inches diameter minimum or as indicated on Drawings.

F. Pipe and/or Conduit Entry: Furnish openings as indicated on Drawings. Barrel section to pipe connections shall be sealed with resilient connectors, Kor-N-Seal by Trelleborg;

Press-Seal Corporation; or A-Lok Products, Inc., complying with ASTM C923. Mechanical devices shall be stainless steel.

G. Steps: 14 inches wide, 12 inches on center vertically, set into maintenance hole and structure wall.

2.04 BEDDING AND COVER MATERIALS:

A. Bedding: Fill Type as specified in Section 31 23 00.

B. Cover: Fill Type, as specified in Section 31 23 00.

C. Soil Backfill from Above Pipe to Finish Grade: Soil Type, as specified in Section 31 23 00. Subsoil with no rocks over 6 inches in diameter, frozen earth, or foreign matter.

PART 3 - EXECUTION

3.01 EXAMINATION:

A. Verification of existing conditions before starting work.

B. Verify items provided by other sections of Work are properly sized and located.

C. Verify built-in items are in proper location, and ready for roughing into Work.

D. Verify correct size of maintenance hole and structure excavation.

3.02 PREPARATION:

A. Coordinate placement of inlet and outlet pipe or duct sleeves required by other sections.

B. Do not install structures where site conditions induce loads exceeding structural capacity of structures.

C. Inspect precast concrete structures immediately prior to placement in excavation to verify structures are internally clean and free from damage. Remove and replace damaged units.

3.03 INSTALLATION:

A. Excavation and Backfill:

1. Excavate for maintenance holes and structures in accordance with Section 31 23 00 in location and to depth shown. Provide clearance around sidewalls of structure for construction operations.

2. When groundwater is encountered, prevent accumulation of water in excavations. Place maintenance holes and structures in dry trench.

3. Where possibility exists of watertight structure becoming buoyant in flooded excavation, anchor structure to avoid flotation.

B. Place base pad, trowel top surface level.

C. Place maintenance hole and structure sections plumb and level, trim to correct elevations, anchor to base pad.

D. Backfill excavations for maintenance holes and structures in accordance with Section 31 23 00.

E. Grout base of shaft sections to achieve slope to exit piping. Trowel smooth. Contour to form continuous drainage channel as indicated on Drawings.

F. Set cover frames and covers level without tipping, to correct elevations.

G. Coordinate with other sections of Work to provide correct size, shape, and location.

3.04 PRECAST CONCRETE MAINTENANCE HOLE AND STRUCTURE INSTALLATION:

A. Lift precast components at lifting points designated by manufacturer.

B. When lowering maintenance hole and structures into excavations and joining pipe to units, take precautions to ensure interior of pipeline and structure remains clean.

C. Set precast structures bearing firmly and fully on crushed stone bedding, compacted in accordance with provisions of Section 31 23 00 or on other support system shown on Drawings.

D. Assemble multi-section structures by lowering each section into excavation. Lower, set level, and firmly position base section before placing additional sections.

E. Remove foreign materials from joint surfaces and verify sealing materials are placed properly. Maintain alignment between sections by using guide devices affixed to lower section.

F. Joint sealing materials may be installed on site or at manufacturer’s plant.

G. Verify maintenance holes and structures installed satisfy required alignment and grade.

H. Remove knockouts or cut structure to receive piping without creating openings larger than required to receive pipe. Fill annular space with mortar.

I. Cut pipe to finish flush with interior of structure.

J. Install exterior joint wrap per manufacturer's written installation instructions. Wrap shall extend 12 inches above and 12 inches below the joint.

K. Shape inverts through maintenance hole and structures as shown on Drawings.

3.05 CAST-IN-PLACE CONCRETE MAINTENANCE HOLE AND STRUCTURE INSTALLATION:

A. Prepare crushed stone bedding or other support system shown on Drawings, to receive base slab as specified for precast structures.

B. Erect and brace forms against movement in accordance with Section 03 10 00.

C. Install reinforcing steel as indicated on Drawings and in accordance with Section 03 21 00.

D. Place and cure concrete in accordance with Section 03 30 00.

3.06 FRAME AND COVER INSTALLATION:

A. Set frames using precast concrete grade rings. Maximum height of grades rings shall be 12 inches.

B. Set frame and cover 2 inches above finished grade for maintenance holes and structures with covers located within unpaved areas to allow area to be graded away from cover beginning 1 inch below top surface of frame.

3.07 FIELD QUALITY CONTROL:

A. Section 01 45 00: Field inspecting, testing, adjusting, and balancing.

B. Test cast-in-place concrete in accordance with Section 03 30 00.

C. Vertical Adjustment of Existing Maintenance holes and Structures:

1. Where required, adjust top elevation of existing maintenance holes and structures to finished grades shown on Drawings.

2. Reset existing frames, grates and covers, carefully removed, cleaned of mortar fragments, to required elevation in accordance with requirements specified for installation of castings.

3. Remove concrete without damaging existing vertical reinforcing bars when removal of existing concrete wall is required. Clean vertical bars of concrete and bend into new concrete top slab or splice to required vertical reinforcement, as indicated Drawings.

4. Clean and apply sand-cement bonding compound on existing concrete surfaces to receive cast-in-place concrete in accordance with Section 03 30 00.

D. Precast Concrete Maintenance Hole Test:

1. Vacuum test: For precast concrete maintenance holes 25 feet deep and less, a vacuum test may be used instead of exfiltration test. Conduct tests prior to backfilling and include joint between maintenance hole cover and frame. Plug and brace pipe openings. Draw vacuum of 10 inches of mercury. Minimum time to drop to 9 inches of mercury follows:

Table 33 39 15-1

	Maintenance Hole Diameter in Inches		
Depth in Feet	48	60	72
Up to 10	60 sec.	75 sec.	90 sec.
10.01-15	75 sec.	90 sec.	105 sec.
15.01-25	90 sec.	105 sec.	120 sec.

2. If maintenance hole fails the test, make necessary repairs and repeat the vacuum test and repairs until maintenance hole passes test. Submit test results.

3.08 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 33 40 00

STORM DRAINAGE UTILITIES

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide storm drainage utilities as indicated and in compliance with Contract Documents.

B. This section specifies storm drainage systems from 5 feet outside the building and excludes interceptors, storm separators, or sub-drainage.

C. Section includes:

1. Storm drainage piping, fittings, and accessories.

2. Storm drainage catch basins, inlets, area drains, maintenance holes or other structures.

1.02 REFERENCES:

A. American Association of State Highway and Transportation Officials (AASHTO):

9. C990: Standard Specification for Joints for Concrete Pipe, Manholes, and Precast Box Sections Using Preformed Flexible Joint Sealants.

10. C1103: Standard Practice for Joint Acceptance Testing of Installed Precast Concrete Pipe Sewer Lines

11. D1785: Standard Specification for Poly(Vinyl Chloride) (PVC) Plastic Pipe, Schedules 40, 80, and 120.

12. D2729: Standard Specification for Poly(Vinyl Chloride) (PVC) Sewer Pipe and Fittings.

13. D3034: Standard Specification for Type PSM Poly(Vinyl Chloride) (PVC) Sewer Pipe and Fittings.

14. D3212: Standard Specification for Joints for Drain and Sewer Plastic Pipes Using Flexible Elastomeric Seals.

15. F477: Standard Specification for Elastomeric Seals (Gaskets) for Joining Plastic Pipe

16. F679: Standard Specification for Poly(Vinyl Chloride) (PVC) Large-Diameter Plastic Gravity Sewer Pipe and Fittings

17. F1417: Standard Practice for Installation Acceptance of Plastic Non-pressure Sewer Lines Using Low-Pressure Air

1.03 DEFINITIONS:

A. Catch Basin or Catchbasin: A special type of inlet structure designed to retain sediment and debris transported by stormwater into the storm drainage system.

1.04 SUBMITTALS:

A. Submit the following in accordance with Section 01 33 00.

1. Sustainable Design Submittals.

2. Shop Drawings:

a. Precast Concrete Structures: Indicate locations, dimensions, configuration, thicknesses, elevations, sizes, and penetration elevations.

3. Product Data:

   a. Pipe: Material, pipe accessories, and manufacturer's installation instructions.

4. Certificates: Manufacturer's certificate stating that product meets or exceeds specified requirements.

5. Project Record Documents: Provide record drawings of actual pipe run locations, connections, structures, and invert elevations.

6. Testing results.

1.05 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.06 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

B. Conform to Standard Practices for Salt Lake City Public Utilities for materials and installation of work specified in this section.

1.07 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

PART 2 - PRODUCTS

2.01 PIPE MATERIALS:

A. Reinforced Concrete Pipe (RCP):

1. Pipe: ASTM C76, minimum Class III, unless noted otherwise; nominal inside diameter as indicated.

2. End Joints: Bell and spigot for pipes 12-inch diameter through 48-inch diameter. Tongue and groove for pipes 60-inch diameter and larger.

3. Joint Device:

   a. Water Tight: ASTM C443, rubber compression gasket.

   b. Manufacturer:

      (1) Geneva Pipe and Precast

      (2) Oldcastle Infrastructure

B. Plastic Pipe (PVC):

1. Pipe (4-inch through 15-inch diameter): ASTM D3034, Type PSM PVC material; minimum SDR35, nominal inside diameter as indicated.

2. Pipe (18-inch through 48-inch diameter): ASTM F679, Type PSM PVC material; minimum pipe stiffness 46 psi, nominal inside diameter as indicated.

3. End Joints: Bell and spigot per ASTM D3212.

4. Joint Device: Gasket Flexible elastomeric locked-in gasket per ASTM F477.

5. Manufacturer:

a. JM Eagle

b. Vinyltech

c. Diamond Plastics Corporation

C. Plastic Pipe (HDPE): AASHTO M294, Type S; high density polyethylene (HDPE) material; smooth interior and annular-corrugated exterior; bell shall be an integral part of the pipe and shall be watertight in accordance with ASTM D3212. Pipe gaskets shall be meet the requirements of ASTM F477 and shall be manufacturer installed. Joints shall remain watertight when subjected to a 1.5-degree deflection for pipe 4-inch through 24-inch diameter and 1.0-degree deflection for pipe 30-inch through 60-inch diameter.

1. Manufacturer:

a. ADS, Inc N-12 WT IB

b. Springfield Plastics, Inc.

2.02 CATCH BASINS:

A. Cast-in-place drainage structure per APWA Plan 315.1.

B. Minimum sump depth is 12 inches, unless noted otherwise.

C. Steps: None.

D. Grating: Per APWA Plan 308. Bicycle friendly, gray iron ASTM A48 Class 35B grate for H-20 traffic loading with asphalt-based coating.

1. Manufacturer:

a. D&L Supply

b. East Jordan

c. Neenah Foundry

2.03 CLEANOUT BOXES:

A. Cast-in-place drainage structure per APWA Plan 331.2, Type B.

B. Minimum sump depth is 12 inches, unless noted otherwise.

C. Steps: Required in boxes greater than 6 feet deep.

D. Ring and Cover: 30-inch per APWA Plan 302.1.

2.04 AREA DRAINS:

A. Precast drainage structure per ASTM C858 or ASTM C913.

B. Loading: H-20 traffic loading.

C. Grating: Steel frame to be cast into concrete riser or base. Bicycle friendly, gray iron ASTM A48 Class 35B grate for H-20 traffic loading with asphalt-based coating.

1. Manufacturer:

a. D&L Supply

b. East Jordan

c. Neenah Foundry

D. Minimum sump depth is 12 inches, unless noted otherwise.

E. Steps: None.

F. Manufacturer:

1. Harper Precast, Inc.

2. Geneve Pipe and Precast, Inc.

3. Oldcastle Infrastructure, Inc.

2.05 PRECAST MAINTENANCE HOLES:

A. Maintenance Hole Sections: Circular reinforced precast concrete in accordance with ASTM C478. Maintenance Hole diameter shall be as indicated on the Drawings. Axial length of barrel sections shall be selected to provide the correct total height with the

fewest joints. Conical sections shall be designed to support cast iron frames and covers under H-20 loading, unless noted otherwise.

1. Manufacturer:

   a. Geneva Pipe and Precast, Inc.

   b. Oldcastle Infrastructure, Inc.

B. Pipe Connections: Barrel section to pipe connections shall be sealed with resilient connectors, Kor-N-Seal by Trelleborg, complying with ASTM C923. Mechanical devices shall be stainless steel.

C. Joints: Water-tight joints shall be sealed with butyl-rubber sealants, ConSeal CS-102 or Ram-Nek RN101 conforming to ASTM C990.

D. Per Section 33 39 15.

2.06 CAST-IN-PLACE STRUCTURES:

A. Materials:

1. Concrete: Section 03 30 00, minimum compressive strength of 4,000 psi.

2. Portland Cement: ASTM C150, Type II.

3. Hydrated Lime: ASTM C207, Type S.

4. Sand: ASTM C33, Fine Aggregate, except all passes No. 8 sieve.

5. Water: Potable, not detrimental to concrete.

2.07 MIXES:

A. Mortar for Plugging Lift Holes: Mix Portland cement and sand, 1 part cement to 1/2 part sand with sufficient water to make mortar damp without "balling".

2.08 COMPONENTS:

A. Frame and Cover: Shall be non-rocking conforming to ASTM A48, Class 30B cast iron construction or ASTM A536, Grade 60-40-18 ductile iron construction. Machined flat bearing surface, removable lid; rated for AASHTO HS-20 loading, unless noted otherwise. Unless noted otherwise, covers and frames shall be 30-inches in diameter, non-vented, machined flat bearing surface, removable lid; with embossed lettering saying "STORM DRAIN" cast into cover.

1. Manufacturer:

a. D&L Supply Company

b. East Jordan Company

c. Neenah Foundry

2. Castings shall be as follows:

a. Free from scale, lumps, blisters, and sandholes.

b. Machine contact surfaces to prevent rocking.

c. Thoroughly clean and hammer inspect.

B. Maintenance Hole Steps: ASTM C478. Maintenance hole steps shall have a 1/2-inch ASTM A615 grade 60 steel reinforcement rod encased in polypropylene copolymer plastic. Steps shall have a tread width of 14-inches (nominal), contoured to fit the hand for comfort, and a sure grip sturdy tread design with side molded slip-resistant wings. Steps shall be manufactured by American Step Company, Inc. or M.A. Industries.

PART 3 - EXECUTION

3.01 EXAMINATION:

A. Verify items provided by other sections of Work are properly sized and located.

B. Verify built-in items are in proper location, and ready for roughing into Work.

C. Verify correct size of maintenance hole and structure excavation.

3.02 PREPARATION:

A. Do not install structures where site conditions induce loads exceeding structural capacity of structures.

B. Inspect precast concrete structures immediately prior to placement in excavation to verify structures are internally clean and free from damage. Remove and replace damaged units.

3.03 TRENCHING:

A. See Section 31 23 23 for additional requirements.

B. Hand trim excavation for accurate placement of pipe to indicated elevations.

3.04 CATCH BASINS AND CLEANOUTS:

A. Form bottom of excavation, clean and smooth and to correct elevation.

B. Provide bedding in accordance with Section 31 23 33.

C. Place structure plumb and level on prepared bedding.

D. Orient structure for pipe connections.

E. Form and place cast-in-place concrete base pad.

F. Level the top surface of base pad and sleeve concrete shaft sections to receive storm drainage pipe sections.

G. Establish elevations and pipe inverts as indicated.

H. Establish top elevation and mount frame and cover.

I. Mount frame level in grout, secured to top cone section.

3.05 PRECAST STRUCTURES:

A. Provide bedding according to Section 31 23 33.

B. Lift precast components at lifting points designated by the manufacturer.

C. Assemble multi-section structures by lowering each section into excavation. Lower, set level, and firmly position base section before placing additional sections.

D. Remove foreign materials from joint surfaces and verify sealing materials are placed properly. Maintain alignment between sections by using guide devices affixed to lower section.

E. Joint sealing materials may be installed on site or at manufacturer’s plant.

F. Verify maintenance holes installed plumb and level and satisfy required alignment and grade.

G. Remove knockouts or cut structure to receive piping without creating openings larger than required to receive pipe or flexible connector.

H. Steps shall not be installed in maintenance holes.

I. Prior to backfilling, fill all cracks and voids in the maintenance holes or vaults with non-shrink grout, polyurethane sealant, or both.

3.06 FIELD QUALITY CONTROL:

A. Remove work that does pass tests; replace and retest until successful installation is achieved.

B. General:

1. Perform field-testing under provisions of Section 01 45 33.

2. Request inspection by Engineer prior to placing bedding.

C. Displacement Test:

1. After trench has been backfilled and compacted, after cover over pipeline has been brought to finished grade, and after debris and silt has been removed Engineer will visually inspect pipe. Pipes that do not present a uniform bore due to displacement and misalignment shall be replaced.

D. Deflection Test:

1. Test pipes for vertical ring deflection within 15 days after completion of backfill and again at least 4 months after installation but not later than 30 days before estimated substantial completion.

2. Maximum allowable ring deflection is 5 percent of vertical internal pipe diameter.

3. Replace pipe exceeding this allowable deflection.

E. Make deflection tests with deflectometer which produces a continuous record of pipe deflection by pulling mandrel, sphere, or pin-type go/no-go device through pipe. Make the diameter of go/no-go device to be 95 percent of the undeflected inside pipe diameter.

F. Vertical Adjustment of Existing Maintenance Holes and Structures:

1. Where required, adjust top elevation of maintenance holes and structures to finished grades shown on Drawings.

2. Reset existing frames, grates and covers, carefully removed, cleaned of mortar fragments, to required elevation in accordance with requirements specified for installation of castings.

G. Cleaning and Testing:

1. Testing of Storm Drainage Utilities: At such times as Engineer may direct, prove watertightness of buried storm drainage utilities or portions thereof by one of the following tests. Conduct tests under supervision of the Engineer. Furnish materials, labor, and equipment required for tests and repair system until test results are satisfactory.

2. Infiltration: When, in opinion of the Engineer, trench or excavation is sufficiently saturated by groundwater or rain, tests may be made on basis of infiltration. Infiltration tests will only be allowed when hydrostatic head outside pipe is minimum of 4 feet above crown of pipe for entire length of pipe being tested. Measure flow of water at nearest downgrade maintenance hole. Make three series of measurements at intervals of not less than 1 hour, and average results. Using this average, calculate infiltration rate for 24-hour period. Infiltration rate: Not greater than 100 gallons per inch of pipe diameter per mile of pipe per day in any section of system including maintenance holes.

3. Exfiltration: When conditions are not suitable for infiltration test, subject pipe to hydrostatic head of at least 4 feet above pipe crown. Fill line until appropriate water level is obtained at selected upstream maintenance hole. Observe rate of drop at this maintenance hole for 1 hour. Leakage rate: Not to exceed maximum rate allowed for infiltration.

4. Air Pressure Test:

   a. Air testing for sections of pipe shall be limited to lines less than 36-inch average inside diameter.

   b. Lines 36-inch average inside diameter and larger shall be “joint” tested at each joint. The minimum allowable for the pressure drop from 3.5 psig to 2.5 psig during a joint test shall be 10 seconds, regardless of pipe size. Joint test shall be conducted as follows:

      (1) Each joint shall be tested successfully.

      (2) Joint tester shall be set over joint to be tested so that the two inflation tubes straddle the joint.

      (3) Inflate tubes to 25 psig to seal off joint to be tested.

      (4) Apply air pressure into void between inflation tubes until pressure reaches 4 psig.

      (5) After pressure has stabilized, bleed air pressure back to 3.5 psig.

      (6) Record time required for pressure to drop from 3.5 psig to 2.5 psig.

(7) If the time in seconds for the air pressure to decrease from 3.5 psig to 2.5 psig is greater than 10 seconds, the joint shall be presumed to be free from defect. When the time is less than 10 seconds pipe breakage, joint leakage, or leaking testing seals are indicated and an inspection must be made to determine the cause. The Contractor shall affect such repairs as may be required to accomplish a successful air joint test.

c. For pipe sections less than 36-inch average inside diameter:

(1) Determine the groundwater level.

(2) Plug both ends of the pipe. For concrete pipe, flood pipe and allow 2 hours to saturate concrete. Then drain and plug pipe.

(3) After a maintenance hole to maintenance hole section of pipe has been sliplined and prior to any services lines being connected to new liner, plug liner at each maintenance hole with pneumatic plugs.

(4) Pressurize pipe to 4.0 psig. Increase pressure 1.0 psi for each 2.3 feet of ground water over highest point in the system. Allow pressure to stabilize for 2 to 4 minutes. Adjust pressure to start at 3.5 psig (plus adjustment for ground water table). See Table 33 40 00-2 at the end of this Section.

(5) To determine air loss, measure the time interval for pressure to drop to 2.5 psig. The time must exceed that listed in the Table 33 40 00-2 at the end of this Section for pipe diameter and length. For sliplining, use diameter of carrier pipe.

d. The test of the pipe and service laterals shall be conducted in the presence of the Engineer. Testing of pipe, regardless of the pipe material, shall be performed in accordance with ASTM C828 or ASTM F1417, as applicable.

e. Any section of pipe which fails to meet requirements shall be repaired and retested.

5. Vacuum test: For precast concrete maintenance holes 25 feet deep and less, a vacuum test may be used instead of exfiltration test. Conduct tests prior to backfilling and include joint between maintenance hole cover and frame. Plug and brace pipe openings. Draw vacuum of 10 inches of mercury. Minimum time to drop to 9 inches of mercury follows:

Table 33 40 00-1			
	Maintenance Hole Diameter in Inches		
Depth in Feet	48	60	72
Up to 10	60 sec.	75 sec.	90 sec.
10.01-15	75 sec.	90 sec.	105 sec.
15.01-25	90 sec.	105 sec.	120 sec.

6. If maintenance hole fails the test, make necessary repairs and repeat the vacuum test and repairs until maintenance hole passes test. Submit test results.

3.07 VIDEO INSPECTION:

A. Immediately after cleaning and testing, video the storm drainage pipeline to document the condition of the line. Notify the Engineer 24 hours in advance of any video inspection so that the Engineer may observe inspection operations.

B. Survey video inspection DVDs shall be continuous for pipe segments between maintenance holes. Do not leave gaps in the videotaping of a segment between maintenance holes and do not show a single segment on more than one DVD.

C. Do not pull or propel the video camera through the line at a speed greater than 30 feet per minute.

3.08 ALIGNMENT AND GRADE TEST:

A. Line and grade of pipe may not vary more than 1/2 inch in 10 feet and not more than 1-inch variance from true line at any location.

B. Grade of pipe may not vary more than 1/4 inch in 10 feet for all design grades less than or equal to 1 percent and not more the 1/2-inch total variance from true grade at any location. Also, grade of pipe may not vary more than 1/2 inch in 10 feet for all design grades greater than 1 percent and not more than 1-inch total variance from true grade at any location. These tolerances shall be acceptable provided that such variation does not result in a level or reverse sloping invert.

C. The variation in the invert elevation between adjoining ends of pipe due to eccentricity of joining surface and pipe interior surfaces shall not exceed 1/64 inch per inch of pipe diameter, or 1/4 inch maximum.

3.09 PROTECTION:

A. Protect pipe and bedding from damage or displacement until backfilling operation is completed.

3.10 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

TABLE 33 40 00-2												
Pipe Diameter (inch)	Minimum Time (min:sec)	Length for Minimum Time (ft)	Time for Longer Length (sec/ft)	Specification Time for Length (L) Shown (min:sec)

SECTION 33 42 16

REINFORCED CONCRETE CULVERT PIPE

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide materials, fabrication, testing, and installation of circular reinforced concrete culvert pipe complying with ASTM C76 or C655 as indicated and in compliance with Contract Documents.

1.02 REFERENCES:

A. ASTM International (ASTM):

1. C76: Standard Specification for Reinforced Concrete Culvert, Storm Drain and Sewer Pipe

2. C150: Standard Specification for Portland Cement

3. C361: Standard Specification for Reinforced Concrete Low-Head Pressure Pipe

4. C443: Standard Specification for Joints for Concrete Pipe and Manholes, Using Rubber Gaskets

5. C655: Standard Specification for Reinforced Concrete D-Load Culvert, Storm Drain, and Sewer Pipe

6. C1478: Standard Specification for Storm Drain Resilient Connectors Between Reinforced Concrete Storm Sewer Structures, Pipes, and Laterals

7. C1479: Standard Practice for Installation of Precast Concrete Sewer, Storm Drain, and Culvert Piping Using Standard Installations

8. D507: General Methods of Testing and Tolerances for Spun Rayon Yarns and Threads

1.03 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Prior to delivery of pipe from each manufacturing lot or run, submit:

1. Test results for external load crushing strength test per Section 11 of ASTM C76 or 10 of ASTM C655.

2. Certification of compliance with cited ASTM specifications of cement, aggregate, and reinforcement.

3. Manufacturer's description of admixtures used.

4. Adsorption test results per Section 11 of ASTM C76.

5. Manufacturer's report of visual inspection.

1.04 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.05 SPARE PARTS:

A. Comply with the requirements specified in Section 01 61 00.

1.06 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

1.07 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

PART 2 - MATERIALS

2.01 CIRCULAR REINFORCED CONCRETE CULVERT PIPE:

A. Comply with ASTM C76 or C655. Method of manufacture shall be either cast or spun. Obtain class or D-load rating from drawings. If no class or D-load is shown, use D-2000 pipe.

B. Cement shall comply with ASTM C150, Type V.

C. Acceptance shall be on the basis of plant load-bearing tests, material tests, and inspection of manufactured pipe for visible defects and imperfections as defined in ASTM C76 or C655. Conduct three-edge bearing test for load to produce a 0.01-inch crack. Conduct tests on 2 percent of the number of each size of pipe furnished for the project. For extended delivery schedules, conduct tests on two pipe sections for each size preliminary to delivery of pipe. Conduct remainder of tests during extended delivery schedule.

2.02 JOINTS:

A. Use push-on rubber-gasketed watertight type.

B. Bells, spigots, and rubber gaskets shall conform to ASTM C361 or C443 and shall be compatible with ASTM C76 or C655 pipe barrel. Use flared or flush bell design.

2.03 BASE, BEDDING, AND BACKFILL MATERIAL:

A. Use the following materials as specified in Section 31 23 33:

Zone	Material
Bedding, Pipe Zone, Trench Zone	3/4-inch well grade material

PART 3 - EXECUTION

3.01 PRODUCT MARKING:

A. Letter on the interior of each section of pipe the following:

1. Class designation or corresponding D-load to produce a 0.01-inch crack.

2. Date of manufacture.

3. Name of manufacturer and plant.

4. For elliptical or quadrant reinforcement, the vertical axis in which the pipe is to be laid.

3.02 REJECTION:

A. Reject and replace pipe exhibiting any of the following:

1. Fractures or cracks passing through the wall, except for a single end crack that does not exceed the depth of the joint.

2. Defects that indicate imperfect proportioning, mixing, and molding.

3. Surface defects indicating honeycombed or open texture.

4. Damaged or cracked ends where such damage would prevent making a satisfactory joint.

5. Any continuous crack having surface width of 0.01 inch or more and extending for a length of 12 inches or more, regardless of position in the wall of the pipe.

6. Exposure of any reinforcement indicating incorrect placement.

7. Any tested pipe that fails to meet the specified D-load.

3.03 INSTALLING BURIED PIPE:

A. Install in accordance with Section 31 23 33 and as follows.

B. When installing pipe in trenches, do not deviate more than 1 inch from line or 1/4 inch from grade. Measure elevation at the pipe invert.

C. Lay pipe upgrade from structure to structure, with the bell ends of the pipe upgrade.

D. After joint assembly, bring the pipe zone and bedding material up to 1 foot above the top of pipe. Place the material in even lifts on each side of the pipe.

3.04 LEAKAGE AND INFILTRATION TESTING OF RUBBER GASKET JOINTS:

A. See Section 33 40 00.

3.05 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 33 71 10

OVERHEAD POWER DISTRIBUTION

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide overhead power distribution system as indicated and in compliance with Contract Documents.

I. Underwriters' Laboratories Inc. (UL):

1. 467: Standard for Grounding and Bonding Equipment

2. 486A: Standard for Safety Wire Connectors and Soldering Lugs for Use with Copper Conductors

3. 486B: UL Standard for Safety for Wire Connectors

1.03 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Product Data:

1. Conductors.

2. Crossarms.

3. Cable Terminations.

4. Surge arresters.

5. Guy anchors.

6. Guy wires.

C. Coordination Drawings:

1. Submit to supplement Drawings, manufacturer's data and Drawings, and Contractor's data to demonstrate compliance with Contract Documents. Dimension Drawings or scale to show relative arrangement and mounting details of equipment or equipment assemblies.

D. Operation and Maintenance Data:

1. Include assembly, installation, operation and maintenance manuals, spare parts data which provides supplier name, current cost, catalog order number, and recommended list of spare parts to be stocked and documents previously submitted and accepted.

2. Data shall also include data outlining step-by-step procedures for system startup and operation, and troubleshooting guide which lists possible operational problems and corrective action to be taken.

3. Include brief description of equipment and their basic operating features.

1.04 QUALITY CONTROL:

A. Items of same classification shall be identical including equipment, assemblies, parts, and components.

B. Code Compliance:

1. Installation shall comply with requirements and recommendations of NFPA 70 and IEEE C2 for medium loading district, Grade B construction. No reduction in clearance shall be made.

C. Standard Product:

1. Material and equipment shall be standard product of manufacturer regularly engaged in manufacture of product and essentially duplicate items in satisfactory use for at least 2 years prior to Bid opening.

D. Equipment Nameplates:

1. Each major component of equipment shall have, as minimum, manufacturer's name, address, and catalog or style number on nameplate securely attached to item of equipment.

2. Nameplates for individual items of electrical equipment shall be as specified in referenced publications and provided on each item of equipment.

E. Items provided under this section shall be listed or labeled by UL or other Nationally Recognized Testing Laboratory (NRTL).

1. Term "NRTL" shall be as defined in OSHA Regulation 1910.7.

2. Terms "listed" and "labeled" shall be as defined in National Electrical Code, Article 100.

F. Regulatory Requirements:

1. National Electrical Code (NEC): Components and installation shall comply with National Fire Protection Association (NFPA) 70.

PART 2 - PRODUCTS

2.01 CORROSION PREVENTION:

A. Metallic Materials: Protect against corrosion as specified. Aluminum shall not be used in contact with earth or concrete. Where aluminum conductors are connected to dissimilar metal, use fittings conforming to UL 486A-486B.

B. Ferrous Metal Hardware: Hot-dip galvanized in accordance with ASTM A123 and A153.

2.02 CONDUCTORS, CONNECTORS AND SPLICES:

A. Bare Conductors:

1. Aluminum-Composition Conductors (ACSR): Aluminum-conductor-steel-reinforced, ACSR; ASTM B232.

2. Copper Conductors (CU): ASTM B1 and B8 to conductor size, hard-drawn temper.

B. Conductor sizes indicated are based on electrical and physical properties provided by materials specified. Where conductor materials other than as specified are used, such conductors shall provide equivalent ampacity and adequate strength for specified loading conditions.

C. Connectors and Splices: Copper alloys for copper conductors, aluminum alloys for aluminum-composition conductors, designed to minimize galvanic corrosion for copper to aluminum composition conductors.

1. Bare Conductors: NEMA CC 3 for aluminum composition and aluminum composition to copper.

2. Insulated Aerial Low Voltage Cable: NEMA CC 3 and UL 486A-486B for aluminum composition, aluminum composition to copper, and UL 486A-486B for copper to copper.

2.03 CROSS ARM AND HARDWARE:

A. Cross-arm Assembly:

1. RUS DT-5B solid wood, distribution type, with pressure treatment conforming to AWPA C25, and 1/4-inch, 45 degree chamfer on top edges.

2. Straight and free of twists to within 1/10-inch/foot of length. Bend or twist shall be in one direction only.

3. Machine, chamfer, trim, and bore cross-arms for stud and bolt holes before pressure treatment.

B. Pole Line Hardware:

1. Zinc-coated; IEEE C135.1, IEEE C135.2, ANSI C135.4, ANSI C135.14, ANSI C135.17, IEEE C135.22, and IEEE C135.33.

2. Steel hardware material, ASTM A575 and A576. Hardware shall be hot-dip galvanized in accordance with ASTM A153.

3. Pole-line hardware shall be hot-dip galvanized steel.

4. Install washers under boltheads and nuts on wood surfaces and elsewhere as required.

5. Washers used on through-bolts and double-arming bolts shall be approximately 2-1/4 inch square and 3/16-inch thick.

6. Diameter of holes in washers shall be correct standard size for bolt on which washer used.

7. Washers for use under heads of carriage bolts shall be of proper size to fit over square shanks of bolts.

8. Provide eye bolts, bolt eyes, eyenuts, strain-load plates, lag screws, guy clamps, fasteners, hooks, shims, and clevises wherever required to adequately support and to protect poles, brackets, crossarms, guy wires, and insulators.

2.04 MATERIALS AND EQUIPMENT:

A. Grounding and Bonding:

1. Equipment: UL 467.

2. Wire: ASTM B8, soft drawn copper

B. Guy Strands:

1. Zinc-coated steel, ASTM A47.

2. Material shall be aluminum-clad-steel-strand, with minimum breaking strength not less than as shown, except where 2 or more guys are used to provide required strength.

C. Guy Rods: Not less than 8 feet long by 1-1/2 inch diameter.

D. Nameplates:

1. Nameplates shall be made of corrosion-resistant metal with not less than 1/4-inch raised or engraved characters. Mount nameplate on front of enclosure.

E. Surge Arresters: IEEE C62.11 of metal-oxide type suitable for outdoor installations.

PART 3 - EXECUTION

3.01 PREPARATION:

A. Coordinate connection to utility lines with Owner and electric utility.

3.02 POLE LINES:

A. General:

1. Provide cross-arm mounted, three-phase surge arrester and cable termination installations.

B. Clearances:

1. Cross arm shall be of length and strength indicated.

C. Guy Assemblies:

1. Construction:

a. Guy assemblies, including insulators and attachments, shall provide strength exceeding required guy strength.

b. Provide thimbles or thimble eyes on anchor rods and eye-bolt guy attachments to protect strands.

c. Provide half-round, yellow polyvinyl, fiberglass or other suitable plastic guy marker, not less than 8 feet long, where shown or required at anchor end of each guy, securely clamp to guy or anchor at bottom and top of marker.

d. Holding capacities for down guys shall be based on lead angle as indicated.

e. When field conditions prevent indicated lead angles, place anchors in other locations as accepted and increase guy strengths by ratio of sine of lead angle indicated to sine of lead angle provided, except lead angles shall be not less than 15 degrees.

2. Installation:

a. Guys shall be provided where shown, with loads and strengths as indicated.

b. Where single guy will not provide required strength, provide 2 or more guys.

c. Provide steel band attachment of guy wires to poles as indicated.

d. Provide multiple-helix screw anchors in marshy ground; install rock anchors in rock at right angles to guys, elsewhere anchors shall be expanding type, except power-installed screw anchors of equivalent holding power are acceptable.

3.03 CROSS-ARM INSTALLATION:

A. Mounting:

Bolt cross-arms to poles using mounting brackets with 5/8-inch through-bolts with square washers at each end. Bolts shall extend not less than 1/8-inch nor more than 2 inch beyond nuts. On single cross-arm construction, install bolt head on cross-arm side of pole.

B. Equipment Arms:

Set parallel or at right angles to lines to provide climbing space. Locate below line construction to provide necessary wire and equipment clearances.

C. Mounting Bracket Installation:

1. Install pole mounting brackets for cable termination and surge-arrester cross-arm supports to provide not less than required climbing space.

2. Attach brackets to poles with minimum of 2 bolts.

3.04 CONDUCTOR INSTALLATION:

A. Install conductor jumper loops to cable termination to maintain required clearances.

1. Miscellaneous Installations:

a. In vertical risers on poles, protect cables by conduit secured at intervals not exceeding 10 feet and within 12 inch of each side of bend or termination.

2. Supports: Use connectors, supports, clamps, and ties designed for particular purpose. Use materials, size and install in accordance with standard practice.

3.05 APPARATUS:

A. General:

1. Ground apparatus as specified in Article 3.07.

B. Surge Arresters:

1. Surge arresters shall be provided for protection of aerial-to-underground transitions.

2. Arresters shall be distribution-valve class rated as shown.

3. Equip arresters with mounting brackets suitable for indicated installations.

3.06 CONNECTIONS BETWEEN MEDIUM VOLTAGE OVERHEAD AND UNDERGROUND SYSTEMS:

A. Where indicated, connections between medium voltage overhead and underground systems shall be made as shown.

3.07 GROUNDING:

A. General Requirements:

1. Install equipment, neutral, and surge arrester ground systems at poles where indicated.

2. Resistance of not greater than 25 ohms shall be provided, unless otherwise specified.

3. Measure ground resistances in normally dry conditions not less than 48 hours after rainfall.

4. Combined ground resistance of separate systems bonded together below grade may be used to meet specified ground resistance.

B. Ground Rods:

1. Additional ground rod to the existing poles shall be provided for equipment grounding to achieve the specified ground resistance. New ground rod shall be driven into ground until tops of rods are approximately 1 foot below finished grade.

2. Space ground rods as evenly as possible at least 6 feet apart and connected 2 feet below grade.

3. Copper-coil-type grounds may be used at wood poles in lieu of ground rods where required ground resistance can be obtained by this method. Copper-coil-type ground shall consist of coil of at least 12 feet of 6 AWG minimum bare copper wire stapled to butt of pole.

4. Connections:

a. Make connections above grade with bolted solderless connectors and below grade with fusion-welding process.

b. Where ground wires are connected to aluminum-composition conductors, use specially treated or lined copper-to-aluminum connectors suitable for this purpose.

C. Equipment Grounding:

1. Ground noncurrent-carrying metal parts of medium voltage cable terminations and guy wire attachments as shown.

2. Ground wire sizes, not otherwise indicated, shall be not smaller than 6 AWG.

D. Surge Arrester Grounding:

1. Ground surge arresters.

2. Ground resistance for distribution class arresters shall be not more than 25 ohms.

3. Ground wire connections shall be not be less than 4 AWG for distribution arresters.

4. Overhead portion of surge arrester, cable termination and neutral ground conductor shall be bonded together to a new pole ground at pole base. The new pole ground shall be bonded to the existing pole ground and neutral as shown.

3.08 TESTS:

A. Ground-Resistance Measurements:

1. Ground-resistance measurements of each ground rod shall be taken and certified by Contractor to Engineer.

2. No part of electrical distribution system shall be energized prior to resistance testing of that system's ground rods and grounding systems and submission of test results to Engineer.

3. Test reports shall indicate location of ground rod and grounding system and resistance and soil conditions at time test was performed.

4. When building water service is used as ground or part of grounding system, ground-resistance measurements shall also be made of this connection.

5. Ground-resistance measurements shall be made in normally dry weather, not less than 48 hrs after rainfall, and with ground under test isolated from other grounds.

6. Resistance to ground shall be measured using fall-of-potential method described in IEEE 142.

B. Medium Voltage Pre-assembled Cable Test:

1. Medium voltage riser cables shall be installed and tested in accordance with Section 26 05 13.

C. Operating Test:

1. After installation is complete, conduct operating test for acceptance.

2. Equipment shall be demonstrated to operate in accordance with Contract Documents.

3. Perform tests in presence of Engineer.

4. Furnish instruments and personnel required for test, and necessary electric power.

3.09 CONTRACT CLOSEOUT:

A. Provide in accordance with Section 01 77 00.

SECTION 40 05 33

HIGH-DENSITY POLYETHYLENE (HDPE) PRESSURE PIPE AND FITTINGS

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide materials testing and installation of high-density polyethylene (HDPE) pressure pipe and fittings as indicated and in compliance with Contract Documents.

1.02 REFERENCES:

A. American Society of Mechanical Engineers (ASME):

1. B18.2.2: Nuts for General Applications: Machine Screw Nuts, Hex, Square, Hex Flange, and Coupling Nuts (Inch Series)

B. ASTM International (ASTM):

2. A194: Standard Specification for Carbon Steel, Alloy Steel, and Stainless Steel Nuts for Bolts for High Pressure or High Temperature Service, or Both

3. A240: Standard Specification for Chromium and Chromium-Nickel Stainless Steel Plate, Sheet, and Strip for Pressure Vessels and for General Applications

4. D638: Standard Test Method for Tensile Properties of Plastics

5. D3261: Standard Specification for Butt Heat Fusion Polyethylene (PE) Plastic Fittings for Polyethylene (PE) Plastic Pipe and Tubing

6. D3350: Standard Specification for Polyethylene Plastics Pipe and Fittings Materials

7. F714: Standard Specification for Polyethylene (PE) Plastic Pipe (DR-PR) Based on Outside Diameter

8. F1055: Standard Specification for Electrofusion Type Polyethylene Fittings for Outside Diameter Controlled Polyethylene and Crosslinked Polyethylene (PEX) Pipe and Tubing

9. F2620: Standard Practice for Heat Fusion Joining of Polyethylene Pipe and Fittings

10. F3190: Standard Practice for Heat Fusion Equipment (HFE) Operator Qualification on Polyethylene (PE) and Polyamide (PA) Pipe and Fittings

C. American Water Works Association (AWWA):

1. C906: Polyethylene (PE) Pressure Pipe and Fittings, 4-inch through 63-inch, for Water Distribution and Transmission.

2. M55: PE Pipe-Design and Installation

D. Plastics Pipe Institute (PPI):

1. TN-38: Bolt Torque for Polyethylene Flanged Joints

2. TR-33: Generic Butt Fusion Joining Procedure for Field Joining of Polyethylene Pipe

1.03 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

1. Sustainable Design Submittals.

2. Action Submittals:

a. Shop Drawings:

(1) Catalog information confirming pipe, fittings, and other materials conform to requirements of this Section.

(2) Drawings of specific connection details.

(3) Drawing of fabricated or manufactured fittings.

(4) A plan for pipe joining and installation. The plan must be reviewed and approved by Engineer prior to pipe installation.

b. Submit HDPE temperature control plan describing Contractor's approach to controlling movement of the pipe related to the thermal expansion and contraction of the pipeline during installation. Plan shall outline Contractor's approach to mitigate and control movement during installation, backfill, and connection to flanges or structures.

3. Informational Submittals:

a. Manufacturer's Certificate of Compliance.

b. Infrared temperature gun product data.

c. Certificates of qualification for persons to be fusing HDPE pipe. Experience and training record of persons to be fusing HDPE pipe of this diameter.

d. Hydrostatic Testing Plan as required per Section 01 45 00.

e. Certifications of Calibration: Approved testing laboratory certificate if pressure gauge for hydrostatic test has been previously used. If pressure gauge is new, no certificate is required.

f. Hydrostatic test report documentation.

g. Fusion parameters including recommended limits of criteria recorded by data logger.

h. Fusion report for each joint.

1.04 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.05 SPARE PARTS:

A. Comply with the requirements specified in Section 01 61 00.

1.06 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

B. Sustainability Standards Certifications.

C. Qualifications:

1. Pipe Manufacturer: Listed with Plastic Pipe Institute.

2. Persons fusing HDPE pipe shall have minimum of 1 year of experience with fusing HDPE pipe and shall have received a minimum of 20 hours of training for fusing HDPE pipe from pipe supplier or fusing equipment supplier.

1.07 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

1. Shipping: Do not cut, kink, or otherwise damage pipe during transportation.

2. Storage:

a. Limit stacking of pipe to a height that will not cause excessive deformation of bottom layers of pipes under anticipated temperature conditions.

b. Where necessary, because of ground conditions, store pipe on wooden sleepers, spaced suitably and of such widths as not to allow deformation of pipe at point of contact with sleeper or between supports.

c. Keep pipe shaded from direct sunlight prior to installation in trench.

1.08 CONNECTIONS TO EXISTING PIPE, NEW PIPE, AND STRUCTURES:

A. Fusing to Existing HDPE Pipe: Comply with manufacturer's or distributor's recommendations based on Site conditions and PPI TR-33.

B. Any connections from new HDPE pipe to existing or new pipelines shall be done using a flanged restrained joint. If plans do not specify the type of joint between HDPE and another pipe or structure, use a flanged welded steel pipe spool to connect the new HDPE pipe to another pipe or concrete structure.

PART 2 - PRODUCTS

2.01 MANUFACTURERS:

A. JM Eagle

B. WL Plastics

C. Performance Pipe

D. InfraPipe

E. AGRU America, Inc.

2.02 MATERIALS:

A. Pipe and Fittings:

1. Conform to requirements of ASTM F714.

2. Resin: Polyethylene resin shall meet or exceed requirements of ASTM D3350 for PE 4710 material Cell Classification 445574C. Pressure rating shall be based on hydrostatic design stress of 200 psi at 73.4 degrees F.

3. Outside Diameter Basis: Iron Pipe Size (IPS) unless noted otherwise on Drawings.

4. Pipe Wall:

a. Sizes 2 Inches to 102 Inches: Solid wall

b. Sizes over 60 Inches: Profile wall

c. Sizes in the overlap range may be solid wall or profile wall.

d. Minimum Wall Thickness:

(1) Solid Wall: DR 13.5, unless Drawing require otherwise, or depth of cover dictates thicker wall for buried pipe.

(2) Profile Wall: RSC250, unless depth of cover dictates a higher class.

5. For piping exposed as in buildings, galleries and pumping stations connect to equipment using flanged connections. Use butt fused pipe, unless otherwise indicated.

6. Buried Piping: Use butt fused joints except where flanged joints are called out.

7. Pipe lengths, fittings, and flanged connections to be joined by thermal butt-fusion shall be of a compatible resin mix for the fusion process.

8. Fittings:

a. Sizes 6 Inches and Smaller: Molded or fabricated from polyethylene pipe.

b. Sizes 8 Inches and Larger: Use thermal butt-fusion.

c. Polyethylene fittings shall have same or higher pressure rating as pipe.

B. Backup Rings:

1. Convoluted for Flanged Connections:

a. ASTM A240, Type 316 stainless steel, unless noted otherwise on the drawings.

b. Complete with one-piece, molded polyethylene flange adapters.

c. Flanged Connections: Same or greater pressure rating as pipe and sized to be compatible with mating flange.

C. Gaskets: Material, size, and thickness shall be as recommended by pipe or flange manufacturer, and in accordance with PPI Technical Note 38.

D. Joints:

1. Buried Pipe: Provide thermal butt fusion joints except where flanges joints are called out on plans.

2. Buried Flanged Joints: Buried HDPE flanged joints shall have 316 stainless steel follower rings and bolting, all coated (after assembling) with wax tape coating per AWWA C217.

E. Bolts, Nuts, Washers:

1. Type 316 stainless steel, ASTM A193, Grade B8 hex head bolts; and ASTM A194, Grade 8 hex head nuts.

2. Bolts: Fabricated in accordance with ASME B18.2.2 and provided with washers of same material as bolts.

F. Wall Anchor (Anchor Ring):

1. Material: Same as HDPE pipe.

2. Internal Diameter: Equal to adjacent pipe.

3. Shear Strength: Equal to or greater than tensile strength of adjacent pipe.

4. Fabrication: Butt fusion. Extrusion bead welding is not allowed.

G. Electrofusion Flex Restraint: Electrofusion flex restraint is not allowed.

H. Products that restrain HDPE pipe with wedges, machined serrations, or clamps are not acceptable.

2.03 TRACER WIRE:

A. All direct bury piping (including service lines) shall be installed with 12 gauge solid copper THHN tracer wire for pipeline location purposes by means of an electronic line tracer.

1. The wires must be installed along the entire length of the pipe on the top of the pipe and be held in place with ties or hitches spaced not more than 12-feet apart.

2. Sections of wire shall be spliced together using approved splice caps and waterproof seals or solder. Twisting the wires together is not acceptable.

PART 3 - EXECUTION

3.01 INSTALLATION:

A. General:

1. Install buried polyethylene pipe in conformance with Section 31 23 33, AWWA M55, PPI TR-33, ASTM F2620, and pipe manufacturer's recommendations.

2. Joining:

    a. Buried Pipe:

        (1) Butt-fuse pipes and fittings in accordance with pipe manufacturer's recommendations. Depending on Site conditions, perform butt-fusion joining in or outside of excavation.

3. If HDPE pipe surface temperature is above 80 degrees F as measured with infrared temperature gun, allow pipe to cool prior to making any connections to flanges, existing pipeline systems, or structures.

4. Connect HDPE pipe to auxiliary equipment such as valves, pumps, tanks, and other piping systems with flanged connections as follows:

    a. Polyethylene flange adapter, thermally butt-fused to end of pipe. Flange "stub ends" are not allowed.

    b. Convoluted backing flange, as specified herein.

    c. Bolt and nut of sufficient length to show a minimum of three complete threads when joint is made and tightened to manufacturer's standard.

    d. Follow requirements of PPI Technical Note 38 including mandatory 4-hour bolt retorquing.

5. Special Precautions at Flanges: Support polyethylene pipe connected to heavy fittings, maintenance holes, and rigid structures in such a manner that no subsequent relative movement between polyethylene pipe at flanged joint and rigid structures is possible.

6. Minimum Long-Term Field Bending Radius: Restricted to limits recommended by AWWA M55, Table 8-2.

B. Placement in Trench:

1. Control water in trench per Section 31 23 33.

2. Handle joined pipeline in such a manner that pipe is not damaged by dragging it over sharp and cutting objects.

3. Position slings for handling pipeline away from butt-fused joints.

4. Remove sections of damaged pipe and replace it with undamaged pipe. Damaged pipe is defined as pipe with kinks or gouges exceeding 10 percent of pipe wall thickness.

5. Exercise care when lowering pipe into trench to prevent damage or twisting of pipe.

6. At flanges, valves, and connections, excavate out trench bottom sufficiently to provide clearance between undisturbed trench bottom and flange, valve, or connection.

3.02 FIELD TESTING:

A. Joint Fusion:

1. Measure and log each joint fusion by an electronic monitoring device (data logger) affixed to fusion machine, and shall be capable of being retrieved electronically. Fusion operators shall be certified according to ASTM F3190 or latest nationally recognized certification. Data to be logged shall include the following:

a. Pipe size and dimensions.

b. Machine model and size.

c. Operator identification.

d. Job identification number.

e. Weld number.

f. Fusion, heating, and drag pressure settings.

g. Heater plate temperature.

h. Time stamp showing when weld was performed.

i. Heating and curing time of weld.

j. Curing temperature readings and time stamps of readings.

k. Error messages and warnings for out of range temperature or pressure settings.

2. In addition to logged items above, the following shall be logged or annotated on report:

a. Location of joint being fused by pipeline station or by reference to pipe Shop Drawing.

b. Ambient temperature and humidity.

c. If internal bead was removed.

B. Joint Weld Testing:

1. Contractor shall perform joint testing in accordance with testing procedures specified in ASTM D638.

2. Specimens: Cut pipe 12 inches on each side of field made joint. Rejoin ends and proceed with Work.

3. Test Frequency:

a. First 500 Linear Feet: Two joints selected at random by Engineer.

b. Each Additional 2,000 Linear Feet: One joint selected at random by Engineer.

c. Each Test Failure: Two additional joints selected at random by Engineer.

3.03 PRESSURE AND LEAK TEST:

A. The system design pressure shall be 150 psi, unless noted otherwise on the drawings. Hydrotest DR 26 forcemains to the pressure rating of the pipe (ie 64 psi).

B. Testing in the trench: Fill the pipeline with water after it has been laid; bleed off any trapped air. Subject the lowest element in the system to a test pressure that is 1.5 times the design pressure, and check for any leakage. When, in the opinion of the Engineer, local conditions require that the trenches be backfilled immediately after the pipe has been laid, apply the pressure test after backfilling has been completed but not sooner than a time which will allow sufficient curing of any concrete that may have been used.

1. The test procedures consist of two steps: the initial expansion and the test phase. When test pressure is applied to a water-filled pipe, the pipe expands. During the initial expansion of the pipe under test, sufficient make-up water must be added to the system at hourly intervals for three hours to maintain the test pressure. After about four hours, initial expansion should be complete and the actual test can start.

2. When the test is to begin, the pipe is full of water and is subjected to a constant test pressure of 1.5 times the system design pressure. The test phase should not exceed three hours, after which time any water deficiency must be replaced and measured. Add and measure the amount of make-up water required to return the test pressure and compare this to the maximum allowance in Table 40 05 33-1 below.

Table 40 05 33-1 Allowance for Expansion Under Test Pressure							
Nominal Pipe Size	U.S. Gal/100 ft of Pipe			Nominal Pipe Size	U.S. Gal/100 ft of Pipe		
	1-Hour	2-Hour	3-Hour		1-Hour	2-Hour	3-Hour
2	0.08	0.12	0.15	22	3.50	7.00	10.50
3	0.10	0.15	0.25	24	4.50	8.90	13.30
4	0.13	0.25	0.40	28	5.50	11.10	16.80
5	0.21	0.41	0.63	30	6.20	12.60	19.10
6	0.30	0.60	0.90	32	7.00	14.30	21.50
8	0.50	1.00	1.50	36	9.00	18.00	27.00
10	0.75	1.30	2.10	42	12.00	24.00	36.00
12	1.10	2.30	3.40	48	15.00	27.00	43.00
14	1.40	2.80	4.20	54	18.00	30.00	50.00
16	1.70	3.30	5.00	60	21.00	33.00	57.00
18	2.20	4.30	6.50	72	27.00	39.00	71.00
20	2.80	5.50	8.00	78	30.00	42.00	78.00

From PPI Technical Report TR-31 by the Plastic Pipe Institute.

C. An alternate leakage test consists of maintaining the test pressure over a period of four hours, and then dropping the pressure by 10 psi. If the pressure then remains within 5 percent of the target value for one hour, this indicates there is no leakage in the system.

D. Under no circumstances shall the total time under test exceed eight hours at 1.5 times the system pressure rating. If the test is not complete within this time limit (due to leakage, equipment failure, etc.), the test section shall be permitted to "relax" for eight-hours prior to the next test sequence.

3.04 MANUFACTURER'S SERVICES:

A. Provide pipe manufacturer's representative at Site for assistance during pipe joining operations and pipe installation.

3.05 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

Page Intentionally Left Blank

SECTION 40 05 90.02

STAINLESS STEEL SLIDE GATES AND APPURTENANCES

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide and test stainless steel slide gates and appurtenances as indicated and in compliance with Contract Documents.

1.02 REFERENCES:

A. ASTM International (ASTM):

1. A240: Standard Specification for Chromium and Chromium-Nickel Stainless Steel Plate, Sheet, and Strip for Pressure Vessels and for General Applications

2. A276: Standard Specifications for Stainless Steel Bars and Shapes.

3. B584: Standard Specification for Copper Alloy Sand Castings for General Applications.

4. D2000: Standard Classification System for Rubber Products in Automotive Applications.

5. D4020: Standard Specification for Ultra-High-Molecular-Weight Polyethylene Molding and Extrusion Materials

B. American Welding Society Code.

C. American Water Works Association (AWWA):

1. C561: Fabricated Stainless Steel Slide Gates

1.03 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00:

1. Certified shop and erection drawings. Contractor shall submit electronic files of the proposed equipment in the capacity, size, and arrangement as indicated and specified. Contractor shall confirm opening size prior to developing shop drawings for gates.

2. Data for gate and actuator characteristics and performance.

3. Complete description of all materials, material thicknesses of all components.

4. Maximum bending stress and deflection of the slide under design head specified and indicated.

5. Installation drawings showing the details required for installation, dimensions, clearances and anchor bolt locations, including for stem guides, stem guide supports and pedestal supports. Where indicated in the Gate Schedule, structural design of the stem guide supports and pedestal supports, including anchors, shall be signed and sealed by an engineer in the State of Utah.

6. Shop drawing data for accessory items.

7. Certified setting plans, with tolerances, for anchor bolts.

8. Manufacturer's literature as needed to supplement certified data.

9. Operating and maintenance instructions and parts lists.

10. Certified results of gate shop testing, including shop leakage test results of each gate at the design unseating head specified and indicated

11. Certified results of actuator shop testing from the actuator manufacturer.

12. List of recommended spare parts other than those specified.

13. Shop and field inspection reports.

14. Qualifications of field service engineer.

15. Recommendations for short and long-term storage.

16. Shop and field testing procedures and set up

17. Special tools.

18. Manufacturer’s product data, specifications and color charts for shop painting.

19. Motor shop test results.

20. The latest ISO 9001 series certification or quality system plan.

21. Material Certification:

    a. Provide certification from the equipment manufacturer that the materials of construction specified are recommended and suitable for the service conditions specified and indicated. If materials other than those specified are proposed based on incompatibility with the service conditions, provide technical data and certification that the proposed materials are recommended and suitable for the service conditions specified and indicated including an

installation list of a minimum of five (5) installations in operation for a minimum of five (5) years. Provide proposed materials at no additional cost to the Owner.

b. Where materials are not specified, provide technical data and certification that the proposed materials are recommended and suitable for the service conditions specified and indicated.

B. A copy of the contract mechanical process, structural, electrical and instrumentation drawings, with addenda that are applicable to the equipment specified in this section, marked to show all changes necessary for the equipment proposed for this specification section. If no changes are required, mark all drawings with "No changes required" or provide a statement that no changes are required.

1. Failure to include all drawings or a statement applicable to the equipment specified in this section will result in submittal return without review until a complete package is submitted.

C. A copy of this specification section with addenda and all referenced specification sections with addenda, with each paragraph check-marked to indicate specification compliance or marked and indexed to indicate requested deviations and clarifications from the specified requirements.

1. If deviations and clarifications from the specifications are indicated, therefore requested by the Contractor, provide a detailed written justification for each deviation and clarification.

2. Failure to include a copy of the marked-up specification sections and or the detailed justifications for any requested deviation or clarification will result in submittal return without review until marked up specifications and justifications are submitted in a complete package.

1.04 SPARE PARTS:

A. Comply with the requirements specified in Section 01 61 00.

1. One set of all special tools.

1.05 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

B. Gates shall be the product of one manufacturer.

C. Gates shall be manufacturer's standard cataloged product and modified to provide compliance with the drawings, specifications and the service conditions specified and indicated.

D. Welding: In accordance with latest applicable American Welding Society Code, ASME Welding Code, or equivalent.

E. Shop tests as specified, including shop leakage testing of each gate at the design unseating head to confirm compliance with the leakage rate specified and indicated.

F. The Contractor shall obtain the gates, actuators and appurtenances from the gate manufacturer, as a complete and integrated package to insure proper coordination and compatibility and operation of the system.

G. Services of Manufacturer's Representative as stated in Section 01 45 00 and as specified herein.

1.06 DELIVERY, STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

B. Ship electric actuators separate from the gate assembly.

PART 2 - PRODUCTS

2.01 SYSTEM DESCRIPTION:

A. Gate sizes and operating data are indicated in the Slide Gate Schedule.

2.02 MANUFACTURERS:

A. Stainless Steel Slide Gates:

1. Whipps

2. RW Gate Co.

2.03 SEISMIC DESIGN REQUIREMENTS:

A. Conform to the requirements indicated on the structural drawings and as specified in Section 01 41 20.

B. The Contractor shall conform to the seismic design requirements for this project and for the work of this specification section.

C. Provide all equipment bases, anchorage, supports and foundations designed in accordance with the seismic requirements indicated and specified.

D. Additionally, provide with the Certificate of Unit Responsibility, certification for all equipment signed by a registered structural engineer stating that computations were

performed and that all components have been sized for the seismic forces specified and indicated.

2.04 SLIDE GATE CONSTRUCTION:

A. Provide all gates produced by a single manufacturer and designed for installation in the channels and structures as specified and indicated.

B. Gate Configuration: As indicated in the Slide Gate Schedule.

C. Provide all gates in conformance with AWWA C561 and as specified.

D. Self-contained, non-self-contained, rising or non-rising stem, flush bottom type with self-adjusting seals.

E. Gates with adjustable wedges or wedging devices are not acceptable.

F. Provide all structural components 1/4-inch minimum thickness.

G. Gate assemblies shall be media blasted or passivated in accordance with ASTM A380 prior to shipment to remove all mill scale, weld splatter, discoloration, or other surface imperfections.

H. Leakage Rate:

1. Seating head and unseating head conditions: Leakage not to exceed half of the allowable leakage rate specified in AWWA C561.

I. Assembly to consist of the following:

1. Frame

2. Slide

3. Stem

4. Seals

5. Benchstand with operator type as indicated in the Slide Gate Schedule.

J. Materials:

1. Frame Assembly and Retainers: ASTM A240 Type 316L stainless steel.

2. Slides and Stiffeners: ASTM A240 Type 316L stainless steel.

a. 1/4-inch minimum thickness.

3. Seat, seals and facing: ASTM D4020 UHMW (Ultra-high Molecular Weight Polyethylene

4. Invert Seal for upward acting gates only: ASTM D2000 Neoprene or EPDM

5. Stems: ASTM A276 Type 316 stainless steel.

   a. Minimum diameter: 1-1/2-inch

6. Lift Nuts: ASTM B584 Bronze

7. Floorstand and Wall Brackets: ASTM A276 Type 316L stainless steel

8. Gear Operator Housing: Cast aluminum or ductile iron

9. Hardware, studs and nuts: ASTM A276 Type 316 stainless steel

10. Anchor bolts: Type 316L stainless steel. Minimum diameter of 1/2-inch.

K. Slide:

1. Slide and reinforcing stiffeners welded to the slide.

   a. Stainless steel plate, minimum 1/4-inch.

   b. Reinforcement: Provide a minimum of two horizontal stiffeners welded to the slide and two vertical stiffeners welded to outside of the horizontal stiffeners.

   c. Provide slide to engage the guide a minimum of 1 inch on each side and have a minimum material thickness of 1/2 inch where it engages the guide.

   d. Provide the stem connector constructed of two angles or plates welded to the slide. Provide a minimum of two bolts connecting the stem to the stem connector.

2. Deflection: Maximum as specified in AWWA C561.

L. Seals:

1. Provide a self-adjusting seal system suitable for the leakage, frequent cycling and velocities specified herein, and mounted such that there is no obstruction to the specified gate opening size.

2. Provide gates equipped with UHMW polyethylene seat/seals to restrict leakage and to prevent metal to metal contact between the frame and slide.

3. Extend the seat/seals to accommodate the 1.50 x the slide height with the gate in the fully open or fully closed position.

4. Provide all upward opening gates with a resilient flush bottom seal for sealing the invert of the gate.

5. Provide all downward opening weir gates with self-adjusting UHMW seat/seals across the invert member.

6. Provide all seals mechanically fastened to the frame or slide, force fit seals or seals attached with adhesive are not acceptable.

7. Provide all seats and seals to be field replaceable without the need to remove grout or concrete and without the need to remove the frame from the wall or wall thimble.

8. Gates using "J" or "P" seals are not acceptable.

M. Frames:

1. Provide frame assembly including guide members, invert members and yoke members constructed of formed stainless steel plate with a minimum thickness of 1/4-inch.

2. Provide gussets to support the guide members for unseating gates as required by the design head specified and indicated.

   a. Provide gussets extended to support the outer portion of the guide assembly and positioned to transfer the load to the anchor bolts or the wall thimble studs.

3. Provide frames for mounting type as indicated in the Slide Gate Schedule.

   a. Embedded

   b. Wall mounted with stainless steel anchor bolts and non-shrink, non-metallic grout or EPDM gasket

   c. Thimble mounted with stainless steel mounting studs and mastic gasket

4. Provide all wall mounted and thimble mounted gates with a flanged frame. Flat frame gates are not acceptable.

5. Provide all mounted and wall thimble mounted frames with a minimum guide weight of 11 lbs/ft and a minimum guide extension weight of 6.5 lbs/ft.

6. Provide guide extensions constructed of C-channel shape or similar. Angles are not acceptable guide extensions.

7. Frame Guides and Invert Members: Provide frames as a one-piece, fully welded assembly.

    a. Bolt-on yokes are acceptable when necessary to facilitate slide removal.

    b. Frames that require field assembly are not acceptable unless the overall frame size exceeds a size suitable for shipment on a standard flatbed truck.

8. Provide the frame guides extending to accommodate the entire height of the slide when the slide is in the fully opened position on upward opening slide gates or downward opening weir gates.

9. For self-contained gates, provide a yoke across the top of the frame guides with the yoke formed by two structural members fixed to the top of the guides to provide a one-piece rigid frame.

    a. Provide the yoke designed to allow removal of the slide.

10. Provide a rigid stainless steel invert member across the bottom of the opening.

    a. Invert member: Flush bottom type on upward opening gates with a minimum weight as specified

11. Provide a rigid stainless steel top seal member across the top of the opening on gates designed to cover submerged openings.

12. Provide a rigid stainless steel member across the invert of the opening on downward opening weir gates.

N. Stems:

1. Provide a threaded operating stem to connect the operating mechanism to the slide.

2. For rising stem gates provide the threaded portion engaging the operating nut in the manual operator or motor actuator.

3. For non-rising stem gates provide the threaded portion engaging the nut on the slide.

4. Minimum stem outside diameter of 1-1/2 inches.

5. Stem extension pipes are not acceptable.

6. Provide the stem constructed of solid stainless steel bar for the entire length

7. Tensile strength: Not less than 60,000 psi for stems.

8. Provide the stem threaded to allow full travel of the slide unless otherwise specified or indicated.

9. L/R: Not to exceed 200.

10. Provide the stem in accordance with AWWA C561, to withstand in tension the loads caused by an 80 pound effort on the manual crank or handwheel without exceeding 25 percent of the ultimate tensile strength of the stem material.

11. Motor Operators: Design stems to withstand in compression 1.30 x stalled output.

12. Provide the stem, in tension, designed to withstand a load caused by a 40 pound effort on the crank or handwheel without exceeding 1/5 of the ultimate tensile strength of the stem material.

13. Provide the threaded portion of the stem machined rolled or cut full depth ACME type threads with 16 micro-inch or better finish. Stub threads are not acceptable.

14. Provide stems of more than one piece joined by bronze or stainless steel couplings with the coupling bolted to the stem.

15. Provide dual stems for upward opening gates wider than 60-inch when the opening width is 2 x greater or more than the height of the slide. Provide dual stems for downward opening gates wider than 48 inch when the opening width is 2 x greater or more than the height of the slide.

16. Provide stems on manually operated gates with an adjustable stop collar to prevent over closing of the gate.

17. For rising stem gates, provide clear plastic covers with 1-inch graduations. Provide vent holes to prevent condensation.

2.05 STEM GUIDES:

A. Provide stem guides where required to maintain L/R of 200 or less for the unsupported length of the stem

B. Provide stem guides and brackets of Type 316L stainless steel.

1. Adjustable in two directions

2. Minimum Thickness: 1/4-inch

3. Bushings: UHMW or bronze

2.06 WALL THIMBLES:

A. Provide where indicated on the Slide Gate Schedule.

1. Provide “F” thimbles for all systems not connected to piping systems

2. Provide “E” thimbles for all gates connected to piping systems

B. Provide “E” thimble depth equal to the thickness of the concrete wall in which the thimble is to be mounted.

C. For “F” thimbles in walls 36 inch thick and smaller provide thimble depth equal to the thickness of the concrete wall in which the thimble is to be mounted. For walls 36 inches thick and larger provide a minimum of 36-inch deep “F” thimble.

D. Provide a water stop continuously welded or stitch welded and sealed on both sides around the periphery of the thimble.

E. Provide wall thimbles of fabricated Type 316L stainless steel construction of adequate section to withstand all operational and installation stresses.

1. Minimum thickness including front face: 3/8-inch

F. Provide the thimble square and plumb and the front face sufficiently flat to provide a mounting surface for the gate frame to achieve the specified leakage rate.

G. Provide the face of the wall thimble machined if recommended by the gate manufacturer. If the wall thimble is to be machined provide the front face with a minimum thickness of 3/8-inch after machining.

H. Provide a gasket or mastic to seal between the gate frame and the wall thimble.

2.07 MANUAL OPERATORS:

A. Provide a manual gate operator for each gate so specified.

1. Provide all gates with slides 24 inches tall or taller with a gearbox operator suitable for use with a portable operator.

B. Type of operator as indicated in the Slide Gate Schedule.

C. Manually operated floorstands and benchstands:

1. Handwheel or crank operated floorstand or benchstand as indicated in the Slide Gate Schedule.

a. Handwheel: No gear reduction.

b. Handwheel or Crank Gearbox Operator: Single or double gear reduction.

c. Material: Cast aluminum or ductile iron housing

2. Provide a threaded cast bronze lift nut to engage operating stem.

3. Provide roller bearings above and below a flange on the operating nut to support both opening and closing thrusts.

4. Operate gates under the operating head and design head, as specified and indicated, with no greater than a 40 pound effort on the crank or handwheel.

5. Gears, where required, steel with machined cut teeth designed for smooth operation.

6. Provide Type 304 or 400 Series stainless steel pinion shafts on crank operated benchstands and floorstands supported on tapered roller bearing or ball bearings with all components totally enclosed in a weatherproof housing with a removable cover.

a. Design bearing arrangement for use with portable operators specified herein.

7. Provide mechanical seals on the operating nut and the pinion shafts to exclude moisture and dirt and prevent leakage of lubricant out of the hoist mechanism.

8. Provide lubricating fittings for the lubrication of all gears and bearings.

9. Floorstands: Provide a Type 316L stainless steel pedestal, constructed of minimum Schedule 40 tube and 3/8-inch thick base plates, designed to position the input shaft or crank operator or handwheel approximately 36-inch above the operating level.

10. Benchstands: Provide with a rectangular cast aluminum or ductile iron base machined and drilled for mounting purposes. Provide all adaptor plates of Type 316L stainless steel.

11. Stamp or cast an arrow with the word "OPEN" on the floorstand, benchstand or handwheel indicating the direction of rotation to open the gate.

12. Handwheels: Minimum 15 inches, maximum 24 inches diameter and removable.

13. Cranks: Cast aluminum or stainless steel with revolving nylon grip and removable.

14. Provide two gearboxes for all upward opening gates 60 inch wide and larger and with opening widths greater than 2 x gate height. Provide two gearboxes for all downward-opening gates wider than 48 inch wide and larger and with opening widths greater than 2 x gate height.

    a. Provide Type 316 stainless steel interconnecting shaft.

    b. Provide flexible couplings at each end of the interconnecting shaft.

    c. Provide a handwheel or crank mounted on the pinion shaft of one of the gear boxes.

D. Extended Operators:

1. Provide an extended operator system to bring the pinion shaft to 36 inches above the operating level utilizing chain and sprockets when the centerline of the handwheel on a non-geared operator is located 48 inches or more above the operating level.

2. Chainwheels are not acceptable.

3. Provide a removable Type 316L stainless steel cover to enclose the chain and sprockets.

4. If the centerline of the pinion shaft is 60 inches or less above the operating level a handwheel may be used with a gearbox in lieu of the extended operator system specified above.

E. Operating Nut:

1. All gates shall be provided with a 2 inch square operating nut mounted to the manual or electric actuator.

    a. Nut Material: Bronze.

    b. Where indicated and specified provide a Type 316L stainless steel or cast iron floor box be set in the concrete floor above the gate as indicated.

    c. Provide one Type 316L stainless steel T-handle wrench for operation.

F. Floorstands and Wall Brackets:

1. Provide Type 316L stainless steel floorstands of a height such that the handwheel or crank operated pinion shaft is located 36 inches (915 mm) above the operating level.

2. Provide Type 316L stainless steel wall brackets to support floorstands.

a. Provide wall brackets reinforced to withstand in compression a minimum of 2 x rated output of the operator with an 80 pound effort on the crank or handwheel.

2.08 ELECTRIC MOTOR ACTUATORS:

A. Provide in accordance with Section 40 23 13.03.

2.09 PORTABLE OPERATORS:

A. Furnished and fabricated by slide gate manufacturer.

1. Provide 1 portable operator sized to operate all slide gates provided.

B. Electric Drill Operator:

1. Ensure all gates provided are compatible with the Owner's portable electric drill operator:

a. Milwaukee 1-1/4 inch Super Hole Shooter

(1) Cat. No. 2404-1, 250 RPM, 120V, 10A

2. Provide portable operator with reversing switch and safety hold-down, ON-OFF switch incorporated in handle.

a. Electrical Service: 120V, single-phase, 60 Hertz.

3. Drive through overload release clutch of positive spring-loaded pawl type releasing instantly at preset torque of 40 feet-pound.

4. Provide adapter to fit pinion shaft of floorstand.

5. Provide 25 feet long heavy duty cord with 3-prong plug with unit.

2.10 SHOP PAINTING:

A. Primer and Finish Paint: Shop apply to all exterior ferrous surfaces, high solids epoxy in accordance with Section 09 91 10.

B. Ferrous surfaces which are not to be painted shall be given a shop applied coat of grease or rust resistant coating.

C. Provide additional shop paint coating for touch-up to all surfaces after installation and testing is completed and equipment accepted.

2.11 SHOP TESTING:

A. Provide motor actuator shop testing in accordance with Section 40 23 13.03.

B. Assemble each gate and inspect for proper seating.

1. Check clearance between frame and disc seating surfaces.

C. Fully open and close each gate in guide system to ensure gates operate freely as recommended by the gate manufacturer.

D. Conduct a shop leakage test at the design unseating head on each gate to confirm leakage as specified and indicated for Field Testing.

E. Operate floorstands and benchstands to insure proper assembly and operation.

F. Repeat tests until specified results are obtained.

G. Correct or replace promptly all defects or defective equipment revealed by or noted during tests at no additional cost to the Owner.

PART 3 - EXECUTION

3.01 INSTALLATION:

A. Install items in accordance with shop drawings, manufacturer's printed instructions and as indicated.

B. Clean debris, dirt, and gravel, from inside of gates and channels before placing gates.

C. Install slide gates in completely assembled condition.

D. Erect and support slide gates in positions free from distortion and strain on appurtenances during handling and installation.

E. Inspect material for defects in workmanship and material.

F. Clean out debris and foreign material from gate opening and seats, test operating mechanisms to check proper functioning, and check nuts and bolts for tightness. Repair gates and other equipment which do not operate easily or are otherwise defective.

G. Set floorstand operators and stem guides so stems run smoothly in true alignment. Anchor guides firmly to walls. Check distances from centerlines of gates to operating level or base of floorstand and adjust if necessary to suit actual conditions of installation.

3.02 MANUFACTURERS SERVICES:

A. Provide services of factory-trained Service Technician, specifically trained on type of equipment specified:

1. Service Technician must be present on site for all items listed below. Person-day requirements listed are exclusive of travel time, and do not relieve Contractor of the obligation to place equipment in operation as specified.

2. Comply with requirements for checkout, startup, and testing in Section 01 78 25.

3. Physical Checkout and Field Testing (Functional Completion Testing): Inspect grouting, location of anchor bolts; setting, leveling, alignment, field erection; coordination of piping, electrical and miscellaneous utility connections; certify proper installation:

a. 1/2 person-day

4. Startup: Calibrate, check alignment and perform a functional test with water or process fluid. Tests to include all items specified.

a. 1/2 person-day

B. Provide services of factory-trained Service Technician, specifically trained on type of equipment specified:

1. Service Technician must be present on site for all items listed below. Person-day requirements listed are exclusive of travel time, and do not relieve Contractor of the obligation to place equipment in operation as specified.

2. Installation: Inspect grouting, location of anchor bolts; setting, leveling, alignment, field erection; coordination of electrical connection:

a. 1 day

3. Functional Testing: Calibrate, check alignment and perform a functional test. Tests to include all items specified.

a. 1 day

4. Field Performance Testing: Field performance test equipment specified.

a. 1 day

5. Vendor Training: Provide classroom and field operation and maintenance instruction including all materials, slides, videos, handouts and preparation to lead and teach classroom sessions.

   a. 1 trips, 1/2 day per trip

6. Credit to the Owner, all unused service person-days specified above, at the manufacturer's published field service rate.

7. Any additional time required of the factory trained service technician to assist in placing the equipment in operation, or testing or to correct deficiencies in installation, equipment or material shall be provided at no additional cost to the Owner.

C. Manufacturer of gates shall have a minimum of five (5) operating installations with gates of the size specified and in the same service as specified operating for not less than five (5) years or manufacturer of gates shall utilize a Project Manager that is experienced in stainless steel gate design and construction. The Project Manager shall be an employee of the gate manufacturer and shall have designed a minimum of five (5) operating installations with gates of the size specified and in the same service as specified operating for not less than five (5) years.

3.03 FIELD TESTING:

A. Field testing will not be conducted without a procedure accepted by the Engineer, calibration certificates for all testing equipment, gauges and flow meters and a completed and signed pretesting check list. See Section 01 78 25.

B. After installation of gates, and after inspection, operation, testing and adjustment have been completed by the manufacturer's field service technician, conduct operating and leakage test for each gate in presence of the Engineer to determine its ability to operate as specified, and to operate smoothly without jamming under specified conditions.

C. Test all operators.

D. Leakage Test: Leakage not to exceed half of the allowable leakage rate specified in AWWA C561.

   1. Conduct tests at design heads shown in the slide gate schedule.

E. Immediately correct or replace all defects or defective equipment revealed by or noted during tests at no additional cost to the Owner.

F. Repeat tests until specified results are obtained.

G. Contractor to provide all water labor, piping, testing equipment for conducting tests.

H. Make all adjustments necessary to place equipment in specified working order at time of above tests.

I. Remove and replace equipment at no additional cost to the Owner with equipment that will meet all requirements specified and indicated if unable to demonstrate to the satisfaction of the Engineer that equipment will perform the service specified, indicated and as submitted.

3.04 FIELD TOUCH-UP PAINTING:

A. After installation and testing accepted by the Engineer, apply touch-up paint to all scratched, abraded and damaged shop painted surfaces. Coating type and color shall match shop painting.

3.05 TRAINING:

A. Vendor Training: Provide classroom and field operation and maintenance instruction including all materials, slides, videos, handouts and preparation to lead and teach classroom sessions. See Section 01 78 24.

3.06 CONTRACT CLOSEOUT:

A. Provide in accordance with Section 01 77 00.

Table 1: Gate Schedule

	Area	Commodity	Tag	Type	Size (WXH)	Seating Head (ft)	Unseating Head (ft)	Mount (Embedded/ Wall/ Thimble)	Self Contained/ Non Self Contained	Stem	Electric Actuator	Motor Enclosure Type	Notes
1	01 - IPS	RWW	01-FV-11101	SG	8-0"x 8'-0"	15	minimal	Embedded	Self Contained	Rising	Y	NEMA 7 FM	Provide removable hand crank actuator
2	01 - IPS	RWW	01-FV-11201	SG	8-0"x 8'-0"	15	minimal	Embedded	Self Contained	Rising	Y	NEMA 7 FM	Provide removable hand crank actuator

END OF SECTION

SECTION 40 05 90.07

STOP LOGS AND APPURTENANCES

1.01 DESCRIPTION:

A. Provide aluminum or stainless steel stop logs and stainless steel frames and appurtenances as indicated and in compliance with Contract Documents.

1.02 REFERENCES:

A. Aluminum Association (AA):

1. ASM35: Aluminum Construction Manual.

2. H35.1: Aluminum Alloy and Temper Designation.

B. ASTM International (ASTM):

1. A240: Standard Specification for Chromium and Chromium-Nickel Stainless Steel Plate, Sheet, and Strip for Pressure Vessels and for General Applications

2. A276: Standard Specifications for Stainless Steel Bars and Shapes.

3. D2000: Standard Classification System for Rubber Products in Automotive Applications.

4. D4020: Standard Specification for Ultra-High-Molecular-Weight Polyethylene Molding and Extrusion Materials

C. American Welding Society Code (AWS):

1. D1.2: Structural Welding Code - Aluminum

2. D1.6: Structural Welding Code – Stainless Steel

1.03 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00:

1. Certified shop and erection drawings. Contractor shall submit electronic files of the proposed equipment in the capacity, size, and arrangement as indicated and specified. Contractor shall confirm opening size prior to developing shop drawings for stop logs.

2. Data for stop log characteristics and performance.

3. Complete description of all materials, material thicknesses of all components.

Page Intentionally Left Blank

4. Maximum bending stress and deflection of the stop logs under design head specified and indicated.

5. Installation drawings showing the details required for installation, dimensions, clearances and anchor bolt locations.

6. Recommended storage racks with dimensions and layout.

7. Shop drawing data for accessory items.

8. Certified setting plans, with tolerances, for anchor bolts.

9. Manufacturer's literature as needed to supplement certified data.

10. Operating and maintenance instructions and parts lists.

11. Shop and field inspection reports.

12. Qualifications of field service engineer.

13. Recommendations for short and long-term storage.

14. Field testing procedures and set up

15. Special tools.

16. The latest ISO 9001 series certification or quality system plan.

B. A copy of the contract mechanical process and structural drawings, with addenda that are applicable to the equipment specified in this section, marked to show all changes necessary for the equipment proposed for this specification section. If no changes are required, mark all drawings with "No changes required" or provide a statement that no changes are required.

1. Failure to include all drawings or a statement applicable to the equipment specified in this section will result in submittal return without review until a complete package is submitted.

C. A copy of this specification section with addenda and all referenced specification sections with addenda, with each paragraph check-marked to indicate specification compliance or marked and indexed to indicate requested deviations and clarifications from the specified requirements.

1. If deviations and clarifications from the specifications are indicated, therefore requested by the Contractor, provide a detailed written justification for each deviation and clarification.

2. Failure to include a copy of the marked-up specification sections and or the detailed justifications for any requested deviation or clarification will result in submittal return without review until marked up specifications and justifications are submitted in a complete package.

1.04 SPARE PARTS:

A. Comply with the requirements specified in Section 01 61 00.

1. One set of all special tools is required.

1.05 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

B. Stop logs shall be the product of one manufacturer.

C. Stop logs shall be manufacturer’s standard cataloged product and modified to provide compliance with the drawings, specifications and the service conditions specified and indicated.

D. Welding: In accordance with latest applicable American Welding Society Code, ASME Welding Code, or equivalent.

E. The Contractor shall obtain the stop logs, guide frames (groves) and appurtenances from the stop log manufacturer, as a complete and integrated package to insure proper coordination and compatibility and operation of the system.

F. Services of Manufacturer's Representative as stated in Section 01 45 00 and as specified herein.

G. Manufacturer of stop logs shall have a minimum of ten (10) operating installations with stop logs of the size specified or larger and in the same service and head as specified operating for not less than five (5) years or manufacturer of stop logs shall utilize a Project Manager that is experienced in stop log design and construction. The Project Manager shall be an employee of the gate manufacturer and shall have designed a minimum of ten (10) operating installations with stop logs of the size specified or larger and in the same service and head as specified operating for not less than five (5) years.

1.06 DELIVERY, STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

PART 2 - PRODUCTS

2.01 SYSTEM DESCRIPTION:

A. Stop log sizes and operating data are indicated in the Stop Log Schedule.

2.02 MANUFACTURERS:

A. Stop Logs:

1. Whipps

2. RW Gate Co.

2.03 STOP LOG CONSTRUCTION:

A. Provide all stop logs produced by a single manufacturer and designed for installation in the channels and structures as specified and indicated.

B. Stop log Configuration, Dimensions and Characteristics: As indicated in the Stop Log Schedule.

C. Leakage Rate: Not to exceed 0.05 gpm per foot of wetted seal perimeter.

D. Provide the stop logs with a continuous resilient seal along the bottom and both sides. Seals on or within the guide frames are not acceptable.

E. Stop Log Height: As indicated and designed to function as specified and indicated when stacked in any order.

F. Provide all structural components of the stop logs fabricated of aluminum or stainless steel and with strength to prevent distortion during normal handling, during installation and while in service as specified and indicated.

G. Provide all structural components of the guide frames fabricated of stainless steel with strength to prevent distortion during normal handling, during installation and while in service as specified and indicated.

H. Provide all welds performed by welders with AWS D1.2 certification for aluminum and AWS D1.6 or ASME Section IX certification for stainless steel.

I. Finish: Mill finish on aluminum and passivated mill finish on stainless steel.

1. Provide welds on aluminum cleaned to provide a uniform finish.

2. Provide weld on stainless steel passivated in accordance with ASTM A380 to remove weld burn and scale.

J. Materials:

1. Stop Logs: ASTM A240 Type 316L stainless steel or 6061-T6 Aluminum, as indicated

2. Frame Guides and Invert: ASTM A240 Type 316L stainless steel

3. Lip Seal: Urethane ASTM D4020, Neoprene ASTM D2000 or EPDM

4. Fasteners, Nuts and Bolts: ASTM A276 Type 316 stainless steel

a. Anchor Bolts: Minimum 1/2-inch diameter

2.04 STOP LOGS:

A. Provide stop logs constructed of extruded aluminum or stainless steel shapes with a minimum thickness as specified below or as required for the head as indicated in the Stop Log Schedule.

1. Aluminum: 1/4-inch

2. Stainless steel: 1/4-inch

B. Provide each stop log 12 inches tall unless otherwise indicated in the Stop Log Schedule

C. Maximum Bending Stress: Not to exceed 7600 psi at the maximum operating head.

D. Provide stop logs designed to prevent buoyancy and to allow drainage.

E. Provide two slots in the top of each stop log for removal and installation by means of the specified stop log lifter.

F. Provide each stop log with a welded identification tag indicating the following:

1. Manufacturer and model number

2. Width of the opening

3. Design head

4. Seal Material

G. Finish: All stainless steel shall be passivated.

2.05 SEALS:

A. Provide stop logs with a continuous resilient seal along the bottom and both sides to restrict the leakage to the rate specified.

B. Provide all seals of urethane or rubber, replaceable and mechanically retained to the stop logs.

C. Stop logs using rubber “J” or “P” seals are not acceptable.

2.06 FRAMES:

A. Provide frame guides or grooves and invert members constructed of stainless steel plate with a minimum thickness of 1/4-inch.

B. Provide frame design to allow for embedded mounting or mounting directly to a wall with stainless steel anchor bolts and grout.

C. Provide mounting style as indicated in the Stop Log Schedule

D. Provide a flush bottom invert member across the bottom of the guides.

E. Frame mounted seals are not acceptable.

F. Finish: All stainless steel shall be passivated.

2.07 STOP LOG LIFTER:

A. Provide one (1) stop log lifter for each different stop log (guide frame) width.

B. Provide the lifter constructed of aluminum or Type 304L stainless steel and fitted with UHMW guide bars and stainless steel fasteners.

C. Provide the lifter with lifting hooks designed to engage the slots in the top of the stop logs.

D. Provide a lanyard release.

E. Provide the lifter capable of installing and removing all stop logs of the same width whether they are installed or at the operating floor level.

PART 3 - EXECUTION

3.01 INSTALLATION:

A. Install items in accordance with shop drawings, manufacturer's printed instructions and as indicated.

B. Clean debris, dirt, and gravel, from inside of stop logs, guide frames and channels before placing stop logs.

C. Install guide frames in a true vertical position and grout all voids between guide frames and walls.

D. Inspect material for defects in workmanship and material.

3.02 STARTUP AND TESTING:

A. Provide services of factory-trained Service Technician, specifically trained on type of equipment specified:

1. Service Technician must be present on site for all items listed below. Person-day requirements listed are exclusive of travel time, and do not relieve Contractor of the obligation to place equipment in operation as specified.

2. Comply with requirements for checkout, startup, and testing in Section 01 78 25.

3. Installation: Inspect grouting, location of anchor bolts; setting, leveling, alignment and field erection:

a. 1/4 person-days per stop log location identified on the Stop Log Schedule

4. Functional Testing: Check alignment and perform a functional test. Tests to include all items specified.

a. 1/4 person-days per stop log location identified on the Stop Log Schedule

5. Testing: Field performance test equipment specified.

a. 1/4 person-days per stop log location identified on the Stop Log Schedule

6. Vendor Training: Provide classroom and field operation and maintenance instruction including all materials, slides, videos, handouts and preparation to lead and teach classroom sessions. See Section 01 78 24.

a. 1 trip, 1/2 day per trip

7. Credit to the Owner, all unused service person-days specified above, at the manufacturer's published field service rate.

8. Any additional time required of the factory trained service technician to assist in placing the equipment in operation, or testing or to correct deficiencies in installation, equipment or material shall be provided at no additional cost to the Owner.

3.03 FIELD TESTING:

A. Field testing will not be conducted without a procedure accepted by the Engineer, calibration certificates for all testing equipment, gauges and flow meters and a completed and signed pretesting check list. See Section 01 78 25.

B. After installation of guide frames, and after inspection, operation, testing and adjustment have been completed by the manufacturer's field service technician, conduct operating and leakage test for each stop log in presence of the Engineer to determine its ability to operate as specified, and to operate smoothly without jamming under specified conditions.

C. Test installation and removal of each stop log location with the number of stop logs as indicated.

D. Leakage Test: Leakage not to exceed 0.05 gpm per foot of seal perimeter.

1. Conduct tests at 7 feet of head.

E. Immediately correct or replace all defects or defective equipment revealed by or noted during tests at no additional cost to the Owner.

F. Repeat tests until specified results are obtained.

G. Contractor to provide all water, labor, piping, testing equipment for conducting tests.

H. Make all adjustments necessary to place equipment in specified working order at time of above tests.

I. Remove and replace equipment at no additional cost to the Owner with equipment that will meet all requirements specified and indicated if unable to demonstrate to the satisfaction of the Engineer that equipment will perform the service specified, indicated and as submitted.

3.04 CONTRACT CLOSEOUT:

A. Provide in accordance with Section 01 77 00.

Table 1: Stop Log Schedule

	Area	Commodity	Tag	Size (WXH)	Seating Head (ft)	Unseating Head (ft)	Mount (Embedded/ Surface/ Face)	Stop Log Material	Bottom Sill Seated(Y/N)	Notes
1	01 - IPS	RWW	01-SL-11100	8'-0"x14'-6"	15	Minimal	Embedded	Aluminum	Y	Provide one set of stop logs
2	01 - IPS	RWW	01-SL-11200	8'-0"x14'-6"	15	Minimal	Embedded	Aluminum	Y	

END OF SECTION

SECTION 40 23 13.01

PROCESS VALVES AND APPURTENANCES

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide and process valves and appurtenances as indicated and in compliance with Contract Documents.

1. Provide sizes and capacities as indicated and in compliance with Contract Documents.

1.02 REFERENCES:

A. American Society of Mechanical Engineers (ASME):

1. B1.20.7: Hose Coupling Screw Threads

2. B16.1: Standard for Cast Iron Pipe Flanges and Flanged Fittings, 125 lb

3. B16.4: Cast-Iron Threaded Fittings, Class 125 and 250

4. B16.10: Face-to-Face and End-to-End Dimensions of Ferrous Valves

B. ASTM International (ASTM):

1. A48: Standard Specification for Gray Iron Castings

2. A126: Standard Specification for Gray Iron Castings for Valves, Flanges and Pipe Fittings

3. A536: Standard Specification for Ductile Iron Castings

C. American Water Works Association (AWWA):

1. C500: Metal-Seated Gate Valves for Water Supply Service

2. C504: Rubber-Seated Butterfly Valves

3. C509: Standard Specifications for Resilient-Seated Gate Valves for Water and Sewage Systems

4. D102: Coating Steel Water-Storage Tanks

D. NSF International (NSF):

1. 61: Drinking water system components health effects

1.03 SUBMITTALS:

A. Submit the following in accordance with Section 01 33 00:

1. Data, regarding valve characteristics and performance including Cv.

2. Shop drawing data for accessory items.

3. Manufacturer's literature as needed to supplement certified data.

4. Operating and maintenance instructions and parts lists.

5. Listing of reference installations as specified with contact names and telephone numbers.

6. Valve shop test results.

7. Qualifications of field service technician.

8. Shop and Field inspections reports.

9. List of recommended spare parts other than those specified.

10. Recommendations for short and long term storage.

11. Special tools.

12. Shop and field testing procedures and equipment to be used.

13. Number of service technician days provided and per diem field service rate.

14. Manufacturer’s product data and specifications for shop painting.

15. Provide a layout drawing, plan and section showing orientation of plug, gate, check, ball valves and actuators and nearest obstructions for each valve.

16. Manufacturer's product data and specifications for shop painting.

17. Provide a listing of the materials recommended for each service specified and indicated. Provide documentation showing compatibility with process fluid and service specified and indicated.

18. The latest ISO 9001 series certification or quality system plan.

19. Material Certification:

    a. Provide certification from the equipment manufacturer that the materials of construction specified are recommended and suitable for the service conditions specified and indicated. If materials other than those specified are proposed based on incompatibility with the service conditions, provide technical data and certification that the proposed materials are recommended and suitable for the service conditions specified and indicated including an installation list of a minimum of five (5) installations in operation for a minimum of five (5) years. Provide proposed materials at no additional cost to the Owner.

    b. Where materials are not specified, provide technical data and certification that the proposed materials are recommended and suitable for the service conditions specified and indicated.

B. A copy of this specification section with addenda and all referenced specification sections with addenda, with each paragraph check-marked to indicate specification compliance or marked to indicate requested deviations and clarifications from the specified requirements.

    1. If deviations and clarifications from the specifications are indicated, therefore requested by the Contractor, provide a detailed written justification for each deviation and clarification.

    2. Failure to include a copy of the marked-up specification sections and or the detailed justifications for any requested deviation or clarification will result in submittal return without review until marked up specification and justification are resubmitted with the entire package.

1.04 SPARE PARTS:

A. Comply with requirements specified in Section 01 61 00.

1.05 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

B. Provide enclosures for the area classifications specified and indicated.

C. Contractor responsible for verifying outside diameter of pipe to be tapped.

D. Services of Manufacturer's Representative as stated in Section 01 45 00 and specified herein.

E. Manufacturer of valve shall have a minimum of five (5) operating installations with pumps of the size specified and in the same service as specified operating for not less than five (5) years.

F. If equipment proposed is heavier, taller, different laying length or requires more operating space than specified and indicated; provide all structural, architectural, mechanical, electrical and plumbing revisions at no additional cost to the Owner.

1. If equipment is heavier than specified, the Contractor shall provide all hoisting equipment sized to maintain the minimum safety factor between the specified maximum equipment weight and the lifting capacity of the hoisting equipment indicated and specified.

1.06 DELIVERY, STORAGE AND HANDLING:

A. Comply with the requirements specified in AWPA Section 01 66 00 and as specified.

PART 2 - PRODUCTS

2.01 ECCENTRIC PLUG VALVES:

A. Manufacturers:

1. DeZurik

2. Kennedy

3. Val-Matic

B. Type: Non-lubricated, eccentric.

C. Body and Working Pressure:

1. Cast Iron, ASTM A126 Class B or Ductile Iron, ASTM A536, Grade 64-45-12.

a. Valves 4-inch through 12-inch: 175 psi

b. Valves 14-inch and larger: 150 psi

D. Ends:

1. Grooved: ANSI/AWWA C606 for ductile iron valves.

2. Flanged: ANSI B16.1 Class 125 pound for cast iron valves.

3. Buried Valves: Mechanical joint.

E. Valve Ports:

1. Provide rectangular ported valves, circular ports are not acceptable.

2. Valves 20-inch and smaller: Not less than 80 percent of pipe area.

3. Valves 24-inch and larger: Not less than 70 percent of pipe area.

F. Valve Seats:

1. Coat plug with seat material specified. Bolted systems are not acceptable.

a. Seat Material:

(1) Neoprene or Buna-N synthetic rubber.

2. Provide valves with seats clamped to valve with mating seat of 90 percent, minimum, pure nickel welded to the valve body.

G. Upper and Lower Plug Journal Bearings:

1. Removable, permanently lubricated stainless steel bushings for valves 20-inch and smaller.

2. Bronze bearings with Type 316 stainless steel bushings for valves 24-inch and larger.

3. Provide grit seals for upper and lower plug shafts for all valves.

H. Stem Seals:

1. Adjustable multiple V-packing.

2. Replaceable and adjustable without valve disassembly.

3. Provide valves with two sets of packing rated for vacuum service for all pump suction isolation service and for services where a vacuum is specified and indicated.

I. Operators for Valves 4-inch and larger:

1. Manually Operators:

a. Gear operated with handwheels, levers are not acceptable.

b. Provide gear operators rated for bi-directional shutoff at the valve working pressure rating as specified herein.

c. Gear operators: Totally enclosed worm gear, traveling nut type is not acceptable. Provide permanently lubricated, watertight and dustproof, with adjustable open and closed stops and plug position indicator.

d. Provide all work gears designed and certified to withstand input loads up to 300-feet-pounds minimum at the stops without damage.

e. Chainwheels: Provide where required as specified herein.

2. Electric Motor Actuators: Provide where indicated and provide in accordance with Section 40 23 13.03.

J. Shop Testing:

1. Provide all plug valves tested and certified bubble tight in both directions at the full rated working pressure as specified herein.

K. Shop Painting:

1. Provide epoxy painting as specified herein.

2.02 BALL VALVES – GENERAL SERVICE:

A. Manufacturers:

1. Jamesbury

2. KF

3. Inline

4. Kitz

B. Valves 1/2-inch through 4-inch:

1. Materials:

a. Body and End Cap: Three piece, ASTM A351 Grade CF8M

b. Body Seal: PTFE

c. Seat: RTFE

d. Ball: Type 316 stainless steel

e. Stem: Type 316 stainless steel

2. Pressure Rating:

a. 1/2-inch through 2-inch: 1000 psi at 100 degrees F

b. 2-1/2-inch through 4-inch: 800 psi at 100 degrees F

3. Ends:

a. 2-inch and Smaller: Screwed, flanged or Pressfit; see Section 40 23 19.05 for Pressfit specifications

b. 3-inch and larger: Flanged

C. Valves 4-inch through 12-inch.

1. Materials:

a. Body and Adaptor: Two piece, ASTM A351 Grade CF8M

b. Seat: TFE

c. Ball: Type 316 stainless steel

d. Stem: Type 316 stainless steel

2. Pressure Rating: ANSI Class 150

3. Ends: Flanged

D. Actuators:

1. Manual:

a. 4-inch and Smaller: Lever

b. 6-inch and Larger: Gear operator

c. Provide chainwheels where required as specified herein

2. Electric Motor Actuators: Provide in accordance with Section 40 23 13.03.

2.03 RUBBER FLAPPER CHECK VALVES:

A. Manufacturers:

1. Val-Matic

2. DeZurik APCO

3. Crispin

B. Materials:

1. Body and Cover: Ductile Iron ASTM A536 Grade 65-42-12.

a. Valves 8-inch and Smaller: ASTM A351 CF8M.

2. Rubber Flapper: Buna N 70 Durometer ASTM 2000-BG encapsulating an ASTM A36 steel plate.

3. Hinge Pin: AISI 1018.

C. Provide valves with a full pipe size flow area.

D. Provide valves 4-inch and larger capable of passing a 3-inch sphere.

E. Provide a threaded connection with bronze plug on cover and on the bottom of the valve.

F. Working Pressure:

1. 2-inch through 24-inch: 250 psi.

2. 30-inch and 36-inch: 150 psi.

G. Ends: Flanged ANSI B16.1, Class 150.

H. Provide seating surface at a 45 degree angle such that the flapper travels a maximum of 35 degrees from full closed to full open position.

I. Provide valve with cover designed for removal of the valve internals without removing the valve from the pipeline.

J. Position Indicator:

1. Provide a mechanical indicator to provide disc position for valves 4-inch and larger.

2. Provide the indication with continuous contact with the disc.

3. Provide a limit switch for remote indication of valve position. Provide limit switches in accordance with Section 40 23 13.03.

K. Backflow Device:

1. Provide a screw type rising stem backflow device located on the bottom of the check valves.

2. Provide a stainless steel T-handle device with bronzed bushings.

L. Valve Schedule:

Rubber Flapper Check Valve Schedule	
Valve Tag Number	01-CV-1111A, 1122A, 1113A, 1124A, and 1115A
Fluid	Raw Sewage
Fluid Temperature Range, degrees F	50 - 77
Valve Size, inches	30
Number of Valves	5
Max Operating Pressure, psi	150
Valve Port	Circular
Valve Ends	Flanged
Service	Open/Close
Operator Type	N/A
Opening/Closing Time, seconds	N/A

2.04 AIR RELEASE VALVES – WASTEWATER SERVICE:

A. Manufacturers:

1. Val-Matic
2. Crispin
3. DeZurik-APCO
4. ARI

B. Valves: Fully automatic float operated valves designed to release air from the piping system while the system is in operation and under pressure.

C. For wastewater services provide valves with the following:

1. Extended valve body
2. 2-inch cleanout
3. Minimum 2-inch inlet
4. 1/2-inch outlet with stainless steel ball valve with hose connection
5. 1-inch drain with stainless steel ball valve
6. Provide ball valve as specified herein

D. Valves 3-inch and Smaller: NPT inlet and outlet connections equivalent to the valve size.

1. Provide stainless steel ball valve for isolation as specified herein.

E. Valves 4-inch and Larger: Flanged inlet and outlet connections equivalent to the valve size.

1. Provide plug valve for isolation as specified herein.

2. Flanges: ANSI B16.1 Class 125

3. Flanges: ANSI B16.42 Class 300

F. Provide valves with two (2) additional NPT connections for the addition of gauges and for testing, and draining.

G. Provide valve body with a through flow area equal to the nominal valve size.

H. Provide valves with a bolted cover and flat gasket.

1. Valves 4-inch and Larger: Provide cover fitted to the valve body with a machined registered fit.

I. Provide guide shafts supported by bushings.

1. Valves 4-inch and Larger: Provide float double guided and a resilient bumper.

J. Floats: Provide floats with bottom shaped for accelerated closure.

K. Seats to provide drop tight shut off at full valve pressure rating.

L. Provide vacuum check on valve outlet to prevent air from re-entering the system during negative pressure conditions.

M. Materials:

1. Valve Body, Cover and Baffle:

a. ASTM A126 Class B Cast Iron for Class 125 valves

b. ASTM A536 Grade 65-45-12 Cast Ductile Iron, ANSI Class 300

c. ASTM A216 Grade WCB cast steel, ANSI Class 300

d. ASTM A351 Grade CF8M stainless steel

2. Floats, Guide Shafts and Bushings: Type 316 stainless steel

3. Seats: Buna-N

4. Hardware: Type 316 stainless steel

5. Interior Valve Coating: Fusion bonded epoxy

2.05 AIR/VACUUM VALVES – VERTICAL WET PIT PUMPS:

A. Manufacturers:

1. Val-Matic

2. Crispin

3. DeZurik-APCO

4. Vent-O-Mat

B. Valves: Fully automatic float operated valves designed to vent air within the pump discharge column on pump start-up and allow air to re-enter the column on pump shutdown or if a negative pressure occurs.

C. Provide with flanged inlet connections equivalent to the valve size. Provide Valves 6-inch and smaller with NPT outlet connections and valves larger than 6-inch with flanged outlet connections.

1. Flanges: ANSI Class 150

D. Provide valves with two (2) additional NPT connections for the addition of Air Release Valve, gauges, testing, and draining.

E. Provide valve body with a through flow area equal to the nominal valve size.

F. Provide valves with a bolted cover and flat gasket. Provide cover fitted to the valve body with a machined registered fit.

G. Provide guide shafts supported by bushings.

1. Provide float double guided and a resilient bumper.

H. Seats to provide drop tight shut off at full valve pressure rating.

1. Provide an anti-slam device.

I. Anti-Slam Device:

1. Provide for valves 6-inch and larger.

2. Flanged globe pattern spring operated device with a center guided disc and seat assembly.

3. Provide the disc with threaded ports to provide adjustment of flow rate.

4. Provide the device mounted on the valve inlet.

5. Seat and Disc: ASTM A351 Grade CF8M Stainless Steel.

J. Materials:

1. Valve Body, Cover and Baffle:

a. ASTM A126 Class B Cast Iron for Class 125 valves

b. ASTM A536 Grade 65-45-12 Cast Ductile Iron for Class 300 valves

2. Floats, Guide Shafts and Bushings: Type 316 stainless steel

3. Seats: Buna-N

4. Hardware: Type 316 stainless steel

5. Springs: ASTM A313 Type 302 stainless steel

2.06 SOLENOID VALVES:

A. Manufacturers:

1. JD Gould

2. ASCO

3. Berkert

B. Type:

1. Size: 1/8-inch to 2-inch.

2. Globe type.

3. 2-way, internal piston pilot operated.

4. Energize to open.

5. Operating Pressure Differential: 150 psi.

C. Materials:

1. Body: Type 316 stainless steel.

2. Seat Discs: PTFE.

3. Piston Assembly: Type 316 stainless steel.

4. Pilot Assembly: Type 316 stainless steel jacket welded on steel core.

D. Coil: Class F.

E. Electrical: 120 Volt, 1 phase, 60 Hertz.

F. Ends: Threaded.

G. Enclosure: NEMA 4X for locations in non-classified areas and NEMA 7 for use in classified areas.

2.07 CHAINWHEEL OPERATORS – STAINLESS STEEL:

A. Provide chainwheels with chain and chain guides. For all valves with handwheels or gear operators higher than 6.5 feet above operating floor level.

B. Provide chain that reaches to within 3 feet of the operating floor level.

C. For valves with gear operator mount with chainwheel in the vertical position.

D. Provide secondary safety restraint system.

E. Manufacturer:

1. Trumbull

F. Materials:

1. Chainwheels: Pocket type wheel, Type 316 stainless steel.

2. Chain: Type 316 stainless steel straight link machine chain.

3. Hardware and Attachments: Type 316 stainless steel.

4. Safety Restraint Cables and Hardware: Type 316 stainless steel.

2.08 FLOORSTANDS-NRS INDICATING TYPE:

A. Type: Non-Rising Stem (NRS), Indicating.

B. Materials:

1. Pedestal: Cast Type 316 stainless steel with a vertical indicating slot.

2. Indicator: Bronze. Provide indicator that travels on a threaded stem to indicate the position of the valve.

3. Handwheel: Type 316 stainless steel, 12-inch diameter.

4. Couplings: Type 316 stainless steel.

C. Provide the word “OPEN” cast in the pedestal at the top of the indicating slot and provide a “CLOSED” tag mounted to the pedestal, to indicate the closed position of the valve.

D. Floorstands fabricated by welding flanges to pipe are not acceptable.

2.09 EXTENSION STEMS:

A. Provide where indicated and required for operation of all valves

B. Material:

1. Stems: Type 316L solid stainless steel bar or Schedule 40 Type 316L pipe.

a. Minimum Size: 1.25 inch diameter, Slenderness ratio <200.

2. Connectors, thrust relief assemblies, torque tube assemblies, universal joints and operating nuts: Type 316 or Type 316L stainless steel.

3. Miter gears: Cast iron with 2 part epoxy coating.

2.10 STEM GUIDES:

A. Manufacturer:

1. Trumbull Industries

B. Provide valve stem guides where indicated and as required by the valves manufacturer.

C. Stem Guide Spacing: 6 to 8 feet, maximum slenderness ratio of 200.

D. Stem Guides for Stems 2-inch and Smaller:

1. Materials:

a. Stem Guide: Cast Type 316 stainless steel with 2 to 36 inch adjustment.

b. Bushing: Bronze, NSF 61.

c. Hardware: Type 316 stainless steel.

E. Stem Guides for Stems 2-1/8-inch to 4 inch:

1. Materials:

a. Stem Guide: Ductile Iron 65-45-12 with 2-3/4 to 17-1/4 inch adjustment.

b. Bushing: Split type, Bronze, NSF 61.

c. Hardware: Type 316 stainless steel.

2.11 POSITION INDICATORS:

A. Manufacturer:

1. Trumbull Industries

B. Provide position indicators installed on all multi-turn valves and quarter turn valves with gear boxes 3 inch and larger.

1. Type: Planetary gear design.

C. Materials:

1. Provide the sun gear, planet gear, ring gears and scale plate constructed of Delrin.

2. Housings of carbon steel or aluminum are not acceptable.

3. Hardware and Fasteners: Type 316 stainless steel.

D. Position Indicator Design Features:

1. Provide the position indication to show the position of the valve, from fully open to fully closed, identified at ground level.

2. Movement of the indicating arrow must be visible through a window covering a minimum of 300 degrees of the circumference of the indicator.

3. Size of the characters and numerals: minimum 3/16-inch.

4. Provide the top scale plate with markings representing the number of turns, contain the word “CLOSED”, and a directional arrow.

5. Provide permanently recessed, embossed or engraved markings in the scale plate. The use of adhesive labels is not acceptable.

6. Provide the “OPEN” line marked on a transparent polycarbonate window, field adjusted for the number of turns of each valve size.

7. Provide the position of the adjustable “OPEN” window secured to the top surface of the scale plate by the outside diameter of three Type 316 stainless button head cap screws.

8. Provide all adapters to secure the position indicator, for installation in either a floor box or wall bracket as indicated and required.

9. Provide the position indicator and adapter with matching flat sides to prevent rotation of the indicator during operation.

E. Exposed and Submerged Valves:

1. Provide a Type 316 stainless steel extension stem connected to a 2 inch square nut on the valve and extend up through the position indicator, terminating in a 2 inch square nut, operable by a standard waterworks tee-handle wrench.

F. Valves Installed Inside a Structure:

1. Provide the position indicator installed in a floor box.

2. Where a floor is not directly over the valve and extension stem, support position indicators with a Type 316 stainless steel wall bracket mounted to a side wall.

3. When installed in a floor, provide the adapter with a bronze bushing to support and center the extension stem with the bronze bushing retained in the cast iron floor adapter by two Type 316 stainless steel screws and drilled to an inside diameter 1/16-inch larger than the outside diameter of the extension stem.

2.12 ELECTRIC MOTOR ACTUATORS:

A. Provide in accordance with Section 40 23 13.03.

2.13 SHOP PAINTING:

A. Coat internal and external ferrous surfaces of valve with NSF Certified Epoxy in accordance with ANSI/NSF Std. 61, and in conformance to AWWA D102. All valves not specified to have a fusion bonded epoxy coating.

B. Process Valve Color: Match piping system.

PART 3 - EXECUTION

3.01 INSTALLATION:

A. Prior to installation, protect stored valves and appurtenances from damage due to exposure to sunlight, heat, dirt, debris, freezing and thawing, vandalism, etc.

B. Clean all debris, dirt, gravel, etc, from inside of piping before placing valves in place.

C. Erect and support valves in respective positions free from distortion and strain on appurtenances during handling and installation. Inspect material for defects in workmanship and material. Clean out debris and foreign material from valve openings and seats, test operating mechanisms to check functioning, and check nuts and bolts for tightness. Repair, valves and other equipment which does not operate easily or are otherwise defective at no additional cost to the Owner.

D. Set plumb and support valves in conformance with instructions of manufacturer. Shim valves mounted on face of concrete vertically and grout in place. Install valves in control piping for access.

E. Provide bolted split sleeve coupling or flexible type grooved coupling on downstream side of buried valves to assist in valve removal.

F. Where indicated provide Type 316 stainless steel stem extension to operating floor elevation as shown and provide the bevel gear operator with a fabricated steel floorstand and handwheel.

3.02 CHECK VALVES:

A. Install check valves horizontally in pipelines unless otherwise indicated.

3.03 PLUG VALVES:

A. Install valves in horizontal piping with shaft horizontal such that in open position, plug is located in upper part of valve body. Orient valves so that in closed position, flow is against the face of the plug.

3.04 FLOORSTAND OPERATORS AND STEM GUIDES:

A. Set floorstand operators and stem guides so stems run smoothly in true alignment. Anchor guides to walls. Check distances from centerlines of gates to operating level or base of floorstand and adjust if to suit actual conditions of installation.

3.05 FIELD TESTING:

A. Pressure test valves with pipeline pressure testing.

B. Test functions of each valve.

C. Make all adjustments necessary to place valves in specified working order at time of above tests.

D. Remove all replace valves and appurtenances at no additional cost to the Owner with equipment that will meet all requirements specified and indicated if unable to

demonstrate to the satisfaction of the Engineer that valves will perform the service specified, indicated and as submitted and accepted.

3.06 FIELD TOUCH-UP PAINTING:

A. After installation and accepted testing by the Engineer, apply touch-up paint to all scratched, abraided and damaged shop painted surfaces. Coating type and color shall match shop painting.

3.07 CONTRACT CLOSEOUT:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 40 23 13.03

ELECTRIC MOTOR ACTUATORS AND APPURTENANCES

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide electric motor actuators and appurtenances as indicated and in compliance with Contract Documents.

1. Actuators for all valves, gates and equipment to be the product of one manufacturer.

1.02 REFERENCES:

A. ASTM International (ASTM):

1. B117: Standard Practice for Operating Salt Spray (Fog) Apparatus.

2. B179: Standard Specification for Aluminum Alloys in Ingot and Molten Forms for Castings from All Casting Processes.

B. FM Global (FM):

1. 3615: Explosionproof Electrical Equipment General Requirements.

C. Institute of Electrical And Electronics Engineers (IEEE):

1. 802.15.4: Standard for Information Technology.

1.03 SUBMITTALS:

A. Submit the following in accordance with Section 01 33 00:

1. Certified shop and erection drawings.

a. Drawings shall be in conformance with all other requirements as specified in this specification.

2. Data, regarding actuator and motor characteristics and performance.

3. Actuator and Valve set-up for each application: Position or torque seating

4. Shop drawing data for accessory items.

5. Manufacturer’s literature as needed to supplement certified data.

6. Operating and maintenance instructions and parts lists.

7. Listing of reference installations as specified with contact names and telephone numbers.

8. Actuator shop test results.

9. Motor shop test results.

10. Qualifications of field service engineer.

11. Schematic control and power wiring diagrams.

12. Shop and Field inspections reports.

13. Recommended spare parts other than those specified.

14. Recommendations for short and long term storage.

15. Special tools.

16. Shop and field testing procedures and equipment to be used.

17. Torque capability and settings for each actuator.

    a. Provide a listing of operating torque, safety factor applied and actuator torque capability and actuator safety factor as specified for each valve, gate and equipment.

18. Number of service person days provided and per diem field service rate.

19. Manufacturer's product data and specifications for shop painting including statement of compliance for compatibility with field painting.

20. Provide a listing of the materials recommended for each service specified and indicated.

21. ISO 9001 certification.

22. Material Certification:

    a. Provide certification from the equipment manufacturer that the materials of construction specified are recommended and suitable for the service conditions specified and indicated. If materials other than those specified are proposed based on incompatibility with the service conditions, provide technical data and certification that the proposed materials are recommended and suitable for the service conditions specified and indicated including an installation list of a minimum of five (5) installations in operation for a

minimum of three (3) years. Provide proposed materials at no additional cost to the Owner.

b. Where materials are not specified, provide technical data and certification that the proposed materials are recommended and suitable for the service conditions specified and indicated.

B. A copy of the contract mechanical process, electrical and instrumentation drawings, with addenda that are applicable to the equipment specified in this section, marked to show all changes necessary for the equipment proposed for this specification section. If no changes are required, mark all drawings with "No changes required".

1. Failure to include all drawings or a statement application to the equipment specified in this section will result in submittal return without review until a complete package is submitted.

C. A copy of this specification section with addenda and all referenced specification sections with addenda, with each paragraph check-marked to indicate specification compliance or marked and indexed to indicate requested deviations and clarifications from the specified requirements.

1. If deviations and clarifications from the specifications are indicated, therefore requested by the Contractor, provide a detailed written justification for each deviation and clarification.

2. Failure to include a copy of the marked-up specification sections and or the detailed justifications for any requested deviation or clarification will result in submittal return without review until marked up specifications and justifications are submitted in a complete package.

1.04 SPARE PARTS:

A. Comply with the requirements specified in Section 01 61 00.

B. Provide for each Actuator:

1. Two fuses of each size and type used in the actuator.

2. One set of back-up batteries for display operation.

C. Provide spare parts that are identical to and interchangeable with similar parts installed.

1. One set of all special tools

2. Supply each actuator with a start-up kit consisting of installation instructions, electrical wiring diagrams and two sets of cover screws and seals.

1.05 QUALITY ASSURANCE:

A. Provide in accordance with Section 01 45 00 and as specified herein.

B. Actuators for all valves, gates and equipment to be the product of one manufacturer.

1. Contractor to coordinate actuator sizing and configuration with all valve, gate and equipment suppliers.

C. Actuators to be manufacturer's standard cataloged product and configured to provide compliance with the specifications and the service conditions specified and indicated.

D. Shop tests as specified.

E. Provide Services of Manufacturer's Representative as stated in Section 01 61 00 and as specified herein.

1.06 DELIVERY, STORAGE AND HANDLING:

A. Provide in accordance with Section 01 61 00 and as specified herein.

PART 2 - PRODUCTS

2.01 ELECTRIC ACTUATORS – 3 PHASE:

A. Each actuator shall include electric motor, reduction gearing, reversing starters, thermal overloads, controls transformer, limit controls, non-intrusive local controls as a complete integrated package to ensure proper coordination, compatibility, and operation of the system.

1. Provide actuators capable of setting of torque, turns, and configuration of indication contacts, through the use of a non-intrusive infrared setting tool without the necessity to remove any electrical compartment covers. The setting tool must be the means for adjustment. The use of control knobs for programming the actuator is not acceptable.

2. Provide actuators with torque capability 150 percent above the maximum operating torque required by each valve, gate or equipment.

3. Enclosure:

a. Watertight to IP68, classification. Enclosure must be certified NEMA 6 for all units except those for use in classified areas.

b. Provide explosion proof Class 1, Division 1, Groups C, D, E, F, & G. NEMA 7 FM (Factory Mutual) certified to FM3615 for actuators as indicated and located in classified areas.

4. Provide an internal watertight compartment to protect switches, contacts, motor and internal electronics from ingress of moisture and dust when the external terminal cover is removed.

5. Breathers, drains and or heaters are not permitted, enclosure must be totally sealed.

6. Provide each actuator with a handwheel for manual operation. Provide a hammerblow device which permits motor to come up to speed before picking up load and unseating valve.

B. Motors:

1. Open/Close applications: Motors, Class F with 15 minute duty rating.

2. Modulating applications: Motors, Class H with a 30 minute duty rating.

3. Motor: Low inertia, high torque type, specifically designed for use with motor actuators, to prevent over travel.

C. Provide internal clutch that cannot engage handwheel operating mechanism and motor-operating mechanism at the same time. Friction type declutching is not acceptable.

1. Provide handwheel with arrow and the word CLOSE or SHUT cast on handwheel to indicate turning direction to close.

2. Handwheel must not rotate during power operation.

3. Provide handwheel and low gear ratio combined to give maximum rate of movement possible with 80 pound rim pull.

D. Drive Unit:

1. Metal worm wheel and worm shaft type.

2. Provide an oil filled drive housing. Grease lubrication is not acceptable.

3. Worm shaft to operate in ball or roller bearings and be machine cut, ground, and highly polished, hot rolled steel, hardness 50-60 Rockwell Scale C bronze worm wheel with large contact area. Provide mating surfaces of dissimilar metals to prevent galling. Cast metals or gears manufactured from non-metallic materials are not acceptable.

4. Worm and shafts: Heat treated steel and accurately machined. Output or driving shaft to operate in bronze bearing or in ball or roller bearings.

5. Make provisions to take thrust in both directions.

6. Worm and wheel to be oil lubricated at all times.

7. Drive housing: Cast iron or aluminum depending on size of actuator offered, all thrust or torque bearing components shall be ductile iron.

8. Provide drive bushing as part of a detachable thrust base making for easy retrofit.

E. Fully wire electric motor operators at factory and furnish complete with terminal strips for external power and control connections.

1. Wiring: Copper with tropical grade PVC cover. Internal wiring to remain in a watertight compartment with external cover removed.

F. Provide manual or automatic control as indicated and specified.

G. Manual Control: Provide the following Control, Status, Alarm and Diagnostic capabilities locally, at the actuator:

1. Control:

a. OPEN/STOP/CLOSE

b. Desired Valve Position Control 0-100 percent

2. Status:

a. Motor Running Open Direction

b. Motor Running Close Direction

c. Fully Open

d. Fully Closed

e. Percentage Open 0-100 percent in 1 percent increments

f. Percentage Output Torque 0-100 percent in 1 percent increments

3. Alarms:

a. Remote Control Communications Failure

b. Actuator Alarm

c. Valve Alarm

d. Battery Low Alarm

4. Diagnostics:

   a. Provide an integral diagnostic module, which will store and enable download of historical actuator data to permit analysis of changes in actuator, gate or valve performance. Access to data shall be via a non-intrusive an IrDA™ port to an appropriate devise capable of standard IRDA communications i.e. Notebook PC, Windows CE based "Personal Digital Assistant (PDA)" or an IrDA™ compatible cellular telephone.

   b. Provide diagnostic software from actuator manufacturer to allow configuration and diagnostic information to be reviewed, analyzed and reconfigured. Provide diagnostic status screens capable of showing multiple functions simultaneously so troubleshooting can be affected rapidly and efficiently.

H. Automatic Control: Provide REMOTE automatic control capability as specified herein.

I. Provide each actuator fitted with four (4) hard-wired configurable contacts. Each Contact shall be rated at 5A, 250VAC, 30VDC and able to provide any one of the following:

   1. Status:

      a. Valve Fully Open

      b. Valve Fully Closed

      c. Valve Opening or Closing

      d. Valve Moving (Continuous or Pulsing)

      e. Local Stop Selected

      f. Local Selected

      g. Remote Selected

      h. Open or Close Interlock Active

      i. ESD Active

   2. Alarms:

      a. Motor Tripped on Torque in Mid-Travel

      b. Motor Tripped on Torque Going Open

      c. Motor Tripped on Torque Going Closed

d. Pre-Set Torque Exceeded

e. Valve Jammed

f. Actuator Being Operated by Handwheel

g. Lost Main Power Phase

h. Customer 24V DC or 120V AC Supply Lost

i. Battery Low

j. Internal Failure Detected

k. Thermostat Tripped

J. Provide a back-up power source integral to the actuator to ensure that in the event of a main power supply loss or failure that the LCD display indication contacts must remain operational for a minimum of 24 hours and still function on change of status.

K. Provide contacts and operating parts made of non-corrodible metal and suitable for a sea atmosphere and for contact with H_2S.

L. Control:

1. Provide non-intrusive selectors on actuator electrical controls cover. One for Local/Stop/Remote selection, pad-lockable in each position and the other for local Open/Close control. Switches penetrating the housing are not acceptable.

M. Starters/Transformers: Consists of two relay contactors, 3-pole, mechanically interlocked, reversing with suitable arc suppressors.

1. Electrical Service:

a. 480V, 3-phase, 60 Hertz.

2. Provide inverse time element overload relays.

3. Provide a control transformer capable of generating either 110VAC (220VAC) or 24VDC as required for the application. Refer to typical Instrument Loop Diagrams in Division 40 61 00.

4. Provide electromechanical starter capable of OPEN/CLOSE sixty starts per hour or solid state starter for modulating service capable of 1200 starts per hour.

5. Provide replaceable fuses to protect wiring, fuses must be locally available.

6. Provide automatic phase correction.

N. Limit Controls:

1. Type: Positive in action ensuring tight seating and full openings.

2. Position Setting Range: 2.5 to 100,000 turns, with resolution of 7.5 degrees of one actuator output revolution.

3. Provide mechanism designed to minimize drift or over-travel and to open or close valve, gate or equipment to fixed, predetermined limits of opening and closing travel.

4. Provide controls that disconnect driving mechanism from stem utilizing Hall effect magnetic pulse system or similar technology. Measurement of torque shall be by direct measurement of force at the output of the actuator. Methods of measuring torque derived from the motor such as motor speed, current, flux, are not acceptable. Position and torque sensor shall accurately measure and control the position of the actuator without the use of mechanical gears. Potentiometers for position transmission are not acceptable.

5. Provide torque switches for both directions of travel.

   a. Sensing to be independent of voltage fluctuation.

   b. Provide torque protection to prevent repeated starting in the same direction.

   c. The initial unseating hammer blow shall not cause overtorque.

   d. Provide torque switch settings independent of OPEN/CLOSE position switches.

O. Provide output drive coupling to accept rising stem for rising spindle valves and include roller and ball type thrust bearings.

P. Provide actuator sized to close valve, gate or equipment against differential pressure as specified and indicated. Size actuator motor to seat and unseat valve gate or equipment and ensure torque switch trip at maximum valve torque when supply voltage is 10 percent below normal. Size motor to open or close valve, gate or equipment to satisfy the process dynamics.

Q. All fasteners and hardware: Type 316 stainless steel.

R. Secondary Gear Boxes:

1. Provide secondary gearing for multi-turn or quarter-turn applications where operating times, thrust or torque considerations require.

   a. Secondary Gearing: Bevel or spur, totally enclosed in a cast iron housing, fully sealed and lubricated for the service indicated and specified.

2. Provide gear assemblies that are a manufacturer's standard selection or combination of as detailed in published product literature.

   a. Provide each gearbox with a removable output drive coupling sized for the service specified and indicated.

   b. Provide quarter-turn gearboxes equipped with adjustable mechanical stops (at 0 and 90 degrees plus or minus 5 percent) to permit limiting open and closed travel during manual operation.

   c. Factory prime and finish paint all gear boxes with 2 part high solids epoxy or as specified herein for the actuator.

2.02 ELECTRIC ACTUATORS – SINGLE PHASE:

A. Each actuator shall include electric motor, reduction gearing, reversing starters, thermal overloads, limit controls as a complete integrated package to ensure proper coordination, compatibility, and operation of the system.

1. Provide actuators with torque capability 150 percent above the maximum operating torque required by each valve, gate or equipment.

2. Gearing: Rolled steel worm gear and aluminum bronze worm wheel. Non-metallic gearing is not acceptable.

3. Enclosure:

   a. Watertight to IP68, classification. Enclosure must be certified NEMA 6 for all units except those for use in classified areas.

   b. Provide explosion proof Class 1, Division 1, Groups C, D, E, F, & G. NEMA 7 FM (Factory Mutual) certified to FM3615 for actuators as indicated and located in classified areas.

   c. Material: Aluminum with epoxy-polyester powder coating

4. Provide each actuator with a handwheel for manual operation, auto declutch lever and automatic reset when motor is energized.

5. Provide actuator with a top mounted continuous visual position indicator.

6. Provide 20 watt internal space heater

7. Provide two cam actuated and adjustable end of travel limit switches

8. Provide two can actuated torque switches for over torque protection

9. Provide mechanical stops

B. Provide manual or automatic control as indicated and specified.

C. Automatic Control: Provide REMOTE automatic control specified in Section 40 23 13.03 and as indicated.

D. Electrical Service:

a. 110V, 1-phase, 60 Hertz

E. Limit Controls:

1. Type: Limit switches.

2. Provide torque switches for both directions of travel.

F. Provide actuator sized to close valve against required differential. Size actuator motor to seat and unseat valve and ensure torque switch trip at maximum valve torque when supply voltage is 10 percent below normal. Size motor to open or close valve to satisfy the process dynamics.

G. All fasteners and hardware: Type 316 stainless steel.

2.03 SHOP TESTS:

A. Motor Test:

1. Give each motor a standard commercial test in the shop of the motor manufacturer and submit certified copies of the test results to the Engineer for review prior to installation of the motors.

B. Actuator Testing:

1. Test performance of each actuator. Provide individual test certificates at no additional cost to the Owner simulate a typical valve, gate or equipment load and record the following parameters:

a. Current at maximum torque setting.

b. Torque at maximum torque setting.

c. Test voltage and frequency.

d. Flash test voltage.

e. Actuator output speed or operating time.

2. Test housing oil tightness, 30 psi for 2 minutes.

3. Insulation test on motor and control circuit.

4. In addition, record details of specification on the test certificate, such gear ratios for both manual and automatic drive, closing direction, wiring diagram code number, and when applicable remote transmitter resistance and interposing relay voltage.

C. In event that specified tests indicate that motor or actuator will not meet specifications, Engineer has the right to require complete witnessed tests for all motors and actuators at no additional cost to the Owner.

1. Repeat tests until specified results are obtained.

2. Correct or replace promptly all defects or defective equipment revealed by or noted during tests at no additional cost to the Owner.

2.04 SHOP PAINTING:

A. Paint Finish: Baked on polyester powder coating 70 microns thick and must have passed ASTM B117 35 degrees C Salt Spray Test for 1,000 hours.

1. Provide materials for touch-up of all damaged or abraided surfaces due to installation.

2. Ferrous surfaces obviously not to be painted shall be given a shop applied coat of grease or rust resistant coating.

2.05 DISCONNECT AND LOCAL CONTROL STATION:

A. Enclosure:

1. NEMA 4X (Ingress Protection Rating IP68) Type 316 stainless steel for all non-classified areas.

2. NEMA 7, cast aluminum for all classified areas.

3. Mount on a pedestal, or on adjacent structure.

a. Hardware and Mounting Supports: Type 316 stainless steel.

B. Provide each actuator with a primary voltage rated non-fused disconnect.

C. Provide each actuator mounted in excess of 6.5 feet above the operating level or in a position that cannot be accessed with a single integrated disconnect and local control station. Mount the disconnect and local control station on a wall, column or pedestal 5.0 feet above the operating level.

D. Provide red, green, and yellow indicating lights as on actuator. GREEN light on when valve, gate or equipment is completely closed, RED light on when valve, gate or equipment is completely opened, and YELLOW light when valve, gate or equipment is in mid travel.

E. Control circuits: 24 VAC or 120 VAC as required.

F. LOCAL/STOP/REMOTE switch: Padlockable in all positions. With actuator selector set to "Remote" actuator shall be capable of accepting operation input through separate pushbutton station, that pushbutton station has been selected for remote "COMPUTER" control.

G. OPEN/CLOSE switch: With actuator selector set to "Remote", actuator shall be capable of accepting operation input from separate pushbutton station, when pushbutton station has been selected for local "Open/Close" control.

PART 3 - EXECUTION

3.01 INSTALLATION:

A. Install items in accordance with manufacturer's printed instructions and as indicated and specified.

3.02 MANUFACTURER SERVICES:

A. Provide services of factory-trained Service Technician, specifically trained on type of equipment specified:

1. Service Technician must be present on site for all items listed below. Person-day requirements listed are exclusive of travel time, and do not relieve Contractor of the obligation to place equipment in operation as specified.

2. Installation: Inspect setting, alignment, field erection; coordination of electrical and miscellaneous utility connections:

   a. 1/2 person-day per actuator

3. Functional Testing: Calibrate, check alignment and perform a functional test. Tests to include all items specified.

   a. 1/2 person-day per actuator

4. Field Performance Testing: Field performance test equipment specified.

   a. 1/2 person-day per actuator

5. Vendor Training: Provide classroom and field operation and maintenance instruction including all materials, slides, videos, handouts and preparation to lead and teach classrooms sessions.

   a. 1 person-day, 1 trip

6. Credit to the Owner, all unused service person-days specified above, at the manufacturer's published field service rate.

7. Any additional time required of the factory trained service engineer to assist in placing the equipment in operation or to correct deficiencies in installation, equipment or material shall be provided at no additional cost to the Owner.

B. Manufacturer of actuators must have at least five (5) operating installations with actuators of the type and size specified and in the same service as specified operating for not less than five (5) years.

3.03 FIELD TESTING:

A. After installation of equipment, and after inspection, operation, testing and adjustment have been completed by manufacturer's field service engineer, conduct running test for each actuator in presence of Engineer to determine its ability to operate without vibration or jamming and to operate at the speeds specified.

1. During tests, observe and record, motor inputs.

2. Promptly correct or replace all defects or defective equipment revealed by or noted during tests, at no additional cost to the Owner, and repeat tests until specified results and results acceptable to the Engineer are obtained.

3. Contractor to provide all labor, equipment, and materials necessary for conducting tests.

B. Make all adjustments necessary to place equipment in specified working order at time of above tests.

C. Remove and replace equipment at no additional cost to the Owner with equipment that will meet all requirements specified and indicated if unable to demonstrate to satisfaction of the Engineer that units will perform the service specified and indicated.

3.04 FIELD TOUCH-UP PAINTING:

A. After installation and accepted testing by the Engineer. Contractor shall apply touch-up paint to all scratched, abraided and damaged shop painted surfaces. Coating type and color shall match shop painting.

3.05 CONTRACT CLOSEOUT:

A. Provide submittals in accordance with Section 01 77 00.

END OF SECTION

4. B62: Standard Specification for Composition Bronze or Ounce Metal Castings

C. American Water Works Association (AWWA):

1. C500: Metal-Seated Gate Valves for Water Supply Service

D. NSF International (NSF):

1. 61: Drinking water system components health effects

1.03 SUBMITTALS:

A. Submit the following in accordance with Section 01 33 00:

1. Data, regarding valve characteristics and performance including Cv.

2. Shop drawing data for accessory items.

3. Manufacturer's literature as needed to supplement certified data.

4. Operating and maintenance instructions and parts lists.

5. Listing of reference installations as specified with contact names and telephone numbers.

6. Valve shop test results.

7. Qualifications of field service technician.

8. Shop and Field inspections reports.

9. List of recommended spare parts other than those specified.

10. Recommendations for short and long term storage.

11. Special tools.

12. Shop and field testing procedures and equipment to be used.

13. Number of service technician days provided and per diem field service rate.

14. Manufacturer’s product data and specifications for shop painting.

15. Provide a layout drawing, plan and section showing orientation of valves and nearest obstructions for each valve.

16. Manufacturer's product data and specifications for shop coating and painting.

17. Provide a listing of the materials recommended for each service specified and indicated. Provide documentation showing compatibility with process fluid and service specified and indicated.

18. The most recent ISO 9000 series certification or quality system plan.

19. Material Certification:

a. Provide certification from the equipment manufacturer that the materials of construction specified are recommended and suitable for the service conditions specified and indicated. If materials other than those specified

are proposed based on incompatibility with the service conditions, provide technical data and certification that the proposed materials are recommended and suitable for the service conditions specified and indicated including an installation list of a minimum of five (5) installations in operation for a minimum of five (5) years. Provide proposed materials at no additional cost to the Owner.

b. Where materials are not specified, provide technical data and certification that the proposed materials are recommended and suitable for the service conditions specified and indicated.

B. A copy of this specification section with addenda and all referenced specification sections with addenda, with each paragraph check-marked to indicate specification compliance or marked to indicate requested deviations and clarifications from the specified requirements.

1. If deviations and clarifications from the specifications are indicated, therefore requested by the Contractor, provide a detailed written justification for each deviation and clarification.

2. Failure to include a copy of the marked-up specification sections and or the detailed justifications for any requested deviation or clarification will result in submittal return without review until marked up specification and justification are resubmitted with the entire package.

1.04 SPARE PARTS:

A. Comply with requirements specified in Section 01 61 00.

1.05 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

B. Provide enclosures for the area classifications specified and indicated.

C. Contractor responsible for verifying outside diameter of pipe to be tapped.

D. Services of Manufacturer's Representative as stated in Section 01 45 00 and specified herein.

E. Manufacturer of valve shall have a minimum of five (5) operating installations with pumps of the size specified and in the same service as specified operating for not less than five (5) years.

1.06 DELIVERY, STORAGE AND HANDLING:

A. Comply with the requirements specified in AWPA Section 01 66 00 and as specified.

PART 2 - MATERIALS

2.01 SELF-CONTAINED AUTOMATIC CONTROL VALVES:

A. Manufacturers:

1. Singer Valve Inc.

2. Ross Controls.

3. Golden Anderson (GA Industries)

B. Type: Pilot operated, piston or diaphragm design, automatic valve.

1. Body Type: Globe or angle body, provide body style as indicated.

2. Provide valve that utilize line pressure as its operating source.

3. Provide valves with all necessary accessories to provide a complete operating unit.

C. Provide size and configuration as specified and indicated.

D. End Connections:

1. Valves 3-inches and Smaller: NPT

2. Valves 1-1/2-inches and Larger: Flanged end connections ANSI standard B16.1 of a class to mate with pipe flanges.

E. Diameter of Seat Opening: Equal to diameter of pipe size.

F. Provide valves designed to remove and replace all internal parts without removing the valve body from the pipeline.

G. Diaphragm style valves: Provide NSF 61 approved replaceable seals designed to prevent metal to metal contact.

1. Material: Type 316 stainless.

H. Piston style valves: Provide treated leather replaceable seals designed to prevent metal to metal contact.

1. Material: Treated leather or polyurethane seats.

I. Minimum pressure rating: 150 psi.

J. Hydrostatic test: 300 psi.

K. Provide a visual position indicator.

L. Materials:

1. Valve Body and Covers: A536 (65-45-12) ductile iron or ASTM A126 cast iron.

   a. Diaphragm style valve cover: Provide a separate stem cap giving access to the stem for alignment check, spring installation and ease of assembly.

      (1) Provide main bonnet cover and locating pins to accurately locate the main valve body.

   b. Internal and External Coating: NSF 61 fusion bonded epoxy.

   c. Provide two NPT connections on each side of the valve body for external control piping and provide Type 316 stainless steel plugs for all unused ports

2. Piston: ASTM B62 Bronze, for piston style valves.

3. Diaphragm: EPDM or Buna N of the rolling type design.

4. Stem: Type 316 stainless steel, for diaphragm style valves.

5. Seat Disc:

   a. Valves 12-inches and Smaller: ASTM B62 Bronze, Cast Iron, Ductile Iron or Type 316 stainless steel.

   b. Valves 14-inches through 36-inches:

      (1) ASTM A126 cast iron center with ASTM B62 bronze outer ring or cast iron.

      (2) One-piece design in ductile iron or Type 316 stainless steel.

   c. Valves 42-inches through 48-inches: Cast steel, Cast Iron, Ductile Iron or Type 316 stainless steel.

6. Plates:

   a. Valves 4-inches through 36-inches: ASTM B62 bronze or ASTM A536 ductile iron (65-45-12).

   b. Valves 42-inches through 48-inches: Cast steel or ASTM A536 ductile iron (65-45-12).

7. Bushings:

   a. Valves 4-inches through 36-inches: ASTM B62 bronze.

b. Valves 42-inches through 48-inches: Type 316 stainless steel.

8. Seat Ring, Stem Nuts, Indicator, and Seat Packing Support: Type 316 stainless steel.

9. External Control Piping, Strainers and Valves: Type 316 stainless steel.

a. Provide tubing or hose.

M. Valve Types:

1. Pressure Reducing Valves:

a. Provide valves designed to maintain a pre-adjusted downstream pressure regardless of changes in flow rate.

b. Provide an external pilot control including an external strainer, needle valve, position indicator, gauges and isolation ball valves.

c. Provide settings as specified and indicated.

2. Surge Relief/Surge Anticipator Valves:

a. Provide valves designed to anticipate the surge wave by monitoring the line pressure and opening when an unusual drop in pressure occurs or on loss of electric power.

b. Provide a relief pilot for over-riding control at all times.

c. Provide an external pilot control including an external strainer, needle valve, position indicator, gauges and isolation ball valves.

d. Provide settings as specified and indicated.

3. Altitude Valves – 1 way:

a. Provide valves designed as a two position control valve, either fully open or fully closed.

(1) Provide valves to allow normal forward flow to fill the reservoir or tank to the maximum level and then closes drip-tight at the set-point.

(2) Provide valves to opens to refill the reservoir or tank once the level drops a fixed distance below the high water level.

(3) Valves do not operate as a check valve to prevent reverse flow.

b. Provide an external pilot control including an external strainer, needle valve, position indicator, gauges and isolation ball valves.

c. Provide settings as specified and indicated.

4. Altitude Valves – 2 way:

a. Provide valves designed as a two-position control valve, either fully open or fully closed.

(1) Provide valves to allow normal forward flow to fill the reservoir or tank to the maximum level and then closes drip-tight at the set-point.

(2) Provide valves to opens to allow reverse flow through the valve when the supply pressure drops a fixed amount below the reservoir or tank head.

(3) When a higher supply pressure is restored the valve will then allow normal forward flow to refill the reservoir or tank to the maximum level.

b. Provide an external pilot control including an external strainer, needle valve, position indicator, gauges and isolation ball valves.

c. Provide settings as specified and indicated.

5. Float Valves:

a. Provide valves designed as a two-position control valve, either fully open or fully closed.

(1) Provide valves to remains closed when the reservoir or tank level drops, until the float reaches the pre-determined adjustable minimum reservoir or tank level.

(2) Provide valves to open to refill the reservoir or tank and close tightly when high water level is achieved.

b. Provide an external pilot control and float, position indicator, gauges and isolation ball valves.

c. Provide settings as specified and indicated.

N. Provide all valves in compliance with NSF 61 for all services.

PART 3 - EXECUTION

3.01 INSTALLATION:

A. Prior to installation, protect stored valves and appurtenances from damage due to exposure to sunlight, heat, dirt, debris, freezing and thawing, vandalism, etc.

B. Clean all debris, dirt, gravel, etc, from inside of piping before placing valves in place.

C. Erect and support valves in respective positions free from distortion and strain on appurtenances during handling and installation. Inspect material for defects in workmanship and material. Clean out debris and foreign material from valve openings and seats, test operating mechanisms to check functioning, and check nuts and bolts for tightness. Repair, valves and other equipment which does not operate easily or are otherwise defective at no additional cost to the Owner.

D. Set plumb and support valves in conformance with instructions of manufacturer. Shim valves mounted on face of concrete vertically and grout in place. Install valves in control piping for access.

3.02 FIELD TESTING:

A. Pressure test valves with pipeline pressure testing.

B. Test functions of each valve.

C. Make all adjustments necessary to place valves in specified working order at time of above tests.

D. Remove all replace valves and appurtenances at no additional cost to the Owner with equipment that will meet all requirements specified and indicated if unable to demonstrate to the satisfaction of the Engineer that valves will perform the service specified, indicated and as submitted and accepted.

3.03 FIELD TOUCH-UP PAINTING:

A. After installation and accepted testing by the Engineer, apply touch-up paint to all scratched, abraided and damaged shop painted surfaces. Coating type and color shall match shop painting.

3.04 CONTRACT CLOSEOUT:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 40 23 13.09

KNIFE GATE VALVES AND APPURTENANCES – BONNETED TYPE

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide and test knife gate valves, actuators and appurtenances as indicated and in compliance with Contract Documents.

1. Provide sizes and capacities as indicated and specified.

2. Conform to American Iron and Steel Requirements set forth by WIFIA, reference specification 01 41 13.

1.02 REFERENCES:

A. American Society of Mechanical Engineers (ASME):

1. B16.47: "Large Diameter Steel Flanges NPS 26 Through NPS 60 Metric/Inch Standard"

2. B16.34: "Valves-Flanged, Threaded, and Welding End"

B. ASTM International (ASTM):

1. A216: "Standard Specification for Steel Castings, Carbon, Suitable for Fusion Welding, for High-Temperature Service"

2. A576: "Standard Specification for Steel Bars, Carbon, Hot Wrougt, Special Quality"

3. A276: "Standard Specification for Stainless Steel Bars and Shapes"

C. American Petroleum Institute (API):

1. SP-55: "Quality Standard for Steel Castings for Valves, Flanges, Fittings, and Other Piping Components - Visual Method for Evaluation of Surface Irregularities"

2. SP-25: "Standard Marking System for Valves, Fittings, Flanges, and Unions"

1.03 SUBMITTALS:

A. Submit the following in accordance with Section 01 33 00:

1. Certified shop and erection drawings. Contractor shall submit electronic files of the proposed equipment in the performance size and arrangements as indicated and specified.

2. Data, regarding valve characteristics and performance including Cv.

3. Shop drawing data for accessory items.

4. Certified drawings of the valves including valve operators and parts lists.

5. Manufacturer's literature as needed to supplement certified data.

6. Operating and maintenance instructions and parts lists.

7. Listing of reference installations as specified with contact names and telephone numbers.

8. Qualifications of field service technician.

9. Shop and Field inspections reports.

10. Manufacturer’s affidavit stating that valves comply with all provisions of this specification.

11. Certified test reports covering shop performance, leakage, hydrostatic tests and as specified

12. List of recommended spare parts other than those specified.

13. Recommendations for short and long term storage.

14. Special tools.

15. Shop and field testing procedures and equipment to be used.

16. Manufacturer’s product data and specifications for shop painting.

17. Provide a layout drawing, plan and section showing orientation of valve and actuators and nearest obstructions for each valve.

18. Provide a listing of the materials recommended for each service specified and indicated. Provide documentation showing compatibility with process fluid and service specified and indicated.

19. Manufacturer's affidavit stating that valves furnished comply with all pertinent provisions of this specification.

20. The most recent ISO 9001 series certification or quality system plan.

21. Material Certification:

    a. Where materials are not specified, provide technical data and certification that the proposed materials are recommended and suitable for the service conditions specified and indicated.

B. A copy of this specification section with addenda and all referenced specification sections with addenda, with each paragraph check-marked to indicate specification compliance or marked to indicate requested deviations and clarifications from the specified requirements.

1. If deviations and clarifications from the specifications are indicated, therefore requested by the Contractor, provide a detailed written justification for each deviation and clarification.

2. Failure to include a copy of the marked-up specification sections and or the detailed justifications for any requested deviation or clarification will result in submittal return without review until marked up specification and justification are resubmitted with the entire package.

1.04 SPARE PARTS:

A. Comply with requirements specified in Section 01 61 00.

1.05 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

B. Provide enclosures for the area classifications specified and indicated.

C. Services of Manufacturer's Representative as stated in Section 01 45 00 and specified herein.

D. Valve manufacturer must have a minimum of ten (10) years of experience with valves of the same design and size specified and larger. Provide a minimum of three (3) references of operating installations with valves of the size specified or larger and in the same service as specified operating for not less than five (5) years.

E. If equipment proposed is heavier, has a different laying length or requires more operating space than specified and indicated; provide all structural, architectural, mechanical, electrical and plumbing revisions at no additional cost to the Owner.

1. If equipment is heavier than specified, the Contractor shall provide all hoisting equipment sized to maintain the minimum safety factor between the specified

maximum equipment weight and the lifting capacity of the hoisting equipment indicated and specified.

F. Valves shall be the product of one manufacturer.

G. Valves shall be manufacturer's standard cataloged product and modified to provide compliance with the drawings, specifications and the service conditions specified and indicated.

H. The Contractor shall obtain the valves, actuators and appurtenances from the valve manufacturer, as a complete and integrated package to insure proper coordination and compatibility and operation of the system.

1.06 DELIVERY, STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00 and as specified.

PART 2 – MATERIALS

2.01 KNIFE GATE VALVES:

A. Manufacturers:

1. Hilton (Special order required)

2. Orbinox

B. Provide in accordance with Section 01 61 00.

C. Valve Construction:

1. Provide all valves with a pressure-retaining bonnet that is rated at the same pressure as the valve body.

2. Internal gate packing or gate wipers are not acceptable.

3. Provide a packing gland located at the top of the bonnet to provide a tight seal around the stem.

4. Provide valves designed in SolidWorks or a similar finite-element stress analysis program to demonstrate the integrity of the valve at the design pressure with the body and flanges unconstrained.

D. Valves Port Design:

1. Resilient Seated Valves: Full ported, with a clear port ID equal to or greater than the pipe ID.

E. Provide bi-directional valves with zero leakage shut off from 5 psi to the valve pressure rating specified. Provide valves such that minimal pressure is required to provide drip-tight shut off.

F. Provide all valves suitable for "dead end" service.

G. Provide stem packing replaceable without disassembling the valve or removing the valve from the pipeline, and replaceable while the valve is under maximum operating pressure.

H. Body Types:

1. Provide body without recesses or cavities.

I. Provide valves with OPEN and CLOSE lockout position devices.

J. Materials:

1. Body and Flanges:

a. Submerged and/or Corrosive Service:

(1) Valves 24-inch and smaller: Cast or fabricated solid Type 316L stainless steel.

(2) Valves larger than 24-inch: Fabricated solid Type 316L stainless steel.

2. Bonnet:

a. Submerged and/or Corrosive Service: Fabricated solid Type 316L stainless steel.

3. Gate: Type 316L Stainless Steel with a 32 micro-inch RMS surface finish.

a. Provide beveled gate edge for uni-directional valves.

b. Beveled gate edges are not acceptable for bi-directional valves.

4. Stem: Type 316 Stainless Steel including a Type 316L stainless steel backseating ring to permit repacking under pressure. Provide the backseating ring with a resilient seal.

5. Seats:

a. Bi-Directional Valves: Provide two (2) Viton resilient seats, one on each side of the gate, with no gate wedges.

6. Packing Gland: Cast or fabricated Type 316 stainless steel. Provide the bottom of the packing gland machined to mate with the stem backseating ring, to allow the packing to be replaced while the valve is pressurized.

7. Packing: Teflon impregnated synthetic fiber.

8. Yoke – Submerged and/or Corrosive Service: Fabricated solid Type 316L stainless steel.

9. Hardware: Type 316 stainless steel.

10. Handwheel: Cast iron or cast steel.

11. Stem Nut and Thrust Washer: Acid resistant bronze.

12. Gate Guide:

    a. Provide internal gate guides for all valves where the valve stem is not installed in the vertical position.

    b. Provide gate guides to fully support the gate and allow the gate to seat as specified when the valve is installed as indicated.

    c. Provide all valves marked to indicate the correct installation orientation.

    d. Gate Guides: UHMW or Type 316L stainless steel.

    e. Provide stainless steel gate guides with Stellite hardfacing and ground smooth, to prevent galling.

13. Ends: Flanged:

    a. Valves 24-inch and Smaller: ASME B16.5 Class 150.

    b. Provide all flange bolt holes threaded, unless otherwise specified or indicated.

    c. Provide all flange gasket surfaces fully machined with a spiral serrated finish.

K. Valve Pressure Rating:

1. Provide values as follows unless otherwise indicated or specified in the Valve Schedule:

    a. All valves 48-inch and smaller: Rated at 150 psi Cold Working Pressure (CWP) unless otherwise specified or indicated.

L. Operator:

1. Where the actual operating pressure is less than the valve pressure rating, the operator shall be sized based on the maximum operating pressure.

2. Manual Operators as indicated:

   a. Provide handwheel for valves 12-inch and smaller requiring a maximum 80 pound handwheel rim pull at the valve pressure rating.

   b. Provide bevel geared operators for all valves larger than 12-inch and all valves requiring a greater than 80 pound handwheel rim pull at the valve maximum operating pressure.

      (1) Bevel Gear Operators:

         (a) Provide steel gears fully enclosed and permanently lubricated.

      (2) Provide bevel gear operators with a gear ratio calculated based on a maximum handwheel rimpull of 80 pound at the valve maximum operating pressure.

3. Provide a clear non-metallic removable stem cover with graduations from 100 percent open to closed.

4. Chainwheels: Provide where required and as specified in Section 40 23 13.01.

5. Where indicated provide Type 316L stainless steel stem extension to operating floor elevation as indicated and provide the bevel gear operator with a fabricated carbon steel floorstand and handwheel.

6. Provide stem guides for extension stems, as required to support the stem and prevent buckling. Stem guides shall be adjustable and as specified in Section 40 23 13.01.

7. Provide all valves capable of being operated using a portable power driver equipped with a torque-limiting device, sized to disengage before excessive torque can be applied to the valve operator. Valve manufacturer to provide valve and sizing for torque limiting device.

8. Provide electric motor actuators where indicated. Provide in accordance with Section 40 23 13.03.

M. Valve Schedule:

Knife Gate Valve Schedule				
Valve Tag Number	FV-11112, 11222, 11132, 11142, and 11152	01-KV-1111B, 1122B, 1113B, 1124B, 1115B	FV-11412 and FV-11422	FV-11413 and FV-11431
Fluid	Raw Sewage	Raw Sewage	Raw Sewage	Raw Sewage
Fluid Temperature Range, degrees F	50 - 77	50 – 77	32 – 110	32 – 110
Valve Size, inches	30	6	42	6
Number of Valves	5	5	2	2
Max Operating Pressure, psi	100	100	100	100
Valve Port	Circular	Circular	Circular	Circular
Valve Ends	Flanged	Flanged	Flanged	Flanged
Service	Open/Close	Open/Closed	Open/Closed	Open/Closed
Operator Type	Electric	Manual	Electric	Electric
Opening/Closing Time, seconds	180	180	180	180

2.02 PAINTING:

A. Provide all external surfaces of the valves free of grease or oil and provide all machined surfaces protected with an anticorrosive preparation.

1. Painting: Provide manufacturer's standard epoxy painting system for ferrous valves.

a. Valve Color: Red

2.03 NAMEPLATES/MARKINGS:

A. Provide data plates or markings bearing serial numbers, ratings, and other essential information placed on the valve body. Provide all data on Type 316 stainless steel nameplates.

PART 3 - EXECUTION

3.01 INSTALLATION:

A. Prior to installation, protect stored valves and appurtenances from damage due to exposure to sunlight, heat, dirt, debris, freezing and thawing, vandalism, etc.

B. Clean all debris, dirt, gravel, etc., from inside of piping before placing valves in place.

C. Inspect material for defects in workmanship and material.

D. Erect and support valves in respective positions free from distortion and strain on appurtenances during handling and installation.

E. Set plumb and support valves in conformance with instructions of manufacturer.

F. Clean out debris and foreign material from valve openings and seats, test operating mechanisms to check functioning, and check nuts and bolts for tightness.

G. Repair, valves and other equipment which does not operate easily or are otherwise defective at no additional cost to the Owner.

3.02 FIELD TESTING:

A. Pressure test valves with pipeline pressure testing.

B. Test functions specified for each valve.

C. Test opening and closing speeds of actuated valves

D. Make all adjustments necessary to place valves in specified working order at time of above tests.

E. Remove and replace valves and appurtenances at no additional cost to the Owner with equipment that will meet all requirements specified and indicated if unable to demonstrate to the satisfaction of the Engineer that valves will perform the service specified, indicated and as submitted and accepted.

3.03 STARTUP AND TESTING:

A. Services of Manufacturer's Representative as stated in Section 01 45 00 and as specified herein.

B. Provide services of factory-trained Service Technician, specifically trained on type of equipment specified:

1. Service Technician must be present on site for all items listed below. Person-day requirements listed are exclusive of travel time, and do not relieve Contractor of the obligation to place equipment in operation as specified.

2. Comply with requirements for checkout, startup, and testing in Section 01 78 25.

3. Physical Checkout and Field Testing (Functional Completion Testing): Inspect grouting, location of anchor bolts; setting, leveling, alignment, field erection;

coordination of piping, electrical and miscellaneous utility connections; certify proper installation:

a. 0.5 person-days per valve diameter larger than 6 inches.

4. Credit to the Owner all unused service person-days specified above, at the manufacturer's published field service rate.

C. Any additional time required of the factory trained service technician to assist in placing the equipment in operation, or testing or to correct deficiencies in installation, equipment or material shall be provided at no additional cost to the Owner.

3.04 FIELD TOUCH-UP PAINTING:

A. After installation and accepted testing by the Engineer, apply touch-up paint to all scratched, abraided and damaged shop painted surfaces. Coating type and color shall match shop painting.

3.05 CONTRACT CLOSEOUT:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 40 23 19.01

PIPE SUPPORTS

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Design, and provide a complete system of pipe supports with inserts, bolts, nuts, restraining and hanger rods, washers, miscellaneous steel, sliding Teflon plates, and accessories as indicated and specified. The term pipe support includes hangers, guides, restraints, anchors and saddles.

B. Provide all support systems and the design of all support systems for all piping as specified herein. The Contractor shall provide pipe support locations, configurations and details through accepted shop drawing submittals stamped by a Registered Professional Engineer as specified herein.

C. The Contractor shall be responsible for the proper design, fabrication, location, shop drawings and installation of all pipe supports in accordance with the specified requirements.

D. Pipe support locations and types for piping 1/2-inch and larger shall be determined by the Contractor using the guidelines for support spacing specified herein and other criteria contained in this pipe support specification. Guidelines for pipe supports may need to be adjusted based upon field coordination, field routing, or other considerations outlined herein such as structural load limits. The Contractor may revise the pipe support locations and details through accepted shop drawing submittals stamped by a Registered Professional Engineer as specified herein. The Contractor is responsible for the proper design, installation and fabrication of all pipe supports in accordance with the specified requirements. For pipe supports 1/2-inch and larger pipe support shop drawings together with a marked up piping drawing showing support number, location and typical type shall be submitted by the Contractor for acceptance.

1. The Contractor shall be responsible for coordinating all pipe support designs for all trades to ensure compliance with all of the requirements of this specification, including but not limited to the total limitations specified herein.

2. Pipe support details included in plans and specified herein are intended to be guidelines to be used for reference.

E. Design and provide all temporary pipe supports required during installation and testing.

1.03 SUBMITTALS:

A. Submit the following in accordance with Section 01 33 00:

1. Delegated Design Submittals: For each device, equipment or appurtenance provide written certification from Professional Engineer licensed in the State of Utah stating that supports systems and anchorage for equipment have been designed according to the requirements of Section 1613 of the building codes of Utah, Salt Lake City and ASCE/SEI 7, and in accordance with Specification 01 41 20. Submit calculations stamped by a Professional Engineer licensed in the State of Utah for support systems and anchorage for wind, seismic, and all other pertinent loads.

2. Pipe support drawings specified herein and including data for accessory items for acceptance prior to fabrication. The Contractor shall submit pipe support coordination drawings including all piping and pipe supports for all trades.

   a. Detailed drawing of the device with dimensions.

   b. A table of applied forces and moments.

   c. A complete bill of materials.

   d. A unique identification and revision level.

   e. Stamp of a Registered Professional Engineer, registered in the state where this project is being constructed, experienced in pipe support design and pipe stress analysis as specified herein.

   f. Detailed connections to existing structure.

   g. Indicate all welds, both shop and field, by Standard Units of Measurement as specified in AWS D1.1.

3. Welding Procedure: Submit description required to illustrate each welding procedure to be performed in the specified work.

4. Welding Equipment: Submit descriptive data for welding equipment, including type, voltage and amperage.

5. Qualification for Welders: Provide certification that welders to be employed in work have satisfactorily passed AWS or ASME qualification tests. If recertification of welders is required, retesting is the Contractor's responsibility at no additional cost to the Owner.

6. Pipe support manufacturers' qualifications as specified herein.

    a. List of at least five (5) successful pipe support projects and current addresses and telephone numbers of persons in charge of representing the owner or the owner of those construction projects during the time of pipe support design, fabrication and installation.

    b. Qualification of manufacturers' Registered Professional Engineer, registered in the state where this project is being constructed, who stamps and seals shop drawings and designs.

7. Coordination drawings for pipe supports shall include as a minimum the following information.

    a. Coordination drawings shall include all pipe supports covered by specifications.

    b. These coordination drawings will be used by the Contractor to ensure that the pipe supports do not obstruct access, access for equipment operation or removal including all mechanical and electrical equipment, panels, valves, gauges, and instrumentation.

    c. The Contractor shall be responsible for including and coordinating the work of all subcontractors into the coordination drawings.

    d. Prepare reproducible coordination drawings, indicating equipment, piping, valves, expansion joints, ductwork, conduit, cable trays, junction boxes, lighting fixtures, sleeves, inserts, embedments, supports, hangers and appurtenances at not less than 1/4-inch scale. Drawings shall show beams, columns, ceiling heights, wall, floors, partitions and structural features as indicated on the contract drawings. Individual pipes and conduit 2-inches or less in diameter that will be field routed need not be shown on coordination drawings.

    e. Coordination drawings shall include large-scale details as well as cross and longitudinal sections required to fully delineate all conditions. Particular attention shall be given to the location, size, and clearance dimensions of equipment items, shafts, operators and necessary maintenance access.

    f. Make all minor changes in duct, pipe or conduit routings that do not affect the intended function, but items may not be resized or exposed items relocated without the approval of the Owner. No changes shall be made in any wall locations, ceiling heights, door swings or locations, window or other openings or other features affecting the function or aesthetic effect of the building. If conflicts or interferences cannot be resolved, the Owner shall be notified. Any problems of coordination that require architectural or structural changes of design shall be submitted to the Owner for resolution.

g. After the reproducible drawings have been coordinated and all changes have been made, the drawings shall be signed by the Contractor and all subcontractors indicating that all work on that drawing has been coordinated with all associated vendors and subcontractors and all conflicts have been resolved.

h. Relocation of any duct, pipe, conduit or other material that has been installed without proper coordination among all trades shall be performed at no additional cost to the Owner.

8. Written notification of any deviations from the requirements of this specification.

9. Support documentation and justification as specified.

10. Certificates of Design signed by a Registered Professional Engineer in the State of Utah for all pipe supports.

11. Manufacturer's product data and specifications for shop painting.

B. Material Certification:

1. Provide certification from the manufacturer that the materials of construction specified are recommended and suitable for the service conditions specified and indicated. If materials other than those specified are proposed based on incompatibility with the service conditions, provide technical data and certification that the proposed materials are recommended and suitable for the service conditions specified and indicated including an installation list of a minimum of five (5) installations in operation for a minimum of five (5) years. Provide proposed materials at no additional cost to the Owner.

2. Where materials are not specified, provide technical data and certification that the proposed materials are recommended and suitable for the service conditions specified and indicated.

C. A copy of the contract mechanical process, and structural drawings, with addenda that are applicable to the equipment specified in this section, marked to show all changes necessary for the equipment proposed for this specification section. If no changes are required, mark all drawings with "No changes required" or provide a statement that no changes are required.

1. Failure to include all drawings or a statement applicable to the equipment specified in this section will result in submittal return without review until a complete package is submitted.

2. A copy of this specification section with addenda and all referenced specification sections with addenda, with each paragraph check-marked to indicate specification

compliance or marked and indexed to indicate requested deviations and clarifications from the specified requirements.

a. If deviations and clarifications from the specifications are indicated, therefore requested by the Contractor, provide a detailed written justification for each deviation and clarification.

b. Failure to include a copy of the marked-up specification sections and or the detailed justifications for any requested deviation or clarification will result in submittal return without review until marked up specifications and justifications are submitted in a complete package.

1.04 QUALITY ASSURANCE:

A. Provide in accordance with Section 01 45 00 and as specified.

B. Provide manufacturer's certification in writing, that materials meet or exceed minimum requirements as specified.

C. Welder Qualifications:

1. Quality and certify welding procedures, welders, and operators in accordance with ANSI B31.1, paragraph 127.5 for shop and project site welding of piping work.

D. Pipe supports: All supports and parts shall conform to the latest requirements of the Code for Pressure Piping ASME/ANSI B31.1 and Manufactures Standardization Society (MSS) Standard Practice SP-58, SP-69, SP-89 and SP-90 except as supplemented or modified by the requirements of this specification.

E. Structural Concrete: Conform to the requirements of Section 03 30 00. Concrete strength: 4,000 psi unless noted otherwise.

F. Conform to the requirements of the latest edition of the AISC Manual of Steel Construction for miscellaneous and supplementary steel. Tube steels are ASTM A500 Grade B, structural shapes A36, plates A-572 or equal. Stainless steel structural members shall conform to ASTM requirement Type 316L.

G. Pipe Support Manufacturer Qualifications:

1. Must possess a written quality assurance program.

2. Have a minimum of 5 years' experience in the design and fabrication of pipe supports.

3. Have completed the design and fabrication of at least 5 successful pipe support projects of equal size, complexity, and systems as this project within the past 10 years.

4. Retains the services of a Registered Professional Engineer, registered in the state where this project is being constructed, with a minimum of ten years' experience in the design of piping systems and pipe supports.

5. Manufacturers' Standardization Society (MSS) Member.

6. Have a field service technician on staff with at least 5 years' experience in resolving field installation, interference and interface problems associated with the design, installation and manufacture of pipe supporting components.

H. Hanger inspections shall be performed in accordance with MSS-SP-89 and ASME B31.1.

1.05 DELIVERY, STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

PART 2 - PRODUCTS

2.01 MATERIALS:

A. Provide materials used in pipe supports, which are compatible with the pipes to which they are attached. Provide Type 316L stainless steel supports for all stainless steel piping. Copper plated pipe supports are not acceptable.

B. Allowable materials: As indicated in ANSI B31.1 Appendix A and MSS-SP-58 Table 2.

C. Provide Type 316L stainless steel for pipe supports, hangers, guides, restraints, and anchors that are exterior or interior submerged, in potentially wetted areas in wet wells, channels, screening and grit removal areas and in chemically corrosive atmospheres.

D. Provide only new material. Previously used and/or scrap material is not acceptable.

E. Provide tube steels that are ASTM A500 Grade B, Structural shapes A-36, plates A-572 or equal.

F. Provide sliding Teflon plates. The sliding surfaces shall be a nominal 3/8-inches glass filled Teflon bonded to stainless steel backup plate with a 10 gauge minimum thickness. The bearing pad upper and lower units shall be as follows: Conslide Type CSA elements as manufactured by Con-Serv. Inc., Balco TFE Slide Bearing Plates 10N-cs as manufactured by Balco Inc., or Dynalon Slide Bearings as manufactured by JVI, Inc.

1. The blended TFE material used for this bearing shall be composed of virgin (unreprocessed) TFE resin tested per ASTM D1457 and reinforcing agents milled glass fibers. This structural material shall have the following representative mechanical and physical properties:

2. Tensile strength: 2,000 psi

3. Elongation: 225 percent

4. Specific Gravity: 2.17 to 2.22

5. The coefficient of friction shall average 0.06 under compressive load of 2,000 psi.

6. The compressive creep shall be a minimum of 2 percent at 2,000 psi and 70 degrees F.

7. The elements shall be flat, clean and prepared for installation in the structure. Slots and holes shall be fabricated in the bearing manufacturer's plant.

G. Concrete Anchor Bolts:

1. Hilti Kwik-Bolt II Stud Anchors

2. Rawl Bolt

3. Phillips Wedge Anchors

2.02 DESIGN, LOCATION, AND TYPE OF PIPE SUPPORTS:

A. Design and provide pipe supports for piping 1/2-inch and larger to include the following loads:

1. Gravity Force: This force includes the weight of pipe, pipe contents (hydro load), valves, in-line equipment, insulation and any other weight imposed on the piping and/or pipe support.

2. Thermal Expansion Force: This force is developed by the restraint of free end displacement of the piping due to thermal growth.

3. Hydrostatic/Dynamic Forces: These forces are developed due to the internal pressure (positive and negative) during operation of the piping system. These forces include the forces due to water hammer, pressure pulses due to rapid valve closure, fluid discharge resulting from pump startup, operation of positive displacement pumps, etc.

4. Wind Loadings: Wind loadings.

5. Seismic Loading: Per Section 01 41 20, Section 22 05 48 and Section 23 05 48.

B. Provide supports, guides, anchors, flexible couplings and expansion joints in accordance with the coupling and joint manufacturers' specifications and requirements.

C. For all pump suction and discharge nozzles provide an anchor located between the pump nozzles and the nearest expansion joint or non-rigid coupling.

D. Where possible, provide pipe supports, which are the manufacturers' standard products.

1. Provide pipe supports with individual means of adjustment for alignment.

2. Provide pipe supports complete with appurtenances including locking and adjusting nuts.

3. Hanger rods shall be subjected to tension only.

4. Where lateral or axial pipe movement occurs, provide hangers for the necessary swing without exceeding 4 degrees. Provide base supports designed using pipe slides. The bearing surfaces: 0.06 coefficient of friction or less.

5. Provide concrete inserts capable of supporting the design loads.

6. Metal framing systems will be acceptable to support piping 2 inch and smaller.

7. Provide insulated piping supported using rigid load bearing insulation (baton board type) with 16 gauge shields to fit between the insulation and the support. Shields to encompass a minimum 1/3 of the pipe circumference and be 12 inch in length.

8. Provide load-bearing insulation capable of supporting the load, as a minimum on the bottom 60 degrees of the pipe support. Cope insulation and adjust to avoid interference of steel structures.

9. Provide supplementary steel as needed.

10. Do not support pipes from other pipe, conduits or metal stairs.

11. Chain, strap, T-bar, perforated bar and/or wire hangers are not acceptable.

12. Contact between piping and dissimilar metals such as hangers, building structural work or equipment subject to galvanic action is not acceptable.

13. All pipe supports located in fluid flow shall be supplied with double nutting.

E. Provide thrust anchors to resist thrust where required. Wall pipes may be used as thrust anchors if so designed. Welded attachments shall be of material comparable to that of the piping, and designed in accordance with governing codes.

F. Provide expansion joints where indicated and where required based on Contractor's design of the pipe support system. Indicate expansion joints on submittal drawings.

G. For piping 2-inch and smaller provide manufacturer's standard supports and standard spacing guidelines

H. Pipe supports connected to structural framing and slabs are subject to the following limitations:

1. Less than 100 pounds horizontal load per support.

2. Vertical loads not to exceed in average of 10 PSF for slabs, or a total of 200 PSF including the operating weight, with a maximum vertical load per hanger of 200 lbs. For a maximum of one pipe support per foot of slab width perpendicular to the span.

3. Vertical loads not to exceed 200 pounds per column or 150 pounds per support at walls.

4. Piping not supported from floors by metal framing must meet the limitations as specified above.

I. All outside above ground supports shall be Type 316L stainless steel as specified herein.

J. Provide pipe supports that do not overload or over stress the piping, equipment, or structure that they are supporting or to which they are attached. Allowable pipe stress to be within ANSI B31.1 code allowable.

K. The Contractor shall provide the services of a field service technician (preferably from the pipe support manufacturer) to field coordinate the locations of supports and resolve interferences and conflicts encountered during installation.

2.03 FABRICATION:

A. Provide pipe supports formed in accordance with paragraph 5.1 of MSS-SP-58.

B. Providing welding in accordance with Structural Welding Code.

C. Provide dimensional tolerances as specified in MSS-SP-89.

D. Provide threading and tapping in accordance with MSS-SP-89.

2.04 SHOP PAINTING:

A. Primer and Finish Paint: Shop apply to all exterior ferrous surfaces, high solids epoxy in accordance with Section 09 91 10.

B. Ferrous surfaces which are not to be painted shall be given a shop applied coat of grease or rust resistant coating.

C. Provide additional shop paint coating for touch-up to all surfaces after installation and testing is completed and equipment accepted.

PART 3 - EXECUTION

3.01 INSTALLATION:

A. Install items in accordance with manufacturers' printed instructions and as indicated and specified herein.

B. Perform welding in accordance with Structural Welding Code:

1. Visually inspect welding while the operators are making the welds and again after the work is completed in accordance with AWS D1.1 Section 6.0. After the welding is completed, hand or power wire brush welds, and clean them before the Qualified Inspector makes the check inspection. The Qualified Inspector shall inspect welds with magnifiers under light for surface cracking, porosity, and slag inclusions; excessive roughness; unfilled craters; gas pockets; undercuts; overlaps; size and insufficient throat and concavity. The Qualified Inspector shall inspect the preparation of grove welds for throat opening and for snug positioning for back-up bars.

2. Nondestructive evaluation of welds connecting structural steel members subjected to critical stresses: Perform in accordance with the weld quality and standards of acceptance in AWS D1.1.

3. Magnetic Particle Inspection: Perform in accordance with ASTM E709.

4. Liquid Penetrant Inspection: Perform in accordance with ASTM E165.

5. For weld areas containing defects exceeding the standards of acceptance in accordance with AWS D1.1, Section 3.7. Provide additional testing of the repaired area at no additional cost to the Owner.

6. Test Locations: As selected by the Owner.

7. Correct any deficiencies detected as directed by the Engineer at no additional cost to the Owner.

C. Proceed with the installation of the pipe supports only after required building structural work has been completed and concrete support structure has reached its 28-day compressive strength as specified in Section 03 30 00.

D. Install pipe supports to comply with MSS-SP-89. Group parallel runs of horizontal piping to be supported together on trapeze type hangers.

E. Install pipe supports to provide indicated pipe slopes. Do not exceed maximum pipe deflection allowed by ANSI B31.1.

F. For exposed continuous pipe runs, install pipe supports of same type and style as installed for adjacent similar piping.

G. Install pipe supports to allow controlled movement of piping systems. Permit freedom of movement between pipe anchors, and facilitate action of expansion joints, expansion loops, expansion bends, and similar units.

H. Piping to be free to move when it expands or contracts except where fixed anchors are indicated or required by the Contractor's pipe support systems. Where hanger rod swing length cannot be provided or where pipe movement based on expansion of 1 inch/100 feet, for each 100 degrees F change in temperature exceed 1/2-inch, provide sliding supports.

I. Prevent contact between dissimilar metals. Where concrete or metal support is used, place 1/8-inch thick Teflon, neoprene rubber, or plastic strip under piping at point of bearing. Cut to fit entire area of contact between pipe and pipe support.

J. Prevent electrolysis in support of copper tubing by use of pipe supports which are plastic coated. Electrician's tape is not an acceptable isolation method.

K. Apply an anti-seize compound to nuts and bolts on all pipe supports.

L. Locate reinforcing steel in concrete structure with x-ray prior to drilling for embedment plates and anchor bolts. Avoid contact or interference with reinforcing steel.

3.02 INSTALLATION OF BUILDING ATTACHMENTS:

A. Support piping from structural framing, unless otherwise indicated.

B. Concrete Inserts:

1. Use existing embedded concrete items whenever possible.

2. Use expansion anchors only when existing embedded attachment points are not available or unsuitable. Attach to hardened concrete or completed masonry.

3.03 THRUST ANCHORS AND GUIDES:

A. Thrust Anchors:

1. Center thrust anchors between expansion joints and between elbows and expansion joints for suspended piping. Anchors must hold pipe rigid to force expansion and contraction movement to take place at expansion joints and/or elbows and to preclude separation of joints.

2. Restraining rod size and number shall be as indicated and adhere to manufacturers recommendations as a minimum.

B. Pipe guides: Provide adjacent to sliding expansion joints in accordance with recommendations of the National Association of Expansion Joint Manufacturers and the specific joint manufacturer.

3.04 PIPE SUPPORTS:

A. Where piping of various sizes is to be supported together, space supports for the largest pipe size and install intermediate supports for smaller diameter pipes.

B. Provide minimum of two pipe supports for each pipe piece.

C. Where pipe connects to equipment, support pipe independently from the equipment. Do not use equipment to support piping.

D. Provide pipe supports so that there is no interference with maintenance or removal of equipment.

E. Unless otherwise indicated or authorized by the Engineer, place piping running parallel to walls approximately 1-1/2 inch out from face of wall and at least 3 inches below ceiling.

F. Pedestal pipe supports: adjustable with stanchion, saddle, and anchoring flange. Provide grout between baseplate and floor.

G. Piping supports for vertical piping passing through floor sleeves: use hot dipped galvanized steel riser clamps.

H. Support piping to prevent strain on valves, fittings, and equipment. Provide pipe supports at changes in direction or elevation, adjacent to flexible couplings, adjacent to non-rigid joints, and where otherwise indicated. Do not install pipe supports in equipment access areas or bridge crane runs.

I. Stacked horizontal runs of piping along walls may be supported by metal framing system attached to concrete insert channels.

J. Do not support piping from other piping.

K. Designs generally accepted as exemplifying good engineering practice, using stock or production parts, shall be utilized whenever possible.

L. Whenever possible, pipe attachments for horizontal piping shall be pipe clamps.

M. All rigid rod hangers shall provide a means of vertical adjustment after erection.

N. Where the piping system is subjected to shock loads, such as disturbances due to pump discharge or thrust due to actuation of safety valves, hanger design shall include provisions for rigid restraints or shock absorbing devices.

O. Hanger rods shall be subject to tensile loading only. At hanger locations where lateral or axial movement is anticipated suitable linkage shall be provided to permit rod swing.

P. Hanger spacing shall not exceed the spacing listed below:

1. In the case of concentrated loads the supports shall be placed as close as possible to the load to reduce the bending stress.

2. Where changes in direction of the piping system occur between supports, the total length between supports shall be kept to less than three-fourths of the full span. When practical, a support shall be placed immediately adjacent to any change in direction of the piping system.

Q. Where practical, riser piping shall be supported independently of the connected horizontal piping. Pipe support attachments to the riser piping shall be riser clamp shear lugs. Welded attachments shall be of material comparable to that of the piping, and designed in accordance with governing codes. If friction is relied upon to support riser piping proper justification and documentation shall be submitted to ensure that enough friction force is provided to resist the applied loading.

R. Hanger components shall not be used for purposes other than for which they were designed. They shall not be used for rigging and erection purposes.

S. All threads shall be UNC unless otherwise specified.

T. TFE slide bearing plates with steel backup plates shall be stitch weld attachments to the structure. A 1/8-inch fillet weld, 1/2-inch long every 3 inches on center each side of an element shall be used unless otherwise indicated or specified by the manufacturers' written recommendations. Bearing elements with slots or holes shall be stitch welded in place for location. The TFE surfaces of the bearings shall be maintained clean and free from grit, dirt or grease.

3.05 INSULATED PIPING:

A. Attach clamps, including spacers (if any), to piping with clamps projecting through insulation; do not exceed allowable pipe stresses.

B. Where vapor barriers are indicated on water piping, install coated protective shields.

3.06 CONTRACT CLOSEOUT:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 40 23 19.03

STEEL PIPE AND FITTINGS

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide and test steel pipe 10-inch in diameter and larger, fittings and appurtenances as indicated and in compliance with Contract Documents.

1.02 REFERENCES:

A. ASTM International (ASTM):

1. A36: Standard Specification for Carbon Structural Steel

2. A53: Standard Specification for Pipe, Steel, Black and Hot-Dipped, Zinc-Coated, Welded and Seamless

G. Structural Steel Painting Council (SSPC):

1. SSPC-SP10

1.03 SUBMITTALS:

A. Submit the following in accordance with Section 01 33 00:

1. Certified shop and erection drawings. Contractor shall submit electronic files of the piping layout including the following.

a. Pipe layouts in full detail.

b. Location of hangers and supports.

c. Location and type of anchors.

d. Location of couplings and expansion joints.

e. 1/2 inch = 1 foot-0 inches scale details of all wall penetrations and fabricated fittings or special fittings.

f. Schedules of pipe, fittings, expansion joints and other appurtenances.

g. Electronic files shall conform to the following minimum requirements:

(1) Electronic Files: AutoCAD latest version, drawn to scale.

(2) Submit electronic files as part of the Shop Drawing submittal.

(3) Submit electronic files on CD or DVD.

(4) Drawings shall be in conformance with all other requirements as specified in this specification.

2. Sworn certificates in duplicate of shop tests showing compliance with appropriate standard.

3. Reports of ASME Section IX welding certifications.

4. Catalog cuts of joints, couplings, harnesses, expansion joints, gaskets, fasteners and other accessories.

5. Brochures and technical data on coatings and linings and proposed method for application and repair.

6. Provide record drawings.

7. Provide tag names and numbers for all sections of piping and fittings.

B. Material Certification:

1. Provide certification from the piping and fittings manufacturer that the materials of construction specified are recommended and designed for the service conditions specified and indicated. If materials other than those specified are proposed based on incompatibility with the service conditions, provide technical data and certification that the proposed materials are recommended and designed for the service conditions specified and indicated including an installation list of a minimum of five (5) installations in operation for a minimum of five (5) years. Provide proposed materials at no additional cost to the Owner.

2. Where materials are not specified, provide technical data and certification that the proposed materials are recommended and designed for the service conditions specified and indicated.

C. A copy of the contract mechanical process, civil and structural drawings, with addenda that are applicable to the equipment specified in this section, marked to show all changes

necessary for the equipment proposed for this specification section. If no changes are required, mark all drawings with "No changes required" or provide a statement that no changes are required.

1. Failure to include all drawings or a statement applicable to the equipment specified in this section will result in submittal return without review until a complete package is submitted.

2. A copy of this specification section with addenda and all referenced specification sections with addenda, with each paragraph check-marked to indicate specification compliance or marked and indexed to indicate requested deviations and clarifications from the specified requirements.

    a. If deviations and clarifications from the specifications are indicated, therefore requested by the Contractor, provide a detailed written justification for each deviation and clarification.

    b. Failure to include a copy of the marked-up specification sections and or the detailed justifications for any requested deviation or clarification will result in submittal return without review until marked up specifications and justifications are submitted in a complete package.

1.04 QUALITY ASSURANCE:

A. Welder Qualifications:

1. Qualify and certify welding procedures, welders, and operators in accordance with ASME Section IX, for shop welding and AWS D1.1 for project site welding of piping work.

2. Qualification for welders: Welding shall be performed by welders holding current certification for the welding procedures in use.

3. Visually inspect welding while the operators are making the welds and again after the work is completed. After the welding is completed, hand or power wire brush welds and clean them before the inspector makes the check inspection. Inspect welds for defects exceeding tolerances allowed by code under which the weld was made. Repair all defects exceeding tolerance.

B. Job Conditions:

1. Coordinate dimensions and drillings of flanges with flanges for valves, pumps, and other equipment to be installed in piping system.

1.05 DELIVERY, STORAGE AND HANDLING:

A. Provide in accordance with APWA Section 01 66 00.

B. During loading, transportation and unloading, prevent damage to pipes and coatings. Load and unload each pipe under control at all times. Under no circumstances will a dropped pipe be used unless inspected and accepted by Engineer. Place skids or blocks under each pipe in the shop and securely wedge pipe during transportation to protect pipe, lining, and coating.

PART 2 - PRODUCTS

2.01 MANUFACTURERS:

A. Northwest Pipe

B. Ameron

C. Hanson

D. American Spiral Weld

E. Mid America

2.02 WALL THICKNESS:

A. Steel pipe 10-inch to 24-inch: ASTM A53 Type E or S, Grade B, Black.

Nominal Pipe Size, inches	Minimum Wall Thickness, inches
10	0.250 (SCH 20)
12	0.250 (SCH 20)
14	0.250 (SCH 10)
16	0.250 (SCH 10)
18	0.250 (SCH 10)
24	0.250 (SCH 10)

B. Steel Pipe 30-inch diameter and larger: AWWA C200.

Nominal Pipe Size, in	Minimum Wall Thickness, in Interior Piping	Minimum Wall Thickness, in Buried Piping
28	0.250	0.134
30	0.250	0.134
32	0.250	0.156
36	0.250	0.156
40	0.250	0.181
42	0.250	0.181
48	0.250	0.206
54	0.312	0.231
60	0.312	0.256

Nominal Pipe Size, in	Minimum Wall Thickness, in Interior Piping	Minimum Wall Thickness, in Buried Piping
66	0.375	0.282
72	0.375	0.308
84	0.500	0.358
90	0.500	0.383
96	0.500	0.408
102	0.500	0.433
108	0.500	0.458
114	0.500	0.483
120	0.500	0.508

C. Interior piping wall thickness: Increase wall thickness to limit combined stress (circumferential longitudinal and localized) to 75 percent of the minimum yield of the steel used.

2.03 PIPE:

A. Fabricate to sizes, dimensions, and shapes indicated.

B. Sizes, Pipe, Fittings and Specials:

1. 12 inch and smaller: Nominal

2. 14 inch thru 24 inch: Actual outside diameter

3. 30 inch and larger: Nominal size to be I.D. after lining

C. Seams:

1. Except for seamless mill type pipe, provide piping fabricated from steel plates rolled into cylinders or sections thereof with longitudinal seams or spiral seams butt welded.

2. Do not use more than two longitudinal seams in piping 72 inch and smaller in size.

3. Butt weld girth seams at least 6 feet apart, except in specials and fittings.

2.04 FITTINGS:

A. Fabricate in accordance with AWWA C208.

B. Provide elbows with the following radius:

1. Interior and Exposed Piping: 1.50 times the nominal diameter

2. Buried Piping: 2.50 times nominal diameter, unless otherwise indicated or specified.

3. Provide elbows in accordance with the following:

Fitting Bend Angle, degrees	Number of Pieces
0 to 22.50	2
23 to 45	3
46 to 67.50	4
68 to 90	5

C. Provide reinforced tees, laterals, and outlets in accordance with ASME Pressure Vessel Code, Section VIII, Paragraph UG-37 or AWWA M-11, Chapter 13.

D. Provide reducing sections with same shell thicknesses required for larger ends.

E. Special Sections:

1. Provide fittings and special sections with ends as indicated and fabricated to shapes, sizes, and dimensions indicated.

F. Small Branch Connections:

1. Provide branch connections 2-1/2 inch and smaller fabricated with welding fittings with threaded outlets.

2. Provide branch connections 3 inch through 12 inch fabricated with pipe nipples or with welding fittings.

3. Provide pipe nipples and welding fittings welded to pipe shell and reinforced to meet working and test pressure requirements.

4. Provide pipe nipples of black steel pipe in accordance with ASTM A53 Type E or S Grade B, minimum thicknesses as listed in the above table.

5. Provide threaded and welded outlets as indicated.

6. Provide small branch connections located so as not to interfere with joints, supports, or other details.

G. Provide fittings shop fabricated from previously hydrostatically tested straight pipe with magnetic particle non-destructive testing of all welds that were not previously tested in the straight pipe.

2.05 FIELD JOINTS:

A. Type as indicated:

1. Location and type of joint may be modified to provide for lining, coating and flexibility in field assembly as accepted by the Engineer.

B. Provide pipe end preparation and tolerances in accordance with AWWA C200.

2.06 FLANGES:

A. Provide in accordance with AWWA C207 depending on pressures.

B. Provide flanged end pipe fitted with slip-on flanges. Provide longitudinal or spiral welds ground flush to accommodate type of flanges provided.

1. Provide bolts and bolt-studs in accordance with AWWA C207 with hexagonal or square heads, coarse thread fit, threaded full length with ends chamfered or rounded.

2. Project bolt ends 1/4-inch beyond surface of nuts.

3. Provide hexagonal nuts with dimensions in accordance with ANSI B18.2.2 and coarse threads in accordance with ASME B1.1.

C. Provide face and finish flanges per AWWA C207.

D. Provide flanges attached normal to axis of pipe for alignment.

E. Provide flanges tested, after welding to pipe, for true plane and reface, to bring them within specified tolerances.

F. Blind Flanges: Conforming in diameter, drilling, and thickness to flanges to which they mate and reinforced to produce a watertight joint under test pressures indicated in the Process Pipe Schedule.

G. Gaskets:

1. Provide gaskets per AWWA C207 made from 1/8-inch thick compressed non-asbestos material.

2. Materials:

a. Water, Wastewater and Sludge Services: Buna N, Neoprene

b. UV Systems: Viton

2.07 WELDED JOINTS:

A. Welds:

1. Sound and free from embedded scale or slag, with tensile strength of weld not less than that of thinner of connected sections. Welds to be watertight.

B. Field welding of lined pipe is not acceptable unless otherwise indicated.

C. Field welds of interior piping: Butt welds.

1. Outside back-up bar may be used.

D. Field welds of buried piping: Bell and spigot lap welds with single weld inside or outside.

E. Provide field welds, in accordance with AWWA C206.

2.08 BOLTED SPLIT SLEEVE COUPLINGS:

A. Provide in accordance with Section 40 23 19.05.

2.09 SLEEVE TYPE COUPLINGS:

A. Provide in accordance with Section 40 23 19.05.

2.10 FLANGED COUPLING ADAPTERS:

A. Manufacturers:

1. Dresser "Style 128"

2. Baker

3. ROMAC

B. Provide restrained flanged coupling adapters.

C. Provide tie rods of sufficient number and strength to restrain coupling at test pressure as indicated in Process Pipe Schedule.

2.11 EXPANSION JOINTS:

A. Provide in accordance with 40 23 19.05.

2.12 LINING AND COATING:

A. Lining:

1. Provide lining to the interior of steel pipe, fittings, sleeve couplings and maintenance holes.

2. Provide epoxy lining for all interior piping as indicated in the Process Pipe Schedule.

B. Polyurethane Lining:

1. Provide lining in accordance with AWWA C222

2. For buried piping provide 20 mils interior and 25 mils exterior

3. For exposed piping provide 20 mils interior and painting as specified for the exterior

4. Applied per manufacturer's written instruction.

C. Epoxy Lining:

1. Epoxy-phenolic lining shop applied over grit blast cleaned surface, near white per SSPC-SP10.

2. Minimum of two coats providing a total dry film thickness of at least 12 mils of liquid epoxy in accordance with AWWA C210, Tnemec FC22 or fusion bonded epoxy in accordance with AWWA C213.

3. Applied per manufacturer's written instruction.

D. Cement Lining:

1. Provide in-place lining in accordance with AWWA C602 or factory lined in accordance with AWWA C205 as indicated in the Process Pipe Schedule.

2. If piping is factory lined, provide field line welded joints or O-ring field joints in accordance with Section 7 of AWWA C205.

E. Coating:

1. Where sleeve couplings are used, provide coating to pipe ends and exterior surface for a distance of 9 inch with same material as specified for lining.

2. Exposed exterior surfaces of pipe within the building: Commercial blast (SSPC-SP6) and paint with one shop coat of universal primer compatible with field painting Section 09 91 10.

3. Exterior of buried pipe: Coat and wrap with prefabricated multilayer cold-applied polyethylene tape coating in accordance with AWWA C214 Standard.

   a. The total nominal thickness of coating: 80 mils consisting of: Primer, 20 mil inner wrap for corrosion protection and two 30 mil outer wraps for mechanical protections.

   b. Coat and wrap fittings and field joints with prefabricated multilayer cold-applied polyethylene tape coating in accordance with AWWA C209 Standard. The total thickness of coating shall be 70 mils consisting of: Primer and 2 wraps of 35 mil tape.

      (1) Alternate field joint coating: Heat-Shrink sleeves per AWWA C216. Interior welding of joints with Heat-Shrink sleeves can begin once 3 feet of backfill is placed on the pipe.

2.13 SHOP PAINTING:

A. Provide in accordance with Section 09 91 10.

PART 3 - EXECUTION

3.01 INSTALLATION OF PIPE:

A. Install pipelines per AWWA C604 and parallel to building walls wherever possible. Install piping to lines and grades indicated and support. Where temporary supports are used, provide temporary supports as specified in Section 40 23 19.01 to prevent shifting or distortion of pipe. Provide for expansion.

B. Slope piping toward low points and provide for draining at low points.

C. Before assembly, remove debris from inside pipes and fittings.

D. Before flanges pieces are assembled, remove rust resistant coating from machined surfaces, clean gaskets and smooth burrs. Make up flanged joints tight, and prevent strain upon valves or other pieces of equipment.

   1. Bolt threads must fully engage the nuts. At a minimum the bolt must be flush with the nut and no more than 1/2-inch excess thread protruding from the nut.

E. Install tierods, pipe clamps or bridles when sleeve type couplings or fittings are used in piping system as indicated, and at changes in direction or other places to prevent joints from pulling apart under pressures indicated in the Process Pipe Schedule.

F. Examine pieces for damage. Do not install pieces that are damaged according to Engineer. If any damaged piece should be discovered after having been installed, remove and replace with a sound piece at no additional cost to the Authority.

G. Handle pipe with equipment such as nylon slings and padded skids, designed to prevent damage to the coating. Repair abrasions and injuries to the coating prior to the application of insulation or prior to the application of final field coating.

3.02 INSTALLATION OF LINING AND COATING:

A. After installation of pipe, fittings, and specials, clean, prime, line, and coat as specified for pipe adjacent to weld unlined or uncoated ends adjacent to field welded joints, including weld proper. Repair any damage to lining in accordance with lining manufacturers written recommendations.

B. Preparation of surfaces to be lined and coated after installation of pipe for shop application of coal tar epoxy, except remove foreign matter, including all damaged lining or coating materials, by scraping, chipping, or brushing, and surfaces cleaned to bright metal free of all rust, slag, and scale by means of wire brushing or sand blasting.

C. Use open ends or access maintenance holes for entry for application of interior linings to unlined ends.

D. Pour holes are not allowed.

E. After installation of pipe, fittings, and specials, shop coat on exterior shall be touched up followed by a field coat prior to encasing in concrete.

3.03 INSTALLATION OF FLANGED COUPLING ADAPTERS:

A. Install flange coupling adapters in strict accordance with coupling manufacturer's recommendations.

3.04 INSTALLATION OF PIPE SUPPORTS:

A. Provide in accordance with Section 40 23 19.01.

B. Proceed with installation of pipe supports only after required building structural work has been completed and concrete has reached its 28 day compressive strength.

C. Support piping to prevent forces applied on valves and equipment.

3.05 PHYSICAL CHECKOUT, FIELD AND FUNCTIONAL TESTING:

A. Clean dirt, dust, oil, grease and other foreign material, before pressure and leakage tests.

B. Water for testing provided by the Contractor.

C. Pressure and Leakage Tests shall be done per C604:

1. Provide temporary testing plugs or caps; pressure pumps, pipe connections, meters, gages, equipment, and labor.

2. Test pipelines in sections of accepted length.

3. Fill section of pipe with water and expel air.

4. Pressure and leakage test consists of first raising pressure (based on elevation of lowest point of section under test and corrected to gage location) to pressure in psi numerically equal to test pressures indicated in the Process Pipe Schedule.

5. No visible leakage in joint is acceptable.

6. If unable to achieve and maintain specified pressure for one hour with no additional pumping, section has failed to pass test.

7. If section fails pressure and/or leakage test, locate, uncover, and repair or replace defective pipe, fitting, or joint, and conduct additional tests and repairs until section passes test at no additional cost and without any time extensions.

D. Make piping connections to equipment with pipe in a free supported state and without application of vertical or horizontal forces to align piping with the equipment flanges.

3.06 FIELD PAINTING:

A. Provide in accordance with Section 09 90 00.

3.07 CONTRACT CLOSEOUT:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

Page Intentionally Left Blank

SECTION 40 23 19.05

PROCESS PIPING AND APPURTENANCES

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide and test process piping and appurtenances as indicated and in compliance with Contract Documents.

1.02 REFERENCES:

A. American Society of Mechanical Engineers (ASME):

1. B16.1: AN Standard for Cast Iron Pipe Flanges and Flanged Fittings, Class 25, 125, 250 and 800

2. B16.3: Malleable Iron Threaded Fittings Classes 150 and 300

3. B16.5: AN Standard for Pipe Flanges and Flanged Fittings, Steel Nickel Alloy and Other Special Alloys

4. B16.9: Factory-Made Wrought Buttwelding Fittings

5. B31.1: Power Piping

B. ASTM International (ASTM):

1. A36: Standard Specification for Carbon Structural Steel

2. A47: Standard Specification for Ferritic Malleable Iron Castings

3. A53: Standard Specification for Pipe, Steel, Black and Hot-Dipped, Zinc-Coated, Welded and Seamless

4. A105: Standard Specification for Carbon Steel Forgings for Piping Applications

5. A139: Standard Specification for Electric-Fusion (Arc)-Welded Steel Pipe (NPS 4 and Over)

6. A181: Standard Specification for Carbon Steel Forgings, for General-Purpose Piping

7. A193: Standard Specification for Alloy-Steel and Stainless Steel Bolting for High Temperature or High Pressure Service and Other Special Purpose Applications

8. A194: Standard Specification for Carbon and Alloy Steel Nuts for Bolts for High Pressure or High Temperature Service, or Both

9. A197: Standard Specification for Cupola Malleable Iron

10. A216: Standard Specification for Steel Castings, Carbon, Suitable for Fusion Welding, for High Temperature Service

11. A240: Standard Specification for Chromium and Chromium-Nickel Stainless Steel Plate, Sheet, and Strip for Pressure Vessels and for General Applications

12. A256: Standard Method of Compression Testing of Cast Iron

13. A269: Standard Specification for Seamless and Welded Austenitic Stainless Steel Tubing for General Service

14. A278: Standard Specification for Gray Iron Castings for Pressure-Containing Parts for Temperatures Up to 650°F (350°C)

15. A307: Standard Specification for Carbon Steel Externally Threaded Standard Fasteners

16. A312: Seamless and Welded Austenic Stainless Steel Pipe

17. A351: Standard Specification for Castings, Austenitic, for Pressure-Containing Parts

18. A449: Standard Specification for Hex Cap Screws, Bolts and Studs, Steel, Heat Treated, 120/105/90 ksi Minimum Tensile Strength, General Use

19. A536: Ductile Iron Castings

20. C177: Standard Test Method for Steady-State Heat Flux Measurements and Thermal Transmission Properties by Means of the Guarded-Hot-Plate Apparatus

21. C1136: Standard Specification for Flexible, Low Permeance Vapor Retarders for Thermal Insulation

22. D256: Standard Test Methods for Determining the Izod Pendulum Impact Resistance of Plastics

23. D570: Standard Test Method for Water Absorption of Plastics

24. D638: Standard Test Method for Tensile Properties of Plastics

25. D696: Standard Test Method for Coefficient of Linear Thermal Expansion of Plastics Between-30 Degree C and 30 Degree C with a Vitreous Silica Dilatometer

26. D790: Standard Test Methods for Flexural Properties of Unreinforced and Reinforced Plastics and Electrical Insulating Materials

27. D792: Standard Test Methods for Density and Specific Gravity (Relative Density) of Plastics by Displacement

28. D1330: Standard Specification for Rubber-Sheet Gaskets

29. D1457: Standard Specification for Polytetrafluoroethylene (PTFE) Molding and Extrusion Materials

30. D1599: Standard Test for Short-Time Rupture Strength of Plastic Pipe, Tubing and Fittings

31. D1784: Standard Specification for Rigid Poly(Vinyl Chloride) (PVC) Compounds and Chlorinated Poly(Vinyl Chloride) (CPVC) Compounds

32. D1785: Standard Specification for Polyvinylchloride (PVC) and Chlorinated Polyvinylchloride (CPVC) Plastic Pipe, Schedules 40, 80 and 120

33. D2000: Rubber Products in Automotive Applications

34. D2105: Standard Test for Longitudinal Tensile Properties of Reinforced Thermosetting Plastic Pipe and Tube

35. D2412: Standard Test for External Loading Properties of Plastic Pipe by Parallel-Plate Loading

36. D2467: Standard Specification for Poly(Vinyl Chloride) (PVC) Plastic Pipe Fittings, Schedule 80

37. D2564: Standard Specification for Solvent Cements for Polyvinylchloride (PVC) and Chlorinated Polyvinylchloride (CPVC) Plastic Pipe and Fittings

38. D2855: Standard Practice for Making Solvent Cemented Joints with Polyvinylchloride (PVC) and Chlorinated Polyvinylchloride (CPVC) Pipe and Fittings

39. D3035: Standard Specification for Polyethylene (PE) Plastic Pipe (DR-PR) Based on Controlled Outside Diameter

40. D3350: Standard Specification for Polyethylene Plastics Pipe and Fittings Materials

41. E84: Standard Test Method for Surface Burning Characteristics of Building Materials

42. F441: Chlorinated Poly (Vinyl Chloride) (CPVC) Plastic Pipe, Schedules 40 and 80

43. F593: Standard Specification for Stainless Steel Bolts, Hex Cap Screws, and Studs.

44. F1476: Standard Specification for the Performance of Gasketed Mechanical Couplings for Use In Piping Applications.

C. American Welding Society (AWS):

1. B3.0: Welding Procedure and Performance Qualification

D. American Water Works Association (AWWA):

1. C219: Bolted, Sleeve-Type Couplings for Plain-End Pipe

2. C606: Grooved and Shouldered Joints

E. Expansion Joint Manufacturers Association Standards.

F. Fluid Sealing Association - Technical Handbook.

1.03 SUBMITTALS:

A. Submit the following in accordance with Section 01 33 00:

1. Submit manufacturer's certificates of conformance.

2. Submit certified copies of test reports.

3. Piping layouts in full detail.

4. Location of pipe hangers and supports.

5. Large scale details of wall penetrations and fabricated fittings.

6. Schedules of all pipe, fittings, special castings, flexible connectors, adapters, couplings, expansion joints, and other appurtenances.

7. Reports as required for welding certifications per ASME B31.1.

8. Catalog cuts of joints, couplings, harnesses, expansion joints, gaskets, fasteners and other accessories.

B. Grooved joint couplings and fittings: Provide product submittals with products specifically identified by the manufacturer's style or series designation.

1. Brochures and technical data on coatings and linings and proposed method for application and repair.

2. Manufacturer's descriptive literature and technical data on insulation and proposed method of installation.

3. Shop drawing data for accessory items.

4. Manufacturer's literature as needed to supplement certified data.

5. Operating and maintenance instructions and parts lists.

6. Shop and Field inspections reports.

7. List of recommended spare parts other than those specified.

8. Recommendations for short and long term storage.

9. Special tools.

10. Shop and field testing procedures and equipment to be used.

11. Provide a listing of the materials recommended for each service specified and indicated. Provide documentation showing compatibility with process fluid and service specified and as indicated.

12. The latest ISO 9001 series certification or quality system plan.

13. Material Certification:

a. Provide certification from the piping and equipment manufacturers that the materials of construction specified are recommended and suitable for the service conditions specified and as indicated. If materials other than those specified are proposed based on incompatibility with the service conditions, provide technical data and certification that the proposed materials are recommended and suitable for the service conditions specified. And indicated including an installation list of a minimum of five (5) installations in operation for a minimum of five (5) years. Provide proposed materials at no additional cost to the Authority.

b. Where materials are not specified, provide technical data and certification that the proposed materials are recommended and suitable for the service conditions specified and indicated.

C. A copy of the contract mechanical process, civil, structural, electrical and instrumentation drawings, with addenda that are applicable to the equipment specified in this section, marked to show all changes necessary for the equipment proposed for this specification section. If no changes are required, mark all drawings with "No changes required".

1. Failure to include all drawings applicable to the equipment specified in this section will result in submittal return without review.

D. A copy of this specification section with addenda and all referenced specification sections with addenda, with each paragraph check-marked to indicate specification compliance or marked to indicate requested deviations and clarifications from the specified requirements.

1. If deviations and clarifications from the specifications are indicated, therefore requested by the Contractor, provide a detailed written justification for each deviation and clarification.

2. Failure to include a copy of the marked-up specification sections and or the detailed justifications for any requested deviation or clarification will result in submittal return without review until marked up specification and justification are resubmitted with the entire package.

1.04 QUALITY ASSURANCE:

A. Welder Qualifications:

1. Qualify and certify welding procedures, welders, and operators in accordance with ASME B31.1, for shop and project site welding of piping work.

2. Qualification for Welders: Welding shall be performed by welders holding current certification for the welding procedures in use.

3. Visually inspect welding while the operators are making the welds and again after the work is completed. After the welding is completed, hand or power wire brush welds and clean them before the inspector makes the check inspection. Inspect welds for defects exceeding tolerances allowed by code under which the weld was made. Repair all defects exceeding tolerance.

B. Provide all grooved joint couplings, fittings, valves, and specialties to be the products of a single manufacturer. Grooving tools used must be of the same manufacturer as the grooved components.

1. Provide all castings used for coupling housings, fittings, and valve bodies date stamped for quality assurance and traceability.

C. Job Conditions:

1. Coordinate dimensions and drillings of flanges with flanges for valves, pumps, and other equipment to be installed in piping system.

1.05 DELIVERY, STORAGE AND HANDLING:

A. Provide in accordance with APWA Section 01 66 00.

B. During loading, transportation and unloading, prevent damage to pipes and coatings. Load and unload each pipe under control at all times. Under no circumstances will a dropped pipe be used unless inspected and accepted by Engineer. Place skids or blocks under each pipe in the shop and securely wedge pipe during transportation to protect pipe, lining, and coating.

PART 2 - PRODUCTS

2.01 STEEL PIPE AND FITTINGS 2-1/2-INCH AND LARGER:

A. Provide in accordance with Section 40 23 19.03.

2.02 CPVC PIPE AND FITTINGS:

A. Schedule 80.

B. Material: Type IV, Grade I Chlorinated Polyvinyl Chloride (CPVC) compound with a Cell Classification of 23447 per ASTM D1784.

C. Provide pipe and fittings manufactured in compliance to ASTM F441 meeting the Quality Assurance test requirements of this standard with regard to material, workmanship, burst pressure, flattening, and extrusion quality.

D. Provide pipe and fittings produced in the USA using domestic materials, by an ISO 9002 certified manufacturer, and shall be stored indoors after production, at the manufacturing site, until shipped from factory.

E. Provide pipe and fittings with the National Sanitation Foundation (NSF) seal of approval for potable water applications.

F. Joining:

1. Solvent cementing process.

2. Use only Weld-On 724 for all sodium hypochlorite services.

3. Provide flanges at valves pumps and equipment only or as indicated and specified.

4. Threaded connections are not acceptable.

5. Provide Type 316 stainless steel flange bolting and hardware for all piping system except sodium hypochorite use titanium.

2.03 PVC PIPE AND FITTINGS:

A. Schedule 80

B. Material: Type I, Grade I Polyvinyl Chloride (PVC) compound with a Cell Classification of 12454 per ASTM D1784.

C. Provide pipe and fittings manufactured in compliance to ASTM D1785 meeting and/or exceeding the Quality Assurance test requirements of this standard with regard to material, workmanship, burst pressure, flattening, and extrusion quality.

D. Provide pipe and fittings manufactured in the USA, using domestic materials, by an ISO 9002 certified manufacturer. Store all pipe shall be stored indoors after production at the manufacturing site until shipped from factory.

E. Provide standard lengths of pipe sizes 10-inch and larger beveled each end by the pipe manufacturer.

F. Provide pipe and fittings with the National Sanitation Foundation (NSF) seal of approval for potable water applications.

G. Joining:

1. Solvent cementing process. Solvent shall be suitable for the size of pipe to be joined.

2. Provide flanges at valves, pumps and equipment only or as indicated and specified.

3. Provide Type 316 stainless steel flange bolting and hardware for all piping system except sodium hypochorite use titanium.

2.04 PVC CLEAR PIPE AND FITTINGS:

A. Schedule 80 Clear pipe.

B. Material: Type I, Grade I Polyvinyl Chloride (PVC) compound with a Cell Classification of 12454 per ASTM D1784.

C. Provide pipe and fittings manufactured in compliance to ASTM D1785, consistently meeting and/or exceeding the applicable Quality Assurance test requirements of this standard with regard to material, workmanship, burst pressure, flattening, and extrusion quality.

D. Provide pipe and fittings manufactured in the USA by an ISO 9002 certified manufacturer.

E. Provide all Clear PVC pipe and fittings packaged immediately after its manufacture to prevent damage, and stored indoors at the manufacturing site until shipped from factory.

F. Joining:

1. Solvent cementing process. Use a clear, medium-bodied, fast-setting cement in conjunction with a clear primer for optimum joint integrity, such as IPS Weld-on 705 Clear cement and IPS Weld-On P-70 Clear primer or acceptable equivalent product.

2. Clear female threaded transition fittings, incorporating a Type 316 stainless steel retaining ring. Provide all threaded joints with three wraps of tape in the direction of the threads on the male end, followed by one to two turns beyond finger tight.

3. Standard rigid thermoplastic pipe fittings with flanges, molded grooved coupling adapters and unions.

4. Provide Type 316 stainless steel flange bolting and hardware for all piping system except sodium hypochorite use titanium.

2.05 STEEL PIPE AND FITTINGS 10-INCH AND SMALLER:

A. Materials: Carbon steel, ASTM A53, Schedule 40, 80 or 120 black or galvanized as indicated in the Process Piping Schedule.

B. Joints:

1. Pipe 2-1/2 inch and Smaller: Screwed joints using malleable-iron fittings, black or galvanized, to match pipe.

2. Pipe 3-inch and Larger: Grooved Joints and fittings. Provide flanged connections to equipment and valves with 150-lb. weld neck flat faced flanges.

3. Welding of pipe within classified areas in operation is not acceptable. Provide shop fabricated sub-assemblies and install with flanges or grooved-couplings as specified and indicated.

C. Fittings:

1. 2-1/2-inch and Smaller: Screwed type, 150-lb. malleable iron, black or galvanized to match the pipe, ASTM A197 or A47, conforming to ASME B16.3. Unions of 150-lb. malleable iron with brass to iron seat.

2. 3-inch and Larger: Butt welded carbon steel to match pipe wall thickness, ASTM A234, conforming to ASME B16.9 standards.

3. Grooved end fittings, 2-inch and Larger (where indicated): Ductile iron ASTM A536 Grade 65-45-12; Wrought steel ASTM A234 Grade WPB; or Factory-fabricated from steel pipe conforming to ASTM A53.

D. Grooved Joint Couplings: Provide couplings consisting of two ductile iron housing segments to ASTM A536, pressure responsive gasket to ASTM D2000, and Type 316 stainless steel bolts and nuts. Provide couplings complying with ASTM F1476 Standard Specification for the Performance of Gasketed Mechanical Couplings for Use In Piping Applications.

1. Rigid Type: Provide coupling housings cast with offsetting angle-pattern bolt pads to provide joint rigidity and support and hanging in accordance with ANSI B31.1 and B31.9 or equal.

a. Victaulic Style 107H, Installation-Ready, for direct stab installation without field disassembly, with grade EHP gasket, suitable for water service to plus 250 degrees F.

b. Victaulic Style 07 “Zero-Flex”.

2. Flexible Type: For use in locations where vibration attenuation and stress relief are required, and for the elimination of flexible connectors. Victaulic Installation-Ready Style 177 or Style 77.

E. Branch Connections:

1. 2-inch and Smaller Connections to Welded Pipe: Screwed, forged carbon steel, ASTM A105, 3,000-lb. half-couplings or welding saddle with threaded outlet.

2. 2-1/2-inch and Larger Pipe Connections: Tees or reducing tees. Butt welded carbon steel to match pipe wall thickness, ASTM A181 GR1 or A105 GR1, conforming to ASME B16.1 standards.

F. Flanges: Forged steel, ASTM A181.

1. Slip-on or welding neck type as specified and indicated.

2. Provide 150-lb. flanges drilled and faced.

3. Raised face type: 1/16-inch raised faced in accordance with ASME B16.5.

4. Flat-face, welding neck type: ASME B16.1 Standard for all connections to valves and equipment.

5. Gaskets: For flanged joints, 1/16 inch thick suitable for the service specified and indicated.

6. Flange Adapters: Flat face, ductile iron housing with elastomer pressure responsive gasket, suitable for direct connection to ANSI Class 125 or 150 flanged components. Victaulic Style 741 / W741 (where indicated).

2.06 STEEL PIPE 12-INCH AND LARGER:

A. Provide in accordance with Section 40 23 19.03.

2.07 STAINLESS STEEL PIPE AND FITTINGS 1/2-INCH TO 2-INCH:

A. Provide either Pressfit, grooved or a socket welded system.

1. Provide a sufficient number of unions for Vic-Press and socket welded systems to allow removal of all valves and inline devices.

2. Provide threaded connections only where required.

B. Vic-Press Schedule 10S System:

1. Vic-Press system, 1/2-inch through 2-inch Schedule 10S comprised of stainless steel Vic-Press fittings, couplings and pipe.

2. Type 316 stainless steel Pressfit couplings and fittings and Type 316 stainless steel Pressfit pipe UL classified to ANSI/NSF 61 for cold plus 86 degrees F and hot plus 180 degrees F potable water service.

a. Maximum working pressure of 500 psi for water, oil, gas, chemical, air and vacuum services.

3. Couplings, Fittings: Pressfit products formed of Type 316/316L stainless steel tubing including a self-contained O-ring seals molded of synthetic HNBR rubber suitable for water operating temperatures to plus 210 degrees F.

4. Valves 1/2-inch through 2-inch ball valves with Type 316 stainless steel plain ends for Pressfit assembly. Victaulic Series 569.

a. Pressure Rating: 300 PSI.

b. CF8M stainless steel body and ball

c. Type 316 stainless steel stem

d. PTFE seats.

5. Pipe: Type 316/316L ASTM A312 stainless steel

a. Schedule 10S.

C. Socket Welded System:

1. Schedule 40 Type 316L stainless steel pipe and fittings with socket welded connections.

D. Grooved System:

1. Schedule 10S type 316L stainless steel pipe and fittings with Type 316 stainless steel grooved end connections and couplings.

2. Fittings: ASTM A403 or be factory fabricated from ASTM A312 stainless steel pipe.

3. Provide couplings consisting of ductile iron or stainless steel housings, with pressure responsive elastomer gasket.

a. Rigid Type: Victaulic Style 489 (SS).

b. Flexible Type: Victaulic Style 77S (SS).

2.08 HDPE PIPE AND FITTINGS:

A. Provide in accordance with Section 40 05 33.

2.09 CHEMICAL TUBING AND FITTINGS:

A. Manufacturers:

1. New Age Industries

2. Nalge lnc.

3. Norton Company

B. Construction:

1. Provide braided reinforced flexible PVC tubing resistant to the chemical specified.

2. Tubing to allow tight compression fittings for leak proof connections.

3. Tubing to comply with FDA standards.

4. Tubing to handle a maximum of 130 psi at 70 degrees F.

C. Fittings:

1. Provide no flow restriction compression fittings when connecting pieces is required.

2. Provide transition connections as detailed on the drawings.

2.10 PRESSURE GAUGES:

A. Per Section 40 73 00.

2.11 PRESSURE AND FLOW INSTRUMENTATION:

A. Provide in accordance with Section 40 70 00.

2.12 COUPLINGS-SLEEVE TYPE:

A. Manufacturers:

1. Romac

2. Smith Blair

3. Viking Johnson.

4. Dresser.

B. Provide couplings meeting AWWA C219.

C. Couplings 12-inch and smaller:

1. End rings and center rings: ASTM A536 ductile iron, fusion bonded epoxy coated.

2. Gaskets: Buna-N, NSF 61 approved

3. Hardware: Type 316 stainless steel.

D. Couplings 14-inch and larger:

1. End rings and center rings: ASTM A36 steel, fusion bonded epoxy coated.

2. Gaskets: Buna-N, NSF 61 approved.

3. Hardware: Type 316 stainless steel.

E. Bridles and tie rods: Minimum 3/4-inch diameter, except where tie rods replace flange bolts of smaller size, in which case fit with nut on each side of pair of flanges.

1. Provide as indicated.

F. Lining and Coating: Fusion bonded epoxy in accordance with AWWA C213.

2.13 COUPLINGS-BOLTED SPLIT SLEEVE TYPE:

A. Manufacturers:

1. Victaulic Depend-O-Lok.

B. Type: Bolted, split-sleeve type coupling consisting of four basic components; one piece housing, gaskets assembly, bolts and nuts, and restraint rings as required for restraint.

1. Provide split-sleeve with a double arch cross section closing around pipe ends that are smooth for expansion or contraction requirements or pipe ends with end rings affixed for pipe end restraint requirements. As the coupling housing closes, it confines the elastomeric gasket beneath the arches of the sleeve to create the radial seal. The axial seal is affected by the sealing plate at the closure plates as the bolts pull the coupling housing snug around the pipe.

2. Provide sealing members comprised of two O-ring gaskets and an elastomer sealing pad bonded to the integral sealing plate.

C. Provide couplings designed for the type, size, and working pressure of the piping system as indicated in the Process Piping Schedule and specified.

D. Materials:

1. Split-sleeve:

a. Carbon Steel and Ductile Iron pipelines: ASTM A36 Carbon Steel.

b. Stainless steel pipelines, ASTM A240 Type 316L stainless steel.

c. Provide stainless steel couplings where there is a transition for ductile iron to stainless steel piping.

2. Gaskets:

a. Material: Elastomers in accordance with ASTM D2000.

(1) Air Service: Silicone conforming to ASTM D2000 for air service up to 240 degrees F with intermittent exposure to 280 degrees F.

(2) Liquid Service: Isoprene or Buna-N conforming to ASTM D2000 for service within the temperature range of minus 20 degrees F to 180 degrees F.

3. Bolts and Nuts:

   a. Bolts: Stainless steel conforming to ASTM F593 Type 316, minimum tensile strength 85,000 psi, (or threaded studs to ASTM A193, Class 2 Grade B8M Type 316).

   b. Nuts: ASTM F593 Type 316.

4. End Restraint Rings:

   a. Provide restraint rings of the same material as the coupling housing.

   b. Non-restrained (ExE) type couplings allows for up to 4 degree deflection. Provides for coupling joint where restraint is not required. If restraint is required, it must be provided independent of the coupling.

   c. Fixed x Expansion (FxE) type couplings: Allows for thermal expansion and contraction at the pipe joint. Provide one or two restraint rings fixed to one end of the pipe to keep coupling in the proper location. Where split sleeve coupling FxE for expansion is used provide the expansion side of the coupling with a combination of fixed and sliding supports for thermal movement.

   d. Fixed x Fixed (FxF) type couplings: Provides a fully restrained pipe joint. Provide one restraint ring welded to each of the pipe ends fitting beneath the coupling to prevent the pipe joint from pulling apart.

   e. Provide type as indicated and specified.

   f. Follow manufacturer's written recommendations and instructions for location dimensions and welding detail required to attach the restraint rings.

E. Provide a Type 316 stainless steel nameplate welded to each coupling with the following data:

   1. Manufacturer and date fabricated.

   2. Type of Coupling (ExE, FxE, FxF).

   3. Working Pressure in psi.

   4. Test Pressure in psi.

   5. Materials for coupling, hardware and gaskets.

F. Protective Coating: Prior to installation, couplings shall be coated on the I.D. and O.D. in accordance with Sections 09 90 00.

G. Couplings installed underground: Provide bitumastic coating or joint tape wrap.

H. Installation of couplings shall be in accordance with manufacturer's recommendation.

1. The coupling housing shall be assembled pulling the closure plates together with the bolts tightened to assure snug coupling housing contact with the pipe OD. Follow the manufacturer's recommendation regarding the installation and tightening of the bolts.

2.14 EXPANSION JOINTS-ELASTOMERIC FLEXIBLE CONNECTION:

A. General: Provide flexible connectors as indicated, specified and as required for ductile iron, HDPE, steel and stainless steel piping

1. At equipment connection: To eliminate vibration and stress on equipment.

2. Elsewhere: Designed for expansion/contraction. See Section 40 23 19.01.

B. Manufacturers:

1. Mercer Rubber Co. (Series 450 and Series 500)

2. General Rubber Co.

3. Garlock, Inc.

4. Proco

C. Products:

1. Straight-through or tapered design as required.

2. Unless indicated otherwise on drawings, provide dual arch type for wastewater, reclaimed water, glycol service, sludge and scum applications.

a. For sludge service provide filled arches

b. All other services shall be unfilled arches

3. For 12 inch and smaller provide Mercer Flexmore Series 450. For greater than 12 inch provide Mercer Invincible Heavy Duty Expansion Joints.

4. Furnish control rods for test pressures as indicated or required.

5. Materials: EPDM or alternative material suitable for service specified and indicated.

6. At expansion joints, provide guide supports located per manufacturer's recommendations.

7. Flanges: 125 lb drilling.

8. Provide Type 316 stainless steel retaining rings.

D. Install joints in their neutral position.

2.15 EXPANSION JOINTS-CHEMICAL SERVICE:

A. Service Conditions:

1. 5 to 20 percent sodium hypochlorite solution.

a. Temperature: 110 degrees C.

b. pH: 11 to 13.5.

2. Polymer:

a. Temperature: 110 degrees C.

3. 50 percent caustic soda.

4. Working Pressure: 150 psi.

5. Mating Pipe: SCH 80 CPVC, SCH 80 PVC, Kynar lined steel, titanium or stainless steel as indicated in the Process Piping Schedule.

B. Type: Bellows.

1. Capable of angular, parallel and rotary misalignment at maximum extended and minimum retracted length when mechanically limited by restraints.

2. Joints, as specified, must be manufacturer’s standard cataloged product.

C. Materials:

1. Convoluted Components: Pure white virgin PTFE-Fluorocarbon resin conforming to ASTM D1457 without pigments, lubricants or additives of any kind and suitable for the service specified. Provide a written recommendation from the expansion joint manufacturer.

a. Wall thickness: Suitable for the service specified or indicated and as recommended by the joint manufacturer.

2. Reinforcing rings:

   a. Type 316 stainless steel for caustic service and polymer.

   b. Titanium or Kynar coated for sodium hypochlorite service.

3. Flanges: Drilled and tapped to 150-lb ANSI standard.

   a. Type 316 stainless steel for caustic service and polymer.

   b. Titanium or Kynar coated for sodium hypochlorite service.

4. Hardware:

   a. Type 316 stainless steel for caustic service and polymer.

   b. Titanium for sodium hypochlorite service.

D. Joint Testing:

1. Leak free after 100,000 cycles at maximum rated travel 10 cycles per minute at 21 degrees C.

2. Test at 75 psi.

3. Provide high intensity light test to detect any imperfections or inclusions.

4. Provide a 10,000 volt spark test, no arcing is acceptable.

2.16 SAFETY SHIELDS-CHEMICAL SERVICE:

A. Provide shield type and materials for the service specified. Provide a written recommendation from the safety shield manufacturer.

B. Material: Non-porous Teflon-impregnated glass cloth with a 5 mil thickness and sewn with 100 percent Teflon thread and Velcro closures and folded in a trifold design with an 0.82 mil Teflon cord inserted on the sides to act as a draw string tying on the flange neck. Provide for use with 150 lb ANSI flanges.

C. Draw string or cord: 100 percent virgin unbleached Teflon fiber.

D. Provide a clear leak indicating window with a pH paper insert that will change color to indicate a leak.

E. Provide shields with a working temperature rating of 93 degrees C and a working pressure rating of 200 psi.

F. Install safety shield for the following:

1. Expansion joints chemical services.

2. Flanged connections on chemical system pipe and fittings.

3. Safety shields are NOT required for expansion joints on the polymer system.

2.17 HOSE, HOSE FITTINGS AND ACCESSORIES:

A. Hose Manufacturers:

1. Goodrich, HPD Industries

2. Goodyear

3. United Rubber Supply

4. Goodall

B. Hose: 1-inch:

1. Provide 4-ply rubber-lined and rubber-covered water hose for 150 psi working pressure.

2. Nozzle:

a. Shatter proof and UV resistant Lexan constant flow nozzle with bumper.

C. Hose Reels:

1. Type 316 stainless steel, mill finish.

2. Heavy duty square tubing frame.

3. Spring rewind with declutching arbor.

4. Stainless steel ball bearing swivel joint.

5. 1-inch female NPT.

6. 50 feet of hose.

7. Provide a flexible connector between the inlet pipe and inlet swivel joint.

8. Manufacturer: Hannay Model SS800.

2.18 CHEMICAL HOSE AND FITTINGS:

A. Provide hoses that are suitable for suction and discharge application.

B. Materials:

1. Tube: Type T (FEP) Teflon with crosslinked polyethylene backing.

2. Reinforcement: Synthetic textile with steel helix.

3. Cover: EPDM.

C. Sizes:

1. 3/4-inch through 2 inch: 200 psi.

2. 2.5 and 3 inch: 150 psi.

3. 4 inch: 125 psi.

4. 3/4 inch through 4 inch: 30 in Hg vacuum.

D. Coupling: Provide type and materials as recommended by the hose manufacturer for the service conditions specified and indicated.

1. For sodium hypochlorite and sodium hydroxide provide flanged connection.

2.19 BASKET STRAINERS-CHEMICAL SERVICE:

A. Service Conditions:

1. Provide strainers suitable for the chemical service as indicated in the equipment schedules.

2. Provide size and type, simplex and duplex, as indicated.

B. Materials:

1. Body and Cover: CPVC

2. Valves for duplex strainers: CPVC

3. O-rings: EPDM or suitable for the service specified and indicated.

4. Baskets: CPVC with 1/16-inch perforations

C. Covers: Threaded with hand operable vent.

D. Body:

1. Provide with and operable drain.

E. Provide with integral flat mounting base.

F. Ball Valves for duplex strainers: Provide a 3-way ball valve at the inlet and outlet, mechanically connected with true-union connections.

G. Pressure Rating: 150 psi.

H. End Connections: Flanged 150 psi ANSI (Class 150) standard.

I. Duplex Strainer Configuration: Provide configuration as indicated.

2.20 WALL AND FLOOR SLEEVES:

A. Materials:

1. Floor Sleeves:

a. Schedule 40 Galvanized steel ASTM A53 GRB unless otherwise indicated on the Drawings.

2. Wall Sleeves Between a Dry Area and a Wet Area (Tank, Channel, etc.):

a. Schedule 40 Galvanized steel unless otherwise indicated on the Drawings.

3. Wall Sleeves Between Dry Area or Between Dry Area and Ground:

a. Schedule 40 Galvanized steel ASTM A53 GRB unless otherwise indicated on the Drawings.

B. Water Stops: Provide water stops welded on both sides. Provide water stops 1/4-inch thick and 2-inch high and centered on the wall thickness.

C. Where indicated provide modular, mechanical type seals, consisting of inter-locking synthetic rubber links shaped to continuously fill the annular space between the pipe and the wall opening.

D. Provide the elastomeric elements sized and selected per manufacturer's recommendations and have the following properties as designated by ASTM. Coloration shall be throughout elastomer for positive field inspection. Each link shall have a permanent identification of the size and manufacturer's name molded into it.

E. Temperature Range: -40 to +250 degrees F.

1. Material: EPDM, ATSM D2000 M3 BA510.

2. Color: Black.

F. Modular seal pressure plates: Molded of glass reinforced Nylon Polymer with the following properties:

1. Izod Impact – Notched: 2.05 ft-lb/in. per ASTM D256

2. Flexural Strength at Yield: 30,750 psi per ASTM D790

3. Flexural Modulus: 1,124,000 psi per ASTM D790

4. Elongation Break: 11.07 percent per ASTM D638

5. Specific Gravity: 1.38 per ASTM D792

G. Hardware: Type 316 stainless steel.

2.21 TRANSITION COUPLINGS:

A. Provide coupling in accordance with AWWA C219 as specified herein

B. Sizes: 2-inch through 24-inch.

C. Materials:

1. End rings and center rings: Ductile iron ASTM A536.

2. Gaskets: Virgin Styrene Butadiene Rubber (SBR) suitable for potable water and wastewater service, ASTM D2000 MBA 710.

3. Provide Type 316 Stainless steel bolts and nuts

D. Working Pressure: 250 psi.

E. Lining and Coating: Fusion bonded epoxy in accordance with AWWA C213.

2.22 DISMANTLING JOINTS:

A. Materials:

1. Flanged Spool: AWWA Class D steel ring flange compatible with ANSI Class 125 and 150 bolt circles. Provide pipe of ASTM A36 plate 1 percent cold expanded to size.

2. End Ring and Body: ASTM A36 steel

3. Gaskets: ASTM 2000 Virgin NBR suitable for wastewater service

4. Bolts and Nuts: Type 316 stainless steel

5. Tie Rods: Type 316 stainless steel

B. Assembly Tolerance: 3 inches

C. Coating: Fusion bonded epoxy, NSF 61 certified

D. Pressure Rating: 150 psi working pressure

E. Manufacturers:

1. Romac

2. Viking Johnson

2.23 INSULATION:

A. General:

1. Provide insulation where specified and indicated.

2. Provide pre-molded or pre-formed pipe insulation.

3. Provide insulation with a flame spread index of less than 25, and a smoke-developed index of less than 50 when tested in accordance with ASTM E84.

4. Provide insulation with a maximum thermal conductivity of 0.7 Btu-in/h-ft^2-degrees F at 75 degrees F mean temperature when tested in accordance with ASTM C177.

B. Insulation for systems with an operating temperature of 60 degrees F or higher:

1. Type:

a. Pre-Molded Fiberglass.

b. Provide All Service Jacket (ASJ) consisting of white draft paper bonded to aluminum foil with fiberglass reinforcement in accordance with ASTM C1136 Type 1.

c. Provide self-sealing lap.

d. Provide insulation thickness as indicated on the Process Pipe Schedule.

2. Manufacturers:

a. Knauf Insulation

3. Accessories:

   a. Butt Strips: Provide self-adhesive butt strips for sealing circumferential joints between insulation sections. Provide strips manufactured from white Kraft paper bonded to aluminum foil with fiberglass reinforcement in accordance with ASTM C1136 Type 1.

   b. PVC Fitting Covers: Provide pre-molded, insulated, white glass finish, suitable for inside and outside use. Provide fitting covers manufactured from PVC material having a flame spread index of less than 25, and a smoke-developed index of less than 50 when tested in accordance with ASTM E84, PVC material shall meet the requirements of ASTM D1784.

   c. Vinyl Tape: Provide white, adhesive backed vinyl tape, minimum 1-inch wide for sealing PVC fitting covers to insulation.

   d. Tacks: Provide white coated, stainless steel, barbed tacks.

   e. Aluminum Protective Jacketing: Provide 0.020 inch Stucco Embossed Aluminum Jacketing.

   f. Sound Barrier Jacketing: Provide a composite sound attenuating system comprised of an acoustic decoupler material laminated to 0.020 inch Stucco Embossed Aluminum Jacketing.

   g. Stainless Steel Strapping: Provide Type 316 stainless steel strapping and wing seals. Provide strapping 1.2-inch wide or greater with a minimum thickness of 0.015-inch. Provide wing seals 1/2-inch wide or greater with a minimum thickness of 0.032 inches.

   h. Sheet Metal Screws: Provide Type 304 stainless steel sheet metal screws.

C. Insulation for systems with an operating temperature below 60 degrees F.

   1. Type: Pre-molded, Flexible Closed Cell Elastomeric Foam.

   2. Insulation for the foul air system shall be flexible closed cell elastomeric foam.

   3. Provide self-sealing lap for pipe sizes 6-inch and smaller. For pipe sizes above 6-inch and equipment provide Closed Cell Elastomeric Foam Sheets.

   4. Manufacturers:

      a. Armacell Engineered Foams, AP Armaflex SS and AP Armaflex.

5. Accessories:

a. Adhesive: Provide contact adhesive specifically designed for use with the insulation supplied.

b. Pipe support inserts: Provide a pre-fabricated insert designed to prevent damage to the insulation at the pipe support attachment point.

c. Provide an aluminum or stainless steel outer jacket, a foam inner core with plastic support and self-sealing closure, or acceptable equivalent product.

2.24 CHEMICAL INJECTORS:

A. General:

1. All materials of construction for chemical injectors shall be compatible with the service chemicals being injected.

B. Provide assemblies consisting of the following components:

1. Corporation stop with safety device to prevent release of solution tube under line pressure of ball valve.

2. Flange tapped to accept the corporation stop or ball valve.

3. Solution Tube of the length indicated with a locking device to prevent release of the tube under line pressure.

a. Ball check valve as specified in Section 40 23 13.01.

b. Type 316 stainless steel safety chain.

4. Chemical line connection to the assembly:

a. Provide a section of flexible tubing or hose suitable for the service conditions specified and indicated.

b. Isolation valve of the type indicated and specified.

2.25 SEAL WATER CONTROL AND MONITORING UNIT

A. Manufacturer

1. John Crane/Safeunit

2. Chesterton Flow Guardian

B. Provide a single assembly to control and monitor seal water flow and pressure

1. Provide a flow rate indicator with memory pin

2. Provide a pressure gauge with memory pin

3. Provide a flow regulating valve

4. Provide an inductive low flow alarm and signal

5. Provide non-clog valves

6. Provide manual cleaning valve capable of operation while unit and pump is in service

C. Pressure and Temperature Ration:

1. 150 psi

2. Maximum Temperature: 175 degrees F

D. Flow Range: Provide range suitable for system flow rate and as recommended by pump manufacturer.

2.26 SHOP PAINTING:

A. Provide in accordance with Section 09 91 10.

PART 3 - EXECUTION

3.01 INSTALLATION OF PIPE:

A. Install pipelines parallel to building walls wherever possible. Install piping to lines and grades indicated and support. Provide for expansion.

B. Where temporary supports are used, provide temporary supports as specified in Section 40 23 19.01 to prevent shifting or distortion of pipe. Provide for expansion.

C. Slope piping toward low points and provide for draining at low points.

D. Before assembly, remove debris from inside pipes and fittings.

E. Before flanges pieces are assembled, remove rust resistant coating from machined surfaces, clean gaskets and smooth burrs. Make up flanged joints tight, and prevent strain upon valves or other pieces of equipment.

1. Bolt threads must fully engage the nuts. At a minimum the bolt must be flush with the nut and no more than 1/2-inch excess thread protruding from the nut.

F. Install grooved joints in accordance with the manufacturer's written recommendations.

1. Grooved Ends: Clean and free from indentations, projections, or roll marks.

2. Gaskets: Molded and produced by the coupling manufacturer of an elastomer suitable for the service pecified and indicated.

3. The coupling manufacturer's factory trained representative shall provide on-site training for the contractor's field personnel in the use of grooving tools and installation of product. The representative shall periodically visit the job site to ensure best practices in grooved product installation are being followed.

G. Install tierods, pipe clamps or bridles when sleeve type couplings or fittings are used in piping system as indicated, and at changes in direction or other places to prevent joints from pulling apart under pressures indicated in the Process Pipe Schedule.

H. Examine pieces for damage. Do not install pieces that are damaged according to Engineer. If any damaged piece should be discovered after having been installed, remove and replace with a sound piece at no additional cost to the Authority.

I. Handle pipe with equipment such as nylon slings and padded skids, designed to prevent damage to the coating. Repair abrasions and injuries to the coating prior to the application of insulation or prior to the application of final field coating.

J. Support piping laid in trenches in trench on bed of selected backfill material which maintains desired line and grade.

K. Use dielectric bushings or unions when ferrous pipes join nonferrous pipes carrying liquid either underground or elsewhere.

L. Welding in accordance with ASME B31.1 and AWS B3.0.

3.02 WALL SLEEVE SEALS:

A. Expand rubber against pipe and sleeve by tightening bolts when assembled around pipe and inserted in wall.

3.03 TEMPORARY PLUGS:

A. Close open ends of pipe with temporary plugs or caps when pipe installation is not in progress. Use watertight plugs for exterior, buried piping and if water or debris is in trench when work is resumed, do not remove until adequate provision has been made to prevent any water or debris entering pipe even if it necessitates dewatering trench.

3.04 PHYSICAL CHECKOUT, FIELD AND FUNCTIONAL TESTING:

A. Clean dirt, dust, oil, grease and other foreign material, before pressure and leakage tests.

B. Water for testing provided by the Contractor.

C. Pressure and Leakage Tests:

1. Provide temporary testing plugs or caps; pressure pumps, pipe connections, meters, gages, equipment, and labor.

2. Test pipelines in sections of acceptable length.

3. Fill section of pipe with water and expel air.

4. Pressure and leakage test consists of first raising pressure (based on elevation of lowest point of section under test and corrected to gage location) to pressure in psi numerically equal to test pressures indicated in the Process Pipe Schedule.

5. No visible leakage in joint is acceptable.

6. If unable to achieve and maintain specified pressure for one hour with no additional pumping, section has failed to pass test.

7. If section fails pressure and/or leakage test, locate, uncover, and repair or replace defective pipe, fitting, or joint, and conduct additional tests and repairs until section passes test at no additional cost and without any time extensions.

D. Make piping connections to equipment with pipe in a free supported state and without application of vertical or horizontal forces to align piping with the equipment flanges.

E. Do not cover joints in underground piping with backfill material until piping has successfully passed pressure test.

F. Test pressures as indicated in Process Pipe Schedule.

G. Repair faulty joints even to extent of disassembling and remaking joint, remove defective pipe and fittings and replace in manner satisfactory to the Owner.

3.05 CONTRACT CLOSEOUT:

A. Provide in accordance with Section 01 77 00.

3.06 PROCESS MECHANICAL PIPING SCHEDULE:

A. See Contract Drawings.

END OF SECTION

SECTION 40 61 13

PROCESS CONTROL SYSTEM GENERAL PROVISIONS

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide process control system general provisions as indicated and in compliance with Contract Documents.

1.02 REQUIREMENTS OF WORK:

A. Supply, install, commission and provide warranty for a complete and fully documented instrumentation and control (I&C) system as shown on the drawings and specified herein. The I&C system will form a subsystem of the overall plant control system and contains vendor component subsystems specified in this and other sections of the specification.

B. Overall plant-wide control system integration including configuration and programming of PLC systems, SCADA systems, and related communication systems is not part of this contract and will be supplied under separate contract.

C. Programming of individual vendor packaged PLC systems, operator interface terminals and related communication systems are specified within the respective equipment specification sections.

D. This contract shall coordinate and cooperate with the plant-wide control system integrator and packaged equipment control system integrators to; establish and test communication systems, fully test all control system I/O, verify analog input & output signal polarity and scaling, test all control loops for correct functionality, and verify system performance under operating conditions.

E. Component subsystems of the I&C system will include, but are not limited to, the following:

1. Primary elements and transmitters

2. Final control elements

3. I&C field devices

4. I&C junction boxes, local control panels, and marshalling panels.

5. Where instrumentation, field devices, and final control elements are concentrated in plant areas, provide Analog Junction Boxes (AJB), and Control Junction Boxes (CJB) to concentrate wiring for home runs to the main PLC control panels.

6. Instrumentation cabling

7. SCADA, security, fire and business communication network cabling systems.

8. Communication network cabinets, switches, routers, and media conversion.

9. Instrumentation and communication systems power supplies

10. Conduit and cable tray

11. Distributed Programmable logic controller (PLC) based control system.

12. Operator interface terminals.

13. Human Machine Interfaces (HMI).

F. The Contractor's responsibility also includes receiving, un-crating, examining for shortages or damage, assembling, field fitting, installing, mounting, wiring and testing of vendor supplied component subsystems including all loose supplied components of the vendor package(s).

G. Where packaged, stand-alone control systems are supplied under other divisions of this specification, provide installation and cabling to connect to the required remote monitoring and/or controllers and all loose supplied components of the vendor package(s). Provide end-to-end commissioning and ensure the correct functionality of any equipment supplied under other divisions of this specification.

H. Documentation provided by the Contractor shall include as a minimum:

1. Equipment descriptive data.

2. Equipment installation instructions, service manuals, operation and maintenance (O&M) manuals, bills of materials, and recommended spare parts lists.

3. Schematics and interconnection wiring diagrams sealed by a Professional Engineer registered in the State of Utah.

4. Records of conductor identification, field terminals, cable lists, changes, etc.

5. I&C panel Shop Drawings, face layouts, schematics, and point-to-point wiring diagrams sealed by a Professional Engineer registered in the State of Utah.

6. Records of record drawing information for the complete instrumentation system.

7. For vendor package programmable logic controller (PLC) based control system, the Contractor shall provide detailed documentation of the system hardware and software. Minimum software documentation shall include a detailed operating description, flow charts that describe the functionality of the PLC program, a memory map, and the PLC program documentation. This information shall be submitted at the Shop Drawing stage.

8. For vendor package OIT and HMI systems, the Contractor shall provide detailed documentation of the system hardware and software.

I. Documentation provided by the Contractor shall be formatted as follows:

1. Process and Instrumentation Diagrams (P&IDs): Depict the general design intent of the process and control systems.

2. Instrument Index: A tabular index of the detailed information for control system devices shown on the P&IDs. The index lists the appropriate support documentation for the specified devices' supply and installation.

3. Input/Output (I/O) Index: A tabular index of the control system I/O points shown on the P&IDs, providing a description of the application and function together with references to supporting documentation.

4. Instrument Specifications: Detail the relevant technical data for the supply of instruments and devices. Instrument specifications and related process application data are provided in section 40 70 00 and related sub-sections detailing the requirements for each instrument to be supplied for the project. Instruments supplied shall meet these requirements. Record drawing Instrument Specification Sheets based on ISA S20 templates shall be provided for each instrument and shall include instrument particulars obtained from reviewed shop drawings and testing and commissioning data.

5. Instrument Loop Diagrams (ILDs): Show typical interconnections and hook-up of devices and control circuits. The Contractor is to produce an ILD for each device and record all relevant record drawing information on each sheet for submission at the completion of the work. Fill in all terminal and wiring numbers etc. from the reviewed shop drawings as they become available. A set of 'B' size (11" x 17") ACAD drawings and associated files will be made available to the successful bidder. Where an ILD is not shown for wiring of simple devices provide a legible sketch for record drawing information.

6. Location Drawings: Indicate in plan and/or elevation views where the instrument elements are physically located. These drawings are provided to assist the Contractor in estimating the amount of wire, cable, cable tray and ducting required.

7. Standard Details: Provide a reference for installation, operation, and other instructions pertinent to a particular device. Where standard details are not provided, The Contractor shall follow manufacturers recommended installation details. All instrument installations shall include provisions for calibration, and maintenance of the respective device.

8. Detailed Specification: Lists qualifications, quality of materials and workmanship, and supplementary information.

J. Codes, Rules, Permits and Fees:

1. Comply with all laws, ordinances, rules, regulations, codes, and orders of all authorities having jurisdiction relating to this work.

2. Comply with all rules of the electrical Safety Act of the State, National Fire Protection Association (NFPA), Underwriters Laboratories (UL) and the applicable building codes, whether specifically shown on drawings or not.

3. Give all required notices, submit drawings, obtain all permits, licenses, and certificates, and pay all fees required for this work.

4. Furnish a certificate of final inspection and approvals from inspection authorities to the Engineer.

K. Qualifications:

1. The instrumentation subcontractor shall be a firm normally engaged and fully competent in the type of work described in this section of the specification. The firm shall have been continuously and successfully engaged in this business for at least five (5) years.

2. Submit with the bid a list of similar projects recently completed and resumes of the personnel proposed for the project.

3. The Instrumentation Subcontractor shall be experienced in the process and instrument requirements of this contract.

4. The Instrumentation Subcontractor shall show that it maintains a fully equipped and qualified organization, capable of performing the present work and of providing warranty service to the system after installation.

5. Qualified journeyman instrument mechanics that are familiar with the devices being installed shall perform all instrument hook-ups, calibrations and checkouts.

6. Qualified journeyman electricians shall perform all control wiring installation and connections.

L. Standards of Workmanship:

1. Execute all work in a manner which will result in the completed installation presenting an acceptable appearance, to a level of quality defined in the general conditions of this specification.

2. Employ a competent supervisor and all necessary licensed tradesmen to complete the work in the required time.

3. Arrange and install products to fit properly into designated building spaces.

4. Install products in accordance with the recommendations and ratings of the product manufacturers.

5. Supply and execute installation of all instrumentation control tubing in accordance with Division 40.

M. Contract Drawings and Specifications:

1. Refer to Division 01.

2. Supply and install all items and accessories specified by the drawings or the specification in the quality and quantity required. Perform all operations as designated by the specifications according to the methods prescribed, complete with all necessary labor and incidentals.

3. Treat any item or subject omitted from this division's Specifications or drawings, but which is mentioned or reasonably specified in other divisions' specifications or drawings and pertains to the I&C system, as being integral to the overall system. Provide such specified items or subjects.

4. Provide all minor items and work not shown or specified but which are reasonably necessary to complete the work.

5. If discrepancies or omissions in the drawings or specifications are found, or if intent or meaning is not clear, consult the Contract Administrator for clarification before submitting the bid response.

6. The responsibility to determine which division provides various products and work rests with the Contractor. Additional compensation will not be considered because of differences in interpretation of specifications.

1. 455: General Requirements for Standard Test Procedures for Optical Fibers, Cables, Transducers, Sensors, Connecting and Terminating Devices, and Other Fiber Optic Components

2. 568: Broadband Coaxial Cabling and Components Standard

K. Underwriters Laboratories (UL).

1.04 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Delegated Design Submittals: For each control panel, marshalling panel, equipment rack, or appurtenance thereto, provide written certification from Professional Engineer licensed in the State of Utah stating that supports, systems and anchorage for equipment have been designed according to the requirements of Section 1613 of the building codes of Utah, Salt Lake City and ASCE/SEI 7, and in accordance with Specification 01 41 20. Submit calculations stamped by a Professional Engineer licensed in the State of Utah for support systems and anchorage for wind, seismic, and all other pertinent loads.

C. Tender submittals:

1. Submit an equipment list indicating the type and make of all equipment and materials proposed for this project within 10 business days of award of contract.

D. Receiving, storing, and protection of components during construction:

1. Examine each component upon delivery to site. Report all damage noted to the Contract Administrator prior to accepting or rejecting delivery. All instrumentation primary elements, control components, panels, etc. shall be placed in a secure, dry, heated storage building. Maintain the space temperature above 50 degrees F and the space relative humidity below 50 percent.

2. Perform a preliminary examination upon delivery to ensure that:

a. All I&C components supplied for this project under this section of the specifications comply with the requirements stated in the instrument specification sheets.

b. All I&C components supplied under other sections of these specifications, to be connected to I&C components supplied under this section of the specifications, comply with the requirements stated in the contract documents.

c. Itemize all non-conformities noted above and forward them to the Contract Administrator. Any delays in construction resulting from the delivery to site of non-conforming I&C components shall be borne by the Contractor.

d. Do not install primary elements or other sensitive equipment until construction is sufficiently completed to provide an "operating condition" environment. Notify the Engineer prior to installing any equipment of this type.

e. Ensure that covers where required are properly installed on all equipment. Provide all covers, padding, guards, etc. as required to guard any equipment against damage.

f. Follow the manufacturer's recommendation for the storage of all I&C components.

3. Take all necessary precautions to ensure that equipment is supplied free of damage. If deemed necessary by the Contract Administrator, damaged equipment shall be replaced with new Product. The Contractor shall bear any costs due to construction delays resulting from the delay in delivery of acceptable equipment.

E. Submit a schedule within 30 days of award of contract to the Contract Administrator showing projected ordering and delivery dates of all products to meet the required construction schedule. Provide all necessary information regarding ordering and delivery dates for those product whose delivery effects the construction schedule.

F. Submit shop drawings for all products supplied by this Division. Submit shop drawings for review prior to purchase of any products or equipment and sufficiently in advance to allow ample time for checking.

G. Contractor to review, modify, and approve the shop drawings prior to submitting shop drawings to the Contract Administrator for review. Contractor approval of a drawing indicates the following:

1. The drawing has been checked by the person making the approval.

2. The equipment or material complies in all respects with the requirements of the specifications and drawings.

3. The quantities indicated are correct.

4. The physical dimensions of the components are such that they can be installed without interference with the building structure or other equipment, and after installation, there are sufficient clearances on all sides for maintenance, servicing and operation of the equipment.

5. The points of attachment are clearly indicated, i.e. TOP, BOTTOM, SIDE, etc.

6. The arrangement and location are properly oriented.

7. The product is suitable for its intended use.

8. The submission consists of sufficient information to adequately convey the scope of supply and the specific product to be supplied is highlighted.

9. The submission contains sufficient information to install the equipment or systems.

H. Stamp and sign the shop drawing to show approval, indicating the above has been complied with. If Contractor revisions are too extensive, return the submission to the manufacturer for revision, then repeat the shop drawing approval process before submitting to the Contract Administrator.

I. Manufacture of products shall conform to shop drawings marked as reviewed by the Contract Administrator and returned to the Contractor.

J. Keep one complete, maintained set of shop drawings at the job site during the construction period. Record site modifications.

K. Refer to Division 01 for further information on Shop Drawing submittals.

L. Operation & Maintenance Manuals:

1. Refer to Division 01 for general O&M manual submittal information.

2. In addition to the requirements specified in Division 01, provide the following information:

a. Table of Contents: Arrange contents sequentially by systems under section numbers. Label tabs of dividers between each to match section numbers in the Table of Contents.

b. Systems Descriptions: A brief synopsis of each system typed and inserted at the beginning of each section. Include sketches and diagrams where appropriate.

c. O&M Instructions of All Equipment and Controls: These operating instructions need not be manufacturer's data but may be typewritten instructions in simple language to guide the City in the proper O&M of this installation.

d. A copy of all wiring diagrams complete with wiring coding.

e. Include type and accuracy of instruments used.

f. Set of final reviewed Shop Drawings.

g. Provide a tabulated list of all consumables utilized (fuses, lamps, etc.) indicating where used, type, rating and reorder details.

M. Record Drawings:

1. Maintain on-site a complete set of record drawings as listed in Division 01 of this specification.

2. In addition to the requirements as stated in Division 01, record on the drawings the following information:

a. All changes alterations or additions

b. All instrumentation cable and control tubing

c. All changes to the numbers and location of outlets, motors, panels and end devices that may occur during the course of the work

3. Before requesting the final completion certificate make any necessary final corrections to the drawings, sign each print as a certification of accuracy and deliver all sets to the Contract Administrator for approval.

1.05 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.06 SPARE PARTS:

A. Comply with the requirements specified in Section 01 61 00.

1.07 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

1.08 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

1.09 PROJECT/SITE CONDITIONS:

A. Classification of Plant Areas:

1. Refer to Division 26 and project contract drawings

PART 2 - PRODUCTS

2.01 GENERAL:

A. Refer to the requirements of Division 01.

B. Selected Products:

1. Provide products and materials that are new and free from all defects.

2. Products and materials called for on the drawings or in the specifications by trade names, manufacturer's name and catalogue reference are to be used as the basis for the bid submission.

3. The design has been based on the use of the first named product where multiple products have been listed.

C. Quality of Products:

1. All Products provided to be NEC and UL approved where applicable.

2. If Products specified are not NEC and UL approved, obtain approval of the relevant State regulatory authority. Pay all applicable charges levied and make all modifications required for approval.

3. Refer to Division 01 of this specification for further information.

D. Uniformity of Manufacture:

1. Unless otherwise specifically called for in the specification, uniformity of manufacture to be maintained for similar products throughout the work.

E. Product Finishes:

1. Contractor to specify proposed finishes to be used for Contract Administrator's review.

F. Use of Products During Construction:

1. Any equipment used for temporary or construction purposes is to be approved by the Contract Administrator and in accordance with Division 01 of this specification. Clean and restore to "as new" condition all equipment prior to the time of substantial completion.

2.02 INSTRUMENTATION:

A. General:

1. Instruments are to be suitable for the environmental conditions in which they are to be installed. In this facility, many areas are wet and corrosive, subject to hose washdown, and may have been deemed electrically hazardous with a designation of Class 1, Division 1 or Class 1, Division 2. Refer to electrical plan drawings and process plan drawings for additional details pertaining to each area.

2. Determine where injurious conditions may be expected to occur and make proper provision to protect the instruments to ensure their proper and reliable operation.

3. Provide power surge protection, heating cables, and devices to protect instruments, equipment, and lines from being functionally impaired or damaged by power surges or environmental conditions such as moisture or freezing.

B. Identification:

1. Refer to Division 26 for general identification requirements. Provide lamacoid nameplates with 0.25 inch black lettering on white background. Identify the loop tag number (where applicable) and the device name, function, and instrument range or setpoint value on the nameplate.

2. Where it is not possible to attach a lamacoid nameplate to a field instrument component, provide the component with a stainless steel metal tag firmly wired to the device and identified with the loop tag number.

3. Identify all wires where they terminate at the marshalling panels, junction boxes, control panels, and field devices with a heat shrink sleeve with machine printed labelling.

4. Clearly mark all panels, pull boxes, junction boxes, etc. to indicate the nature of service.

5. Provide neatly typed circuit directories for panel power distribution systems to indicate loops or devices powered by the circuit and the fuse size.

6. Identify all exposed control conduits at all pull box locations, where the conduits enter or leave a room, and 40 feet on center throughout the room. This shall apply to conduits above removable ceilings. Refer to Division 26 for conduit identification.

7. For direct current wiring use black for positive and white for negative.

8. For thermistor wiring to motors use red and blue colored insulated wire.

PART 3 - EXECUTION

3.01 EXAMINATION:

A. Refer to the requirements of Division 01.

B. No additional compensation will be given for extra work due to existing conditions which a site examination prior to tender should have disclosed.

3.02 COORDINATION WITH OTHER DIVISIONS:

A. Examine the drawings and specifications of all divisions and become fully familiar with the work. Before commencing work, obtain a ruling from the Contract Administrator on any conflicting issues between divisions. No compensation will be made for any costs arising from conflict not identified before work has commenced.

B. Coordinate the work to be performed under this section of the specification with all divisions installing equipment to ensure that there are no conflicts.

C. Install anchors, bolts, pipe sleeves, hanger inserts, etc. required in ample time to prevent delays to other divisions' installation work.

D. Lay out the work and equipment with due regard to architectural, structural, and mechanical features. Architectural and structural drawings take precedence over electrical drawings regarding locations of walls, doors, and equipment.

E. Structural members shall not be cut without prior approval of the Contract Administrator.

F. Examine previously constructed work and notify the Contract Administrator of any conditions which prejudice the proper completion of this work.

3.03 PRODUCT HANDLING:

A. Use all means necessary to protect the products included in this division before, during and after installation, and to protect products and installed work of all other trades.

B. Any damage to the products and/or installed work shall be repaired or replaced to the approval of the Contract Administrator by the Contractor at no additional cost to the Owner.

C. Remove advertising labels from all products installed that have such labels attached. Identification, NEC, and UL labels are not to be removed.

D. Remove dirt, rubbish, grease, etc. resulting from work performed under this section of the contract from all surfaces.

3.04 SEPARATION OF SERVICES:

A. Maintain separation between the electrical wiring system, piping, ductwork and the instrumentation cables so that each system is isolated (except at approved connections to such systems) to prevent galvanic corrosion. In particular, contact between dissimilar metals, such as copper and aluminum, in damp or wet locations is unacceptable.

B. Do not support wiring from pipes, ductwork, etc. Hangers for suspended ceilings may be used for the support of wiring only when approval is obtained from the Contract Administrator and the ceiling installer, and only if approved clips or hangers are used.

C. Classifications of Circuits:

1. The circuit categorization shall of first priority follow National Electric Code (NEC, NFPA 70) with respect to separation for electrical safety and the following shall apply with respect to electro-magnetic compatibility:

Very Noisy	High voltage circuits and their associated grounding
	High current (>200A) LV circuits.
	Harmonic-rich LV circuits.
	DC circuits: un-suppressed or above 50V.
Noisy	Low current class two (2) circuits.
	Medium power pulsed or radio frequency circuits.
Indifferent	ELV digital status circuits.
	Intrinsically safe circuits.
	Telecommunications circuits.
	Fire alarm and emergency lighting circuits (note that some fire alarm circuits may fall into the category of signal circuits).
	Any other emergency, shutdown, or high integrity circuit (e.g. toxic gas alarm).
Sensitive	Analogue signal circuits.
	Data communication circuits.
Very Sensitive	Low level voltage and current signals (e.g. from instrument sensors).

D. Separation of Circuits:

1. This section relates to the running of cables carrying differing types of circuit in close proximity to one another and to other services. Sensitive circuits shall normally be run in overall shielded cable. Very sensitive circuits shall normally be run in individually twisted pair shielded cable.

2. For cables sharing the same support/containment system, the following shall provide guidance to minimize extraneous interference.

Segregation between circuits	Very Noisy	Noisy	Indifferent	Sensitive	Very Sensitive
Very Noisy	Thermal grouping as per NEC.	6 inches	12 inches	12 inches	12 inches
Noisy	6 inches	Thermal grouping as per NEC Code.	6 inches	6 inches	6 inches
Indifferent	12 inches	6 inches	Separation of circuit types.	4 inches	4 inches
Sensitive	12 inches	6 inches	4 inches	Touching	2 inches
Very Sensitive	12 inches	6 inches	4 inches	2 inches	Touching

3.05 WIRE AND CABLE:

A. Refer to Section 40 66 33. Coordinate with Division 26 and Division 28 of the project documents.

3.06 EQUIPMENT CONNECTIONS:

A. Prior to the connection of signal wiring to process control and instrumentation devices, check the device voltage rating and polarity for compatibility with the corresponding loop and/or schematic diagram. Where device and circuit characteristics are found to be incompatible, the connections are not to be made. Report the condition immediately to the Contract Administrator.

B. All control wiring diagrams illustrate typical control circuits applicable to the type of equipment specified. Control circuits may vary with different manufacturers' equipment. Verify all control circuits with the manufacturers of the equipment and make any corrections to the control wiring diagrams that may be required.

C. Provide circuit breakers in control panels for all instruments fed from the control panel and provide fused disconnect terminals in control panels for PLC inputs/outputs sourced from the panel. Provide local power disconnect switches for all 120VAC powered instruments. Mount the disconnect switches adjacent to the respective instrument.

D. Provide a disconnecting means in the cable connecting each ultrasonic transponder to the transmitter. This disconnect shall consist of a terminal strip in a local water proof junction box.

3.07 WIRING TO EQUIPMENT SUPPLIED BY OTHERS:

A. Equipment supplied by others, that have loose supplied external or field mount control devices, are to be installed, wired and commissioned by this division.

3.08 ACCESS PANELS:

A. Provide access panels where I&C system junction boxes are concealed. Panels to be of adequate size for servicing of the concealed junction box and complete with necessary frames and hinged doors held closed with captive fasteners.

B. In removable ceiling areas provide markers on ceiling tile to locate equipment requiring access. Use a 1 inch diameter blue circle painted on the access panel to indicate that it is for instrumentation and control system access.

3.09 INSTRUMENT MOUNTING STANDS:

A. Supply and install instrumentation mounting stands as required. Stands are to be either floor or wall mounted. The mounting stands are to be fabricated from aluminum or galvanized steel.

B. Supply and install protective drip shields for any exterior stand-mounted instrumentation equipment. The drip shield is to extend 2 inches at the top and sides from the front face of the equipment. The drip shield is to be fabricated from aluminum.

3.10 SEALING OF WALL AND FLOOR OPENINGS:

A. Seal all conduit and cable entries passing through outside walls of buildings, through partition walls separating electrical rooms from other areas, through fire separations, and through floors above grade.

B. Seal openings after all wiring entries have been completed.

C. Sealing material shall be fire resistant and not contain any compounds which will chemically affect the wiring jacket or insulating material. Cable penetrations through fire separations, if required, are to be sealed in accordance with Division 26.

D. Provide sleeves of galvanized steel pipe with machine cut ends of ample size to accommodate conduits passing through walls, partitions, ceilings, floors, etc.

E. For wall partitions and ceilings the ends shall be flush with the finish on both sides. For floors, the ends shall extend 4 inches above finished floor level.

F. Fill the space between the sleeve and the conduit with fire stop material and caulk around the top and bottom with approved permanently resilient, non-flammable and weatherproof silicone base compound. Ensure that the seal is compatible with the floor and ceiling finishes.

G. Locate the sleeves and position exactly prior to construction of the walls and floors.

H. Failure to comply with the above requirements shall be remedied at the Contractor's expense.

3.11 CONNECTIONS TO MECHANICAL, ELECTRICAL AND EXISTING SYSTEMS:

A. Refer to Division 26 for the required tie-in procedures.

3.12 TAGGING STANDARDS FOR DEVICES AND WIRING:

A. Tag all devices, wires, and I/O using the assigned loop, equipment, or device tag name. Where tag naming and numbering is not defined the Contract Administrator will provide naming and numbering that is consistent with the plant naming conventions.

3.13 TESTING OF INSTRUMENTATION LOOPS:

A. After all devices within a loop have been connected, check the loop for correct functioning and interaction with other loops, where applicable. Provide written notice to the Contract Administrator when the loops are going to be tested so that the tests may be witnessed at the Contract Administrator's discretion.

B. Check the operation of final control elements such as solenoid valves, actuators, etc. by manual control before checking with automatic control.

C. Check and simulate all alarms and shutdown functions.

D. Verify the status of all points connected or accessible to the plant control and monitoring system.

E. Where applicable, test all tubing for leaks in compliance with ISA RP7.1. Isolate all instruments when tubing is being tested to protect against over pressure.

F. Perform tests and record results on the test data forms that are included in this section. Develop additional and/or more detailed test forms as necessary to suit more complex instrumentation.

G. Sign and date all test reports. Submit the test reports to the Contract Administrator within five (5) working days of testing.

3.14 CALIBRATION:

A. Instruments are to be factory pre-calibrated. Verify calibration “in situ” after installation. Provide a printed record of the factory calibration and as constructed parameters for “smart” devices. Include device tag numbers and serial numbers in the calibration records.

B. Instruments are to be set up and calibrated by an accredited instrument technician working under the approval of the instrument manufacturer.

C. Calibrate all instruments to the accuracy specified in in Section 40 70 00, or to the manufacturer’s stated accuracy of the instrument when required accuracy is not specified.

D. Following instrument installation, perform the following “in situ” calibration for each instrument and its associated signal conditioning equipment:

1. Calibrate all inline flow meters by a draw-down test. Take at least three calibration points to demonstrate linearity.

2. Calibrate all density meters by lab samples. Take at least three calibration points to demonstrate linearity.

3. Calibrate all vacuum and pressure instruments by manometer or certified calibration standard. Take at least three calibration points to demonstrate linearity.

4. Calibrate gas detectors using standard gas samples for zero and upscale.

5. Calibrate temperature instruments against a standard lab thermometer or certified calibration standard. Take at least three calibration points to demonstrate linearity.

6. Calibrate level instruments by comparison to a known physical reference measurement and by adjusting tank level throughout the measurement range.

7. Calibrate analytical instruments using manufacturer’s prepared calibration standards, or suitable calibration standards prepared in on-site or local lab as appropriate

3.15 INSTALLATION AND PERFORMANCE TESTING:

A. Refer to the requirements of Division 01 for additional requirements.

B. Inspections:

1. Provide two (2) weeks written notice to the Contract Administrator prior to energizing any system to allow for inspection by the Contract Administrator of the following:

a. Proper mounting

b. Proper connections

C. During commissioning, demonstrate to the Contract Administrator proper calibration and correct operation of instruments and gauges.

D. Commissioning of the I&C system is to include but not be limited to the following:

1. Verify installation of components, wiring connections, and piping connections.

2. Supervise wiring continuity and pipe leak tests.

3. Verify instrument calibration "in-situ" and provide written reports. Refer to attached sample instrument test report form at the end of this section

4. Perform instrument loop checks, function check and adjust the I&C equipment under operational conditions. Refer to attached sample Loop Check Form at the end of this section

5. Coordinate I&C equipment supplier's service personnel as required for complete system testing.

6. Instruct plant personnel in correct method of I&C equipment operation.

7. Direct plant personnel at hand-over as to final adjustment of the system for correct operation of plant.

8. Ensure that the I&C equipment suppliers cooperate to complete the Work of this Section.

9. Verify signal levels and wiring connections to all I&C equipment.

10. Coordinate and cooperate with City staff, the control system integrator, and the Contract Administrator to commission the interface between the Plant supervisory control and data acquisition (SCADA) and the PLC based control system.

3.16 TRAINING:

A. Provide training, described in detail in Division 01, as required by the plant's personnel to become fully competent in the proper operation and maintenance of all control

devices, control valves, and ancillary instrumentation described under this section of the specifications.

B. For the PLC based control system, the control system integrator shall provide maintenance training that includes a review of the PLC program, system troubleshooting, and identification of programmed system variables such as set-points, alarms, and statuses.

3.17 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

3.18 SCHEDULES:

A. Instrument Test Report (ITR)

B. Loop Check Report (LCR)

NOTES:

1. PROVIDE FIELD JUNCTION BOXES AS SPECIFIED.
2. CONFIGURE ALARM RELAY TO TRANSFER STATE UPON ALARM OR POWER FAILURE. CURRENTLY SHOWN DE-ENERGIZED.
3. FIELD WIRING SUITABLE FOR CLASS 1, DIVISION 1 AREA.
4. REFER TO ILD-A.H.4AS FOR ADDITIONAL CONNECTIONS IN NOTIFICATION RELAY PANEL.
5. THIS DRAWING IS TYPICAL. UPDATE DEVICE TAGS, TERMINAL NUMBERS AND WIRE NUMBERS BASED ON LOOP NUMBERS.
6. PROVIDE LAMACOID STATING "CAUTION: MULTIPLE VOLTAGE SOURCES PRESENT".
7. RELAY WETTING POWER CIRCUIT TO BE SERVICED BY EMERGENCY GENERATOR. IN AREAS WITHOUT EMERGENCY GENERATOR SERVICE, PROVIDE UPS SIZED TO SUPPORT LOADS FOR MINIMUM 30MIN RUNTIME.
8. NOTIFICATION RELAY PANEL SHOWN WITH ONLY ONE TRANSMITTER CONNECTED FOR CLARITY. WHERE MULTIPLE TRANSMITTERS ARE CONNECTED TO THE RELAY PANEL, PROVIDE ADDITIONAL R-W#, R-A#, AND R-F# FOR EACH TRANSMITTER.

SECTION 40 61 21

PROCESS CONTROL SYSTEM TESTING

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide control system Factory Acceptance Testing (FAT) and Site Acceptance Testing as specified in this section and in compliance with the Contract Documents. The purpose of the site acceptance testing is to demonstrate the performance of the process control system by testing all components and functions of the system. The tests will be conducted in four phases:

1. Factor Acceptance Testing: This Section describes the Factory Acceptance Testing (FAT) required to demonstrate that the process control system hardware, and software are in conformance with specified requirements. The Contractor will submit a schedule of proposed FAT tests thirty (30) days after Contract award. FAT testing shall be performed on all vendor packaged control systems and the plant-wide distributed control system and SCADA equipment.

2. Component Testing: Demonstrate in manual mode that each connected component of the control system functions in accordance with specifications and manufacturer requirements. Demonstrate that field device inputs and outputs for the control system are functioning properly with correct polarity and scaling.

3. PLC Area Acceptance Testing: Demonstrate the key data acquisition, control strategies, interlocks, and alarm functions for each process area in manual, semi-automatic, and automatic control modes as applicable. Coordinate and cooperate with other divisions and simulate and/or force key process variables as required to facilitate testing activities.

4. Overall Integrated System Performance Testing: In cooperation with other contractors and divisions, participate in the Overall Integrated Performance Tests specified in the process and mechanical divisions.

1.02 REFERENCES:

9. S96: Valve Actuators

10. S99: Control System Cyber Security

11. 101: Human-Machine Interfaces

1.03 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

1. For Factory Acceptance Tests, include the following information in the submittal for this Section:

a. A detailed step-by-step test procedure for each test at least fifteen (15) business days in advance of each scheduled test date.

b. Confirm, in writing, times, dates and locations of Factory Acceptance Tests at least fifteen (15) business days before a test.

2. Process methodology statement stating how and what will be done by the Contractor during the acceptance testing, and what the impact on the NEW WRF will be. The methodology statement will be prepared by the Contractor with the Engineer providing reviews and input and must be approved before implementation.

3. Test schedule for each Component, Process Unit, and Process Area.

4. Process control system component test procedures.

5. Process Area control strategy test procedures.

6. Integrated System Performance Test procedures.

1.04 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.05 SPARE PARTS:

A. Comply with the requirements specified in Section 01 61 00.

1.06 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

B. Within two (2) weeks following completion of any acceptance tests, submit acceptance test report to the Engineer.

1.07 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

1.08 PROJECT/SITE CONDITIONS:

A. Coordinate all work of this Section with the Other Contractors responsible for the construction of the related work, with plant operations and the Engineer.

B. Schedule field testing which affects the NEW WRF operation or existing WRF operation through the Engineer daily.

C. Do not perform testing which may affect NEW WRF or existing WRF operation without the Engineer's approval.

PART 2 - PRODUCTS

2.01 GENERAL:

A. Provide any additional software, tools, testing equipment, temporary configuration programs, cables, wiring, terminals and other accessories required to fully test and verify the proper connection and operation the process control system.

PART 3 - EXECUTION

3.01 PREPARATION:

A. Meet the following conditions prior to the start of any acceptance testing.

1. Correct deficiencies noted during installation prior to commencement of testing.

2. Have on site, documentation pertinent to the equipment being tested. Provide a detailed description of the testing methodology to be used to ensure satisfactory performance of the process control system equipment.

3. Keep on site, labelled, and properly stored spare parts, expendables and test equipment pertinent to the equipment being tested.

4. Have the Engineer review acceptance test schedules and acceptance test procedures.

5. Perform the acceptance testing on a per Process Area basis. Test no more than one Process Area at any given time unless other arrangements are made with the Engineer.

6. Obtain approval from the Engineer prior to conducting any testing which may affect operations.

7. Schedule any testing which affects the system operation through the Engineer daily.

B. Provide all required plant startup and commissioning, performance testing, and reliability testing as specified in Sections 01 78 25, 01 78 26, and 01 78 27.

3.02 FACTORY ACCEPTANCE TESTING (FAT):

A. Provide all labor, materials, equipment and incidentals, specified and as may be required to perform the FAT. Conduct the FAT at the Contractor's facility at the completion of program development and before shipment, verify that the system components are functioning properly and that they meet the functional and performance requirements of the Contract Documents.

1. The process control system includes but is not necessarily limited to the PLC control panels, server computers, historian, operator workstations, application software, communication networks, and related appurtenances.

2. Submit information on FAT procedures to verify that testing shall fulfill the requirements of the Contract Documents. Submittal shall be made at least two weeks in advance of any scheduled testing and shall include dates of scheduled tests.

3. Notify the Engineer in writing at least fifteen (15) business days before expected initiation of each test. The SLCDPU and Engineer reserve the right to be present at the Contractor's facilities during operational test of system equipment, either for individual units or as an integrated system. Presence of the SLCDPU and/or Engineer during testing does not relieve the Contractor from conforming to the requirements of the Contract Documents and shall in no way imply acceptance of the equipment.

B. Hardware and Software Tests

1. Demonstrate that all system hardware has been tested and is capable of running diagnostic software without error.

2. All system components shall be tested to verify proper operation of the equipment as stand-alone units. Test shall include, but not be limited to, the following:

3. AC/DC power checks.

4. Power fail/restart tests.

5. Diagnostics checks.

6. Functional test of all PLC I/O from the field terminal blocks to the processor.

7. Functional test of Hot Standby PLC processor switchover.

8. Functional tests of all power supplies, circuit breakers, relays and associated panel components.

9. Functional demonstration of operator interface terminals and review of graphic screen layouts.

10. All system components shall be tested to verify that communication between units is working properly.

11. Demonstration of communication between PLCs and other devices connected on Ethernet networks shall be included in the Test Procedure.

12. The SLCDPU and Engineer reserve the right to be present during the tests. Log each test result and provide the Engineer with a deficiency list at the end of the testing period. Rectify any deficiencies within two weeks of completion of the FAT.

13. If a test or a portion of a test fails, it may be re-tested at the end of the FAT. Troubleshooting and repair shall not interfere with continuation of the FAT. If a test or portion of a test fails to the point where it needs to be rescheduled at a later date, tests shall be required at no additional expense of the client. Include expenses for the SLCDPU and/or Engineer, for travel, accommodations, and sustenance of the same quality used for the original test. Re-test expenses shall be for a maximum of three persons.

C. Test Duration

1. Provide FAT for Real Time Servers, Historian, Workstations, Engineering Stations, Hardware, Ethernet Communications, Software and Integrated System.

2. The FAT duration shall be proposed by the Contractor in his schedule, it is envisaged that no FAT shall take longer than five (5) business days.

D. Release of Process Control System for Shipment

1. The development of testing schedules shall be produced in conjunction with the Project Master Schedule. Prior to shipping provide the following:

a. Shipment method and the details of the insurance coverage.

b. Details of storage requirements.

c. Loading and unloading requirements.

d. Physical dimensions and weight.

e. A signed letter stating that all deficiencies noted during in-factory acceptance testing have been corrected and retested.

E. Testing Aids and Equipment

1. Provide the following documentation:

a. One copy of approved submittals applicable to the equipment to be tested.

b. One master copy of each FAT procedure.

c. A complete inventory of the equipment to be tested including make, model, and serial number.

2. Provide use of the following test equipment:

a. Off-line diagnostic and test programs.

b. Any other special test equipment that is required to demonstrate the proper operation of the system

F. Factory Test Schedule

1. General:

a. Testing will, in general, be limited to a maximum of ten (10) hours per day.

b. A meeting will be held each morning to review the day's test schedule.

c. A meeting will be held each evening to review the day's test results and to review or revise the next day's test schedule.

3.03 FIELD TESTING:

A. Organize acceptance testing sequentially by Process Area and in line with the master schedule. Include testing of all inputs/outputs (I/Os), PLC functions and communications for each Process Area.

B. Check each Process Area against drawings and database lists. Test each PLC and corresponding data communication links.

C. Check all I/O from the field components to the process control system. Include instruments, control devices, panels, termination cabinets, input/output cards, and other devices in the I/O to ensure proper operation. The applicable Other Contractor will be in attendance during I/O field checks.

D. Document the component testing and submit to the Engineer. Include the following:

1. I/O name

2. I/O description

3. Drawing reference

4. Type of test(s) performed

5. Date tested

6. Signature of tester and date

7. Signature of Engineer and date

E. Test the process control system equipment as follows:

1. Check equipment against inventory lists.

2. Certify that the equipment has been installed properly.

3. Power up the process control system equipment and run diagnostics to verify proper operation.

4. Load the application system software from backup media.

5. Verify peripheral operation and peripheral failure operation.

6. Check polling of remotes.

7. Verify that data is not lost on failover from the primary to the backup communication path.

8. Verify that operating data is not lost on failover from the primary to the standby processor.

9. Verify historical data is not lost if the system server is down for less than 72 hours.

10. Test input/output, display, control, and report generation software.

11. Test historical data collection capabilities.

12. Test trending functions.

13. Certify that the system is ready for performance testing.

14. Test operation of the Local Area Network associated with the process control system equipment.

15. Test all alarm functions and alarm history files.

16. Test system automatic backup and restore procedures.

F. Document the process control system area testing and submit to the Engineer. Include the following:

1. Description of functions tested

2. Tests performed

3. Copies of messages, displays, reports, and trends which verify operation

4. Signature of tester and date

5. Signature of the Engineer's and date

6. Problem description, if any

7. Performance Verification

8. Completed Form 102 for each component or subsystem

9. Completed Form 103 for each component or subsystem

G. After Process Area Testing and component testing have been completed, perform an Integrated System Performance Test to verify the system performance. Provide onsite personnel for the Integrated System Performance Test duration.

H. Participate in tests over a thirty (30) day period when the Influent Pump Station is operating. Any deficiencies will be promptly corrected, and the test restarted. If deficiencies remain uncorrected at the end of the test period, the test period will be

extended on a day-to-day basis at the Contractor's expense until proper operation can be demonstrated. Final Acceptance will only be achieved when the requirements of the Integrated System Performance Test has been successfully demonstrated to the Engineer's satisfaction.

3.04 DEMONSTRATION:

A. Use the communications statistics to verify and demonstrate that the average process control system equipment to PLC communications availability is greater than 99.99 percent. Failure of data communication equipment will not count as downtime.

B. Demonstrate an availability of 99.99 percent or better for the entire process control system. Availability is defined as:

1. Availability = (Test Duration - Downtime)/Test Duration.

C. The system is down if a PLC cannot be accessed from the operator station because of a hardware/software failure, an operational PLC is not polled, alarm and event reporting functions are lost, trend or historical data is lost, or operator commands cannot be carried out because of a hardware/software failure.

D. Failover to a backup device will not be counted as downtime provided the backup device assumed proper operation.

E. Make necessary operational adjustments to the system while the Influent Pump Station is operating.

F. Demonstrate the historical logging and reporting functions of the system.

G. Demonstrate system response times for operator displays and data update to or from other process areas and remote sites. Perform test reruns the Engineer may deem necessary.

3.05 PROTECTION:

A. Operate control system equipment only in areas where construction is sufficiently completed and with environmental controls in place and operational such that the manufacturer's environmental requirements are not compromised.

B. Provide dust and moisture protection for control system equipment overnight and when not in use to protect against unanticipated construction activities, painting, cleaning, etc.

C. Maintain daily backups of all program and configuration files for all control system components on removeable media. Backup files may be stored off-site or on-site provided that they are physically separated from the respective control system equipment.

3.06 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 40 61 93

PROCESS CONTROL SYSTEM INPUT/OUTPUT LIST

PART 1 - GENERAL

1.01 DESCRIPTION:

A. The control system I/O indices included in this section have been provided for reference and includes all the control system input and output points shown on the P&ID diagrams and the mechanical system schematics. The control system I/O indices will be used by the control system programmers and integrators to develop the control system PLC application programs, server and historian computer configurations, and Human-Machine Interface graphics.

1.02 REFERENCES:

A. International Society of Automation (ISA):

1. S5.1: P&IDs and Tagging

2. S5.4: Instrument Loop Diagrams

3. S7: Instrument Air

4. S12: Electrical Equipment for Hazardous Locations

5. S18.2: Alarm Management

6. S20: Instrument Specifications

7. S50: Electrical Control Signals

8. S75: Control Valve Design, Specification and Testing

9. S96: Valve Actuators

10. S99: Control System Cyber Security

11. 101: Human-Machine Interfaces

1.03 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

1. The Input/Output indices provided in this section shall be updated by the Contractor based on the finalized Input/Output requirements for each packaged

system and piece of equipment obtained from the “No Exceptions Taken” or “Make Corrections Noted” shop drawings.

2. Submit finalized For Construction Input/Output indices for the process control system when all shop drawings have been reviewed.

3. Submit finalized Input/Output indices for the HVAC control system when all shop drawings have been reviewed.

4. Submit As-Constructed Input/Output indices for the entire control system for review when construction and commission is completed.

1.04 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.05 SPARE PARTS:

A. Comply with the requirements specified in Section 01 61 00.

1.06 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

1.07 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

PART 2 - PRODUCTS

(Not Used)

PART 3 - EXECUTION

3.01 GENERAL:

A. Update Input/output indices provided in this section based on the finalized Input/output requirements for each packaged system and piece of equipment obtained from the “No Exceptions Taken” or “Make Corrections Noted” shop drawings.

B. Use only updated and reviewed Input/output lists in the development of the control system PLC application programs, server and historian computer configurations, and Human-Machine Interface graphics.

C. Update the Input/output indices during construction and commissioning of the Influent Pump Station.

D. Submit the record information Input/Output indices for review by the Engineer and include copies in the project O&M manuals in both printed and soft copies on removable media.

3.02 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

SECTION 40 61 96

PROCESS CONTROL DESCRIPTIONS

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide control system programming and configuration services to achieve the operational functionality generally as described in the control descriptions provided in this section and in compliance with Contract Documents.

1. This Section outlines the proposed operation and control strategies for the Influent Pump Station (IPS).

2. It should be noted that these control descriptions are provided as a guide to the intent of the main control strategies for the Influent Pump Station and do not purport to describe every detail and nuance of the completed programs. The control system integrator and Contractor must study contract documents and take into consideration the Salt Lake City standard practices for PLC program design, graphics objects characteristics, screen layouts, and operator interface features.

3. All aspects of the new control sequences, operator interface, and remote monitoring must be thoroughly tested in cooperation with the City and the Engineer to demonstrate correct functioning of all control system features and to verify that all interlocks and alarms are functioning properly.

1.03 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

1.04 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.05 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

PART 2 - PRODUCTS

2.01 GENERAL:

A. All package equipment status points will be monitored by the SCADA, recorded by the historian, and available to be trended. Important operating measurements will be visible directly on the process's HMI screen. All package equipment available control inputs will be integrated with the SCADA.

B. All equipment will be able to be run manually by the operators from the SCADA. All equipment not in automatic mode from a physical Hand/Off/Auto switch will raise the alarm "Not in Auto".

C. All pumps will have a fail to start alarm if the run feedback does not show the pump is running after 30 seconds from being called to start.

D. All wet wells with level monitoring will have a high level alarm, a high high level alarm, a low level alarm, and a low low level alarm.

E. All equipment will raise alarms when a fault is generated, or abnormal operating conditions are detected. See equipment specifications and manufacturer's ratings for operating condition limits.

F. Operators shall be able to toggle the preferred operating control mode in SCADA. Selections include:

1. Averaging of analog sensors,

2. Automatically select lowest reading analog sensor,

3. Automatically select highest reading analog sensor, or

4. Control via floats only.

2.02 INFLUENT PUMP STATION (IPS) SEE P&ID DRAWINGS (0100-X602, 603, 604)

A. General:

1. The influent pumping station (IPS), comprised of two wet wells with a total of five raw wastewater (RWW) pumps, is designed for a maximum peak hour flow (PHF) of 105 millions of gallons per day (MGD) at Phase 1. This control narrative is valid up to and including Phase 1 flows only.

2. Three pumps are located in Wet Well 1 and two pumps are located in Wet Well 2 with space for a future sixth pump. The pumps discharge to a common header for each wet well. The two discharge headers exit the pump station building and are cross connected on a valve pad to deliver flow through two 48" force mains (FM) to the Headworks. A stub out is provided for a future third FM. Valves on the pad allow flow to be controlled from Wet Well 1,2, or both through either or both force mains.

3. A self-cleaning maintenance cycle will occur at a frequency set by the operator or by manual initiation during low flow conditions. A self-cleaning cycle will pump one wet well to a level low enough such that the Cleanout Pump (01-P-11110, 01-P-11120) will pump floatable and spherical solids up to 6 inches in diameter to the Headworks. Initially, one wet well will be cleaned at a time due to limited fluid volumes. The influent gate (01-FCV 11101, 01-FCV 11201) shall be closed so that all flow is directed to the wet well being cleaned.

4. Once per annum, or as necessary, the inside of each of the wet wells will be washed down manually using a supplied water cannon.

5. A FM scour maintenance cycle will occur at a frequency set by the operator or by manual initiation. A FM scour cycle will use the duty pumps to increase flow into the active FMs such that the velocity shall exceed 6 feet per second (fps). The FM scour cycle should only be performed during peak flows to maintain fluid levels and minimize air entrainment. Initially, only one FM should be scoured at a time, until there is substantial and sufficient flow to achieve the desired velocities in both FMs.

6. In the event of PLC failure, the pumps are capable of running in staged fashion independently.

7. The PLC shall send a heartbeat signal to the smart relay. If the heartbeat fails, or the relay receives a level transmitter failure signal from the PLC, the relay switches the pumps over to local float control and shall send a "float mode" status signal to

the PLC. To switch back to PLC operation, the operator must press a reset signal on the HMI.

B. Equipment Control Description

1. Variable Frequency Drives, Level Sensors, and Electrically Actuated Valves

a. All instruments and P&ID loops that provide pump monitoring and control shall include:

(1) Operator adjustable set points.

(2) Low, Low Low, High, and High High level alarms.

(3) PID pop up displays for control of the PID loop.

(4) Valve position indication for all valves in the pump station building and exterior valves. All valves will default to normally open and normally closed as shown on P&IDs.

b. The SCADA screen displays the actual status (% speed, etc.) when the controller is in AUTOMATIC mode and displays manual position when in MANUAL mode.

2. Raw Influent Feed:

a. The influent sewers that combine in this area, do so at the IPS Junction Wye. The symmetry of the wye will allow the flow to split evenly to each of the two wet wells or be conveyed to just one of the wet wells if the influent slide gate (01-FCV 11101, 01-FCV 11201) on the other is closed.

b. Electric motor-actuated slide gates (01-FCV 11101, 01-FCV 11201) allow each wet well to be isolated and taken out of service.

c. Stop logs (01-SL-11100, 01-SL-11200) allow the influent slide gates to be taken out of service.

d. Totalized influent flow measurement is obtained by summing three influent flow meters (01-FT-10101, 01-FT-10201, 01-FT-10301)

3. IPS Pumps Normal Operation:

a. Wet Well 1 includes three raw wastewater (RWW) pumps and Wet Well 2 includes two RWW pumps for a total of four duty pumps and one standby pump. Each pump is rated for a pumping capacity of 26.25 MGD. The four duty pumps provide a firm capacity of 105 MGD.

(1) Space in the IPS is allotted for the installation of one additional pump in Wet Well 2 for a buildout configuration of five duty pumps and one standby pump with a firm capacity of 131.25 MGD.

b. Two analog level instruments and five float level sensors in each wet well provide fluid level indication to the plant SCADA.

c. SCADA will compare the signals and choose the higher value of the two for each wet well as the operational signal for fluid level control in that wetwell.

d. When a pump is called to run, it shall operate for a minimum of 15 minutes in order to ensure the pumps do not violate their manufacturer-recommended maximum number of starts per hour.

e. The lead pump shall operate continuously to maintain the Level Setpoint and shall not shut down unless the wet well is taken offline or the pump position is changed.

(1) The lead pump speed shall vary between 68% and 100% to maintain the Level Setpoint.

(2) Additional pumps (lag) shall come online to maintain the Level Setpoint according to Table 3.

f. Pumps are controlled by the Level Setpoint as indicated by the level sensors in each wet well.

(1) Operator shall input the user-adjustable desired operating Level Setpoint that applies to each of Wet Well 1 and Wet Well 2. The recommended Level Setpoint is 14’8” above the Lower Level as shown on the plans, or at an elevation of 4191.7’.

(2) Beginning with one pump in operation, the pump speed will increase or decrease to maintain the liquid level in the wet well at the Level Setpoint.

(3) When all pumps in operation are running at 100 percent speed and the wet well level has been above the Level Setpoint by 6 inches for the length of time indicated by the user adjustable Time Delay setting, an additional pump is turned on. All pumps in operation will run at the

same speed. The Time Delay setting will be adjustable from 0-300 seconds, with a default setting of 90 seconds.

(4) The pumps will not drop below 68 percent speed, unless a manual override by an Operator is performed. If the pumps are running at 68 percent speed and the level has been below the Level Setpoint by 6 inches for the length of time indicated by the Time Delay setting, the most recent pump to turn on will be turned off. The Time Delay setting will be adjustable from 0-300 seconds, with a default setting of 90 seconds.

(5) SCADA shall compare the readings of the ultrasonic and radar level sensors for each well (LIT-11102 and LIT-11103 in Wetwell 1, and LIT-11202 and LIT-11203 in Wetwell 2). A discrepancy of more than 20% between the two values for more than 15s, will trigger a LEVEL SENSOR MISMATCH alarm for the associated wetwell. The alarm shall clear once the discrepancy is less than 10% for 60s.

g. The pump in duty position 1 will always be turned on first, followed by position 2, and so forth. If a pump is set to OFF when the control indicates that it needs to be turned on, it is skipped and the next pump in the sequence is turned on instead. After a cleaning cycle in either wetwell, the duty position number for each pump is reduced by one. An example is shown in Table 1 and 2 below.

Table 1

Pump	Initial Position	Position After Wet Well 1 Cleaning
RWW Pump 1 (Wetwell 1 Cleanout Pump)	1	3
RWW Pump 3	2	1
RWW Pump 5	3	2

For Buildout Conditions when the future sixth pump is added to the IPS, the pump will be controlled in a similar fashion. An example of how the rotation of pump position might look after buildout for Wet Well 2 is shown in Table 2 below.

Table 2

Pump	Initial Position	Position After Wet Well 2 Cleaning
RWW Pump 2 (Wetwell 2 Cleanout Pump)	1	6
RWW Pump 4	2	2
RWW Pump 6 (Future)	3	4

h. Table 3 below provides a recommended alarm level and associated actions for the wet wells in normal operation. When the IPS is in a maintenance cycle, these set points do not apply. The Operator shall adjust these initial normal operation setpoints based upon operating experience. The Operator shall input the user-adjustable Low Level Alarm, Low Low Level Alarm, High Level Alarm, and High High Level Alarm for the system in SCADA. The levels will apply to both wet wells if they are both in operation. All alarms clear and control is returned to normal operation when the level reaches the Level Setpoint. Care should be taken to select a High High Level Alarm that prevents the influent sewer from surcharging and causing trapped foul air to be released from the upstream maintenance hole.

Table 3

Setting Name	Action Taken	Alarm Clearing Condition	Default depth (ft) above the "10 LOWER LEVEL" as shown on contract drawings	Elevation (ft)
Low Low Level Alarm	On falling level, alarm appears on SCADA and all pumps but the lead pump turns off and speed is reduced to 68%	Alarm clears when the fluid level rises above the Low Level Alarm setpoint for 30 seconds.	14.2	4191.0
Low Level Alarm	Alarm appears on SCADA and lead pump returns to 100% speed	Alarm clears when the fluid level reaches the Level Setpoint.	14.5	4191.5
High Level Alarm	Alarm appears on SCADA and one additional pump turns on at 100%. If a cleaning cycle is running, it is terminated.	Alarm clears when the fluid level descends below the Level Setpoint.	17.2	4194.0
High High Level Alarm	Alarm appears on SCADA and all additional pumps turn on and are set to 100% speed.	Alarm clears when the fluid level descends below the High Level setpoint.	20.2	4197

i. Operators will be able to advance the duty position of all pumps via SCADA. The action will advance all pumps simultaneously. Individually advancing or setting the position of a single pump is not permitted.

j. Each wet well can be selected as IN-SERVICE or OUT-OF-SERVICE through the plant SCADA.

(1) When a wet well is selected as OUT-OF-SERVICE:

(a) The associated slide gate is closed (01-FCV 11101, 01-FCV 11201).

(b) The associated level sensor alarms are disabled.

(c) The other pumps inside the wet well are OFF and locked out.

(d) The cleanout pump is turned on and run at default 68% speed until the associated header flow meter (01-FI-11411, 01-FI-11421) reads zero. The cleanout pump is then OFF and locked out.

(e) An alarm is displayed on SCADA and HMI: "WARNING: WETWELL STILL CONTAINS HAZARDOUS GASES WITH EXPLOSION POTENTIAL, PLEASE CLEAR GASES FROM WETWELL PRIOR TO SERVICE ACCORDING TO THE O&M MANUAL."

(2) When a wet well is returned to IN-SERVICE:

(a) The associated slide gate is opened (01-FCV 11101, 01-FCV 11201).

(b) The associated level sensor alarms are enabled.

(c) The pumps inside the wet well are set to AUTO.

k. Each pump can be selected to AUTO, MANUAL, or OFF mode through the plant SCADA.

(1) When a pump is in AUTO mode, the pump is controlled as described in Section 2.22.B.3 IPS Pumps Normal Operation.

(2) When a pump is in MANUAL mode, the pump is controlled with a '%' speed input in the plant SCADA, minimum value of 68%, maximum of 100%.

(3) When the pump is placed in OFF or is otherwise out of service, SCADA will not include this pump and associated control devices (isolation valves, etc.) as part of the normal operation control loop.

l. Local Pump Control

(1) Each pump can be selected as LOCAL using the pump local control panel. The pump will be considered OFF and will not respond to SCADA inputs and control until the local control panel returns the pump to AUTO control.

(2) Each pump includes an E-Stop on the local control panel.

m. Each pump isolation valve (01-FV-11112, 01-FV-11132, 01-FV-11152, 01-FV-11222, 01-FV-11242) is normally open and cannot be closed unless the associated pump is set to OFF. The status of a pump cannot be changed from OFF if the associated pump control valve is closed.

n. Force Main to Wet Well 1 Isolation Valve (01-FV 11412) is normally open and cannot be closed unless Wet Well 1 is OUT-OF SERVICE or the Cross Connect Valve (01-FV 11431) is open. Wet Well 1 status cannot be changed to IN-SERVICE unless the Force Main 1 Isolation Valve (01-FV 11412) or the Cross Connect Valve (01-FV 11431) is open and Operator clears Warning to verify the wet well is not occupied.

o. Force Main to Wet Well 2 Isolation Valve (01-FV 11422) is normally open and cannot be closed unless Wet Well 2 is OUT-OF SERVICE or the Cross Connect Valve (01-FV 11431) is open. Wet Well 2 status cannot be changed to IN-SERVICE unless the Force Main 2 Isolation Valve (01-FV 11422) or the Cross Connect Valve (01-FV 11431) is open and Operator clears Warning to verify the wet well is not occupied.

p. RWW Pump 1, 3, and 5 cannot be turned on if Force Main to Wet Well 1 Isolation Valve (01-FV 11412) is closed, unless the Cross Connect Valve (01-FV 11431) and isolation valve (01-FV 11422) are open.

q. RWW Pump 2 and 4, and future 6, cannot be turned on if Force Main to Wet Well 2 Isolation Valve (01-FV 11422) is closed, unless the Cross Connect Valve (01-FV 11431) and isolation valve (01-FV 11412) are open.

4. IPS Wet Well Cleaning Cycle

a. Only one wet well shall be cleaned at a time. During a cleaning cycle the status of the wet well being cleaned shows as CLEANING and displays TIMER.

b. A cleaning cycle can be initiated automatically as programmed, or manually for each wet well by an Operator.

c. During the wet well cleaning cycle, certain normal operation setpoints and alarms are suspended or modified. Once the cycle is complete, normal operational setpoints and alarms are restored.

d. A cleaning cycle cannot be initiated if any of the following conditions exist:

(1) The wet well is set to OUT-OF-SERVICE (OOS),

(2) the Cleanout pump (01-P-11110, 01-P-11120) is set to OFF or OOS, or,

(3) the flow meter (01-FI-11411, 01-FI-11421) associated with the wet well reads a flow greater than 23 MGD.

e. A cleaning cycle should be initiated when the flow in the wet well to be cleaned is approximately 12 MGD.

f. If the flow is greater than 12 MGD but less than 23 MGD when a cleaning cycle begins, the pump speed will be set to 100% until the low low level alarm is triggered.

g. When the flow reaches 12 MGD, the wet well level sensor alarms are disabled for that wet well and the Cleanout pump mode is changed to Fixed, operating at 68% speed, pumping to an operational FM.

h. Cleanout flow is pumped to the Headworks via the operating FMs.

i. The cleaning cycle ends when the wet well flow meter reads 0 MGD flow.

j. If the total cleaning cycle time exceeds a user-adjustable maximum cleaning cycle time, the cleaning cycle ends and a CLEANING CYCLE TIME alarm is triggered. The default time setting is 15 minutes. The cleaning cycle time is operator adjustable; however, care should be taken to minimize the time the pump runs without fluid.

k. When the cleaning cycle ends, the IPS returns to operation as described in Section 2.02B.3 IPS Pumps Normal Operation. Level control alarm is restored in the wet well.

5. IPS Force Main Cleaning Cycle

a. Only one FM shall be cleaned at a time until daily flows are above 80 MGD. During a cleaning cycle the status of the FM being cleaned shows as CLEANING and displays TIMER.

(1) The TIMER shall be operator adjustable. The default value is 1800 seconds and begins once the flow meters (01-FI-11411, 01-FI-11421) read a combined flow equivalent to 6 feet per second velocity in the

FM. Once the TIMER expires, the IPS shall be returned to normal operation.

b. A cleaning cycle can be initiated automatically as programmed (monthly), or manually for each wet well by an Operator through SCADA.

c. A cleaning cycle cannot be initiated if a any of the following conditions exist:

(1) The wet well is set to OUT-OF-SERVICE (OOS),

(2) The Cleanout pump (01-P-11110, 01-P-11120) is set to OFF or OOS,

(3) The flow meters (01-FI-11411, 01-FI-11421) read a combined flow less than 40 MGD under normal operating conditions,

(4) The low level alarm is active, or

(5) The low low level alarm is active.

d. For low flow conditions, one FM should be OUT-OF-SERVICE (OOS), during cleaning to achieve the desired velocities.

e. If the low low level alarm is activated, the FM cleaning cycle is aborted and the IPS is returned to normal operating conditions.

f. A FM scour cycle will use the duty pumps to increase flow into the active FMs such that the velocity shall exceed 6 feet per second (fps) as measured by the discharge flow meter (01-FI-11411, 01-FI-11421).

C. Emergency Start-Up Operations

1. Start-Up Following Emergency or Unscheduled Shutdown

a. In case of a power outage, backup power will be supplied to the pumps by the onsite standby generators, and the IPS will continue operating with the programmed sequence prior to the outage.

b. Initially, the pumps in position 1 and 2 in the wet wells will be restarted first at 100% speed. Additional pumps will be brought online every 35 seconds sequentially to restore the operational sequence prior to power loss as needed by the Level Setpoint.

c. The pumps are equipped with non-reverse ratchet setups so that the pumps can be started up immediately, instead of waiting for a complete pump spin down.

D. Loss of PLC

1. This operational sequence applies only to pumps and wet wells that are in service.

2. Priority of control sources shall be that ethernet control will be considered default operation. Local inputs to the VFD will be the secondary control source.

3. While in AUTO, the backup controller shall exchange a heartbeat signal between the PLCs and the backup controller. The heartbeat exchange shall repeat every ten seconds.

    a. If the PLC fails to receive two consecutive heartbeat signals from the backup controller, it will generate a fault and display an alarm on the HMI.

    b. If the backup controller fails to receive two consecutive heartbeat signals, it will activate the backup control mode.

4. If, while in AUTO, the VFD for a pump loses connectivity from the PLC, all VFDs in the associated well shall automatically default to their secondary control source.

5. While in backup control mode, the backup controller shall send a IN BACKUP MODE signal to the PLC. An IN BACKUP CONTROL MODE warning shall appear on the HMI.

6. If while operating on the backup control source, communications is restored, the VFD will not resume accepting commands from the PLC until a reset button is pressed on the HMI. Only then will the pumps resume PLC-controlled operation and ignore commands from the backup control source.

7. The secondary control source consists of:

    a. Start signals from the associated wet well level floats. The VFD shall receive these signals via discrete inputs directly onboard the VFD.

    b. Pre-programmed speed settings and step-based logic within the VFD.

8. As the level in the wet well rises, each pump will be called to run as its start setpoint is crossed for greater than 60 seconds. Pumps will start and then increase speeds in a stepped fashion as shown in Tables 4 and 5 below.

    a. For example, as water rises past LSH-1106, Pump 1 remains running at 100%, Pump 3 increases its speed from 68% to 100%, and Pump 5 starts and runs at 68%. Conversely, on falling water level, Pump 5 will stop, Pump 3 will slow down to 68%, and Pump 1 will remain running at 100%.

9. A setpoint that triggers a speed change must maintain that state for ten minutes prior to the pump changing its speed.

10. When the water level drops below the low level setpoint, LSL-11108 and LSL-11208 shall act as a low level cutout and shut down any running pumps except Pumps 1 and 2. Pumps 1 and 2 shall have a minimum speed as listed below and will not shut off during backup control mode.

11. Any pump that is called to start must run for a minimum of 15 minutes to avoid violating the maximum of 4 starts per hour required by the pumps.

12. During PLC Communication Failure – Wet Well 1 Setpoints and Behavior are as follows in the table below:

Table 4

Level Switch	Pump 1	Pump 3	Pump 5
Level below LSLL-11104	MINIMUM, ON: ~40%	OFF	OFF
Level at/above LSLL-11104	ON: 68%	OFF	OFF
Level at/above LSL-11108	ON: 100%	OFF	OFF
Level at/above LSH-11107	ON: 100%	ON: 68%	OFF
Level at/above LSH-11106	ON: 100%	ON: 100%	ON: 68%
Level at/above LSHH-11105	ON: 100%	ON: 100%	ON: 100%

13. During PLC Communication Failure – Wet Well 2 Setpoints and Behavior are as follows in Table 5 below:

Table 5

Level Switch	Pump 2	Pump 4	Pump 6
Level below LSLL-11204	MINIMUM, ON: ~40%	OFF	OFF
Level at/above LSLL-11204	ON: 68%	OFF	OFF

Table 5			
Level Switch	**Pump 2**	**Pump 4**	**Pump 6**
Level at/above LSL-11208	ON: 100%	OFF	OFF
Level at/above LSH-11207	ON: 100%	ON: 68%	OFF
Level at/above LSH-11206	ON: 100%	ON: 100%	ON: 68%
Level at/above LSHH-11205	ON: 100%	ON: 100%	ON: 100%

14. General VFD Control Source Matrix

    a. Each VFD shall have three control sources, each defined by a start source and a speed source.

Table 6		
Control Source	**Start Source**	**Speed Source**
1	Ethernet	Ethernet
2	Float	Preset onboard frequencies
3	VFD Faceplate	VFD Faceplate

15. Control Source Matrix

Pump	Start Source 1	Speed Source 1	Start Source 2	Speed Source 2	Start Source 3	Speed Source 3
Pump 1	Ethernet	Ethernet	LSLL-11104	68	LSL-11108	100
Pump 3	Ethernet	Ethernet	LSH-11107	68	LSH-11106	100
Pump 5	Ethernet	Ethernet	LSH-11106	68	LSHH-11105	100
Pump 2	Ethernet	Ethernet	LSLL-11204	68	LSL-11208	100

Pump	Start Source 1	Speed Source 1	Start Source 2	Speed Source 2	Start Source 3	Speed Source 3
Pump 4	Ethernet	Ethernet	LSH-11207	68	LSH-11206	100
Pump 6 (future)	Ethernet	Ethernet	LSH-11206	68	LSHH-11205	100

E. SCADA System:

1. SCADA Screens:

a. The following input, display, and trending parameters are provided on each Influent Pump Station's SCADA screen:

Input, Display, Trending Parameters		
Equipment or Instrument	**Interaction (1)**	**Parameter**
Influent Pump Station		
Wet Well 1 Flow	D, T	Flow (MGD)
Wet Well 2 Flow	D, T	Flow (MGD)
Wet Well 1 Level	D, T	Level (ft)
Wet Well 2 Level	D, T	Level (ft)
Level Setpoint	I	LEVEL SETPOINT [ft]
Wet Well 1 High Alarm	I	HIGH ALARM [ft]
Wet Well 1 Low Alarm	I	LOW ALARM [ft]
Wet Well 1 High High Alarm	I	HIGH HIGH ALARM [ft]
Wet Well 1 Low Low Alarm	I	LOW LOW ALARM [ft]
Wet Well 2 High Alarm	I	HIGH ALARM [ft]
Wet Well 2 Low Alarm	I	LOW ALARM [ft]

Input, Display, Trending Parameters		
Equipment or Instrument	**Interaction [1]**	**Parameter**
Wet Well 2 High High Alarm	I	HIGH HIGH ALARM [ft]
Wet Well 2 Low Low Alarm	I	LOW LOW ALARM [ft]
Time Delay	I	Time Delay Input (sec, 0-300)
Wet Well 1 Status	I	IN-SERVICE/OUT-OF-SERVICE/CLEANING STATUS
Wet Well 2 Status	I	IN-SERVICE/OUT-OF-SERVICE/CLEANING STATUS
RWW Pump 1-2 Status	I, D	AUTO/CLEANING/MANUAL/LOCAL/OFF STATUS
RWW Pump 3-6 Status	I, D	AUTO/MANUAL/LOCAL/OFF STATUS
RWW Pump 1-6 Health Status	D	Winding and Bearing Temperature (˚F) and Vibration (Hz)
RWW Pump 1-6 Speed	I, D	VFD SPEED (%)
RWW Pump 1-6 Seal Water Flow	D, T	Flow (gpm)
RWW Pump 1-6 Discharge Pressure	D, T	Pressure (psi)
RWW Pump 1-6 Control Valve	I, D	OPEN/CLOSED STATUS
Force Main 1-2 Control Valve	I, D	OPEN/CLOSED STATUS
Cross Connect Valve	I, D	OPEN/CLOSED STATUS
[1] Legend: I = Operator Input; D = Display of actual or calculated value; T = Trend		

2. Interlocks:

a. PCS Interlocks

(1) RWW pumps are interlocked with respective discharge pressure transmitters (01-PIT-11153, 01-PIT-11133, 01-PIT-11113, 01-PIT-11243, 01-PIT-11223). At high pressure setpoint (default is 60 psi), RWW pumps' speed shall ramp down to 68%.

b. Hardwired Interlocks:

(1) Pumps are disabled by high motor vibration or high bearing temperature reading provided with each pump.

(2) Pumps are disabled by low/no seal water intake flow.

(3) Pumps are disabled by high discharge pressure switch reading of greater than 65 psi.

(4) Respective pump is disabled by closed discharge valve (01-FV-11112, 01-FV-11132, 01-FV-11152, 01-FV-11222, 01-FV-11242).

(5) Pumps are disabled by two closed FM isolation valves (01-FV-11412, 01-FV-11422).

(6) The slide gates are disabled by limit switches provided with each gate.

(7) The pumps are interlocked with relay logic to the valve positions on the discharge header (01-FV-11412, 01-FV-11422, 01-FV-11431). The pumps will not run unless the valves are configured such that there is a valid pumping path.

(8) All Pumps are disabled by low level floats (01-LSL-11108, 01-LSL-11208), except during a wet well cleaning cycle where Pumps 1 and 2 will remain operational (01-P-11110, 01-P-11220).

PART 3 - EXECUTION

3.01 FIELD TESTING:

A. Comply with the requirements specified in Section 40 61 21.

3.02 DEMONSTRATION:

A. Comply with the requirements specified in Section 40 61 21.

3.03 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 40 62 00

COMPUTER SYSTEM HARDWARE AND ANCILLARIES

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide Computer System Hardware and Ancillaries as specified in this section and in compliance with the Contract Documents.

1.02 DEFINITIONS:

A. HDMI: High-Definition Multimedia Interface – an audio/video display interface used to connect a video source to a display device.

B. DP: DisplayPort – an audio/video display interface used to connect a video source to a display device.

C. OSI: Owner's System Integrator.

D. USB: Universal Serial Bus.

E. VESA: Flat Display Mounting Interface also known as VESA Mounting Interface Standard is a family of standards by the Video Electronics Standards Association.

F. CPU: Central Processing Unit

G. CAL: Client Access License

1.03 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

1.04 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.05 SPARE PARTS:

A. Comply with the requirements specified in Section 01 61 00.

1.06 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

1.07 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

1.08 PROJECT/SITE CONDITIONS:

A. Coordinate all work of this Section with the Other Contractors responsible for the construction of the related work, with plant operations and the Contract Administrator.

1.09 WARRANTY:

A. Provide a three (3) year warranty on all computers and monitors.

PART 2 - PRODUCTS

2.01 GENERAL:

A. Provide any software, tools, cables, wiring, terminals and other accessories required to provide a complete and operable computer system.

2.02 SERVER COMPUTERS:

A. No servers will be required for the Influent Pump Station.

2.03 OPERATOR WORKSTATION COMPUTERS:

A. Provide operator workstations to allow operators to perform their daily tasks. Provide the following workstations:

Tag	Description	Location	Notes
01-WS-90451	SCADA Workstation	0101 IPS	Single 27” Monitor
01-WS-90452	Business Workstation	0101 IPS	Single 27” Monitor
01-WS-90453	SCADA Workstation	0104 IPS Electrical Building	Single 27” Monitor
01-WS-90454	Business Workstation	0104 IPS Electrical Building	Single 27” Monitor

B. Workstations shall consist of a mini-computer, 27 inch monitor, wireless keyboard and wireless mouse. The mini-computer mounts to the VESA mounting holes on the back of the monitor. Provide a 3-foot DisplayPort cable for connection between the computer and the monitor.

C. The computer shall have the following minimum specifications:

1. Windows 10 Pro Operating System
2. 9th Generation Intel Core i7 Processor
3. 16 GB memory; 512 GB SSD storage
4. Intel UHD Graphics 630
5. Integrated Intel Gigabit Ethernet Network Interface
6. Intel Wi-Fi 6 AX200 (2x2)
7. Bluetooth M.2
8. 2 DisplayPort 1.2 video ports
9. 2 SuperSpeed USB 10 Gbps; 2 SuperSpeed USB 5Gbps
10. Audio jacks with headset and headphone front ports (3.5 mm)
11. Mini form factor
12. VESA mounting bracket

D. The computer shall be the HP EliteDesk 800 G5.

E. Prior to installation, deliver the computer to SLCDPU for initial OS configuration.

F. Provide a 27 inch monitor with the following minimum specifications:

1. 27 inch Full High Definition (FHD, 1920 x 1080) LED monitor
2. VESA mounting (100 mm x 100 mm)
3. Built-in Speaker System
4. HDMI, DisplayPort and VGA video inputs
5. Provide the Asus VS278Q-P

G. Provide a wireless keyboard and mouse combination for each workstation with the following minimum specifications:

1. Comfortable full-size keyboard and easy-to-carry sculpted mouse with snap-on wireless transceiver (2.4 GHz).
2. Long-life battery system

3. Provide the Logitech MK320

PART 3 - EXECUTION

3.01 PREPARATION:

A. The following tasks will be executed by the OSI:

1. Following delivery of the computer equipment to the SLC IMS department by the Contractor, the OSI will coordinate the installation of the operating system with the SLC IMS department. The OSI will take possession of the equipment and install the necessary software and program files.

2. Upon completion of computer equipment setup, the OSI will deliver the computer equipment back to the Contractor to be installed in racks and enclosures in preparation for factory acceptance testing (FAT) at the Contractor's panel shop. All FAT activities shall be with the actual computer hardware to be utilized for the project.

3. The OSI, with guidance from the SLC IMS department, will setup the computer domains, network configurations, firewall rules, virus protection, and software configurations.

B. Coordinate the installation of the workstations and industrial PCs with other trades. Only install these systems after construction of the facility has been completed so as to minimize dust and construction debris getting into the equipment housings.

C. Coordinate the installation of the computer operating system with SLCDPU. Computers shall be delivered to SLCDPU for initial configuration prior to installation on site.

3.02 INSTALLATION:

A. Install the workstations and industrial PCs according to the manufacturer's recommendations and as shown on the Contract Drawings. Final locations for workstations on desks shall be coordinated with the Owner.

B. Test each workstation for proper functionality. Work with the OSI to verify connectivity to the plant SCADA system or facility business network.

C. Ensure that all appropriate cables, mounts, fasteners, etc. are properly installed and rated for the area in which it is being located.

D. Calibrate industrial touch screen monitors for accurate mouse movement by touch.

3.03 PROGRAMMING:

A. Once each computer has been physically installed after a successful FAT, final setup and configuration shall be implemented and tested by the OSI.

B. Each computer shall be connected to its appropriate network and network configuration loaded and tested.

C. The OSI shall verify that the operating system is functioning properly, verify that the computer name and domain is correct, verify that the firewall rules are correct and functional and verify that virus software is operating normally.

D. The OSI shall verify that the historian servers are setup properly for redundancy and failover and that databases are setup appropriately. Verify that the databases are properly being backed up to the NAS device.

E. The OSI shall setup and verify the SCADA servers are operating properly and redundancy/failover is functioning. Setup and verify all communications drivers, OPC servers and connections to client computers.

3.04 TESTING:

A. Initial computer testing and demonstration shall occur at the FAT at the panel shop. The OSI shall demonstrate that each computer has its operating system installed and operating properly, that the network is setup correctly, software has been installed, configured and is functioning properly.

B. Final testing and demonstration shall be repeated after the equipment has been installed on site.

3.05 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

Page Intentionally Left Blank

SECTION 40 66 00

NETWORK AND COMMUNICATION EQUIPMENT

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide network and communication equipment as indicated and in compliance with Contract Documents.

1.02 REFERENCES:

A. American Society for Testing and Materials (ASTM)

B. Institute of Electrical and Electronic Engineers (IEEE)

C. International Standards Organization/International Electrotechnical Commission (ISO/IEC):

1. 11801: Information Technology – Generic cabling for customer premises

D. National Electrical Manufacturers Association (NEMA)

E. National Electric Code (NEC)

F. Telecommunications Industry Association / Electronic Industries Association (TIA/EIA):

1. 568B: Commercial Building Telecommunications Cabling Standards

2. 569B: Commercial Building Standard for Telecommunications Pathways and Spaces

G. Underwriters Laboratories Inc. (UL).

1.03 DEFINITIONS:

A. The following definitions may be used throughout this section and subsections:

1. CTC: Communications termination cabinet

2. HMI: Human machine interface

3. LAN: Local area network

4. LCP: Local control panel

5. IP: Internet Protocol

6. MIMO: Multiple-input and multiple-output

7. OIT: Operator interface terminal

8. OSP: Outside Plant

9. PC: Personal computer

10. PLC: Programmable logic controller

11. PoE: Power over Ethernet

12. SCADA: Supervisory control and data acquisition

13. SCS: Structured Cabling System

14. UPS: Uninterruptible power supply

15. VOIP: Voice over IP

16. WAN: Wide area network

17. WAP: Wireless Access Point

1.04 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

1. For each CTC cabinet supplied.

B. Submit on product data for each type of product in accordance with Section 01 33 00.

C. Submit network drawings for physical connections between all network hardware.

1.05 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.06 SPARE PARTS:

A. Comply with the requirements specified in Section 01 61 00.

1.07 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

B. Hardware and software to be furnished under this section shall be the product of firms regularly engaged in the design and manufacturing of this type of equipment. Manufacturer shall assume responsibility for, and guarantee performance of, equipment

furnished. However, this shall not be construed as relieving the Contractor from responsibility for the proper installation and functionality of the work.

C. Examine the Contract Documents and verify that network and communications equipment and software being provided is compatible with the requirements. Provide all necessary accessories for a complete and operable system.

1.08 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

1.09 PROJECT/SITE CONDITIONS:

A. Classification of Plant Areas:

1. Refer to Division 26 and Contract Drawings.

1.10 WARRANTY:

A. The Contractor shall provide a three (3) year warranty on structured cabling systems. This includes all copper and fiber cabling, patch panels, patch cables and CTC assemblies (excluding UPS and other electronic devices).

PART 2 - PRODUCTS

2.01 GENERAL:

A. Refer to the requirements of Division 01.

B. Selected Products:

1. Provide products and materials that are new and free from all defects.

2. Products and materials called for on the drawings or in the specifications by trade names, manufacturer's name and catalogue reference are to be used as the basis for the bid submission.

3. The design has been based on the use of the first named product where multiple products have been listed.

C. Quality of Products:

1. All Products provided to be NEC and UL approved where applicable.

2. If Products specified are not NEC and UL approved, obtain approval of the relevant State regulatory authority. Pay all applicable charges levied and make all modifications required for approval.

3. Refer to Division 01 of this specification for further information.

D. Uniformity of Manufacture:

1. Unless otherwise specifically called for in the specification, uniformity of manufacture to be maintained for similar products throughout the work.

E. Product Finishes:

1. Contractor to specify proposed finishes to be used for Contract Administrator's review.

F. Use of Products During Construction:

1. Any equipment used for temporary or construction purposes is to be approved by the Contract Administrator and in accordance with Division 01 of this specification. Clean and restore to "as new" condition all equipment prior to the time of substantial completion.

2.02 NETWORK SWITCHES:

A. Manufacturers:

1. Cisco

B. Layer 2 Rack Mounted Switches:

1. Provide layer 2 managed switches as shown on the Contract Drawings. Layer 2 switches shall have the following features:

a. 48 Gigabit Ethernet ports with line-rated forwarding performance

b. Four 1/10 gigabit Ethernet SFP+ ports

c. Cisco LAN Lite operating system.

d. Redundant Power Supplies

e. Full IEEE 802.at (PoE+) with 30W power on copper ports

f. Device management with web user interface, over-the-air access via Bluetooth and Command-Line Interface (CLI).

g. Provide the Cisco C9200L-48P-4X switch with redundant 1KW power supplies.

2. Layer 2 Panel Mounted Switches:

   a. The switch shall be built for harsh environments and temperature ranges (-40 degrees C to +75 degrees C)

   b. Fanless, convection-cooled with no moving parts.

   c. Hardened for vibration, shock and surge, and electrical noise immunity.

   d. Switch shall have all Gigabit ports with 2 Gigabit Small Form-Factor Pluggable (SFP) uplinks plus 8x1 Gigabit copper RJ45 downlink ports in a small form-factor base system.

   e. Expandable to 26 ports of Gigabit Ethernet by attaching one of 7 compatible modules (copper, PoE, fiber options).

   f. Supports multiple rings and redundant ring topologies for new network configurations.

   g. Cisco Network Essentials operating system.

   h. Redundant 24VDC Power Supplies.

   i. Device management with web user interface, over-the-air access via Bluetooth and Command-Line Interface (CLI).

   j. For switches where PoE is not required, provide the Cisco IE-3300-8T2S-E switch with option module if required.

   k. For switches where PoE is required, provide the Cisco IE-3300-8P2S-E switch with option module if required.

C. Switch Accessories:

1. Small Form Pluggable (SFP) modules for switches:

   a. For 10Gbps fiber links, provide the Cisco SFP-10G-LR (for rack-mount switches) and the Cisco SFP-10G-LRX (for industrial switches).

   b. For 1Gbps fiber links, provide the Cisco GLC-LH-SM (for rack-mounted switches) and the Cisco GLC-LH-SMD (for industrial switches).

   c. For 1Gbps copper links, provide the Cisco GLC-T (for rack-mounted switches) and the Cisco GLC-TE (for industrial switches).

2. Secure Digital (SD) memory card – All Cisco panel mount switches shall be provided with SD cards for locally storing the switch configuration.

2.03 MEDIA CONVERTERS:

A. General: Standalone media converters shall not be allowed except for use with wireless access points. All other fiber connections shall occur at the managed switch level utilizing SFP ports and modules.

2.04 VOIP PHONES:

A. All VOIP phones will be provided and installed by the Salt Lake City Information Management Systems (IMS) group. The Contractor shall coordinate the final location of each phone and associated wall jack with the Owner.

2.05 WIRELESS ACCESS POINTS:

A. Manufacturers:

1. Cisco Meraki

B. Clean Room Access Points:

1. Support for IEEE 802.11n, ac, ax

2. Integrated antennas at 2.4GHz and 5GHz (4x4 MIMO)

3. Powered over PoE 802.3at/802.3af

4. For non-corrosive and dry areas, provide a ceiling mounted Cisco Meraki MR46 access point

C. Process Room Access Points:

1. Support for IEEE 802.11n, ac, ax

2. Four external antennas at 2.4GHz and 5GHz (4x4 MIMO)

3. Powered over PoE 802.3at/802.3af

4. For corrosive or wet areas, provide the Cisco Meraki MR86 series access point with four Cisco Meraki MA-ANT-20 Dual-band Omni-Antennas

D. Outdoor Access Points:

1. Support for IEEE 802.11n, ac, ax

2. Four external antennas at 2.4GHz) and 5GHz (4x4 MIMO)

3. Powered over PoE 802.3at/802.3af

4. For outdoor locations, provide the Cisco Meraki 86 series access point with four Cisco Meraki MA-ANT-20 Dual-band Omni-Antennas

E. Coordinate installation locations of the wireless access points with the Salt Lake City Information Management Systems (IMS) group.

F. The Contractor shall provide the following quantities of indoor and outdoor wireless access points for each facility.

Building Number	Description	Indoor Access Points
0101	IPS	5
0104	IPS Electrical Building	5

Building Number	Description	Outdoor Access Points
0101	IPS	1
0104	IPS Electrical Building	1

2.06 COMMUNICATIONS TERMINATION CABINETS (CTC):

A. Comply with requirements in Section 27 11 16 for communication racks.

B. CTCs shall be 19-inch rack type systems that shall be able to support and organize electronic equipment, cross-connection and/or termination hardware for fiber optic cabling, station cabling, riser cabling, or building entrance cabling as may be required by design. The rack face shall have a conventional equipment mounting width of 19 inches.

C. The rack must be designed for cable and jumper management and have hardware to organize and support cabling and patch cords in the vertical and horizontal planes. The rack system shall be equipped for electrical grounding to meet EIA/TIA 606 Standards. The fastening system for the equipment shall facilitate easy installation with roll-formed threads in the screw holes for greater strength and durability. The mounting screws shall have pilot points.

D. For NEMA 1 enclosures, all rack components shall be charcoal black in color and made of lightweight 6061-T6 extruded aluminum. For NEMA 4X enclosures the enclosure shall be 304 stainless steel.

E. The rack shall be shipped with all necessary hardware to assemble the included frame. It shall be packed in cartons with suitable shipping inserts such that no damage occurs to the rack finish. The finish shall not be scratched, chipped or marred.

F. Each CTC cabinet shall be supplied with two dedicated 120VAC circuits with associated receptacles mounted in the back of the cabinet.

G. Each CTC shall be equipped with vertical and horizontal cable management systems that allow for neatly routing cables throughout the cabinet.

H. Each CTC shall have conduits routed directly to it or overhead cable management systems installed to neatly route structured cabling into the CTC cabinet.

I. Free Standing Rack Specifications:

1. Self-Supported Rack Framework:

a. The self-supporting equipment rack shall be inside the CTC. Standard grade frames shall be capable of supporting equipment to be mounted inside the CTC.

b. Dimensions: As required to fit in CTC with 19-inch center mounting and a minimum of 67 inches of usable vertical space. Base Footprint of 20.25 inches wide by 36 inches deep.

c. Hole Pattern: EIA310-D 3/8 inch square hole. Provide with a minimum of eighty (80) 12-24 Cage nuts and eighty (80) 12-24 x 3/8 inch screws.

d. Materials: 6061-T6 high strength aluminum.

e. Flanges: Flange edge to edge internal measurement is 17.75 inches.

2. Racks shall be mounted inside NEMA 1 Enclosures with front and rear access doors.

3. Enclosures shall have glass front doors and solid vented rear doors.

4. Approved ground lug and #6 AWG jacketed green ground wire.

5. CTC shall be installed with at least 36 inches clear working space in front and behind cabinet.

6. Minimum 84 inches tall free-standing enclosures.

7. Equipped with a slide-out shelf suitable for a laptop computer to be placed on it for system configuration/programming. The shelf shall be vented.

8. Equipped with a vertical power strip installed with a minimum of 16 outlets rated at 20 amps. The vertical power strip shall be surge protected.

9. Approved Manufacturers:

a. Great Lakes

b. CommScope, Inc.

c. Hammond Manufacturing

d. Leviton Manufacturing Co., Inc.

J. NEMA 1 Wall Mount Rack Specifications

1. Self-Supported Rack Framework:

a. The self-supporting equipment rack shall be inside the CTC. Standard grade frames shall be capable of supporting equipment to be mounted inside the CTC.

b. Dimensions: As required to fit in CTC with 19-inch center mounting. Base Footprint of 20.25 inches wide by 24 inches deep.

c. Hole Pattern: EIA310-D 3/8 inch square hole. Provide with a minimum of forty (40) 12-24 Cage nuts and forty (40) 12-24 x 3/8 inch screws.

d. Materials: 6061-T6 high strength aluminum.

e. Flanges: Flange edge to edge internal measurement is 17.75 inches.

2. Racks shall be mounted inside NEMA 1 Wall Mount Enclosures with a double hinge system allowing front and rear access.

3. Enclosures shall have glass or plexiglass front doors and solid vented rear doors.

4. Approved ground lug and #6 AWG jacketed green ground wire.

5. CTC shall be installed with at least 36 inches clear working space in front and 36 inches on the hinge side of the cabinet to allow access to the rear.

6. Panel mounting height shall be such that the top of the wall mount CTC does not exceed 80” above the finished floor.

7. Approved Manufacturers:

a. Great Lakes

b. APC

c. CPI

K. NEMA 4X Wall Mount Rack Specifications:

1. Self-Supported Rack Framework:

a. The self-supporting equipment rack shall be inside the CTC. Standard grade frames shall be capable of supporting equipment to be mounted inside the CTC.

b. Dimensions: As required to fit in CTC with 19-inch center mounting. Base Footprint of 20.25 inches wide by 24 inches deep.

c. Hole Pattern: EIA310-D 3/8 inch square hole. Provide with a minimum of forty (40) 12-24 Cage nuts and forty (40) 12-24 x 3/8 inch screws.

d. Materials: 6061-T6 high strength aluminum.

e. Flanges: Flange edge to edge internal measurement is 17.75 inches.

2. Racks shall be mounted inside NEMA 4X Wall Mount Enclosures with a double hinge system allowing front and rear access.

3. Enclosures shall have a glass or plexiglass front door.

4. Provide HVAC equipment to properly cool the enclosure while maintaining the NEMA 4X rating.

5. Approved ground lug and #6 AWG jacketed green ground wire.

6. CTC shall be installed with at least 36 inches clear working space in front and 36 inches on the hinge side of the cabinet to allow access to the rear.

7. Panel mounting height shall be such that the top of the wall mount CTC does not exceed 80” above the finished floor.

8. Approved Manufacturers:

a. Hoffman Protek Series

2.07 CTC HVAC EQUIPMENT:

A. All CTC cabinets shall be properly designed to maintain the inner temperatures of the enclosure within the 60 to 80 degrees F.

B. Any HVAC equipment shall maintain the NEMA rating of the CTC assembly.

C. Preferably, fans, air-to-air exchangers and AC units are mounted on the top of each CTC.

2.08 FIBER PATCH PANELS:

A. Provide 19 inch rack-mount fiber optic patch panels for CTC cabinets and wall-mount patch panels for industrial control panels.

B. Provide patch panel adapter plates with duplex LC connectors for single mode fiber. Each plate shall accommodate six duplex connectors.

C. Ensure that the number of fiber ports is as required per the network drawings.

D. The patch panel shall provide protection for all fiber terminations and cable strain relief. The patch panel shall protect and conceal patch cord connections.

E. Fiber patch panels shall be the Panduit FMD series for 19 inch racks and the FWME series for wall-mounted panels.

2.09 CAT 6 PATCH PANELS:

A. Each CTC cabinet shall be supplied with a 19 inch rack mountable 110 punch down to RJ45 jack patch panel. The panel shall be rated for CAT6 cabling.

B. The 110 punch blocks shall support wiring and be labeled for both T568A and T568B standards. The patch panel shall have at a minimum 24 RJ45 ports and at least 12 spare ports. Each RJ45 port shall have a plastic label holder for custom labels.

C. CAT 6 patch panels shall be as manufactured by Panduit or Leviton.

2.10 WALL JACKS AND PLATES:

A. Jacks shall be TIA/EIA Category 6 Compliant and shall support wiring and be labeled for both T568A and T568B standards. Plates shall be constructed of high-impact, flame-retardant, UL 94V-0 thermoplastic. Plates shall be available in single gang with 1-4 ports and double gang with 8 ports. Color of jacks and plates shall be determined by and coordinated with the Owner.

2.11 AC UNINTERRUPTIBLE POWER SUPPLY (UPS):

A. All CTC's shall have a UPS system installed for surge protection and battery backup of critical network equipment. Provide the following UPS equipment to be mounted within the 19 inch racks. (Note: UPS's that are located in electrical rooms are specified in Division 26).

Tag	Description	Location	Size	Load	Duration
01-UPS-91012	Influent Pump Station UPS 1	01-CTC-90302	2KVA	1.5KVA	30 MIN
01-UPS-91013	Influent Pump Station UPS 2	01-CTC-90302	2KVA	1.5KVA	30 MIN

Tag	Description	Location	Size	Load	Duration
01-UPS-91011	IPS Electrical Building UPS	01-CTC-90301	3KVA	2.25KVA	30 MIN

B. The AC UPS shall be 19 inch rack mountable and shall be mounted with sliding rails where possible. The AC UPS shall be a double-conversion system.

C. Each UPS shall be capable of running the connected load for a minimum of 30 minutes.

D. AC UPS Electrical Input Specifications (refer to Section 26 33 53 for electrical room UPS requirements).

1. Nominal Voltage: 120VAC (for 1 to 3KVA UPS's), 120VAC/208VAC for 5-10KVA UPS's)

2. Voltage Range (@120VAC): 80-144VAC

3. Input Power Factor: > 0.95

4. Frequency: 60 Hertz +/- 3 Hertz

E. AC UPS Electrical Output Specifications

1. Voltage Regulation: +/- 3 percent of Nominal

2. Efficiency: > 85 percent

3. Frequency Regulation: +/- 3 Hertz on utility, +/- 1 Hertz on battery

F. AC UPS Communications Specifications:

1. A USB port shall be available for monitoring and configuring the UPS. An appropriate cable shall be supplied to connect to the UPS with a PC.

2. An Ethernet port shall be available with the ability to monitor the UPS utilizing the SNMP protocol.

G. AC UPS Battery Specifications:

1. All batteries shall be sealed, lead-acid batteries and shall be maintenance free. Batteries shall be hot-swappable. The UPS will indicate when the battery is weak and needs to be replaced.

2. The UPS shall be able to accept additional battery modules to extend the runtime of the UPS.

H. Acceptable Manufacturers:

1. Powerware 5 or 9 Series

2. Liebert GTX Series

3. APC Smart-UPS Series

2.12 DC UNINTERRUPTIBLE POWER SUPPLY (UPS):

A. Each CTC that contains DC powered network switches shall have a 24VDC UPS installed in it for surge protection and battery backup of critical network equipment.

B. Provide the following UPS equipment to be mounted on the panel backplane. (Note: UPS's that are located in electrical rooms are specified in Division 26).

Description	Location	Size	Load	Duration
IPS Standby Power & Fuel Storage UPS	01-CTC-90101	4AH	2A	120 MIN

C. Each DC UPS shall be din-rail mountable.

D. Each UPS shall be capable of running the connected load for a minimum of 30 minutes.

E. DC UPS Electrical Specifications

1. Input Nominal Voltage: 24VDC

2. Input Voltage Range (@24VDC): 18-30VDC

3. Output Efficiency: > 98 percent

4. UPS shall have signals available to provide alarm and battery status to controller.

F. DC UPS Battery Specifications:

1. All batteries shall be sealed, lead-acid batteries and shall be maintenance free. Batteries shall be hot-swappable. The UPS will indicate when the battery is weak and needs to be replaced.

2. The UPS shall be able to accept additional battery modules to extend the runtime of the UPS.

G. Acceptable Manufacturers:

1. Phoenix QUINT-UPS series

PART 3 - EXECUTION

3.01 EXAMINATION:

A. Refer to the requirements of Division 01.

3.02 COORDINATION WITH OTHER DIVISIONS:

A. Examine the drawings and specifications of all divisions and become fully familiar with the work. Before commencing work, obtain a ruling from the Contract Administrator on any conflicting issues between divisions. No compensation will be made for any costs arising from conflict not identified before work has commenced.

B. Coordinate the work to be performed under this section of the specification with all divisions installing equipment to ensure that there are no conflicts.

C. Lay out the work and equipment with due regard to architectural, structural, and mechanical features. Architectural and structural drawings take precedence over electrical drawings regarding locations of walls, doors, and equipment.

D. Examine previously constructed work and notify the Contract Administrator of any conditions which prejudice the proper completion of this work.

3.03 PRODUCT HANDLING:

A. Use all means necessary to protect the products included in this division before, during and after installation, and to protect products and installed work of all other trades.

B. Any damage to the products and/or installed work shall be repaired or replaced to the approval of the Contract Administrator by the Contractor at no additional cost to the City.

C. Remove advertising labels from all products installed that have such labels attached. Identification, NEC, and UL labels are not to be removed.

D. Remove dirt, rubbish, grease, etc. resulting from work performed under this section of the contract from all surfaces.

3.04 NETWORK PROGRAMMING

A. All network switches and wireless access points shall be programmed by the Salt Lake City Information Management Systems (IMS) group. Programming for vendor supplied network switches shall be performed by the vendor but shall be coordinated with the Engineer utilizing SLCDPU's standard programming templates. Programs for vendor supplied switches shall be turned over to the Owner.

B. The Contractor shall deliver all network switches and wireless access points to the IMS group for programming. The Contractor shall allow a period of six (6) months for the

IMS group to complete the programming. Once completed, the Contractor shall take possession of the switches and install them in their designated locations.

C. Business VLANS (such as VLANs for workstations, printers, WiFi, Security, etc.) shall be setup on the Business network switches such that all traffic between VLANs is controlled by firewall rules. Similarly, Control Network VLANs (SCADA, BMS, Power) shall be setup on the SCADA network switches such that all traffic between VLANs is also controlled by Firewall rules. By default, ports are disabled and not assigned to any VLAN until physical connections are made to the port and the IMS team then programs the port to the appropriate VLAN.

3.05 INSTALLATION:

A. Refer to the requirements of Division 01 for additional requirements.

B. The Contractor shall utilize personnel to accomplish, or supervise the physical installation of all elements, components, accessories, or assemblies which it provides. The Contractor shall employ installers who are skilled and experienced in the installation and connection of all elements, components, accessories, and assemblies it provides.

C. All components of the SCS shall be the installation responsibility of the Contractor unless specifically noted otherwise. After the installation of the SCS is completed, the installation shall be inspected jointly by the Contractor and the Equipment Manufacturer's representatives. Any problems shall be corrected, and when both are satisfied with the installation, a written certification of the installation shall be delivered to the Engineer. The certification shall state that all cabling and terminations have been inspected and are installed in accordance with the manufacturer's guidelines.

D. Miscellaneous Equipment. The Contractor shall provide any necessary screws, anchors, clamps, tie wraps, distribution rings, wire molding, and support hardware, etc., necessary to facilitate the installation of the CTCs within the SCS. All metal fasteners and straps in corrosive or wet areas shall be 316SS.

E. Special Equipment and Tools. It shall be the responsibility of the Contractor to furnish any special installation equipment or tools necessary to properly complete the SCS. This may include, but is not limited to, tools for terminating cables, testing and splicing equipment for copper/fiber cables, communication devices, jack stands for cable reels, or cable wrenches.

F. Penetrations of Walls, Floors, and Ceilings. The Contractor shall make no penetration of existing walls, floors and/or ceilings without the prior consent of the Owner. Where penetrations through acoustical walls, fire-rated doors or other walls for cableways are to be installed, such penetrations shall be sealed by the Contractor in compliance with applicable code requirements.

G. The CTCs and all components of the system shall be installed in a neat, workmanlike manner. Wiring color codes shall be strictly observed and terminations shall be uniform

throughout the system. Identification markings and systems shall be uniform. TIA/EIA 568B wiring codes as shown on the drawings shall standardize all SCS wiring. The CTC shall be level and plumb.

3.06 TESTING & COMMISSIONING:

A. Commissioning of network and communication systems is to include but not be limited to the following:

1. Verify installation of components, power and network connections.

2. Supervise network cable testing.

3.07 TRAINING:

A. Provide training, described in detail in Division 01, as required by the plant's personnel to become fully competent in the proper operation and maintenance of all network and communication equipment described under this section of the specifications.

3.08 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 40 66 33

METALLIC AND FIBER OPTIC COMMUNICATION CABLING AND CONNECTORS

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide metallic and fiber optic communication cabling and connectors as indicated and in compliance with Contract Documents.

1.02 REFERENCES:

A. American Society for Testing and Materials (ASTM)

B. Institute of Electrical and Electronic Engineers (IEEE)

C. International Standards Organization/International Electrotechnical Commission (ISO/IEC):

1. 11801: Information Technology – Generic cabling for customer premises

D. National Electrical Manufacturers Association (NEMA)

E. National Electric Code (NEC)

F. Telecommunications Industry Association / Electronic Industries Association (TIA/EIA):

1. 568B: Commercial Building Telecommunications Cabling Standards

2. 569B: Commercial Building Standard for Telecommunications Pathways and Spaces

G. Underwriters Laboratories Inc. (UL)

1.03 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Submit product data in accordance with Division 26.

1.04 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.05 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

1.06 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

1.07 INSPECTION:

A. Provide adequate notice to the Contract Administrator so that all cable installations can be inspected prior to energizing equipment.

1.08 WARRANTY:

A. Provide a five (5) year warranty on all metallic and fiber optic communication cabling and connectors.

PART 2 - PRODUCTS

2.01 TWISTED PAIR SHIELDED CABLES (TPSH):

A. TPSH shall be constructed as follows:

1. Two (2) copper conductors, stranded, minimum #18 AWG, PVC insulated, twisted in nominal intervals of 2 inches.

2. Insulated for 600 V, 194 degrees F.

3. 100 percent coverage aluminum foil or tape shield.

4. Separate bare stranded copper drain wire, minimum #18 AWG.

5. Overall flame-retardant PVC jacket to NEC. NEC and UL approved.

6. The entire cable assembly to be suitable for pulling in conduit or laying in cable tray.

7. Interlocked aluminum armor and outer PVC jacket.

8. Belden 9341.

B. Where multi-conductor TPSH cables are called for, each pair shall be individually shielded, continuous number coded, and the cable assembly shall have an overall shield and overall flame retardant PVC jacket.

2.02 RTD AND MULTI CONDUCTOR SHIELDED CABLE:

A. RTD cables shall be UL approved and shall be constructed as follows:

1. Three or more copper conductors, stranded, minimum # 18 AWG.

2. PVC insulated for 600 V.

3. 100 percent coverage aluminum foil or tape shield.

4. Separate bare stranded copper drain wire.

5. Interlocked aluminum armor and outer PVC jacket.

6. Overall flame-retardant PVC jacket to NEC. NEC and UL approved.

2.03 CABLE TRAYS:

A. As specified in Section 26 05 36.

2.04 CONDUIT

A. As specified in Division 26.

2.05 WIRE:

A. As specified in Division 26.

2.06 CATEGORY 6 COMMUNICATION CABLE:

A. Comply with requirements in Section 27 15 13.

B. Category 6 cable shall be NEC approved and constructed as follows:

1. 4 bonded pairs, solid stranded, #23 AWG

2. Rip cord

3. PVC inner and outer jackets

4. UL verified to CAT 6

5. The entire cable assembly to be suitable for pulling in conduit or laying in cable tray.

6. Insulated for 300 V for typical installations. Insulated and shielded for 600 V when installed in industrial control panels, motor control centers and any other location where the cable will be in the presence of other 480V cabling.

7. 300V Cable, Unshielded: Belden 7940A.

8. 600V Cable, shielded: Belden 7953A.

2.07 FIBER OPTIC CABLE:

A. Comply with requirements in Division 27.

B. Fiber optic cabling shall be provided between facilities and furnished with the quantity of fibers as designated on the Contract Drawings.

C. All fiber in a cable run shall be from the same manufacturer and shall be the same type. A mix of fibers from different manufacturers may not be used without written permission from the Engineer.

D. Fiber optic cabling exposed to the elements or in underground raceways shall be an armored type fiber optic cable.

E. No fiber splicing or closures are allowed except to replace existing splices.

F. Single Mode Fiber:

1. All single mode fiber optic cables within the premises shall use graded-index fibers with 9 micron cores only.

2. Optical Specifications:

a. Fibers shall have dual wavelength capability at 1310nm and 1550nm

b. Attenuation: ≤ 0.4 dB/km at 1310nm and 0.3 dB/km at 1550nm

c. Bandwidth: Operation of 10 Gigabit Ethernet at 10,000 meters at 1310nm and 30,000 meters at 1550nm

d. Numerical Aperture: 0.14

3. All fibers shall be color coded to facilitate individual fiber identification. Fibers shall have CPC® or approved equivalent color coatings that resist color degradation, minimize micro-bending losses and improve handling. The coating shall be mechanically strippable.

4. Dimensional Specifications:

a. Core Diameter: 8.2 µm

b. Cladding Diameter: 125.0 +/- 0.7 µm

c. Core-Clad Concentricity: ≤ 0.5 µm

d. Cladding Non-Circularity: ≤ 0.7 percent

e. Coating Diameter: 242 +/- 5 µm

f. Coating-Cladding Concentricity: < 12 µm

5. Environmental Specifications:

a. Operating Temperature: -40 degrees C to +70 degrees C

b. Cable shall be UV resistant, waterproof and corrosion resistant.

6. Mechanical Specifications:

a. Minimum tensile strength: 100,000 psi

b. Fiber Minimum Bending Radius: 0.75 inches

c. Cable Minimum Bending Radius (During Installation): 20 times cable diameter

d. Cable Minimum Bending Radius (After Installation): 10 times cable diameter

e. Cable shall be rated for Underground, Buried and Aerial, OSP

f. Cable shall bear OFNP (Plenum Rated), OFNR (Riser Rated) and/or appropriate markings for the environment in which they are installed.

g. Cable shall be a tight-buffer indoor/outdoor distribution cable with 900 µm color coded buffered fibers which are surrounded by water-swellable aramid strength members with a ripcord, under an overall UV-resistant, flame-retardant black jacket.

7. Fiber Cabling shall contain the number of fibers specified in the Drawings.

8. Acceptable Manufacturers:

a. Corning

G. Inner Duct:

1. Inner duct shall be used for fiber optic installations in conduit 2 inches and larger.

2. Inner duct shall be minimum 1 inch and shall be sized properly for the fiber optic cable.

3. Inner duct shall be orange, ribbed, riser rated and UL listed.

4. Acceptable Manufacturer:

   a. Carlon

H. Fiber Optic Connectors:

1. Fiber Optic Connectors shall be of ceramic construction and shall have a loss ≤ 0.5 dB. They shall be made specifically for the type of fiber being connected to and required bandwidth. The connector shall have no metal parts.

2. Fiber Optic Connectors shall utilize the LC type connector.

3. Acceptable Manufacturer:

   a. Panduit Opticam Series

I. Fiber Patch Cords:

1. The fiber patch cord shall be duplex and consist of buffered, graded-index fiber with a 125 µm cladding. The fiber cladding shall be covered by aramid yarn and a jacket of flame-retardant PVC.

2. The fiber patch cord shall be rated for 10 Gigabit Ethernet.

3. For single mode, the cords shall be Yellow in color.

PART 3 - EXECUTION

3.01 ANALOG SIGNALS:

A. Use TPSH cable for all low level analog signals such as 4-20 mA, pulse type circuits 24 VDC and under, and other signals of a similar nature.

B. Use RTD cable for connections between RTDs and transmitters or control system RTD inputs.

3.02 DIGITAL SIGNALS:

A. Use TPSH cable for all low level input (24 V and below) and output signals to the control system.

3.03 INSTRUMENT POWER:

A. Use tray type instrumentation cable in conduit in accordance with Division 26 for power to instruments, for 120 V signals other than those mentioned above and as otherwise indicated on the Drawings. Use stranded wire and cable to supply power to instruments.

3.04 INSTALLATION:

A. The Contractor shall utilize personnel to accomplish, or supervise the physical installation of all elements, components, accessories, or assemblies which it provides. The Contractor shall employ installers who are skilled and experienced in the installation and connection of all elements, components, accessories, and assemblies it provides.

B. All components of the cabling system shall be the installation responsibility of the Contractor unless specifically noted otherwise. After the installation is completed, the installation shall be inspected jointly by the Contractor and the Equipment Manufacturer's representatives. Any problems shall be corrected, and when both are satisfied with the installation, a written certification of the installation shall be delivered to the Engineer. The certification shall state that all cabling and terminations have been inspected and are installed in accordance with the manufacturer's guidelines.

C. All installations shall be done in conformance with EIA/TIA 568B standards and with the manufacturer's installation requirements. The Contractor shall ensure that the maximum pulling tensions of the specified distribution cables are not exceeded and cable bends maintain the proper radius during the placement of the facilities. Failure to follow the appropriate guidelines will require the Contractor to provide in a timely fashion the additional material and labor necessary to properly rectify the failure. All damage to the cables during the construction of this project is the sole responsibility of the Contractor.

D. Separation from EMI Sources:

1. Comply with BICSI TDMM and TIA/EIA-569-A recommendations for separating unshielded copper voice and data communication cable from potential EMI sources, including electrical power lines and equipment.

2. Separation between open communications cables or cables in nonmetallic raceways and unshielded power conductors and electrical equipment shall be as follows:

   a. Electrical Equipment Rating Less Than 2 kVA: A minimum of 12 inches

   b. Electrical Equipment Rating between 2 and 5 kVA: A minimum of 24 inches

   c. Electrical Equipment Rating More Than 5 kVA: A minimum of 48 inches

3. Separation between communications cables in grounded metallic raceways and unshielded power lines or electrical equipment shall be as follows:

   a. Electrical Equipment Rating Less Than 2 kVA: A minimum of 6 inches

   b. Electrical Equipment Rating between 2 and 5 kVA: A minimum of 12 inches

   c. Electrical Equipment Rating More Than 5 kVA: A minimum of 24 inches

4. Separation between communications cables in grounded metallic raceways and power lines and electrical equipment located in grounded metallic conduits or enclosures shall be as follows:

   a. Electrical Equipment Rating Less Than 2 kVA: 3 inches

   b. Electrical Equipment Rating between 2 and 5 kVA: A minimum of 6 inches

   c. Electrical Equipment Rating More Than 5 kVA: A minimum of 12 inches

5. Separation between Cables and Electrical Motors and Transformers: A minimum of 48 inches

6. Separation between Cables and Fluorescent Fixtures: A minimum of 6 inches

E. Install instrumentation cables in conduit systems or in cable trays. Use a minimum of 12 inches and a maximum of 40 inches length of liquid tight flexible conduit to connect the field sensors to the conduit.

F. Where non-armored instrumentation cables are installed in cable trays, provide barriers in the tray to separate instrumentation cables from power cables.

G. At each end of the run leave enough cable length for termination.

H. Do not make splices in any of the instrumentation cable runs.

I. Cable shields shall be terminated on insulated terminals and carried through to the extent of the cable.

J. Ground cable shields at one end only. Unless otherwise specified, ground the shields at the marshalling panel.

K. Protect all conductors against moisture during and after installation.

3.05 CAT 6 INSTALLATION:

A. Always follow the Manufacturer's guidelines for minimum bend radius and tension.

B. All installations and terminations shall be performed by personnel experienced in CAT 6 cable installation.

C. Perform cable testing with time domain reflectometer instrument and provide complete detailed test report. Test all runs upon completion of permanent terminations, using

instrumentation acceptable to the Engineer. Before commencing testing, submit sample test data sheets and information with respect to test instrumentation to be used.

1. Test for the following:

    a. Continuity

    b. Pair placement and polarity

    c. DC resistance

    d. Characteristics at highest contemplated frequency:

        (1) Attenuation - data cable

        (2) Mutual Capacitance - data cable

        (3) Near-end crosstalk (NEXT) - data cable

    e. Run length

2. Tests to be conducted to CAT 6 standards.

3. Reconnect or re-install and retest as necessary to correct excessive variations.

3.06 FIBER OPTIC INSTALLATION:

A. Always follow the Manufacturer's guidelines for minimum bend radius and tension.

B. All installations and terminations shall be performed by personnel experienced in fiber optic cable installation and testing.

C. Perform cable testing with optical time domain reflectometer (OTDR) instrument and provide complete detailed test report. Test all runs upon completion of permanent terminations, using instrumentation (calibrated within 12 months of test being performed) acceptable to the Engineer. Before commencing testing, submit sample test data sheets and information with respect to test instrumentation to be used.

1. All fiber testing shall be performed on all fibers in the completed end to end system. There shall be no splices unless approved in writing by the Engineer. Testing shall consist of a bidirectional end to end OTDR trace performed per EIA/TIA 455-61. All tests shall be conducted using 200 foot launch cables. The system loss measurements shall be provided at 1310nm and 1550 nm for single mode fibers. The final test results must fall within Corning’s recommended range for the installed cable.

2. The Contractor shall test all fiber optic cable prior to the installation of the cable. The Contractor shall assume all liability for the replacement of the cable should it be found defective later during installation.

3. Loss Budget: Fiber links shall have a maximum loss of:

   a. (3.0 dB loss/km)*(km of fiber in link) + (0.5dB) * (number of connectors)

   b. Note that a mated connector to connector interface is defined as a single connector for the loss calculation.

   c. Any link not meeting the requirements of the standard shall be brought into compliance by the Contractor, at no charge to the Owner.

4. Documentation of all fiber optic cabling tests shall be provided in both hard and electronic copies to the Engineer.

3.07 CONDUCTOR TERMINATIONS:

A. All equipment supplied shall be equipped with terminal blocks to accept conductor connections.

B. Instrumentation conductors, where terminated at equipment terminals other than clamping type terminal blocks, shall be equipped with self-insulated, locking type terminators, sized as required to fit conductors and screw terminals.

3.08 FIELD TESTING:

A. Test all conductors for opens, shorts, or grounds. Resistance values shall not be less than those recommended by the cable manufacturer.

3.09 IDENTIFICATION:

A. Identify all instrumentation cables.

B. Identify each conductor with wire numbers using a machine printed heat shrink wire marker.

3.10 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 40 67 00

CONTROL SYSTEM EQUIPMENT PANELS AND RACKS

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide control system equipment panels and racks as indicated and in compliance with Contract Documents.

B. Local control stations shall be supplied to house local control switches, push buttons and indictor lights associated with field devices (valves, drives, etc.). The control stations shall be located in close proximity to their associated devices. Where a group of devices are located within close proximity to each other, the local controls may be combined into a single common local control panel. Line of site must be maintained between all devices and the respective local controls.

1.02 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Delegated Design Submittals: For each control panel, marshalling panel, equipment rack, or appurtenance thereto, provide written certification from Professional Engineer licensed in the State of Utah stating that supports, systems and anchorage for equipment have been designed according to the requirements of Section 1613 of the building codes of Utah, Salt Lake City and ASCE/SEI 7, and in accordance with Specification 01 41 20. Submit calculations stamped by a Professional Engineer licensed in the State of Utah for support systems and anchorage for wind, seismic, and all other pertinent loads.

1.03 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.04 SPARE PARTS:

A. Comply with the requirements specified in Section 01 61 00.

1.05 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

1.06 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

PART 2 - PRODUCTS

2.01 GENERAL:

A. Unless otherwise specified, provide outside finishes on all enclosures in ANSI 61 Grey.

B. The enclosures must be suitable for carrying the weight of the equipment mounted inside the panel and on the doors without any warpage.

2.02 ENCLOSURES:

A. Provide NEMA Type 1A gasketed enclosures in ordinary locations without process equipment.

B. Provide NEMA Type 4 enclosures in ordinary locations with process equipment.

C. Provide NEMA Type 4X 316SS enclosures for:

1. Category 1 and 2 wet and corrosive locations

2. Outdoor locations

D. Enclosures located in electrically hazardous classified areas shall bear appropriate hazardous area ratings based on the area classifications identified by Division 26.

E. Enclosures for mounting field control indicator lamps and switches in unclassified areas to be heavy duty die cast enclosures.

2.03 PANEL ENCLOSURES:

A. Fabricate panel enclosures from minimum 11 gauge steel panels complete with necessary stiffening to form a rigid free-standing line up. The structures must be suitable for carrying the weight of the equipment mounted inside the panel and on the doors. Provide removable top and bottom cable entry plates.

B. Provide panels with front access only. Doors shall be key lockable and fitted with 3-point heavy duty latching assemblies. Provide a continuous piano hinge and a pneumatic hold open device on each door.

C. Finish the interior of the enclosure with white paint. Provide a switched light fixture and 120 VAC duplex convenience receptacle inside the enclosure.

2.04 MARSHALING AND CONTROL PANELS:

A. Supply, fabricate, checkout, layout, document and deliver to Site fully equipped and functional panels.

B. Supply all components contained on or within the panels fully wired under this Section of the Specification.

C. The selection of all accessories, materials and methods for fabrication are specified in Section 26 27 17. Incidental items not covered by these Specifications, but which are necessary to complete the fabrication of the control panels, is the responsibility of the panel fabricator.

D. Fans and filters shall be installed to pressurize all control panels in non-hazardous areas thus discouraging dust accumulation and providing air purging for temperature and corrosion control.

E. Marshalling and control panels shall be adequately sized to facilitate a professional, uncluttered arrangement. Provide adequate internal and external space to accommodate a 20 percent increase in each type of component used.

F. Control and marshalling panel layouts and wiring diagrams are to be provided by the Contractor as Shop Drawings.

2.05 IPS PROCESS PLC PANEL:

A. Supply and installation of a new PLC control panel for the Influent Pump Station process systems to accommodate the extent of Input/Output points associated with the influent pump station equipment and field instruments.

1. This panel shall be equipped with a Hot-Standby PLC arrangement and will be fed from a UPS power supply specified in Section 26 33 53.

2. Requirements for the control panel and internal components are specified in Section 26 27 17.

3. This panel will be located in the IPS electrical building and shall be of NEMA 12 design and suitable for continuous operation with 90 degrees F ambient. Provide auxiliary cooling system if required to maintain internal temperature less than 95 degrees F.

4. This panel shall be free standing with provisions for secure anchorage meeting seismic restraint specification. The panel size shall be determined based on the specified features and components of the panel together with the specified quantity of PLC Inputs and Outputs defined in the facility I/O list, communication equipment, and including specified quantity of spare rack space and I/O cards.

2.06 WIRING AND ACCESSORIES:

A. Provide wiring inside the panels according to the following Specifications:

1. Control wiring to be a minimum of #16 AWG tinned stranded copper; insulation rated at 600 V.

2. Wiring for power distribution shall be a minimum of #14 AWG tinned stranded copper; insulation rated at 600 V.

3. Install cables in accordance with the requirements of Division 26.

B. Tag each wire at both ends with a heat shrink sleeve that is machine printed. Allow approximately 1 inch of wire insulation between the tag and the bare wire.

C. Wiring systems with different voltage levels or types shall be suitably segregated within the panel, according to relevant electrical codes.

D. Run all wiring in enclosed plastic wire troughs such as Panduit. Size all wire troughs so that the total cross sectional area of the insulated wire and cable does not exceed 40 percent of the cross sectional area of the wire way.

E. Provide a minimum clearance of 2 inches between wire trough and any point of wire termination.

F. Terminate all wiring, incoming and outgoing, at dedicated terminal strips mounted inside the panels. Identify each terminal strip with a terminal strip number, defined as follows:

1. Wire identification to use the connected field device tag name with the wire's corresponding end device terminal number appended to it.

2. Identify every joint and/or terminal of the above wire run with the same identifier until the wire meets another tagged device, at which point the wire identifier will change to use the new device name and terminal number.

3. For example, pressure transmitter S740-FIT located in the field has a 1 PR-TPSH cable connected to it. The cable runs through a junction box to a marshaling panel. The wire identifiers for the pair of wires would be S740-FIT all the way to the marshaling panel.

4. Identify spare wires by using the cable tag, wire number and an “-SP” suffix.

5. Arrange wiring on terminal blocks such that all internal panel wiring terminates on the inboard side of the terminal blocks and all external wiring terminates on the outboard side.

G. Provide a 120 VAC panel power distribution system and 24 VDC and other DC power distribution systems as required in each panel to accommodate all instrumentation systems fed from the panel. Provide a thermal magnetic circuit breaker on each main power circuit and a fused terminal block for each branched circuit off the main.

H. Provide power conditioners in each panel to power AC instrumentation and control loads. Power conditioners are Oneac Series CX or acceptable alternative.

I. Provide all DC power supplies as required for all instrument circuits. Power all circuits from the local control panels or marshalling panels. Power supplies to be equal to Hammond or G.F.C., complete with an overvoltage protection module.

J. Provide redundant configurations for power supply equipment serving more than one instrument loop, so that failure of a single unit will not disable all or any shared part of the instrumentation and communication system. Provide diode isolation for redundant direct current supply units, and ground the negative terminal of the power supply.

K. Unless otherwise required, all DC power supplies to be rated 28 VDC, adjustable plus or minus 5%, and set to provide 26.4 V on the panel direct current bus. Size the power supply for two times the connected load, minimum size is 2 A.

L. Provide disconnect type terminal blocks to isolate field wiring that is powered sourced from the panel. Provide a dedicated fused disconnect type terminal block to isolate each individual PLC input and output.

M. Provide sufficient terminals so that not more than two wires are connected under the same terminal. Provide 20 percent spare terminal capacity at each terminal block assembly.

N. Terminals shall be color coded as follows:

1. Red = positive 24 VDC

2. Black = analog signal plus

3. White = analog signal common and VAC neutral

4. Grey = 120 VAC

5. Green = ground

O. Provide nameplates for each device on or within the panels and enclosures. Nameplates shall be white laminated plastic with black lettering, a minimum of 1 inch x 3 inches in size with up to three lines of 0.25 inch lettering. Securely fasten nameplates in and situate them in a visible location.

2.07 PANEL GROUNDING:

A. Provide a ground system for the instrumentation circuits, isolated from the main power system ground to each marshaling panel.

B. Provide grounding lugs for each panel, suitable for termination of up to #2 AWG copper grounding conductor.

C. Provide in each marshaling panel an isolated grounding bus bar 0.25 x 1 x 24 inch, equipped with necessary lugs for accepting two (2) #2 AWG grounding conductors.

D. Firmly bond all panel-mounted devices on or within the panels to ground. Provide supplementary bonding conductors for backpanels and doors. Attach a separate bonding conductor to all devices that are not firmly fastened to the panels with screws for such devices as case mounted instruments, meters, etc.

PART 3 - EXECUTION

3.01 MOUNTING HEIGHTS:

A. Unless otherwise specified or a conflict exists, mount all control panels:

1. 48 inches or taller such that the top of the control panel is at 78 inches above the finished floor.

2. Less than 48 inches such that the panel is centered at 48 inches above the finished floor.

3.02 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 40 68 00

PROCESS CONTROL SOFTWARE

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide Process Control Software, equipment PLC and OIT programming, as indicated and in compliance with Contract Documents. SCADA programming will be performed by OSI.

1.02 REFERENCES:

A. International Society of Automation (ISA):

1. S5.1: P&IDs and Tagging

2. S18.2: Alarm Management

3. S99: Control System Cyber Security

4. 101: Human-Machine Interfaces

1.03 DEFINITIONS:

A. FAT: Factory acceptance test

B. HMI: Human machine interface

C. I&C: Instrumentation and control for process systems

D. IS: Instrumentation supplier

E. LAN: Local area network

F. LCP: Local control panel

G. NC: Normally closed

H. NO: Normally open

I. OIT: Operator interface terminal

J. OSI: Owner's System Integrator

K. PC: Personal computer

L. PID: Control action, proportional plus integral plus derivative

M. PLC: Programmable logic controller

N. P&ID: Process and instrumentation diagram

O. RIO: Remote input/output

P. SCADA: Supervisory control and data acquisition

Q. VCP: Vendor control panel

1.04 SUBMITTALS:

A. Submittals shall meet the requirements of Section 01 33 00.

B. A minimum of four weeks prior to factory acceptance testing, submit programming files for review.

1.05 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.06 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

1.07 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

PART 2 - PRODUCTS

2.01 PROCESS CONTROL SOFTWARE:

A. SLCDPU has standardized around the Modicon M340 and M580 Series PLC hardware, the Modicon Magelis OIT hardware, and the Inductive Automation Ignition HMI software. The Contractor will not be required to provide any software related to these platforms. However, if a piece of equipment has been approved and is being supplied with PLC hardware, OIT hardware or HMI software that is different than the Department's standard, the Contractor shall provide all licenses associated with the hardware or software. These licenses shall be in the Department's name and shall provide full functionality with the equipment or software that has been provided.

2.02 GENERAL PROGRAMMING REQUIREMENTS:

A. SLCDPU has developed programming standards to provide uniformity between control loops, processes and facilities. These standards should be followed by any vendor or integrator that is providing equipment and/or services for SLCDPU facilities.

B. Control Loops. A control loop is a single piece of equipment or a group of equipment that performs a specific function. Each control loop will have an associated loop number and description. Process Equipment and programming shall be divided into loops based upon their corresponding function. This allows the process to be neatly broken down into parts that are simple and logical. Multiple pieces of equipment should not have the same loop number.

C. Loop Numbers. Each control loop shall be assigned a unique number to set itself apart from all other loops.

D. Control Strategies. Each control loop shall have or be part of an associated control strategy. The control strategy is used to describe the function of each control loop in detail. Refer to Section 40 61 96 for the control strategies for this project.

E. Equipment and Instrumentation Tagging:

1. Equipment and instrumentation shall be tagged as shown on the P&IDs in the Contract Drawings. Instrumentation tagging follows the ISA-5.1-1984 standard where the tag has a functional identification letter code and then the loop number. The functional identification letter code should follow what is shown below in Table 40 68 00-1.

2. The functional identification of an instrument or its functional equivalent consists of letters from the below table and includes one first-letter (designating the measured or initiating variable) and one or more succeeding letters (identifying the functions performed).

3. The functional identification of an instrument is made according to the function and not according to the construction. Thus, a differential pressure transmitter used for flow measurement would be identified by FT and not PDT.

4. The succeeding letters of the functional identification designate one or more readout or passive functions and/or output functions. A modifying letter may be used, if required, in addition to one or more other succeeding letters. Modifying letters may modify either a first letter or succeeding letters, as applicable. Thus, TDAL contains two modifiers. The letter D changes the measured value T into a new variable, “differential temperature.” The letter L restricts the readout function A, alarm, to represent a low alarm only.

5. The sequence of identification letters begins with a first letter selected according to the table below. Readout or passive functional letters follow in any order, and output

functional letters follow these in any sequence, except that output letter C (control) precedes output letter V (valve), e.g., PCV, a self-actuated control valve. However, modifying letters, if used, are interposed so that they are placed immediately following the letters they modify.

6. The number of functional letters grouped for one instrument should be kept to a minimum according to the judgment of the user. The total number of letters within one group should not exceed four. All functional letters groups shall be reviewed by the Owner and Engineer for approval.

7. All letters of the functional identification are uppercase.

Table 40 68 00-1

Preceding Letters				Succeeding Letters		
Measured or Initiating Variable		**Modifier**		**Readout or Passive Function**	**Output Function**	**Modifier**
A	Analysis			Alarm		
B	Burner, Combustion			Emergency	User's Choice	User's Choice
C	Conductivity				Control	
D	Density or Specific Gravity	Differential				
E	Voltage			Primary Element		
F	Flow Rate	Ratio				
G	Gauge			Glass, Viewing Device		
H	Hand					High
I	Current (Electrical)			Indicate		
J	Power	Scan				
K	Time, Time Schedule	Time Rate Of Change			Control Station	
L	Level			Light		Low
M	Motor	Momentary		Moisture		Middle
N	Video			User's Choice	User's Choice	Normal
O	User's Choice			Orifice, Restriction		Open
P	Pressure, Vacuum			Point Connection		Stop
Q	Quantity	Integrate, Totalize

W	Weight, Force			Well		
X	Unclassified	X-Axis		Unclassified	Unclassified	Unclassified
Y	Event, State, or Presence	Y-Axis			Relay, Compute, Convert	
Z	Position, Dimension	Z-Axis			Driver, Actuator, Final Control Element	

F. Process and Instrumentation Diagrams (P&IDs). P&IDs for the project are found in the Contract Drawings and should be used as a basis for developing the programming for the system.

2.03 PLC PROGRAMMING REQUIREMENTS:

A. Vendor systems with PLCs shall be programmed by the vendor and factory tested prior to delivery to the site. Vendors shall become familiar with the requirements of this section.

B. Contractor furnished PLCs (not as part of a vendor package) shall be programmed by the Owner's System Integrator (OSI).

C. PLCs shall be programmed in accordance with the standards described herein to maintain consistency throughout the facility from one PLC to another. SLCDPU has standardized around the Modicon M340 & M580 series of PLCs which is programmed with Unity Pro software. Prior to starting any programming, coordinate with SLCDPU the version of Unity Pro software to be used for the project.

D. PLC Configuration. Each PLC shall be programmed with its own project within Unity. The project name shall be the name of the PLC as shown on the Contract Documents.

1. PLC Hardware Configuration. The PLC Hardware Configuration shall be setup by showing the modules that have been designed for each slot of each rack. The

arrangement of the modules shall be in an orderly fashion with space for future expansion. Redundant controllers consist of two identical racks with redundant power supplies, processors and Ethernet communication modules.

2. Additional racks shall be installed when additional I/O modules are required.

3. PLC Logic Structure. The program is written with tasks and any new program file has a default task called "MAST" that is by default Cyclic with a watchdog at 250ms. It is preferred that all logic reside under this default task and that programming be implemented so that periodic tasks are not required.

4. Routines: All PLCs shall have three types of routines: Internal, Loop, and Communication routines. Internal routines shall contain all the logic that is not directly related to process controls and/or communication. This would include miscellaneous logic like PLC Clock manipulation that may have nothing to do with the Process. Loop routines shall contain all logic used to directly control and/or monitor control loops as described by the Process Control Descriptions provided in 40 61 96 and as depicted on the P&IDs. Communication routines would include all the logic utilized to communicate with other PLCs, HMI machines, and Operator Interfaces. The names of these routines will use the prefixes: IXXXXX, LXXXXX, and CXXXXX respectively. XXXXX represents the number of the routine (or loop number); all routines will have names that adequately describe the logic contained within. For example, a communications routine to communicate with VFD's might be called C00001_VFDs. All routines shall be ordered in a structured and logical fashion. An example is shown in Table 40 68 00-2:

Table 40 68 00-2

Routine Name	Routine Description
C0001_Messaging	Contains the messages used in SCADA communications. If there is a lot of communications being handled by the PLC, it is preferred that multiple routines be implemented
I0001_PLC	Contains all the logic associated with monitoring the status of the PLC
L11210_BSSFeedPump2	Contains all the logic associated with the monitoring and control of BSS Feed Pump 2

Unity Pro allows for logic routines to be programmed with Ladder Diagrams (LD), Structured Text (ST), Function Block Diagrams (FBD) and Sequential Function Charts (SFC). While each has its place and may be utilized, it is preferred that logic be implemented in FBD's.

Routine Structure: Each control loop routine should be structured by having logic organized into the following order:

a. Map PLC or communications inputs and outputs to tag names

b. Loop alarm logic

c. Loop control logic including permissives and interlocks logic

d. Loop auxiliary functions such as run hours or flow total calculations

e. Common logic for when there is more than one piece of equipment

E. Tag Naming. All programming shall be done utilizing tag names or "Symbolic Variables" which do not require physical memory address assignments. The following tag naming convention shall be utilized:

1. Tags when interpreted on a P&ID often will have implied dashes such as FI-01212. Because Unity Pro doesn't allow tag names with dashes, dashes should be omitted when separating a letter and number (FI01212 for example) and underscores should be used when separating two letters or two numbers.

2. Prefixes for tags are created using the ISA Instrument Identification Table. A table of common prefixes is shown below in Table 40 68 00-3. If there are ISA prefixes that a programmer would like to use that do not appear on this list, they must be first approved by the Engineer.

3. If the tag is associated with a certain piece of equipment, the corresponding loop number must follow the prefix used in the tag.

4. If the tag is associated with a group of equipment, for example three RAS pumps, then common tag to all three pumps will use the loop number of lowest numeric value and the appropriate prefix.

5. If the tag is not associated with any physical equipment the PLC name shall be used. All dashes and the prefix "PLC" shall be deleted.

6. If two tags share the same name, they shall be appended with a capital letter starting at A, going in alphabetical order to Z. If there are more tags than letters of the alphabet succeeding tags will start back at A and double the corresponding letter creating tags appended with AA, BB, etc.

7. Tag arrays used for messaging shall use the names of the point of message origination.

8. Other arrays may be used when it simplifies the programming and configuration of the process. Naming for these arrays shall use the same naming convention as described for regular tags.

F. Derived Function Blocks (DFBs) should be utilized to keep PLC code simple and consistent from PLC to PLC. Example DFB's are:

1. ALRM (Alarm Block) – Generates an alarm condition if a certain condition is true for a preset amount of time. The alarm condition may be latched or self-healing.

2. RH (Run Hours) – Calculates run hours for a piece of equipment as well as last start/stop dates/times as well as number of starts and starts per hour.

G. Common Programming Procedures. The following programming methods shall be followed when developing PLC logic:

1. User Data Types: No user defined data types shall be used without approval from the Owner and Engineer. Data types shall be selected to best suit the application. Default data types shall be BOOL, DINT and REAL.

2. Documentation: The following requirements shall be met with regards to documentation:

    a. All tags that have been created in the program shall have a description associated with it that adequately describes the tag and its purpose.

    b. Rung comments shall be used to adequately describe the functions being performed.

3. Messaging: PLC to PLC communication will take place over the plant network. All PLCs will perform reads only. No PLC writes will be accepted without approval from the Engineer. Any control that requires network communications shall have associated logic for communications alarming and watchdog. In the event of a communications alarm, logic shall be written on a case-by-case basis to follow the safest and most logical consequence for that control strategy.

4. Alarming: Alarm priorities shall be set up for each alarm as indicated in the Process Control Descriptions Section 40 61 96. All alarms shall be announced on the HMI and be one of two types of alarms: latched or self-healing alarms. A latched alarm remains active even after the alarm condition clears until an operator uses the alarm reset pushbutton on the HMI. A self-healing alarm clears itself once the alarm condition clears. All alarms shall be generated in the PLC logic utilizing the ALMD function block. Process alarms for each piece of equipment shall be detailed in the corresponding loop description. In addition to process alarms each PLC will have the following alarms:

    a. AC Power Failure Alarm

    b. UPS Alarm

    c. DC Power Supply Alarms

    d. Communications Failure Alarm

    e. PLC Card Failure

    f. PLC Fault

5. Standard Logic: The following methods should be followed when writing PLC logic:

    a. Where possible, utilize derived function blocks to make programming the same between devices and to simplify the look and feel of the program.

    b. All analog inputs shall be scaled within the PLC logic to engineering units.

c. General Latched Alarms: All latched alarms will be latched through the ALRM function block and un-latched by using the appropriate Alarm Reset button on the HMI.

d. General Self-Healing Alarms: All self-healing alarms will be announced on the HMI. Once the alarm condition clears the alarm will clear itself and operation will proceed as normal. Self-Healing Alarms are most common when the operator is required to go to the equipment and reset the alarm locally.

e. Valve Fail to Open: All valves with an Open Command or Open/Close Command shall have a Valve Fail to Open alarm. This is a latched alarm.

f. Valve Fail to Close: All valves with a Close Command or Open/Close Command shall have a Valve Fail to Close alarm. This is a latched alarm.

g. Valve Position Failure: All modulating valves with position control shall have a Valve Position Failure Alarm. The position failure alarm occurs when the Position Indication and Position Control are not within a specified tolerance for a specified delay time. This is a latched alarm.

h. Fail to Start: All equipment with start commands from the PLC shall have a Fail to Start Alarm. This is a latched alarm.

i. Fail to Stop: All motors with start commands from the PLC shall have a Fail to Stop Alarm. This is a latched alarm.

j. Speed Failure: All motors with speed control shall have a speed failure alarm. The speed failure alarm condition occurs when the Speed Indication and Speed Control are not within a user specified tolerance for a user specified delay time. This is a latched alarm.

k. Equipment Ready: All equipment with Start/Stop controls shall have a ready status. The ready status is energized if and only if no alarm conditions are present and the local switch is in remote. The ready status signifies that the equipment is ready to be controlled by SCADA.

l. Equipment Interlocks: Means shall be provided for equipment that is controlled by the PLC to have software interlocks to prevent the equipment from operating. The HMI shall display if an interlock is preventing it from operating.

m. Equipment Hours & Starts: Equipment that "runs" shall have the RH function block programmed for accumulating run hours, tracking starts and start/hour and allowing the operator to see the last time the equipment was started and stopped.

6. Instrument Alarms: By default instruments that provide an analog signal to the PLC shall have Lo-Lo, Low, High and Hi-Hi alarm logic with set points that are adjustable at the HMI.

2.04 OIT PROGRAMMING REQUIREMENTS:

A. Operator Interface Terminals (OITs) are typically provided at the machine level where a local interface is required in the process area. When an OIT is required it shall be programmed as follows:

1. Develop a main page with system status, alarm status and navigation. The main page shall include the date and time and have a button to allow the operator to update the date and time.

2. The OIT shall have user security with viewer, operator and supervisor usernames and passwords. When logged in as viewer (default), the user may see all the pages but does not have any control. When logged in as operator, the user may be able to control the system and change set points that are commonly changed. When logged in as supervisor, the user may control the system and change all set points.

3. The OIT shall have an alarm page that shows current alarms. Alarms may be acknowledged and reset from this screen. The screen shall be synced with the plant HMI system so that alarm acknowledgement may occur at either location and reflect the acknowledgement on both systems. A separate page shall show an alarm history.

4. The OIT shall have additional pages for the process and equipment for which the OIT is monitoring and controlling.

5. Fonts – The font shall typically be Arial size 13 except for titles that may have larger font.

6. Colors – The following color scheme shall be followed:

a. Static text – Gray or Black

b. Status text – Blue

c. Control text – Green

d. Equipment Status – Off – Red; On – Green

e. Valve Status – Closed – Red; Open – Green; Traveling Closed – Blinks between purple and red; Traveling Open – Blinks between purple and green; not travelling and not closed or opened: Purple

f. Alarms – If an instrument or piece of equipment has an alarm condition, it should blink between its normal color and yellow.

2.05 HMI PROGRAMMING REQUIREMENTS:

A. All HMI programming will be performed by the OSI.

B. General. The SCADA system shall be developed based upon the Inductive Automation's Ignition software platform. The core of the system consists of two SCADA servers that are redundant with each other. These SCADA servers host the database and I/O drivers for gathering the tags from the PLC's throughout the Facility. Separate servers are setup as SCADA historians, which collects data from selected tags and records that data to a historical database. The historian software utilizes Microsoft SQL Server and the SCADA servers push historical data into the SQL database. That data is then used for generating trends and reports. All SCADA clients are launched from a network connection established to either of the SCADA servers.

C. Network Configuration. The SCADA network shall be physically separate from all other networks. Only workstations connected to the SCADA network shall be allowed to launch SCADA clients. A firewall separates the SCADA servers from the historian and another firewall separates the historian from the SLCDPU network. This configuration allows SLCDPU to obtain historical data through the firewall. The SCADA servers are in separate buildings with dedicated, redundant connections between each other. The SCADA network is setup as a simple workgroup and IP address assignment should be coordinated with the OSI.

D. Software Installation. Each SCADA server shall be a Windows Server (coordinate the OS version with SLCDPU) and shall have the latest version of the Java Runtime Environment (JRE) installed. Typically, the latest version of Ignition is installed as well but this should be coordinated with SLCDPU. The Historian shall have Microsoft SQL Server Standard installed (coordinate the version with SLCDPU) with licensing based upon the number of cores in the server. All SCADA computers should have their clocks synchronized and be setup with automatic backups of all pertinent files.

E. SCADA Project Setup. The Ignition servers can run multiple projects but generally only one project is required. The project should be named appropriately for the facility that it is being setup for. Each project is assigned an authentication profile, a default database and tag provider.

F. Redundancy Configuration. Ignition redundancy is setup as a Master server and a Backup server. If the Master server goes down or is disconnected the Backup should take over. Then when the Master server is back online it will take over again as the Master.

G. SCADA System Security. Each Ignition server setup shall have security installed to prevent unauthorized users to access the system. The system shall have an audit log setup that records all user transactions to SQL Server. Security shall be setup so that users may be granted access to areas with varying security levels. Areas are generally setup by process area or location. Security levels (also called roles) by default are set as level 10 – Operator; Level 20 – Supervisor; Level 30 – Administrator. Additional levels may be added on an as needed basis. For example, if a separate Operator II level is desired, this

would be assigned to Level 11. Each SCADA tag that has control functions shall be assigned a security access area and level. Each view client shall be setup to auto logout after a preset time (default shall be 10 minutes) to a view-only account called "Viewer". The "Viewer" account shall be setup to allow the operator to view all the SCADA screens but not to perform any control functions.

H. SQL Database Configuration. Ignition connects to as many SQL databases as needed for the project. The default database should be called "SQL01" in Ignition and "ignition_SQL01" in SQL Server. Additional databases would increment in number as needed. The database is setup into different tables some of which are automatically generated by the project. Tables are used for alarm history, security audit log, operator logs, equipment logs, historical data and report data.

I. Alarm Configuration. The SCADA System shall be setup to provide an alarm alerting system that alerts and displays to operators any new or acknowledged alarms. In addition, an alarm history shall allow the operator to see alarms from any chosen previous date and time. Alarms shall be categorized by area or process like the above described security areas.

J. Alarm Notification – Voice Notification. Each alarm condition that is programmed within the SCADA System shall be configurable to notify the operator via a phone call if the alarm occurs. The system shall be setup with an on-call roster and schedule so that the voice notifications are routed to the right phone numbers.

K. I/O Drivers. Ignition is setup with OPC-UA and OPC-DA servers for connecting to devices such as PLC's to monitor and control those devices. Each device shall be strategically named and shall be setup for tag name queries. For Modicon PLC's, the Modicon OPC Factory Server (OFS) shall be utilized to accomplish this. Associated with each PLC shall be a scan class for that device that determines how often the device is polled for data.

L. Tag Database Development:

1. General. SCADA System tags shall be well organized into folders for each process control loop. Parent folders shall contain the facility and process area, location or PLC. Often folders are preceded by a number so that the folders are in process order. An example path to a control loop folder might be: "BCWTP/PLC0901/L0021_ReturnClearWellLevel". Here the facility is Big Cottonwood Water Treatment Plant (BCWTP), the PLC is PLC0901 and the control loop is 0021. Each control loop folder should contain all the tags necessary to monitor and control that loop.

2. Data Types. So that similar tags are consistently the same from one loop to another, Data Types shall be utilized. A Data Type is a tag structure that may consist of one or more individual tags. Typically, the tag structures are like the PLC Derived Function Blocks (DFBs) as described in the PLC programming section. They will

include all the necessary tags from the DFB plus additional internal tags that assist in the monitoring and control of the control loop.

3. Client Tags. Client tags are used for functions that are unique to each Ignition client. Uses include custom user settings, screen settings and security settings.

4. System Tags. System tags are used to show information about the SCADA software. Use these tags to show status of the system, including communications to devices, redundancy health, system date and time, system performance, database connectivity and alarm status.

M. SCADA Screen Development:

1. General. SCADA screens are the mechanism by which operators may monitor and control the facility. It is crucial that they are accurate and therefore each component on each screen should be thoroughly tested and debugged. To maintain consistency throughout SLCDPU's facilities, the following standards for screen development should be followed.

2. Templates. To maintain consistency throughout the SCADA screens, templates shall be used. Wherever there is commonality between display components a template will allow for those components to always be displayed in the same manner. Ignition allows templates to be nested which is a very powerful feature. Templates should be developed for basic building blocks such as pumps, valves, pipes, equipment, discrete displays, numeric displays, control buttons, numeric set points, etc. The combination of these building blocks should help to build more sophisticated templates for popups such as alarm status/configuration, motor status/configuration, PID controllers, alternators, instrument display/configuration, etc. See Figure 2.4.1 for an illustration of a set of templates. This is an example popup screen that has a template for each pump that has nested templates for discrete status, motor run hour information, motor control buttons and alarm configuration. The popup also has templates for pump alternation, PID control and numeric set points. These same templates are used throughout the screens so that they provide consistency to the operator.

3. SCADA Screen Standards. The following standards shall be followed when developing the SCADA screens:

a. Screen Size – Screens shall be developed for wide screen monitors with HD resolution (1920x1080). The development of the screens shall account for the Windows menu on the bottom of the screen as well as application borders.

b. Windows shall automatically resize if the monitor's resolution is something other than 1920x1080.

c. Fonts – The font shall typically be Arial size 13 except for titles that may have larger font.

d. Colors – The following color scheme shall be followed:

(1) Static text – Gray Black

(2) Status text – Blue

(3) Control text – Green

(4) Equipment Status – Off – Red; On – Green

(5) Valve Status – Closed – Red; Open – Green; Traveling Closed – Blinks between purple and red; Traveling Open – Blinks between purple and green; not travelling and not closed or opened: Purple

(6) Alarms – If an instrument or piece of equipment has an alarm condition, it should blink between its normal color and yellow.

e. Navigation – The user shall have the ability to navigate through the SCADA screens by using the top menu and navigation tree (described below). In addition, buttons should be located on individual windows to allow for navigation to other screens and to open popups. The system shall be setup for a "viewer" mode which when the operator isn't logged in navigation is still allowed but all control functions on all screens are disabled. Each control loop within the system should have an associated popup screen (popup screens may contain information from multiple control loops). Typically, the operator would click on the equipment as it is displayed on the screen to open the popup for that equipment.

4. Windows:

a. Top Menu – Across the top of the screen shall be a top menu. This menu is always visible to the operator. The menu shall have the following functionality:

(1) The SLCDPU logo which when pressed opens the main overview screen.

(2) A back arrow that when pressed opens the previously opened window.

(3) A forward arrow that when pressed returns to the original screen that was open after the Back button was pressed.

(4) An Alarms button and symbol that flashes red if an unacknowledged alarm exists (a number should also appear indicating the number of unacknowledged alarms present). When pressed the Alarms window is opened.

(5) A Trends button and symbol that when pressed opens the Trends window.

(6) A Logs button that opens the operator log window

(7) A Reports button and symbol that when pressed opens the Reports window.

(8) A Comms button and symbol that when pressed opens the Communications window.

(9) A Login/Logout button and text that shows the current user that is logged into the system and when pressed open a popup window that allows the operator to login or logout or to switch to the viewer user.

(10) The system date and time shall be displayed on the menu.

b. Navigation Tree – Along the left side of the screen shall be a navigation tree. This tree is always visible to the operator. The tree gives the operator the ability to open all project windows for the facility. It is possible that the tree takes up all the space on the left of the screen if there are a lot of windows in the project. If there are not a lot of windows and there is some space below the tree, then key process information should be shown below the tree.

c. Overview Screen – When the Ignition Client is launched, and the operator logs in for the first time, the Menu, Navigation Tree and main Overview Screen should always be displayed. Clicking on the SLCDPU logo on the Menu will always return the operator to the Overview Screen. The Overview Screen should be a process diagram of the facility. The goal of this window is to show the operator as much information as possible about the facility's overall operation.

d. Standard Windows:

(1) Alarms – The alarms screen is where the operator goes to look at current and past alarms. The screen should be divided into five tabs as follows:

(a) Tab #1 – Active Alarms – This primary tab shows any unacknowledged alarms and acknowledged alarms that have not yet been cleared. Each alarm shall indicate if it has been acknowledged and if so by whom, it shall have the time the alarm became active, an alarm description, current state and active duration. Only operators that are logged in shall be able to acknowledge alarms. In addition, alarms may be shelved by the operator. When shelving an alarm, a dropdown will allow the operator to select for how long the alarm should be shelved for.

(b) Tab #2 – Alarm History – This tab shows a history of alarms which includes when the alarm when active, when it was acknowledged and when it was cleared. A calendar tool at the bottom of the page will allow the operator to view alarm history with specific start and stop dates and times.

(c) Tab #3 – Disables Alarms – This tab shows any alarms in the system that have been disabled by an operator.

(d) Tab #4 – Suppressed Alarms - This tab shows any alarms in the system that have been suppressed by an operator.

(e) Tab #5 – Out of Service – This tab lists any equipment that has been taken out of service by an operator.

The Alarms screen shall have a button called "Test Alarm" that allows the operator to turn on a test alarm to make sure that the alarming system is properly working.

(2) Trending – The trending screen allows operators to view custom and/or saved trends for the facility. The screen shall utilize Ignition's "Ad Hoc Trend" tool which is preconfigured with tag picking from the Historian, date/time selection and buttons with various trending tools.

(3) Communications – The communications screen allows operators to view the architecture of the SCADA system. All devices that are connected to the SCADA system with a communications link (typically an Ethernet link) shall be shown on this screen. Status of the communication of each device is shown and alarms are triggered if communications are lost with each of the devices. PLC's shall show their current state (running, stopped or faulted) and system clock. PLC clocks should automatically synchronize with the primary SCADA server's clock. If a PLC clock is not properly synchronized with the SCADA server, an alarm is triggered. Statistical information should be shown for each PLC in the system.

(4) Logs – The logs screen is a location for operators to view various logs that are being kept through the SCADA software as well as give the operator the ability to enter their own logs. The logs screen shall have a set of tabs for each log that has been configured. What is shown in the example screen is typical but additional logs may be implemented when needed. The first tab is the "Area" log. This is where operators enter logs for areas within the facility. The second tab is the "Equipment" log. This log is for each piece of equipment in the facility. When a piece of equipment is put into service or taken out of service a log entry is automatically added to this log. In addition, the operator may add custom equipment logs when needed. The third tab is the

"Audit log". This log is automatically generated by the Ignition software and reports when operators log in, log out, acknowledge alarms and make control or set point changes on the SCADA screens. The fourth tab is the preventative maintenance "SCADA PM's log. This log is a table of preventative maintenance tanks for each asset in the facility and is used to interact with the facility's asset management software.

(5) Reports – The Reports screen is where the operator goes to setup, view, print and/or obtain data related to the facility's process.

e. Project Windows – The project windows allow the operator to see how each control loop within each process of the facility is functioning and provides access to control loop popups which allow the operator to make control and set point changes. The screens shall be designed in a 2-dimensional process flow diagram manner. Wherever possible, the diagram shall also be laid out in the same orientation as the equipment is physically installed at the facility. When developing project windows, the programmer shall hold screen development workshops with the Owner and Engineer. In the initial workshop the programmer shall present his or her ideas on how the project windows should look and obtain input from the Owner and Engineer. Then the programmer will develop the first draft of all project windows as which point a subsequent workshop will be held and the screens presented. Final modifications will be implemented and then a final workshop should be held. In the final workshop the screens should be presented in a fully functional Ignition client with simulated data.

f. Popups – The programmer shall develop popups for the project so that monitoring and control of each control loop throughout the system is properly achieved. Popups may be unique or may be templates that are interchangeable. Because of the HD resolution of the monitors, popups may be small or large depending on process/system and Owner preference.

5. There shall be a plant overview HMI screen that graphically depicts the plant and allows for logical navigation to each process area through buttons.

6. Each area should generally have three layers of depth that can be clicked into for more details:

   a. Process area overview

   b. Subsystem process view

   c. Detailed view (if required)

7. Each area will have a process overview screen with main status and control available – a point should be included on the area overview generally if the point will be checked or monitored once per 4 hours.

8. Each process area subsystem or control loop should be logically grouped based on the process, functionality, and interactions in the subsystem process view screens. The process area overview screen shall have buttons near the associated process graphics to navigate to the subsystem process view screen. Most status and set points shall be able to be viewed and set from this screen. In areas with complex control loops that cannot fit on one screen with sufficient whitespace, general status and controls will be shown and a button will be provided to navigate to a further detailed view for all available status and control points.

PART 3 - EXECUTION

3.01 PREPARATION:

A. The Contractor is responsible for all factory testing in accordance with Section 40 61 13 and Section 40 61 21.

3.02 INSTALLATION:

A. Provide in accordance with Section 40 61 13.

3.03 FIELD TESTING:

A. Provide in accordance with Section 40 61 21.

3.04 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

Page Intentionally Left Blank

SECTION 40 70 00

INSTRUMENTATION FOR PROCESS SYSTEMS

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide Instrumentation for Process Systems as specified in this section and in compliance with related detailed instrumentation specification sections and Contract Documents.

B. The Work of this section includes the provision of instrument data sheets for all instruments supplied for this project. The contractor shall provide an as-constructed instrument data sheet for each instrument supplied for this project based on the ISA S20 standard for instrument specification forms.

C. Refer to Section 40 61 13 for additional requirements related to instrument specification sheets.

1.02 REFERENCES:

A. International Society of Automation (ISA):

1. S5.1: P&IDs and Tagging

2. S5.4: Instrument Loop Diagrams

3. S7: Instrument Air

4. S12: Electrical Equipment for Hazardous Locations

5. S18.2: Alarm Management

6. S20: Instrument Specifications

7. S50: Electrical Control Signals

8. S75: Control Valve Design, Specification and Testing

9. S96: Valve Actuators

10. S99: Control System Cyber Security

11. 101: Human-Machine Interfaces

1.03 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

1. Prepare and submit Instrument Data Sheets for each instrument supplied for this project in accordance with the ISA S20 standard. Clearly indicate all pertinent data for the respective instrument on the data sheets and clearly indicate any deviations from specified requirements. The completed Instrument Data Sheets shall be submitted together with and form an integral part of the instrumentation shop drawings specified in this division.

1.04 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.05 SPARE PARTS:

A. Comply with the requirements specified in Section 01 61 00.

1.06 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

1.07 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

PART 2 - PRODUCTS

2.01 INSTRUMENTATION INDEX:

A. The table provided in this section is an itemized list of instrumentation to be supplied for this project. The instrumentation index provides detailed information for the tagged instrumentation devices shown on the P&ID diagrams and HVAC schematic diagrams.

B. The Instrumentation Index also provides references to the service conditions, P&ID drawing, instrumentation specification section, wiring diagrams, standard details, and location drawings.

PART 3 - EXECUTION

3.01 INSTRUMENT DATA SHEETS:

A. Contractor shall update the Instrument Data Sheets to reflect all changes in the work, and as required based on shop drawings that have been returned from the Engineer with a “No Exceptions Taken” or “Make Corrections Noted” status.

B. The as-constructed set of instrument data sheets shall be included in the O&M manual submittal.

3.02 INSTRUMENT INDEX:

A. Contractor shall update the Instrument Index to reflect all changes in the work, and as required based on shop drawings that have been returned from the Engineer with a “No Exceptions Taken” or “Make Corrections Noted” status.

B. The as-constructed Instrument Index shall be included in the O&M manual submittal.

3.03 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

SECTION 40 71 00

FLOW MEASUREMENT

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide flow measurement instrumentation as specified in this section and in compliance with Section 40 70 00 and other related sections and Contract Documents.

B. The Work of this section includes the provision of instrument data sheets for all instruments supplied for this project. The contractor shall provide an as-constructed instrument data sheet for each instrument supplied for this project based on the ISA S20 standard instrument specification forms.

C. Refer to Section 40 61 13 for additional requirements related to instrument specification sheets.

1.02 REFERENCES:

2. S5.4: Instrument Loop Diagrams

3. S7: Instrument Air

4. S12: Electrical Equipment for Hazardous Locations

5. S18.2: Alarm Management

6. S20: Instrument Specifications

7. S50: Electrical Control Signals

8. S75: Control Valve Design, Specification and Testing

9. S96: Valve Actuators

10. S99: Control System Cyber Security

11. 101: Human-Machine Interfaces

1.03 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Submit shop drawings for each specified instrument together with a completed Instrument Data Sheet in accordance with ISA S20 standard.

1. Each instrumentation submittal shall include a copy of the respective specification section marked up to show compliance or non-compliance with specified requirements. Provide written justification for any non-compliance features.

1.04 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.05 SPARE PARTS:

A. Comply with the requirements specified in Section 01 61 00.

1.06 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

1.07 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

PART 2 - PRODUCTS

2.01 MAGNETIC IN-LINE FLOW METERS

A. Magnetic in-line flow meters provided for this project shall all be sourced from the same manufacturer and in compliance with this specification.

1. Each magnetic flow meter and signal converter shall be tagged in accordance with the Instrumentation Index and as shown on the P&ID and HVAC Schematic drawings.

2. Flow tubes shall be flanged and lined full-lay-length flow tube suitably rated for the respective process piping pressure rating.

3. Flow tube sizes shall generally be as shown on the contract drawings. Notify the Engineer if the proposed flow meter size will result in flow velocity lower than 1 ft/sec or greater than 16 ft/sec during normal operation.

4. Liner material shall be selected for compatibility with the process application chemical characteristics and operating temperature range.

5. Measuring electrodes and built-in grounding electrodes shall be 316SS bullet-nose unless an alternate material is required for application specific chemical resistance.

6. Line size 316SS grounding/protection rings shall be provided for applications with abrasive slurries and where the process piping system is non-conductive or has a non-conductive liner.

7. Signal converters shall be suitable 120 VAC power supply or as otherwise specified and shall have an accuracy of 0.5 percent of calibrated span or better. Outputs shall include 4-20 maDC analog and a Totalizer Pulse output as a minimum.

8. Provide remote wall mounted signal converters with pre-terminated power and signal cables to facilitate installation of the signal converter at 5.5 feet above finished floor. The signal converter may be mounted directly to the flow tube where the installed height of the signal converter display is between 4 feet – 6 feet above finished floor.

B. The flow tube, signal converter, and related ancillaries shall have environmental ratings suitable for their respective process areas. In no case shall the flow tube or signal converter environmental rating be less than NEMA 4X.

C. Suitable manufacturers of magnetic flow meters include;

1. Siemens

2. Endress + Hauser

3. ABB

2.02 DOPPLER FLOW METERS:

A. Doppler flow meters provided for this project shall all be sourced from the same manufacturer and in compliance with this specification.

2.03 TRANSIT TIME FLOW METERS:

A. Transit Time flow meters provided for this project shall all be sourced from the same manufacturer and in compliance with this specification.

2.04 OPEN CHANNEL FLOW METERS:

A. Open Channel flow meters provided for this project shall all be sourced from the same manufacturer and in compliance with this specification.

2.05 FLOW SWITCHES:

A. Flow switches provided for this project shall all be sourced from the same manufacturer and in compliance with this specification.

PART 3 - EXECUTION

3.01 QUALIFICATIONS:

A. Flow meters are to be set up, configured, and calibrated by Journeyman instrumentation technician working under the approval of the instrument manufacturer.

3.02 INSTALLATION:

A. Install primary flow elements and signal converters in accordance with manufacturer's installation instructions.

1. For magnetic flow meters, flow tubes shall be installed in a designated "meter run" comprising a minimum upstream straight pipe length of 5D and downstream straight pipe length of 3D of the nominal pipe diameter. There shall be no valves, bends, tees, process taps, chemical injectors or other flow disturbing fittings located within the Meter Run.

3.03 CALIBRATION:

A. Refer to the Instrumentation Index for instrument operating conditions, ranges, setpoints, and alarms.

B. Flow meters shall be factory pre-calibrated and calibration shall be verified on site.

C. Provide printed calibration reports of the factory calibration and as-commissioned in-situ calibration check including all smart device configuration parameters.

1. In line liquid flow meter calibrations shall be verified in-situ using volumetric draw down or similar test approved by the Engineer.

D. Submit calibration reports for review by the Engineer and include copies of reviewed and accepted calibration reports in the O&M manuals.

3.04 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 40 72 00

LEVEL MEASUREMENT

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide level measurement instrumentation as specified in this section and in compliance with Section 40 70 00 and other related sections and Contract Documents.

B. The Work of this section includes the provision of instrument data sheets for all instruments supplied for this project. The contractor shall provide an as-constructed instrument data sheet for each instrument supplied for this project based on the ISA S20 standard instrument specification forms.

C. Refer to Section 40 61 13 for additional requirements related to instrument specification sheets.

1.02 REFERENCES:

A. International Society of Automation (ISA):

1. S5.1: P&IDs and Tagging

2. S5.4: Instrument Loop Diagrams

3. S7: Instrument Air

4. S12: Electrical Equipment for Hazardous Locations

5. S18.2: Alarm Management

6. S20: Instrument Specifications

7. S50: Electrical Control Signals

8. S75: Control Valve Design, Specification and Testing

9. S96: Valve Actuators

10. S99: Control System Cyber Security

11. 101: Human-Machine Interfaces

1.03 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Submit shop drawings for each specified instrument together with a completed Instrument Data Sheet in accordance with ISA S20 standard.

1. Each instrumentation submittal shall include a copy of the respective specification section marked up to show compliance or non-compliance with specified requirements. Provide written justification for any non-compliance features.

1.04 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.05 SPARE PARTS:

A. Comply with the requirements specified in Section 01 61 00.

1.06 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

1.07 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

PART 2 - PRODUCTS

2.01 ULTRASONIC LEVEL METERS:

A. Ultrasonic level meters provided for this project shall all be sourced from the same manufacturer and in compliance with this specification.

1. Each ultrasonic level transmitter and corresponding transducer shall be tagged in accordance with the Instrumentation Index and as shown on the P&ID and HVAC Schematic drawings.

2. Level transmitters shall be suitable 120 VAC power supply and shall have an accuracy of 0.5 percent of calibrated span or better.

3. The transmitter shall be a smart programmable type with local display and keypad. Provide a hand-held programming tool with the transmitter.

4. Outputs shall include 4-20 mA DC analog and three programmable relay outputs as a minimum.

5. The transducer model shall be selected for optimum performance at the required measurement range and process vessel configuration for each application.

6. Provide transducer with pre-terminated signal cable of adequate length to facilitate installation of the transmitter at 5.5 feet above finished floor and with enough slack to facilitate sensor removal and inspection without requiring cable disconnection. Supply a minimum cable length of 15 feet.

    a. Junction boxes are not permitted in the Influent Pumping Station Raw Water Wet Wells. For instruments located in the wet wells, provide a cable of sufficient length to suit an initial termination point exterior to the well.

7. Design the transducer mounting bracket(s) and/or stilling well to ensure that the sensor is mounted at least 12 inches above the maximum possible liquid level. Where potential sensor flooding is anticipated, provide the sensor with a flood proof hood.

8. Provide a stilling well for the transducer in accordance with the manufacturers recommendations where the process vessel has turbulent liquid surface conditions, floating foam, floating debris, or when there are stationary objects in the transducer beam path. Stilling wells shall have flanged transducer mounting to facilitate transducer maintenance activities.

B. The transmitter, transducer, cabling and related ancillaries shall have environmental ratings suitable for their respective process areas. In no case shall the transmitter, transducer, or cabling environmental rating be less than NEMA 4X.

1. Devices installed within the Influent Pumping Station Raw Water Wet Wells must carry an intrinsically safe designation and be provided with all required accessories (IS barrier etc.) for a complete IS installation.

C. Suitable manufacturers of ultrasonic level meters include:

1. Siemens Milltronics MultiRanger

2. Endress+Hauser

3. Vega

2.02 RADAR LEVEL METERS:

A. Radar level meters provided for this project shall all be sourced from the same manufacturer and in compliance with this specification.

1. Each radar level transmitter and corresponding antenna shall be tagged in accordance with the Instrumentation Index and as shown on the P&ID and HVAC Schematic drawings.

2. Level transmitters shall be pulsed radar type suitable for 24VDC loop power supply and shall have an accuracy of plus or minus 0.1 percent of calibrated span or better.

3. The transmitter shall be a smart programmable type with local display and programming keypad.

4. Outputs shall include 4-20 mA DC analog and three programmable relay outputs as a minimum.

5. The antenna model shall be selected for optimum performance at the required measurement range and process vessel configuration for each application. The antenna shall include a quick-disconnect feature to facilitate maintenance.

6. Provide antenna with pre-terminated signal cable of adequate length to facilitate installation of the transmitter at 5.5 feet above finished floor and with enough slack to facilitate sensor removal and inspection without requiring cable disconnection. Supply a minimum cable length of 15 feet.

    a. Junction boxes are not permitted in the Influent Pumping Station Raw Water Wet Wells. For instruments located in the wet wells, provide a cable of sufficient length to suit an initial termination point exterior to the well.

7. Design the antenna mounting bracket(s) and/or stilling well to ensure that the sensor is mounted at least 300 mm above the maximum possible liquid level. Where potential sensor flooding is anticipated, provide the sensor with a flood proof hood.

8. Provide a 316SS stilling well for the transducer in accordance with the manufacturers recommendations where the process vessel has turbulent liquid surface conditions, floating foam, floating debris, or when there are stationary objects in the transducer beam path. Stilling wells shall have flanged transducer mounting to facilitate transducer maintenance activities.

9. Orient the antenna rotationally such that non liquid and indirect reflections are minimized.

B. The transmitter, antenna, cabling and related ancillaries shall have environmental ratings suitable for their respective process areas. In no case shall the transmitter, transducer, or cabling environmental rating be less than NEMA 4X.

    1. Devices installed within the Influent Pumping Station Raw Water Wet Wells must carry an intrinsically safe designation and be provided with all required accessories (IS barrier etc.) for a complete IS installation.

C. Suitable manufacturers of radar level meters include:

1. Magnetrol Pulsar

2. Endress+Hauser

3. VEGA

2.03 LASER LEVEL METERS:

A. Laser level meters provided for this project shall all be sourced from the same manufacturer and in compliance with this specification.

2.04 SUBMERSIBLE HYDROSTATIC LEVEL METERS:

A. Submersible Hydrostatic level meters provided for this project shall all be sourced from the same manufacturer and in compliance with this specification.

1. Each submersible level transmitter shall be tagged in accordance with the Instrumentation Index and as shown on the P&ID and HVAC Schematic drawings.

2. Level transmitters shall be submersible hydrostatic type suitable for 24VDC loop power supply and shall have an accuracy of plus or minus 0.2 percent of calibrated span or better.

3. The transmitter shall be factory calibrated type with the span preset for each application.

4. Provide a sensor protection cap to prevent accidental diaphragm damage.

5. Output shall be 4-20 maDC loop powered analog. Provide sensor with pre-terminated signal cable of adequate length to facilitate installation of the termination box 5.5 feet above finished floor and with enough slack to facilitate sensor removal and inspection without requiring cable disconnection. Supply a minimum cable length of 15 feet.

6. Provide a stilling well for the transducer in accordance with the manufacturers recommendations where the process vessel has turbulent conditions or where the sensor is installed in close proximity to pumps or tank mixers. Stilling wells shall have flanged transducer mounting to facilitate transducer maintenance activities. Suspend the transducer from the mounting flange using sensor manufacturer's standard cable grip fitting. Suspend the sensor 4 inches above the tank bottom and record the zero offset in the calibration report.

B. The transmitter, cabling and related ancillaries shall have environmental ratings suitable for their respective process areas. In no case shall the transmitter, or cabling environmental rating be less than NEMA 4X.

C. Suitable manufacturers of submersible level meters include:

1. Endress+Hauser

2. KPSI

3. General Electric

2.05 LEVEL SWITCHES:

A. Float level switches provided for this project shall all be sourced from the same manufacturer and in compliance with this specification.

1. Float switches shall have SPDT output contacts rated for pilot duty.

2. Provide polypropylene float casing with pre-terminated signal cable. Float switch density shall be selected for optimal performance in the specified process liquid.

3. Extension cable shall be 3 conductor 50 foot length

a. Junction boxes are not permitted in the Influent Pumping Station Raw Water Wet Wells. For instruments located in the wet wells, provide a cable of sufficient length to suit an initial termination point exterior to the well.

B. The level switch, cabling and related ancillaries shall have environmental ratings suitable for their respective process areas. In no case shall the transmitter, or cabling environmental rating be less than NEMA 4X.

1. Devices installed within the Influent Pumping Station Raw Water Wet Wells must carry an intrinsically safe designation and be provided with all required accessories (IS barrier etc.) for a complete IS installation.

C. Suitable manufacturers of level switches include:

1. FLYGT ENM-10 with Flygt cable holders and anti-sway rings

2.06 OPTICAL LEVEL SWITCHES:

A. Optical level switches provided for this project shall all be sourced from the same manufacturer and in compliance with this specification

1. Optical switches shall have SPST output contacts rated for pilot duty

2. Provide PFA Teflon float casing with pre-terminated signal cable.

3. Cable shall be 4 conductor 10 foot length with PFA Teflon jack.

4. Provide all fittings and mount to install sensor in location indicated on drawings.

B. The optical level switch, cabling and related ancillaries shall have environmental ratings suitable for their respective process areas. In no case shall the transmitter, or cabling environmental rating be less than NEMA 4X.

C. Suitable Manufacturers of optical level switches include:

1. Flowline Switch-Tek LO10 and associated fittings

PART 3 - EXECUTION

3.01 QUALIFICATIONS:

A. Flow meters are to be set up, configured, and calibrated by Journeyman instrumentation technician working under the approval of the instrument manufacturer.

3.02 INSTALLATION:

A. Install primary level sensors and transmitters in accordance with manufacturer's installation instructions and as described herein.

1. Where possible, locate instruments near an access hatch or manway to facilitate testing and maintenance activities.

2. For ultrasonic level transmitters, the transducer shall be mounted at least 1 ft above the maximum liquid level.

3. Stilling wells shall be fabricated from a continuous length of PVC pipe with no seams or joints. The stilling well diameter shall be selected to accommodate the level sensor OD and manufacturer's recommendations.

4. Stilling wells shall have a flanged sensor mounting 1 foot above vessel cover or finished floor level, 1inch vent hole located above the maximum liquid level, and a 45 degree slash-cut bottom (refer to standard details).

5. Where Ultrasonic or Radar sensors are used in round process vessels, the sensor shall be located at 1/3 of the tank diameter away from the tank wall.

6. Level switches shall be suspended from mounting brackets fabricated from 316 stainless steel. Suspend floats from the mounting brackets using J hooks and float manufacturer's cable grips. Provide anti-sway rings for all float cables longer than 6 feet. Maximum spacing of anti-sway rings is 6 feet.

3.03 CALIBRATION:

A. Refer to the Instrumentation Index for instrument operating conditions, ranges, setpoints, and alarms.

B. Level meters shall be factory pre-calibrated and calibration shall be verified on site.

C. Provide printed calibration reports of the factory calibration and as-commissioned in-situ calibration check including all smart device configuration parameters.

1. In line liquid flow meter calibrations shall be verified in-situ using volumetric draw down or similar test approved by the Engineer.

2. Level meters shall be verified in-situ by adjusting the actual liquid level and verifying the measurement against a manual level measurement to a known structural or other fixed reference point such as the vessel bottom or top of access cover.

3. Level switches shall be verified in-situ by adjusting the actual liquid level and verifying the trip point against a manual level measurement to a known structural or other fixed reference point such as the vessel bottom or top of access cover

D. Submit calibration reports for review by the Engineer and include copies of reviewed and accepted calibration reports in the O&M manuals.

3.04 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 40 73 00

PRESSURE, STRAIN, AND FORCE MEASUREMENT

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide pressure, strain, and force measurement instrumentation as specified in this section and in compliance with Section 40 70 00 and other related sections and Contract Documents.

B. The Work of this section includes the provision of instrument data sheets for all instruments supplied for this project. The contractor shall provide an as-constructed instrument data sheet for each instrument supplied for this project based on the ISA S20 standard instrument specification forms.

C. Refer to Section 40 61 13 for additional requirements related to instrument specification sheets.

8. S75: Control Valve Design, Specification and Testing

9. S96: Valve Actuators

10. S99: Control System Cyber Security

11. 101: Human-Machine Interfaces

1.03 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Submit shop drawings for each specified instrument together with a completed Instrument Data Sheet in accordance with ISA S20 standard.

1. Each instrumentation submittal shall include a copy of the respective specification section marked up to show compliance or non-compliance with specified requirements. Provide written justification for any non-compliance features.

1.04 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.05 SPARE PARTS:

A. Comply with the requirements specified in Section 01 61 00.

1.06 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

1.07 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

PART 2 - PRODUCTS

2.01 PRESSURE AND DIFFERENTIAL PRESSURE GAUGES:

A. Pressure gauges provided for this project shall all be sourced from the same manufacturer and in compliance with this specification.

1. Each pressure gauge shall be tagged in accordance with the Instrumentation Index and as shown on the P&ID and HVAC Schematic drawings.

2. Pressure gauges shall have an accuracy of 0.5 percent of full scale or better.

3. Select gauge range such that the maximum process pressure reads at 1/2 to 2/3 of scale.

a. If a flushing connection is supplied, select a gauge range that will not be damaged at the W3 system pressure.

4. Provide gauges with 4-inch dial and 1/2 inch NPT stem mounting.

5. Wetted parts and movement shall be 316SS with a phenolic case and fluid fill.

6. Provide pressure gauges with factory assembled and filled diaphragm seals or line size pressure sensors where specified.

7. All pressure gauges, with or without diaphragm seals, shall be supplied with a 316 stainless steel block and bleed manifold to facilitate maintenance and calibration activities.

B. Suitable manufacturers of pressure gauges and accessories, include:

1. Ashcroft Duragauge Type 1279 with Ashcroft Plus Performance option

2.02 GAUGE PRESSURE TRANSMITTERS:

A. Gauge pressure transmitters provided for this project shall all be sourced from the same manufacturer and in compliance with this specification.

1. Each gauge pressure transmitter shall be tagged in accordance with the Instrumentation Index and as shown on the P&ID and HVAC Schematic Drawings.

2. Gauge pressure transmitters shall be suitable for 24VDC loop power supply and shall have an accuracy of plus or minus 0.5 percent of calibrated span or better.

3. The transmitter shall have a local display scaled in engineering units.

4. Output shall include 4-20 maDC loop powered analog.

5. All gauge pressure transmitters shall be supplied with specified process connections and/or valve manifold to facilitate the measurement, maintenance and calibration activities.

B. The transmitter, and related ancillaries shall have environmental ratings suitable for their respective process areas. In no case shall the transmitter environmental rating be less than NEMA 4X.

C. Suitable manufacturers of differential pressure transmitters include:

1. Rosemount 3051

2. Endress + Hauser

3. Honeywell

2.03 DIFFERENTIAL PRESSURE TRANSMITTERS:

A. Differential pressure transmitters provided for this project shall all be sourced from the same manufacturer and in compliance with this specification.

1. Each differential pressure transmitter shall be tagged in accordance with the Instrumentation Index and as shown on the P&ID and HVAC Schematic drawings.

2. Differential pressure transmitters shall be suitable for 24VDC loop power supply and shall have an accuracy of plus or minus 0.5 percent of calibrated span or better.

3. The transmitter shall have a local display scaled in engineering units.

4. Output shall include 4-20 maDC loop powered analog.

5. All differential pressure transmitters shall be supplied with specified process connections and/or valve manifold to facilitate the measurement, maintenance and calibration activities.

B. The transmitter, and related ancillaries shall have environmental ratings suitable for their respective process areas. In no case shall the transmitter environmental rating be less than NEMA 4X.

C. Suitable manufacturers of differential pressure transmitters include:

1. Rosemount 3051

2. Endress + Hauser

3. Honeywell

2.04 PRESSURE AND DIFFERENTIAL PRESSURE SWITCHES:

A. Pressure and differential pressure switches provided for this project shall all be sourced from the same manufacturer and in compliance with this specification.

1. Each pressure and differential pressure switch shall be tagged in accordance with the Instrumentation Index and as shown on the P&ID and HVAC Schematic drawings.

2. Pressure and differential pressure switches shall have a setting accuracy of plus or minus 0.5 percent of calibrated range or better.

3. Deadband shall be 10 percent of set point or less.

4. Select switch adjustable range such that the maximum process pressure is 1/2 to 2/3 of maximum range.

5. Pressure and differential pressure switches shall have SPDT contacts rated 3A @ 120 VAC.

6. Pressure switches shall have 1/2 inch NPT stem mounting.

7. Wetted parts and movement shall be 316SS with a corrosion resistant case.

8. Provide pressure gauges with factory assembled and filled diaphragm seals or line size pressure sensors where specified.

9. All pressure switches, with or without diaphragm seals shall be supplied with a 316SS block and bleed manifold to facilitate maintenance and calibration activities.

B. The switch enclosure, cabling and related ancillaries shall have environmental ratings suitable for their respective process areas. In no case shall the switch, or cabling environmental rating be less than NEMA 4X.

C. Suitable manufacturers of pressure switches include:

1. Asco Tri-Point – S Series

2. Ashcroft

2.05 DIAPHRAGM SEALS AND LINE SIZE PRESSURE SENSORS:

A. Diaphragm seals provided for this project shall all be sourced from the same manufacturer and in compliance with this specification.

1. Diaphragm seals shall be constructed of 316SSs with an elastomeric diaphragm and fill fluid to provide chemical seal from the process fluid.

2. The elastomer sensing element and fill fluid shall be selected for chemical and temperature resistance to the process fluid.

3. Acceptable manufacturers for diaphragm seals include:

a. Ashcroft: Diaphragm Seal Type 100

B. Line size pressure sensors provided for this project shall all be sourced from the same manufacturer and in compliance with this specification.

1. Line size pressure sensors shall be constructed of 316SS with an elastomer sensing element providing 360 degree line-size non-clogging pressure sensing.

2. The elastomer sensing element and fill fluid shall be selected for chemical and temperature resistance to the process fluid.

3. Acceptable manufacturers for line size pressure sensors include:

   a. Red Valve: Red Valve Pressure Sensor Series 40/42

   b. Ronningen-Petter

C. All diaphragm chemical seals and line size pressure sensors shall be factory filled and assembled with specified gauges, switches, and/or transmitters.

2.06 PRESSURE INSTRUMENT MANIFOLDS:

A. Pressure instrument Block and Bleed, 3 Valve, and 5 Valve manifolds provided for this project shall all be sourced from the same manufacturer and in compliance with this specification.

1. Where specified, manifolds for pressure instrument impulse lines shall be constructed of 316SS.

2. Block and bleed style manifolds shall be used where specified for pressure gauges, pressure switches, gauge pressure transmitters, and absolute pressure transmitters.

3. 3 Valve, or 5 Valve manifolds shall be used where specified for differential pressure transmitters.

4. Acceptable manufacturers for instrument manifolds include:

   a. Anderson Greenwood

PART 3 - EXECUTION

3.01 QUALIFICATIONS:

A. Pressure instruments and sensors are to be installed, set up, configured, and calibrated by Journeyman instrumentation technician working under the approval of the instrument manufacturer.

3.02 INSTALLATION:

A. Install primary pressure gauges, sensors, and transmitters in accordance with manufacturer's installation instructions and as described herein.

1. Dials and readouts shall be located and positioned where the dial or readout can be easily read from adjacent walkway or platform to facilitate operation, testing, and maintenance activities.

2. Locate sensors and instruments as close as possible to the measurement point to minimize the use of impulse tubing.

3. Where impulse tubing is required, impulse tubing shall be 1/4 inch stainless steel with Swagelok tube fittings.

4. For air or gas applications, the impulse line shall generally be sloped down to the process tap location to prevent condensate buildup in the impulse line. Where this is not possible, provide a condensate drip pot with manual drain valve at the low point in the impulse line.

5. For liquid applications, the impulse line shall generally be sloped up to the process tap location to prevent air buildup in the impulse line. Where this is not possible, provide an automatic air release valve at the high point in the impulse line.

6. Install impulse tubing with a continuous slope from the instrument to the process tapping and avoid high or low spots in the tubing run.

7. Impulse tubing shall be continuously supported for mechanical protection and to prevent sagging.

3.03 CALIBRATION:

A. Refer to the Instrumentation Index for instrument operating conditions, ranges, setpoints, and alarms.

B. Pressure instruments shall be factory pre-calibrated and calibration shall be verified in-situ.

C. Provide printed calibration reports of the factory calibration and as-commissioned in-situ calibration check including all smart device configuration parameters.

1. Pressure gauges shall be verified on site using a certified test gauge, pressure calibrator, or equivalent test approved by the Engineer.

2. Pressure transmitters shall be verified in-situ using a certified pressure calibrator.

D. Submit calibration reports for review by the Engineer and include copies of reviewed and accepted calibration reports in the O&M manuals.

3.04 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

Page Intentionally Left Blank

SECTION 40 74 00

TEMPERATURE MEASUREMENT

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide temperature measurement instrumentation as specified in this section and in compliance with Section 40 70 00 and other related sections and Contract Documents.

B. The Work of this section includes the provision of instrument data sheets for all instruments supplied for this project. The contractor shall provide an as-constructed instrument data sheet for each instrument supplied for this project based on the ISA S20 standard instrument specification forms.

C. Refer to Section 40 61 13 for additional requirements related to instrument specification sheets.

D. This specification covers process temperature measurement. For HVAC temperature measurement refer to Section 23 09 13.

1.02 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Delegated Design Submittals: For each device, equipment or appurtenance provide written certification from Professional Engineer licensed in the State of Utah stating that supports systems, anchorage and equipment have been designed according to the requirements of Section 1613 of the building codes of Utah, Salt Lake City and ASCE/SEI 7, and in accordance with Specification 01 41 20. Submit calculations stamped by a Professional Engineer licensed in the State of Utah for support systems and anchorage for wind, seismic, and all other pertinent loads.

C. Operation and Maintenance Data:

1. Operation and maintenance manuals shall be specific to equipment purchased and crossing out of non-applicable items is not acceptable.

2. Comply with requirements of Section 01 78 23.

1.03 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.04 SPARE PARTS:

A. Comply with the requirements specified in Section 01 61 00.

B. Provide a list of recommended spare parts for the first year of operation and for the first five years of operation, including a price list and location of the nearest facility from which all spare parts can be obtained.

1.05 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

1.06 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

1.07 WARRANTY:

A. Comply with the requirements specified in Section 01 78 36.

PART 2 - PRODUCTS

2.01 RTD SENSOR AND TEMPERATURE INDICATING TRANSMITTER:

A. RTD sensors and temperature indicating transmitters provided for this project shall all be sourced from the same manufacturer and in compliance with this specification.

1. Each RTD sensor and temperature indicating transmitter shall be tagged in accordance with the Instrumentation Index and as shown on the P&ID and HVAC Schematic drawings.

2. The RTD sensor and temperature indicating transmitter as installed shall be capable of measuring between 32 degrees and 120 degrees Fahrenheit with an accuracy of plus or minus 0.5 percent of the installed span.

3. Each RTD shall have a 316 SS thermowell.

a. Provide weld-o-lets as needed

b. Thermowells mounted on process piping shall be sized to extend to the center of the pipe.

c. Thermowells mounted on tanks shall be sized to extend 4 inches into the liquid.

4. Indicating transmitters shall be rated NEMA 4X and have an LCD or LED display scaled in engineering units.

5. RTD sensor and temperature indicating transmitter shall be loop powered with a 4-20 mA output rated for a 500 Ohm load.

6. Where local transmitter displays are not viewable from a standing position without the use of a ladder or a lift, provide a remote mounted indicating transmitter on the wall. Coordinate with Engineer for location.

B. Suitable manufacturers of temperature devices include:

1. Rosemount

2. Emerson

3. Endress+Hauser

PART 3 - EXECUTION

3.01 QUALIFICATIONS:

A. Temperature sensors are to be set up, configured, and calibrated by a Journeyman instrumentation technician working under the approval of the instrument manufacturer.

3.02 INSTALLATION:

A. Install primary flow elements and signal converters in accordance with manufacturer's installation instructions.

B. Thermowells installed in tanks shall be horizontally mounted at a depth to ensure continuous submergence in the fluid.

3.03 FIELD TESTING:

A. Validate the PLC scaling and alarming by injecting a 4-20 mA signal into the PLC terminals with the temperature sensor disconnected.

3.04 TRAINING:

A. Provide field operation and maintenance instruction.

B. Coordinate training time with the Engineer and Owner.

3.05 CALIBRATION:

A. Refer to the Instrumentation Index for instrument operating conditions, ranges, setpoints, and alarms.

B. Temperature sensors shall be calibrated on site.

C. Provide printed calibration reports of the factory calibration and as-commissioned in-situ calibration check including all smart device configuration parameters.

1. Calibrations shall be verified in-situ using a separate thermal sensor with equal or higher accuracy or similar test approved by the Engineer.

D. Submit calibration reports for review by the Engineer and include copies of reviewed and accepted calibration reports in the O&M manuals.

3.06 ADJUSTING:

A. Adjust the calibrated and scaled range for each temperature transmitter as requested during commissioning.

3.07 DEMONSTRATION:

A. Demonstrate RTD accuracy by removing from the installation and applying varying amounts of heat to the probe. Verify the temperature reading with a separate thermal sensor with equal or higher accuracy.

3.08 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 40 76 00

PROCESS GAS ANALYTICAL MEASUREMENT

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide process gas analytical measurement instrumentation as specified in this section and in compliance with Section 40 70 00 and other related sections and Contract Documents.

B. The Work of this section includes the provision of instrument data sheets for all instruments supplied for this project. The contractor shall provide an as-constructed instrument data sheet for each instrument supplied for this project based on the ISA S20 standard instrument specification forms.

C. Refer to Section 40 61 13 for additional requirements related to instrument specification sheets.

B. Submit shop drawings for each specified instrument together with a completed Instrument Data Sheet in accordance with ISA S20 standard.

1. Each instrumentation submittal shall include a copy of the respective specification section marked up to show compliance or non-compliance with specified requirements. Provide written justification for any non-compliance features.

1.04 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.05 SPARE PARTS:

A. Comply with the requirements specified in Section 01 61 00.

1.06 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

1.07 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

PART 2 - PRODUCTS

2.01 COMBUSTIBLE GAS MONITORS:

A. Combustible gas monitors provided for this project shall all be sourced from the same manufacturer and in compliance with this specification.

1. Each combustible gas monitor shall be tagged in accordance with the Instrumentation Index and as shown on the P&ID and HVAC Schematic drawings.

2. The sensor shall be based on Infra-Red-Light absorption for detection of Methane gas in ambient air.

3. The sensor and transmitter shall operate successfully with ambient temperature range of -40 degrees F to +167 degrees F and ambient humidity of 5 to 95 percent RH.

4. The transmitter shall operate on 24 VDC power supply and include the following outputs:

   a. 4 to 20 mA DC calibrated to 0 – 50 percent LFL. Minimum one 4 to 20 mA input required. Transmitters with additional 4 to 20mA inputs to service multiple sensors are acceptable where practicable.

   b. 1 Form-C Warning alarm relay set at 5 percent LFL

   c. 1 Form-C Alarm relay set at 10 percent LFL

   d. 1 Form-C Instrument Fail Alarm relay

5. The transmitter shall have a local display with keypad.

6. Optional features shall include an alarm relay board, non-intrusive calibration, and calibration kit c/w instructions, fittings, and calibration span gas.

B. The sensing element, transmitter, and related ancillaries shall be rated for Class 1, Zone 1 hazardous areas and shall have environmental ratings suitable for their respective process areas. In no case shall the product environmental rating be less than NEMA 4X.

C. Suitable manufacturers of combustible gas monitors include:

1. Honeywell

2. Det-Tronics

3. MSA

2.02 TOXIC GAS MONITORS:

A. Toxic gas monitors provided for this project shall all be sourced from the same manufacturer and in compliance with this specification.

1. Each toxic gas monitor shall be tagged in accordance with the Instrumentation Index and as shown on the P&ID and HVAC Schematic drawings.

B. Hydrogen Sulfide Gas Detectors:

1. The sensor shall be based on Catalytic Bead for detection of H_2S gas in ambient air.

2. The sensor and transmitter shall operate successfully with ambient temperature range of -40 degrees F to +140 degrees F and ambient humidity of 15 to 95 percent RH.

3. The transmitter shall operate on 24 VDC power supply and include the following outputs:

   a. 4 to 20 mA DC calibrated to 0 – 50 ppm. . Minimum one 4 to 20 mA input required. Transmitters with additional 4 to 20mA inputs to service multiple sensors are acceptable where practicable.

   b. 1 Form-C Warning alarm relay set at 2 ppm.

   c. 1 Form-C Alarm relay set at 5 ppm.

   d. 1 Form-C Instrument Fail Alarm relay.

4. The transmitter shall have a local display with keypad.

5. Optional features shall include an alarm relay board, non-intrusive calibration, and calibration kit c/w instructions, fittings, and calibration span gas.

C. Carbon Monoxide (CO) Detector Transmitter:

1. The sensor shall be based on electrochemical CO gas in ambient air.

2. The sensor and transmitter shall operate successfully with ambient temperature range of -4 degrees F to +131 degrees F and ambient humidity of 15 to 95 percent RH.

3. The transmitter shall operate on 24 VDC power supply and include the following outputs:

   a. 4 to 20 mA DC calibrated to 0 – 200 ppm. . Minimum one 4 to 20 mA input required. Transmitters with additional 4 to 20mA inputs to service multiple sensors are acceptable where practicable.

   b. 1 Form-C Warning alarm relay set at 25 ppm (ventilation increased to maximum outside air).

   c. 1 Form-C Alarm relay set at 100 ppm.

   d. 1 Form-C Instrument Fail Alarm relay.

4. The transmitter shall have a local display.

5. Optional features shall include an alarm relay board, non-intrusive calibration, and calibration kit c/w instructions, fittings, and calibration span gas.

D. All combustible and toxic gas sensing elements, transmitters, and related ancillaries shall be rated for Class 1, Zone 1 hazardous areas and shall have environmental ratings suitable for their respective process areas. In no case shall the product environmental rating be less than NEMA 4X.

E. Suitable manufacturers of toxic gas monitors include:

1. Honeywell

2. Det-Tronics

3. MSA

2.03 GAS DETECTION NOTIFICATION

A. Gas detectors shall be interlocked to local annunciation panels as shown on the drawings. Where multiple types of gas detection are interlocked to one panel, any one alarm state for any type of gas shall trigger the required visual and/or audible alarms.

B. Gas detector notification panels shall be complete with:

1. Horn

2. Strobe

3. Alarm silence pushbutton

4. Terminal blocks for connection to transmitters.

5. Enclosure and any ancillaries shall be rated for Class 1, Zone 1 hazardous areas and shall have environmental ratings suitable for their respective process areas. In no case shall the product environmental rating be less than NEMA 4X.

6. Auxillary power supply such that continuous operation is maintained during failure of the normal power supply and shall provide at enough runtime to sufficiently alert personnel.

7. Provide additional components as required by NFPA820 for a fully functional and safe notification system.

PART 3 - EXECUTION

3.01 QUALIFICATIONS:

A. Process gas analytical transmitters are to be set up, configured, and calibrated by Journeyman instrumentation technician working under the approval of the instrument manufacturer.

3.02 INSTALLATION:

A. Install primary sensors and transmitters in accordance with manufacturer's installation instructions and in accordance with this specification.

1. Refer to location diagrams and standard installation details provided for this project.

3.03 CALIBRATION:

A. Provide printed calibration reports of the factory calibration and settings.

B. Verify calibration and output scaling in-situ and record all as-commissioned data including all smart device configuration parameters.

C. Submit calibration reports for review by the Engineer and include copies of reviewed and accepted calibration reports in the O&M manuals.

3.04 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 40 78 00

PANEL MOUNTED INSTRUMENTS

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide panel mounted instruments and devices as specified in this section and in compliance with Section 40 70 00 and other related sections and Contract Documents.

B. The Work of this section includes the provision of instrument data sheets for all instruments supplied for this project. The contractor shall provide an as-constructed instrument data sheet for each instrument supplied for this project based on the ISA S20 standard instrument specification forms.

C. Refer to Section 40 61 13 for additional requirements related to instrument specification sheets.

10. S99: Control System Cyber Security

11. 101: Human-Machine Interfaces

1.03 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Submit shop drawings for each specified instrument together with a completed Instrument Data Sheet in accordance with ISA S20 standard.

1. Each instrumentation submittal shall include a copy of the respective specification section marked up to show compliance or non-compliance with specified requirements. Provide written justification for any non-compliance features.

1.04 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.05 SPARE PARTS:

A. Comply with the requirements specified in Section 01 61 00.

1.06 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

1.07 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

PART 2 - PRODUCTS

2.01 INDICATING LIGHTS:

A. The quality and type of switches and pushbuttons shall be based on industrial grade types generally as described below.

B. All control indicator lamps in ordinary locations to be heavy duty oil tight such as Allen Bradley 800T or 800E.

C. All control indicator lamps in classified or Category 1 & 2 areas, or outdoors to be heavy duty weatherproof such as Allen Bradley 800H.

D. All control indicator lamps shall be push-to-test type.

2.02 SWITCHES AND PUSHBUTTONS:

A. The quality and type of switches and pushbuttons shall be based on industrial grade types generally as described below with contact rated for connected loads.

1. All control pushbutton switches, and selector switches in ordinary locations to be heavy duty oil tight such as Allen Bradley 800T or 800E.

2. All pushbutton switches, and selector switches in classified or Category 1 & 2 areas, or outdoors to be heavy duty weatherproof such as Allen Bradley 800H.

2.03 RELAYS:

A. The quality and type of relays shall be based on industrial grade types generally as described below with contact rated for connected loads.

1. 120 VAC relays to be 4PDT, plug-in, complete with test button and operation indicator, and surge suppressor.

2. 24 VDC relays to be 2PDT plug-in, complete with test button and operation indicator, and surge suppressor diode.

3. Time delay relays for behind panel mounting to be Model 2PDT, plug-in, and programmable for sixteen (16) time ranges and four (4) operation modes.

4. Time delay relays for flush panel mounting and operator accessible timing range modifications to be SPDT, screw terminals, programmable for five (5) timing ranges and eight (8) operation modes, complete with digital display, module for time settings and flexible protective cover.

5. Where the contact ratings of the relays listed are insufficient for the application select an appropriate type from an approved Manufacturer with the same quantity of contacts as was originally specified.

6. Provide relay plug-in sockets for DIN mounting complete with stacked screw clamp terminals.

2.04 ANALOG LOOP CURRENT ISOLATOR:

A. The quality and type of analog loop current isolators shall be based on industrial grade types generally as described below.

1. Provide current loop signal isolators as required to provide isolation of milliampere transmission signals to prevent “ground loop” signal errors caused by mismatched transmitters and receivers.

2. Isolators are to be located in control panels and shall be Din rail mounted.

3. Analog loop current isolators shall be loop powered.

4. Isolator input and output signals to be 4-20 mA, with an error not exceeding 0.1 percent of span. Input resistance will not exceed 550 ohms with an output load of 250 ohms.

2.05 INTRINSIC SAFETY BARRIERS AND RELAYS:

A. The quality and type of analog loop current isolators shall be based on industrial grade types generally as described below.

1. Provide intrinsic safety barriers where required for two-wire transmitters of the active, isolating, loop powered type.

a. Manufacturers:

(1) MTL

(2) Phoenix

(3) Stahl

(4) P+F

2. Provide dual type intrinsic safety barriers for process switches.

a. Manufacturers:

(1) MTL

(2) Phoenix

(3) Stahl

(4) P+F

3. Intrinsic safety relays.

a. Manufacturers:

(1) MTL

(2) Phoenix

(3) Stahl

(4) P+F

2.06 SIGNAL CONDITIONING MODULES:

A. Manufacturers:

1. Red Lion

2. Omega

3. Weidmuller

B. All modules specified in this section to be industrial grade and the product of a single Manufacturer.

C. Where required, provide signal conditioning modules which comply with the following requirements:

1. Analog signal inputs: 4-20 mA DC into 500 ohms or less.

2. Analog signal outputs: 4-20 mA DC into 500 ohms.

3. Discrete output contacts: SPDT or DPDT rated 5A.

4. Arrange electronic trips so that output contact opens in case of loss of signal or loss of power supply.

5. Signal conditioning and isolating modules to be rated for continuous operation in an ambient temperature of 32 degrees F to 175 degrees F. The ambient temperature effect on module accuracy is not to exceed plus or minus 0.01 percent per degrees°F.

6. Span and zero adjustments to be made by front accessible multi turn potentiometers.

7. Provide electronic trip modules with LED indicators for relay status.

8. Signal conditioning modules to withstand 30 V per meter radio frequency radiation between 200 and 500 MHz with not more than 0.25 percent calibration effect. Provide modules with traps on the terminals to shunt conducted radio frequency interference to ground.

9. Provide effective isolation of signal and power supply terminals from the case.

PART 3 - EXECUTION

3.01 QUALIFICATIONS:

A. Panel mounted instruments and related operator devices are to be set up, configured, and calibrated by Journeyman instrumentation technician working under the approval of the instrument manufacturer.

3.02 INSTALLATION:

A. Install panel mounted instruments and related operator devices in accordance with manufacturer's installation instructions and in accordance with this specification.

B. Review the process area classification and panel environmental ratings and install instruments and operator devices with environmental and hazardous area ratings equal to or better than the area requirements.

C. Use normally closed contacts for alarm actuation. The contacts open to initiate the alarm.

D. Use normally open contacts to control equipment. The contacts close to start the equipment.

E. Contacts monitored by solid state equipment to be hermetically sealed and adequately rated for the connected load.

F. Contacts monitored by electro-magnetic devices such as mechanical relays to be rated NEMA ICS 2, designation B300.

G. Provide double barriers between switch elements and process fluids such that failure of one barrier will not permit process fluids into electrical enclosures.

H. Switch electrical enclosures to be rated EEMAC 4, minimum.

I. 120 VAC switches to have a 4 A rating.

3.03 CALIBRATION:

A. Provide printed calibration reports of the factory calibration and settings.

B. Verify calibration and output scaling in-situ and record all as-commissioned data including all smart device configuration parameters.

C. Submit calibration reports for review by the Engineer and include copies of reviewed and accepted calibration reports in the O&M manuals.

3.04 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

Page Intentionally Left Blank

SECTION 41 22 23.19

HOISTING EQUIPMENT

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide and test hoisting equipment, motors, gear reducers, controls and appurtenances as indicated and in compliance with Contract Documents.

1. Rail and supporting beams included in building structure, refer to structural drawings.

2. Hoist capacities and operating data are indicated in the Hoisting Schedule.

1.02 REFERENCES:

A. American Bearing Manufacturers Association (ABMA):

1. 9-2015: Load Ratings and Fatigue Life for Ball Bearings

2. 11-2014: Load Ratings and Fatigue Life for Roller Bearings

B. American Society of Mechanical Engineers (ASME):

1. ASME B30.16-2017: Overhead Underhung and Stationary Hoists

C. American Welding Society (AWS):

1. D1.1-2015: Structural Welding Code – Steel

D. National Electric Code (NEC), NFPA 70-2017

E. National Electrical Manufacturers Association (NEMA):

1. MG 1-2016: American National Standard for Motors and Generators

F. Occupational Safety and Hazard Association (OSHA):

1. 29 CFR 1910.179: Overhead and Gantry Cranes

1.03 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00:

1. Data regarding hoisting equipment characteristics and performance:

2. Manufacturer's literature as needed to supplement certified data.

3. Operating and maintenance instructions and parts lists.

4. Listing of reference installations as specified with contact names and telephone numbers.

5. List of recommended spare parts other than those specified.

6. Shop and field inspection reports.

7. Motor shop test results.

8. Qualifications of field service engineer.

9. Recommendations for short and long-term storage.

10. Shop and field testing procedures, equipment to be used.

11. Special tools.

12. Number of service person-days provided and per diem field service rate.

13. Manufacturer’s product data, specifications and color charts for shop painting.

14. The latest ISO 9001 series certification.

15. Provide Certificate of Responsibility. See Section 01 33 00 for Certificate form.

16. Provide scaled drawing height and weight of equipment serviced by the hoisting equipment including hook height and travel dimensions.

17. Material Certification:

    a. Provide certification from the equipment manufacturer that the materials of construction specified are recommended and designed for the service conditions specified and indicated. If materials other than those specified are proposed based on incompatibility with the service conditions, provide technical data and certification that the proposed materials are recommended and designed for the service conditions specified and indicated including an installation list of a minimum of five (5) installations in operation for a minimum of five (5) years. Provide proposed materials at no additional cost to the Owner.

    b. Where materials are not specified, provide technical data and certification that the proposed materials are recommended and designed for the service conditions specified and indicated.

B. A copy of the contract mechanical process, electrical and instrumentation drawings, with addenda that are applicable to the equipment specified in this section, marked to show all changes necessary for the equipment proposed for this specification section. If no changes are required, mark all drawings with "No changes required" or provide a statement that no changes are required.

C. A copy of this specification section with addenda and all referenced specification sections with addenda, with each paragraph check-marked to indicate specification compliance or marked and indexed to indicate requested deviations and clarifications from the specified requirements.

1. If deviations and clarifications from the specifications are indicated, therefore requested by the Contractor, provide a detailed written justification for each deviation and clarification.

1.04 SPARE PARTS:

A. Comply with the requirements specified in Section 01 61 00.

B. Provide spare parts that are identical to and interchangeable with similar parts installed.

1.05 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

B. Permanently mark the capacity of the hoist and trolley on each hoist, in easy to read letters and in a prominent position.

C. Provide only safety type hooks.

D. Provide hoists so that hook can reach the floor at the lowest level of the lift.

E. Do not use hoists for construction purposes of any nature.

F. Hoists shall be manufacturer's standard cataloged product and modified to provide compliance with the drawings, specifications and the service conditions specified and indicated.

G. Welding: In accordance with American Welding Society Code D1.1.

H. Provide shop tests as specified.

I. Hoisting equipment manufacturer shall provide hoists, motors, gear reducers, switches, and controls regardless of manufacturer as a complete integrated package to ensure coordination, compatibility and operation of the systems.

J. Services of Manufacturer's Representative as stated in Section 01 45 00 and as specified herein.

K. Provide services of factory-trained Service Technician, specifically trained on type of equipment specified:

1. Service Technician must be present on site for all items listed below. Person-day requirements listed are exclusive of travel time, and do not relieve Contractor of the obligation to place equipment in operation as specified.

    a. Each person-day requirement is per area.

2. Installation: Inspect grouting, location of anchor bolts; setting, leveling, alignment, field erection; coordination of electrical:

    a. 1.0 person-day

3. Functional Testing: Calibrate, check alignment and perform a functional test. Tests to include all items specified.

    a. 1.0 person-day

4. Field Testing: Field performance test equipment specified.

    a. 1.0 person-day

5. Vendor Training: Provide classroom and field operation and maintenance instruction including all materials, slides, videos, handouts and preparation to lead and teach classroom sessions.

    a. 1.0 person-day.

6. Credit to the Owner, all unused service person-days specified above, at the manufacturer's published field service rate.

7. Any additional time required of the factory trained service technician to assist in placing the equipment in operation, or testing or to correct deficiencies in installation, equipment or material shall be provided at no additional cost to the Owner.

L. Manufacturer of hoisting equipment shall have a minimum of five (5) operating installations with hoists of the size specified and in the same service as specified operating for not less than five (5) years.

1.06 DELIVERY, STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

PART 2 - PRODUCTS

2.01 SYSTEM DESCRIPTION:

A. Hoisting equipment capacities and operating data are indicated in the Hoist Schedule.

2.02 HOIST AND TROLLEY MANUFACTURERS:

A. Konecranes

B. ACCO-Wright

C. Yale Hoisting Equipment Division

D. Dresser Industries

2.03 SEISMIC DESIGN REQUIREMENTS:

A. Conform to the requirements indicated on the structural drawings and as specified in Section 01 41 20.

B. The Contractor shall conform to the seismic design requirements for this project and for the work of this specification section.

C. Provide all equipment designed in accordance with the seismic requirements indicated and specified.

D. Additionally, provide with the Certificate of Unit Responsibility, certification for all equipment signed by a registered structural engineer stating that computations were performed and that all components have been sized for the seismic forces specified and indicated.

2.04 MANUAL HOISTS:

A. Hoist Mechanism: Fully enclosed high-speed, spur-geared, ball or roller bearing, hand-operated, chain hoist with a retaining brake or other acceptable device built into hoisting mechanism.

B. Hooks: High grade, forged steel with swivel, antifriction bearings.

C. Load Wheel: Make with accurately formed chain pockets to fit load chain.

D. Hoist Operating Wheel: A load limiting clutch mechanism consisting of spring loaded rollers that run between an outer race and an inner hub mounted on the outside of the wheel. The clutch shall be designed to limit the chain pull to not more than 150 percent of that required to lift the rated load capacity of the hoist. Provide with chain guides with chain of sufficient length to hang 3 feet above operating floor.

E. Chain Bucket: Provide where specified to collect load chain. Arrange chain bucket so it will not interfere with smooth operation of hoist.

F. Lightweight Hoists: Make with high strength aluminum frame, hand wheel and housing.

G. Provide each hoist with a clevis connection for use with a trolley, a suspension hook at top, or be integrally built into trolley as indicated on drawings or specified herein.

2.05 ELECTRIC HOISTS:

A. Electric Hoists: Spur-gear driven antifriction bearings throughout, a mechanical load brake, and a separate electrically operated motor brake. Design mechanical load brake with capability of supporting the full load at any point when the motor is stopped. Motor brake shall be externally adjustable, electrically operated friction disk brake that shall apply automatically when the power is off. The brake shall hold 150 percent of the rated load and 125 percent of the rated load at any operating speed. Design shafts of motor, drum, and drum pinion to run in grease-lubricated ball or roller bearings. Design the mechanical-load brake and gear train and bearings to be oil-bath lubricated.

B. Arrange hoist for parallel lug mounting from a 4-wheel geared trolley.

C. Hoist: Standard type.

D. Design drum with machine-cut grooves and guarded flanges and with capacity to take entire run of cable in one layer with no overlapping.

E. Provide hoist with an upper and lower geared limit switch with automatic reset control circuit to prevent overtravel. Settings to be field adjustable in accordance with OSHA 29 CFR 1910.179.

F. Supply sufficient hoisting cable with hoists for two-part single reeving and to accommodate not only the maximum lift but two additional wraps on drum. Make cable flexible high-strength plowsteel cable with a load safety factor of at least 5 to 1.

G. Make load block of rugged construction containing a ball-bearing sheave and a high-grade forged-steel swivel hook with antifriction bearings.

H. Provide control equipment in an enclosed compartment which forms an integral part of hoist and include a transformer for a 120-volt control circuit.

2.06 TROLLEYS:

A. Manual Trolleys: 4-wheel type fabricated from heavy steel or aluminum sections with sides extending beyond wheel flanges to provide bumper protection. Design wheels with machined treads surface-hardened and set at proper angle to bear load evenly on supporting beam flanges. Provide wheels with lifetime lubricated ball or roller bearings.

B. Plain Trolleys: Push type with a hole for attaching suspension hook.

C. Army Type Hoists: Close headroom type, integrally built into a 4-wheel plain or geared trolley.

D. Provide trolley operating wheels with chain guides and make chains for each of sufficient length to hang 3 feet above operating floor.

E. Make trolleys designed for operation on beam or rail indicated on drawings. Trolleys to be provided by the hoist manufacturer.

2.07 JIB CRANE:

A. Jib Crane Manufacturers:

1. ACCO-Wright

2. CONTRX

3. Dresser Industries, Inc., Hoist & Tower Division

4. Ohio Hoist & Mfg. Co., Inc.

B. Jib Crane: Steel S-beam boom, with an adjustable tie rod brace, a hinge-bracket or bar support for both boom and tie rod which permits 180 degrees swing. Fix safety stop at outer end of boom to prevent trolley from running off open end.

C. Base: Special casting adequate to support crane with its maximum load on hoist at extreme end of trolley beam.

2.08 DAVIT:

A. Davit Crane Manufacturers:

1. Thern, Inc.

B. Provide crane capacity and reach as indicated in the davit crane schedule and drawings

C. Crane shall have adjustable sheave block and boom angle

D. Materials: Heavy-duty welded structural steel pipe and tubing

E. Finishes: as indicated on davit crane schedule and drawings

F. Winch and Rope: As indicated in the davit crane schedule and drawings

G. Base: Base and base hardware shall be supplied by jib crane manufacturer as indicated in the davit crane schedule and drawings. Ensure base is adequate to support crane with its maximum load on hoist at extreme end of davit arm.

2.09 SWITCHES AND SWING-OUT SECTIONS:

A. Manufacturers:

1. American Monorail Co.

2. Richards-Wilcox Mfg

3. ACCO-LoudenSwitches: Glide or sliding type, manually operated. Design transfer mechanisms and locking devices capable of positioning switch to maintain true vertical and horizontal alignment of track and conductors and prevent switch operation when any part of trolley is in switch.

C. Furnish swing-out sections at roll-up doors as indicated on drawings.

2.10 SAFETY STOPS:

A. Provide safety stops on all open ends of track (or where indicated) to prevent trolley from running off ends or damaging building. Provide stops with capability of withstanding impact imposed by motion of fully loaded hoist and trolley.

2.11 TRACK:

A. Monorail Track: Standard beam of sizes indicated on drawings.

B. Shop fabricate all curves for either track or switches to radius indicated.

C. Erect track level throughout, with section ends machined fitted and spliced with web-type or other designed couplings to provide flush level connections. Maximum gap between adjacent ends not exceeding 1/16 inch.

2.12 DRUM GRAB:

A. Manufacturers:

1. American Chain & Cable Co.

2. Sterling, Fleishman Co.

3. Heppenstall Co., Material Handling Division

B. Provide drum grab for lifting and tilting 600 pound drums.

C. Make grab with an inverted U-shaped yoke frame made of steel with a lifting eye at its top center. Suspend on trunnions between ends of frame a wide flexible strap or other acceptable device which can be wrapped and fastened around a metal drum approximately 14-inch in diameter and 24-inch high. Fit one trunnion with a hand wheel operated turning gear by which trunnion can be rotated 180 degrees so that drum held by strap can be tilted and emptied. Enclose the gear in a metal housing. Design trunnions

to turn in bushings set in frame. Make provision for lubricating trunnions, gears and their shafts. Construct frame sufficiently rigid, and if necessary, reinforced to ensure no distortion in service.

2.13 DRUM LIFT:

A. Manufacturers:

1. Sterling, Fleishman Co.

2. Morse Mfg. Co.

3. Hercules Industries

B. Make drum lift for handling drums with a hydraulically operated hoisting arm mounted on a steel frame dolly. Make dolly with four wheels, two of which are fixed and two of which are revolving-type casters.

C. Fit hoisting arms with a clamp-on type of saddle of proper size to handle drums. Design saddles to be pivoted in hoisting arms to permit tilting drums in any desired position, and accomplish tilting with a lever handle, spur gear and hand crank.

D. Provide stops for locking wheels or an acceptable floor locking device to prevent movement while drum is being emptied.

2.14 PALLET LIFTER:

A. Manufacturers:

1. Cady Metal Fabrication, Inc.

2. Lewis-Shepard Co., a subsidiary of Hyster Co.

3. Heppenstall Co., Material Handling Division

B. Pallet Lifter: C-shaped welded box frame with two heavy alloy-steel forks, a lifting eye, a counterweight, and guiding handles.

C. Design pallet lifter with a lifting capacity as indicated at least 48 inch and be no wider than 25 inch.

2.15 PORTABLE GANTRY:

A. Manufacturers:

1. Spanco, Inc.

2. Konecranes

B. Portable Gantry: Four-leg rolling-type gantry with capacity as indicated. Horizontal standard aluminum or steel beam suspended at each end by pipe legs adjustable for both height and span at floor, adequately braced, with locking swivel casters for each leg.

C. Position legs and span by pins provided with springs and a locking device to fit matching holes in telescoping pipe members.

D. Fit casters with ball bearings and wheels of rubber plastic treads designed for rated capacity of gantry.

E. Provide stops at ends of beam to prevent trolley rolloff.

F. Design Factors: Gantries shall be designed for a factor of

1. 15 percent of the rated capacity for hoist and trolley weight, and

2. 25 percent of the rated capacity.

2.16 CABLE REELS:

A. Manufacturers:

1. Gleason Reel Division

2. Aero-Motive Mfg. Co.

3. Liftech

B. Feed cable reel for electric current supply for all electric hoists with trolleys, except as otherwise indicated, through a single flexible, multi-conductor power cable from a self-winding spring-operated reel located near mid-point of trolley travel or where indicated on drawings.

1. The cable shall have at least four conductors.

2. The reel shall have a swivel base.

3. The reel shall have an explosion-proof Class 1, Division 1 or 2, Group C/D enclosure based on rating of space where equipment is located.

4. The reel shall have a weatherproof enclosure when located outdoors.

C. Furnish junction box to connect cable reel to power supply circuit with hoist.

2.17 ELECTRICAL CONTROLS:

A. Provide in accordance with Division 40 and as specified herein.

B. Supply complete integral electrical control system with the electric hoisting equipment (by hoist manufacturer) consisting of starters, circuit breakers, overload relays, limit switches, control transformer for a 120-volt control circuit, control relays, and controlling devices.

C. Furnish magnetic controls for motors. Design controls to permit "inching" in both forward and reverse directions under full load, automatically regulated acceleration, and rapid brake response.

D. Provide each hoist with limit switches of automatic-reset control circuit type to prevent overtravel in both raising and lowering directions.

E. Compliance: Make all electrical equipment including motors, controls, resistors, brakes plus all conduit, wiring, panels, and enclosures with applicable requirements for materials, workmanship, construction, and installation of latest NEMA and National Electrical Code Standards.

2.18 MOTORS:

A. Provide in accordance with Section 26 20 00 and as specified herein.

B. Motors for Hoists and Trolley: Totally enclosed, reversible, induction motors especially adapted to hoist service.

1. Enclosure: As indicated in the Hoist Schedule.

2. Insulation: Minimum Class “F” with Class “B” temperature rise, 40 degrees C ambient unless otherwise indicated or specified.

3. Service Factor: 1.15.

4. Provide capacity to start and operate hoists at maximum speed rated capacity indicated without exceeding nameplate ratings for current and power and without operating in the service factor.

5. Provide ball or roller bearings, in accordance with ABMA Standard 9 and Standard 11; minimum L-10 life of 100,000 hours.

6. Premium efficient motors, nominal and minimum motor efficiencies per NEMA MG1.

7. Rating: 460V, 3-phase, 60 Hertz.

2.19 PUSHBUTTON CONTROL:

A. Provide pendent pushbutton control station with pushbuttons to control all operations of hoists and trolley. Clearly mark each pushbutton to indicate its function. Make cable long enough to reach within 4 feet of operating floor or platform level with a supporting

chain. If necessary, attach an arm to hoist so that pendent cable and pushbutton controls will hang vertically and be readily accessible from operating positions.

B. Controls for Wound-Rotor Motors: Five-step, full magnetic type. Design all other controls to be designed for single-speed motors.

C. For control of pump building hoist, use a five-step pushbutton station operating magnetic controls to provide automatically regulated acceleration and rapid brake response.

D. Provide hoist with an upper limit switch of automatic reset control circuit type to prevent overtravel.

2.20 CONDUCTORS AND COLLECTORS:

A. Manufacturers:

1. Insul-8-Bar Protected Conductors made by Insul-8-Corp.

2. Safety-T-Bar Conductor Systems made by Howell Corp.

3. Duct-O-Bar Conductor System made by Duct-O-Wire Co.

B. Use equipment and accessories approved by Underwriter's Laboratories (UL).

C. For conductor for electric current supply use safety type in which conductor is shielded by a molded-plastic cover that surrounds conductor except for a slotted opening shaped to contour of collector head. Provide separate conductor for each phase. (Dual conductors in a single insulating shield are not acceptable.) Make conductor of plated steel or copper designed for carrying maximum anticipated current. Make molded-plastic shield of high dielectric strength, rigid yet sufficiently flexible to permit bending to radius of curves or switches, and resistant to corrosion and deterioration from sunlight or weather. Space insulated supports not over 5 feet on straight track and 3 feet on curves.

D. Provide weather shield for exterior conductors.

E. Use collectors of sliding shoe type with an adjustable spring-load arm capable of horizontal or vertical movement to automatically adapt to irregularities of conductor. Set shoe in a molded-plastic head that will prevent external contact with shoe when it is running on conductor. There shall be no exposed bare current-carrying surfaces or wires in collector or arm where shoe is in contact with conductor.

2.21 SHOP PAINTING:

A. Primer and Finish Paint: Shop apply to all exterior ferrous surfaces, high solids epoxy in accordance with Section 09 90 00.

B. Surface preparation, mixing and application and safety requirements shall be in accordance with the paint manufacturer’s printed instructions and as specified.

C. Ferrous surfaces which are not to be painted shall be given a shop applied coat of grease or rust resistant coating.

D. Provide additional shop paint coating for touch-up to all surfaces after installation and testing is completed and equipment accepted.

PART 3 - EXECUTION

3.01 TRAINING:

A. Provide training in accordance with specification Section 01 78 24.

3.02 INSTALLATION:

A. Install items in accordance with manufacturer's printed instructions and as indicated and specified.

B. Check horizontal and vertical alignment of track and rails.

C. Erect rack level throughout, with section ends machined fitted and spliced with web-type couplings to provide flush level connections. Maximum gap between adjacent ends not exceeding 1/16-inch.

D. Do not use cast fittings.

3.03 FIELD TESTING:

A. Provide in accordance with Section 01 78 25 and as specified herein.

B. Perform all tests with instrumentation controls and motor controls. Perform testing in accordance with OSHA 29 CFR 1910.179 and as specified herein.

C. After installation of hoist equipment, and after inspection, operation, testing and adjustment have been completed by manufacturer's field service technician, conduct test for each hoist in presence of the Engineer to determine its ability to operate at rated speeds and capacity under conditions specified and indicated. During tests, observe and record, capacity and motor inputs. Promptly correct or replace all equipment not conforming to the requirements of this section revealed by or noted during tests, at no additional cost to the Owner, and repeat tests until specified results are obtained. Contractor to provide all labor, weights and materials for conducting tests.

1. Provide a 60 minute test for each hoist.

2. Running test shall consist of moving hoist and trolley through two complete cycles. The first cycle will be with no load. For the second cycle, the unit will be loaded with 100 percent of the specified load rating.

3. Test and simulate all limit switches, locking and safety devices.

D. Make all adjustments to place equipment in specified working order at time of above tests.

E. After three (3) unsuccessful testing attempts, remove and replace equipment at no additional cost to the Owner with equipment that will meet all requirements specified and indicated.

3.04 FIELD TOUCH-UP PAINTING:

A. After installation and testing, apply touch-up paint to all scratched, abraded and damaged shop painted surfaces. Coating type and color shall match shop painting.

3.05 CONTRACT CLOSEOUT:

A. Provide in accordance with Section 01 77 00.

DAVIT CRANE HOIST SCHEDULE

Facility	**0100 -IPS**
Location	Exterior IPS
Description	Stop logs, maintenance equipment removal
Number of Cranes	1
Number of Bases	3
Type	Portable
Winch	Manual stainless steel spur gear hand winch with brake and 304SS, 1/4-inch wire rope
Base	Pedestal
Finish	Corrosion-resistant electrostatic powder coating
Lifting Capacity (lb)	2,000
Hook Reach, Design	
Minimum Clearance under Boom	24 in
Minimum Lift Below Floor Level	22 ft
Model No.	Thern Commander 2000

VERTICAL WET PIT SOLIDS HANDLING PUMPS AND APPURTENANCES

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide and test vertical wet pit solids handling pumps, motors, variable frequency motor controllers, and appurtenances as indicated and in compliance with Contract Documents.

1.02 REFERENCES:

A. American Bearing Manufacturers Association (ABMA):

G. National Electrical Manufacturers Association (NEMA):

1. MG1: Motors and Generators.

1.03 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00:

1. Data regarding pump and motor characteristics and performance:

a. Prior to fabrication and testing, provide guaranteed performance curves based on actual shop tests of mechanically duplicate pumps, showing they meet indicated and specified requirements for head, capacity, horsepower, pump efficiency, wire to water efficiency, submergence and NPSH3. Provide a combined discharge head and column headloss curve.

(1) For units of same size and type, provide curves for a single unit only.

(2) Provide performance curve showing bowl performance and for combined bowl, column and discharge head performance.

b. Provide catalog performance curves at maximum pump speed indicated and specified showing maximum and minimum impeller diameters available.

c. Results of shop performance tests as specified.

d. Pump internal headloss from suction bell to discharge head flange at the Design Rating Point specified and indicated.

e. Provide separate discharge head headloss and discharge column headloss curves.

f. Provide transient analysis of power interruption and any undesirable effects on the piping and valve system.

g. Provide information on time to spin down/spin up in the event of unforeseen pump interruption or restart.

h. Submit all curves for guaranteed performance, headloss data and shop performance tests on 8-1/2-inch by 11-inch sheets, one curve per sheet.

i. Curves for all internal friction losses for the entire pump assembly.

j. Shaft power loss

k. Thrust bearing power loss

2. Characteristic curves for variable speed pumps for maximum pump speed and for speeds required to obtain minimum pump flow and head conditions specified and indicated. Identify curves by speed and provide all curves on one sheet. Provide submergence and NPSH3 curve for each speed.

3. Provide thrust factor and thrust curves.

4. Materials list

5. Component and total pump assembly weights.

6. Shop drawing data for accessory items.

7. Certified setting plans, with tolerances, for anchor bolts.

8. Manufacturer's literature as needed to supplement certified data.

9. Operating and maintenance instructions and parts lists.

10. Listing of reference installations as specified with contact names and telephone numbers.

11. Welding procedures

12. Certified results of hydrostatic testing.

13. Certified results of dynamic balancing.

14. List of recommended spare parts other than those specified.

15. Shop and field inspection reports.

16. Pump shop test results, including performance curves with ANSI/HI acceptance grade and tolerances, all corrections and calculations and pictures of each major pump component showing exterior and interior surfaces.

17. Motor shop test results.

18. Qualifications of field service engineer.

19. Recommendations for short and long-term storage.

20. Resonant frequency analysis.

21. Shop and field testing procedures and equipment to be used and ANSI/HI 14.6 testing tolerances to be followed.

22. Special tools.

23. Number of service person-days provided and per diem field service rate.

24. Results of field vibration test data including a vibration signature for each pump and drive assembly. Provide vibration testing procedure for review.

25. Seal and bearing water flow rate and pressure required.

26. Recommended size and location of air/vacuum valve.

27. Manufacturer's product data, specifications and color charts for shop painting.

28. Provide a listing of the materials recommended for each service specified and indicated. Provide documentation showing compatibility with process fluid and service specified and indicated.

29. The latest ISO 9001 series certification.

30. Provide a scaled drawing for each pump service showing the pumps, motors, and hoists including equipment weights, lifting attachments and clearances for equipment removal and maintenance per contract drawings.

31. Material Certification:

    a. Provide certification from the equipment manufacturer that the materials of construction specified are recommended and suitable for the service conditions specified and indicated. If materials other than those specified are proposed based on incompatibility with the service conditions, provide technical data and certification that the proposed materials are recommended and suitable for the service conditions specified and indicated including an installation list of a minimum of five (5) installations in operation for a minimum of five (5) years. Provide proposed materials at no additional cost to the Owner.

    b. Where materials are not specified, provide technical data and certification that the proposed materials are recommended and suitable for the service conditions specified and indicated.

B. A copy of the contract mechanical process, electrical and instrumentation drawings, with addenda that are applicable to the equipment specified in this section, marked to show all changes necessary for the equipment proposed for this specification section. If no changes

are required, mark all drawings with "No changes required" or provide a statement that no changes are required.

1. Failure to include all drawings or a statement applicable to the equipment specified in this section will result in submittal return without review until a complete package is submitted.

C. A copy of this specification section with addenda and all referenced specification sections with addenda, with each paragraph check-marked to indicate specification compliance or marked and indexed to indicate requested deviations and clarifications from the specified requirements.

1. If deviations and clarifications from the specifications are indicated, therefore requested by the Contractor, provide a detailed written justification for each deviation and clarification.

2. Failure to include a copy of the marked-up specification sections and or the detailed justifications for any requested deviation or clarification will result in submittal return without review until marked up specifications and justifications are submitted in a complete package.

1.04 SPARE PARTS:

A. Provide in accordance with Section 01 61 00 and as specified herein.

B. Provide spare parts that are identical to and interchangeable with similar parts installed.

1. For each pump:

a. One complete set of gaskets

b. One mechanical seal and restriction brushing for each pump provided with mechanical seals

c. One set of wearing rings

2. For each set of pumps of the same size and performance.

a. One set of all special tools required

1.05 QUALITY ASSURANCE:

A. Provide in accordance with Section 01 45 00 and as specified.

B. Pumps shall be the product of one manufacturer.

C. Pumps shall be manufacturer's standard cataloged product and modified to provide compliance with the drawings, specifications and the service conditions specified and indicated.

D. Welding: In accordance with latest applicable American Welding Society Code or equivalent.

E. Shop tests as specified.

F. The Contractor shall obtain the pumps, motors, discharge column, discharge head and hydrocones with vanes, from a single pump manufacturer, as a complete and integrated package to insure proper coordination and compatibility and operation of the system.

1. Variable frequency motor controllers can be supplied by the Contractor or the pump manufacturer at the Contractor's option. The pumping system must be a complete and integrated package to insure proper coordination and compatibility and operation of the system.

a. The Contractor shall coordinate the variable frequency motor controllers with the pump and motor manufacturer and submit as part of the shop drawings a written statement signed by the Contractor, pump manufacturer, motor manufacturer and variable frequency motor controller manufacturer that the variable frequency motor controller manufacturer has received the required information from the pump and motor manufacturers and that all parties have reviewed the system and coordinated the equipment selection. Also include all motor data and information that has been used for the coordination.

b. Failure to include the above statement will result in submittal return without review until the above statement is submitted in a complete package.

2. Provide variable frequency motor controllers in accordance with Section 26 29 23.

G. Manufacturer of pumps shall have a minimum of three (3) operating installations with pumps of the size specified or larger and in the same service as specified operating for not less than five (5) years in a self-cleaning trench wet well.

H. If equipment proposed is heavier or taller than specified and indicated; provide all structural, architectural and mechanical revisions at no additional cost to the Owner.

I. For each pump service provide all pump assemblies of the same length so that any pump can be installed in any position.

J. For variable speed pump systems the pump manufacturer must perform an analysis of the combined motor and pump assembly for resonant frequency or their harmonics independent of a structure.

1. Submit a copy of these calculations for the record.

2. Should calculations indicate the probability of encountering such frequencies within the speed range required, provide all additional supporting devices necessary to affect the unit mass, and raise or lower resonant point as necessary.

3. Provide and install such additional devices at no additional cost to the Owner.

1.06 DELIVERY, STORAGE AND HANDLING:

A. Provide in accordance with APWA Section 01 66 00 and as specified.

1.07 PUMP INTAKE DESIGN:

A. A physical hydraulic model study of the facility was performed by the Engineer.

B. The physical modeling verified that the pump intake design satisfies or is better than the acceptance criteria as specified by Hydraulic Institute Standards, ANSI/HI 9.8-Latest Edition.

C. The pump manufacturer must review the pump installation with particular attention to the pump suction and intake configuration.

D. Pump suction bell outside diameter:

1. Pump Bell Diameter: As specified herein as indicated in the Process Pump Schedule

a. Suction bells with outside diameters less than or greater than specified and indicated, may be submitted and acceptable only if a physical hydraulic modeling study plan is submitted to the Engineer for review and acceptance and subsequently a physical hydraulic model study is conducted by the Contractor to demonstrate that the pump manufacturer's proposed suction bell outside diameter and wet well and intake modifications satisfies all acceptance criteria specified by ANSI/HI 9.8-Latest edition for all specified pump performance requirements and conditions of service specified and indicated.

2. Physical hydraulic model study must incorporate all dimensional modifications to the wet well, pump intake and pump bay design configuration associated with the proposed pump suction bell design and performed at no additional cost to the Owner.

3. Submit physical hydraulic model study to the Engineer for review and acceptance.

4. Submit all modifications associated with the wet well and intake bay design by the Contractor for review and acceptance and stamped by a registered Professional Engineer.

5. All work associated with any design and construction changes due to changes in bell diameters and physical modeling study results must be at no additional cost to the

Owner and is not considered cause for any claim of schedule delay or extension to the contract duration.

PART 2 - PRODUCTS

2.01 SYSTEM DESCRIPTION:

A. Pump capacities and operating data are indicated in the Process Pump Schedule.

B. Influent Pump Station Pumps: Pump raw, unscreened wastewater from wet wells.

C. Pumps are to be installed in a self-cleaning trench wet well, with intake configuration as indicated and as modeled.

D. Equipment Limitations:

1. Pumps: Influent Pump Station Pumps

a. Refer to Process Pump Schedule

b. Coordinate pump dimensions and weights with cranes to be utilized for pump removal with the Owner.

E. Design Heads:

1. The head requirements indicated in the Process Pump Schedule are the heads required at the pump's discharge head outlet.

2. The pump manufacturer must include all internal losses from the intake bell to the discharge head outlet.

2.02 MANUFACTURERS:

A. Fairbanks Nijhuis

B. Flowserve

2.03 SEISMIC DESIGN REQUIREMENTS:

A. Conform to the requirements indicated on the structural drawings and as specified in Section 01 41 20.

B. The Contractor shall conform to the seismic design requirements for this project and for the work of this specification section.

C. Provide all equipment bases, anchorage, supports and foundations designed in accordance with the seismic requirements indicated and specified.

D. Additionally, provide with the Certificate of Unit Responsibility, certification for all equipment signed by a registered structural engineer stating that computations were performed and that all components have been sized for the seismic forces specified and indicated.

2.04 PUMP CONSTRUCTION:

A. Pumps: Vertical wet pit solids handling single-stage, centrifugal pumps with non-reverse ratchet. Driven as indicated in the Process Pump Schedule.

B. Design and proportion all parts of pump specially adapted for the service specified and indicated. Provide room for inspection, repair and adjustment.

C. Bowl Assembly:

1. Cast iron ASTM A48/A48M Class 30.

2. Provide discharge bowls with three symmetrically arranged diffuser vanes.

a. Provide vanes of hydrofoil design with well rounded edges to prevent accumulation of fibers and stringy solids.

3. Bowl shaft: ASTM Type 416 stainless steel. Chrome plated under rubber bearings.

4. Provide lifting eyes on bowls for handling.

5. Provide components with machined registered concentric shoulder fits to ensure precision alignment. Equipment without registered fits is unacceptable.

6. Provide bronze backed Neoprene rubber upper and lower bowl bearings.

a. Bronze: ASTM B505 C39200

7. Provide bowl bearings protected by a PEEK restrictor-bushing system or other field proven system that limits backflow of sand, grit or other potential destructive material during pump shutdown.

a. Provide the restrictor bushing to throttle or limit the amount of flush water used during pump operation, as well as provide proper pressurization of the enclosing tube and bearing lubrication system. Provide the restrictor bushing locked in place with a retaining ring, but free to float along the shaft.

D. Suction Bell:

1. Cast iron ASTM A48 Class 30.

2. Provide bell without any vanes or supporting ribs, for unrestricted flow to the impeller.

3. Provide size as indicated and specified.

    a. If submitted equipment requires a different suction bell diameter from that indicated and specified, prepare and submit for review: physical hydraulic model study and detailed structural, architectural and mechanical drawings showing all necessary changes. All changes are at no additional cost to the Owner.

E. Bowl Assembly and Suction Bell Lining:

1. Manufacturer:

    a. Belzona Supermetalglide

2. Type: Ceramic filled epoxyPercent Solids by Volume: 100 percent

4. Provide two coats 8 to 15 mils thick with total minimum DFT of 20 mils.

5. Cured Hardness: 90D in accordance with ASTM D2240.

6. Surface preparation, mixing and application and safety requirements shall be in accordance with the lining manufacturer's printed instructions and as specified.

F. Impeller:

1. Type: Enclosed solids handling single suction type.

    a. Provide impeller of one piece hydrofoil design with well-rounded leading edges to prevent the accumulation of fibers and stringy material.

2. Provide a maximum of two vanes with wide suction and waterways that will pass solids and stringy materials without clogging.

3. Provide pump capable of passing a minimum diameter sphere, as indicated, between the periphery of the maximum diameter impeller and bowl diffuser vanes.

4. Material:

    a. CA6MN stainless steel.

5. Do not design hub with ports for reduction of thrust on impeller.

    a. Wiper vanes are not acceptable.

6. Key-seat and securely hold impeller to tapered shaft by a key and capscrew and capable of holding securely in event of motor reversal under full torque.

    a. Impeller fasteners: Type 416 stainless steel.

7. Statically and dynamically balance each impeller.

8. Provide means of adjustment of wearing ring clearance.

9. Vertical turbine type pump impellers are not acceptable

G. Wearing Rings:

1. Provide axial type wearing rings on impeller and in pump suction bell.

2. Wearing Ring: Stainless Steel ASTM A743 Grade CA-40 with a 410 to 484 BHN.

a. Provide bell wearing rings of Stainless Steel ASTM A743 Grade CA-40 with a 300 to 350 BHN.

H. Discharge Column Assembly:

1. Column Pipe: Steel ASTM A53 Grade B.

a. Wall Thickness:

Column Size	30
OD, in	30
Wall Thickness, in	0.375

b. Epoxy coated and lined in accordance with AWWA C210.

2. Provide the number of column sections as indicated and specified. Provide with flanged registered connections. Provide column lengths of the length required so that pump can be removed within the space indicated.

3. Provide column pipe with welded in place splitter vane designed to prevent material pumped from accumulating on the shaft enclosing tube. Provide vane running the entire length of the column and align with the bowl diffuser vane and discharge elbow splitter vane.

4. Provide weld neck flange for top column piece connecting to the discharge head. Slip-on flanges are not acceptable.

5. Provide lifting lugs with lifting eyes 180 degree apart below each column flanged connection for pump removal.

6. Hardware: Type 316 stainless steel.

7. Line Shaft and Threaded Couplings: ASTM A582 Type 416 stainless steel.

a. Chrome line shaft in bearing area.

b. Line Shaft Enclosing Tube: Schedule 80 Type 316L stainless steel.

(1) Provide interchangeable lengths not to exceed 5.0 feet.

(2) Carbon steel enclosing tubes are not acceptable.

8. Provide water flush of bearings and seals.

9. Column and lineshaft with spider type bearing retainers are not acceptable.

I. Discharge Head:

1. ASTM A36 fabricated steel discharge head and sole plate sized for mounting the driver specified and indicated.

a. Provide a minimum of four (4) supports and bracing for variable speed operation on all pumps. Heads without bracing are not acceptable.

2. Provide surface type discharge, flanged, drill flange to ANSI/ASME B16.5 Class 150-lb ANSI standard.

a. Provide a minimum three (3) piece mitered bend per contract documents.

3. Provide a flanged adjustable coupling for vertical solid shaft motors.

a. Non-spacer type, John Crane CPAT Style 2.

4. Provide a drain tap for stuffing box leakage and route to nearest floor drain to minimize tripping hazard.

5. Provide a Type 316L stainless steel safety cage conforming to OSHA requirements.

6. Provide Type 316 stainless steel hardware.

7. Epoxy coated and lined in accordance with AWWA C210.

J. Hydrocones with Vanes:

1. Provide fabricated Type 316L stainless steel hydrocones with vane as indicated by pump supplier and hydraulic modeling.

a. Provide Type 316L stainless steel hardware and anchor bolts.

2.05 SEALS:

A. Type: Split Mechanical

1. Manufacturer: Chesterton Style 442

2. Materials:

a. Gland: Type 316 stainless steel

b. Rotary Holder: Type 316 stainless steel

c. Hardware: Type 316 stainless steel

d. Springs: Hastelloy C or Elgiloy

e. Rotating Faces: Silicon Carbide

f. Stationary Faces: Silicon Carbide

g. Elastomers: Viton

2.06 MOTORS:

A. Provide in accordance with Section 26 20 00 and as specified and indicated.

1. Vertical solid shaft with non-reverse ratchet.

B. High thrust motors

C. Horsepower Rating of Motors: Not less than maximum brake horsepower requirements of pumps under any condition of operation specified and indicated without operating in the motor service factor.

D. Motor Enclosure and Speed: As indicated in the Process Pump Schedule.

E. Provide motors with base supports with machined registered joints for mounting on pump discharge head.

F. In addition to the requirements for bearings specified under Electric Motors in Section 26 20 00, provide pump motors with ball or roller bearings. Provide vertical motors with at least one bearing designed for thrust with bearings. Provide bearing with a minimum B-10 life of 100,000 hours. Provide non-reverse ratchet.

G. Overall sound-pressure level of each motor shall not exceed 88 decibels when measured on flat network using an octave-band frequency analyzer conforming to ANSI S1.11. Determine overall sound-pressure level as average of four or more readings at evenly spaced points, 3 feet from motor.

H. Operate without overheating at the speeds specified and indicated.

I. Service Factor: 1.15, with 1.0 inverter duty rating for pumps equipped with variable frequency motor controllers.

J. Premium efficiency with nominal and minimum efficiencies per NEMA MG1.

K. Rating: 4160 V, 3-phase, 60 Hertz

L. Insulation: Class H with Class B temperature rise, 122 degree F ambient.

M. Site Altitude: 4225 feet above sea level

N. Provide Inpro/Seal bearing isolators

O. Motor Temperature Monitoring System:

1. The Resistance Temperature Detector (RTD) monitor system:

a. Platinum, 100 ohm RTDs embedded in the motor windings for each phase and in each motor bearing.

b. Continuously monitor the temperature of the three-wire bearing RTDs via SCADA.

c. Include a display and switch to permit monitoring of actual bearing temperature.

d. Provide an adjustable alarm feature to select an alarm temperature. Selection of temperature range by pump manufacturer. Alarm when bearings reach the selected temperature.

e. Provide an alarm light until reset, and a set of contacts, rated not less than 5 amps at 120 VAC.

f. Temperature range as recommended by the motor manufacturer.

g. Trip point repeatability of not more than 1.8 degree F. detection circuit response time of 5 milliseconds, maximum; deadband, 2 percent maximum; calibration accuracy of 1 degree F.

h. Mount monitors in the variable frequency motor controller as indicated and specified in Section 26 29 23. Mounting in separate panels is not acceptable.

P. Vibration Monitoring System:

1. Reference the requirements listed in Section 26 20 00, including requirements for a vibration monitoring system and accessories.

2.07 DISCHARGE HEAD BASEPLATES:

A. Fabricated ASTM A36 Grade B structural reinforced steel baseplate designed and furnished by pump manufacturer and machined to suit motor base.

B. Grout and anchor baseplate to concrete curb with a minimum of four (4) anchor bolts.

C. Provide supports and bracing for variable speed operation.

2.08 DRAIN, VENT AND SEAL WATER PIPING:

A. Provide drains from stuffing box and drain piping and valves to discharge into nearest floor drain that minimizes risk of tripping, or as indicated.

B. Provide seal water piping, valves and accessories at pump, pre-assembled on rack, as specified and indicated.

C. Drain, seal water and bearing flushing water piping: Type 316 stainless steel in accordance with Section 40 23 19.03 and with a sufficient number of unions to permit removal of each valve and in-line device.

D. Valves: Provide size and type as indicated and as specified in Section 40 23 13.01.

E. Provide seal water control and monitoring unit in accordance with Section 40 23 19.05.

2.09 AIR/VACUUM RELEASE VALVE:

A. Provide an air/vacuum release valve for wastewater service for each pump as specified in Section 40 23 13.01.

B. Locate on discharge piping at high point as indicated.

C. Provide minimum size as indicated.

2.10 GAUGES:

A. Provide gauge assemblies for discharge of each pump as specified in Section 40 73 00 and as indicated.

B. Discharge gauges: Provide standard range with top limit above pump shutoff head at maximum pump speed indicated.

1. Scale: See Section 40 73 00

2.11 SHOP TESTING:

A. Provide as specified herein.

1. Provide motor shop testing in accordance with Section 26 20 00.

B. Pump Tests:

1. Test pump discharge head and bowl separately under a hydrostatic head of at least 75 psi or 150 percent of rated shutoff head, whichever is greater.

2. Provide witness tests as specified herein for all Influent Pump Station Pumps.

3. Witness testing:

a. Run pump at full speed rating point for 60 minutes prior to start of any testing.

b. Full speed tests:

(1) Provide a test curve with a minimum of ten (10) points.

(2) Test pumps at all conditions specified and indicated in the Process Pump Schedule and as a minimum at the following conditions:

(a) Shut off head, if applicable to the type of pump specified

(b) Minimum continuous safe flow

(c) Best Efficiency Point (BEP)

(d) Preferred Operating Range (POR), 2 points, 1 each side of the BEP

(e) Maximum flow or runout

(f) Provide full speed rating curve without the use of a VFD.

(3) Take readings at each point to determine flow rate, differential pressure, rpm, horsepower or kW, and wire to water efficiency.

(a) Wire to Water Efficiency: Pump and job motor combined efficiency excluding any adjustable speed drive.

(b) Provide vibration readings for all submersible and dry pit submersible pumps in accordance with ANSI/HI 11.6

(c) Provide vibration readings for all other pumps 100 hp (75 kW) and larger in accordance with ANSI/HI 9.6.4

(4) Operate each pump for not less than 30 minutes at the specified minimum head condition and take readings to determine that the pump will operate as specified and indicated without cavitation at the specified minimum head condition with not more than the specified and indicated job submergence.

(5) Provide performance curves adjusted for the submitted and approved pump speed.

(6) Provide indication of the specified test acceptance grade and tolerance band.

c. Variable speed tests:

(1) Conduct tests as specified above for full speed but with a minimum of seven (7) points at reduced speeds except that tests for cavitation at minimum head conditions are not required.

(2) As a minimum provide the following test points for reduced speed tests:

(a) Shut off head, if applicable to the type of pump specified

(b) Minimum continuous safe flow

(c) Best Efficiency Point (BEP)

(d) Maximum flow or runout

(e) Specified and indicated rating points

(3) Run one speed test at the speed required to discharge the minimum rating point specified and indicated in the Process Pump Schedule.

(4) Run a second test at a speed approximately midway between full and minimum speed.

(5) Run tests for all reduced speed operating condition specified and indicated in the Process Pump Schedule.

(6) Run one additional test or at the condition specified at the time of the factory testing or as provided in the shop drawing review.

d. Factory tests on pumps:

(1) String test the complete job motor, job variable frequency motor controller, discharge head, bowl assembly and a minimum of 10 feet of column or as many sections as is practical for the manufacturer's test pit.

(a) Use all job motors that are shipped to the pump testing facility for use in these pump tests and match mark each motor serial number with a pump serial number.

(b) Use one (1) job variable frequency motor controller that is shipped to the pump testing facility for use in these pump tests.

(c) Provide performance curves adjusted for the final job column length and provide calculations.

e. Provide a minimum of 30 days written notice to the Engineer prior to shop testing.

4. Run all tests in accordance with the latest standards of the Hydraulic Institute and as specified.

5. Testing Acceptance Grade and Tolerances:

a. ANSI/HI 14.6 Acceptance Grade: 1U.

b. Efficiency Tolerance: -0 percent.

c. If pumps do not meet the tolerances specified, make modifications, adjust the impeller, and pump tolerances and retest until the specified results are obtained.

6. Tests of variable frequency motor controllers specified in Section 26 29 23.

7. In the event that specified tests indicate that pump, motor, or variable frequency drive will not meet specifications, Engineer has the right to require additional complete witnessed tests for all pumps, motors, and variable frequency motor controllers at no additional cost to the Owner.

8. Repeat tests until specified results are obtained.

9. Correct or replace promptly all defects or defective equipment revealed by or noted during tests at no additional cost to the Owner.

10. Pump manufacturer must provide roundtrip airfare from Job site, all local transportation, meals and lodging for witness testing for two (2) people. If air travel is greater than 6 hours, provide business class airfare.

a. Credit the cost of the travel and lodging to the Owner if a virtual witness test is selected.

b. Provide the option of virtual witness testing, Testing must including the following as a minimum:

(1) Real time video of test and data collected

(a) Real time data collected for flow, head, speed, kW and efficiency

(b) Real time performance curve development with specified ANSI/HI 14.6 acceptance grade and tolerances

(2) Provide final performance curve with all corrections at the time of testing.

2.12 SHOP PAINTING:

A. Primer and Finish Paint: Shop apply to all exterior ferrous surfaces, high solids epoxy and system color in accordance with Section 09 91 10.

B. Ferrous surfaces which are not to be painted shall be given a shop applied coat of grease or rust resistant coating.

C. Provide additional shop paint coating for touch-up to all surfaces after installation and testing is completed and equipment accepted.

PART 3 - EXECUTION

3.01 INSTALLATION:

A. Install items in accordance with accepted shop drawings, manufacturer's printed instructions and as indicated.

B. Install pumping units on a concrete pad and align thereon.

1. Set base on metal shims placed directly under the part of the base carrying the greatest weight and spaced close enough to provide uniform support.

C. After alignment is correct, grout using high grade non-shrink grout.

1. Do not imbed leveling nuts in grout.

3.02 STARTUP AND TESTING:

A. Services of Manufacturer's Representative as stated in Section 01 45 00 and as specified herein.

B. Provide services of factory-trained Service Technician, specifically trained on type of equipment specified:

1. Service Technician must be present on site for all items listed below. Person-day requirements listed are exclusive of travel time, and do not relieve Contractor of the obligation to place equipment in operation as specified.

2. Installation: Inspect location of anchor bolts; grouting, setting, leveling, alignment, field erection; coordination of piping, electrical and miscellaneous utility connection:

   a. 2 person-days

3. Functional Testing: Calibrate, check alignment and perform a functional test with water. Tests to include all items specified.

   a. 2 person-days

4. Field Performance Testing: Field performance test equipment specified.

   a. 3 person-days

5. Credit to the Owner, all unused service person-days specified above, at the manufacturer's published field service rate.

6. Any additional time required of the factory trained service technician to assist in placing the equipment in operation, or testing or to correct deficiencies in installation, equipment or material shall be provided at no additional cost to the Owner.

3.03 FIELD TESTING:

A. Provide as specified herein.

B. Test piping connections to prove the pump nozzle are installed with the pipe in a free supported state and without need to apply vertical or horizontal pressure to align piping with pump nozzles by removing and reinstalling all bolting from the pump discharge head flange.

C. After installation of pumping equipment, and after inspection, operation, testing and adjustment have been completed by the manufacturer's field service technician, conduct running test for each pump in presence of the Engineer to determine its ability to operate within the vibration and temperature limits specified, and to deliver its rated capacity under specified conditions.

1. During tests, observe and record head, capacity, motor inputs, motor bearing housing temperatures, noise and vibration.

2. Provide vibration signature test data for each pump and drive assembly.

   a. Limit: 75 percent of ANSI/HI allowable limits at maximum pump speed under load.

3. Bearing and Motor Temperature:

   a. Run each pump for a minimum of one hour, or until the bearings reach a stable temperature prior to taking temperature readings of the motors.

   b. Bearing temperature not to exceed 180 degrees F (82 degrees C).

4. Test Duration: Determined by the Engineer, but not less than one hour of continuous operation at each condition specified and indicated.

5. Immediately correct or replace all defects or defective equipment revealed by or noted during tests, at no additional cost to the Owner, and repeat tests until specified results and results acceptable to the Engineer are obtained.

6. Repeat tests until specified results are obtained.

7. Contractor to provide all water labor, piping, testing equipment, equipment, flow meters, vibration testing equipment and test gauges for conducting tests.

   a. Contractor to provide calibrated test gauges for all permanently installed gauges and portable calibrated flow meters for all pumping systems even in those cases where permanent flow meters are installed.

   b. All calibrations and certifications must be within 30 days of the field testing.

   c. The testing will not be started and will not be accepted until the calibrated testing equipment stated above is operational and all certifications have been submitted and approved.

D. Make all adjustments necessary to place equipment in specified working order at time of above tests.

E. Test pumps on product only. If product is not available, test with water. Water for testing furnished by Contractor.

F. Remove and replace equipment at no additional cost to the Owner with equipment that will meet all requirements specified and indicated if unable to demonstrate to the satisfaction of the Engineer that equipment will perform the service specified, indicated and as submitted and accepted.

3.04 TRAINING:

A. Vendor Training: Provide classroom and field operation and maintenance instruction including all materials, slides, videos, handouts and preparation to lead and teach classroom sessions. See Section 01 78 24.

   1. 3 person-days

3.05 FIELD TOUCH-UP PAINTING:

A. After installation and accepted testing by the Engineer, apply touch-up paint to all scratched, abraded and damaged shop painted surfaces. Coating type and color shall match shop painting.

3.06 CONTRACT CLOSEOUT:

A. Provide in accordance with Section 01 77 00.

SECTION 43 21 00.42

ODOR CONTROL EXHAUST STACK

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide an odor control exhaust stack for the location as shown in the Contract Drawings. The exhaust stack material of construction is to be fiberglass reinforced plastic (FRP). The stack and accessories are to be provided and installed as indicated and in compliance with Contract Documents.

1.02 REFERENCES:

A. American Society of Civil Engineers (ASCE)

1. ASCE/SEI 52-10: Design of Fiberglass-Reinforced Plastic (FRP) Stacks

B. ASTM International (ASTM):

1. C916: Standard Specification for Adhesives for Duct Thermal Insulation.

2. C1290: Flexible Fibrous Glass Blanket Insulation Used to Externally Insulate HVAC Ducts, Type III.

3. E96: Standard Test Methods for Water Vapor Transmission of Materials.

C. National Fire Protection Association (NFPA):

1. 255: Standard Method of Test of Surface Burning Characteristics of Building Materials, 2006 Edition.

2. 259: Standard Test Method for Potential Heat of Building Materials, 2013 Edition.

D. Sheet Metal and Air Conditioning Contractors' National Association (SMACNA):

1. Thermoset FRP Duct Construction Manual, 2nd Edition

2. Accepted Industry Practice for Industrial Duct Construction.

3. Seismic Restraint Manual: Guidelines for Mechanical Systems, 3rd Edition, 1981-2008

E. Underwriters Laboratories Inc. (UL):

1. 181: Standard for Factory-Made Air Ducts and Air Connectors (2013-07-25 edition).

F. Local and National Building Codes

1.03 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Duct Fabrication Drawings:

1. Manufacturer's Product data including details of materials, construction, dimensions of all components, layout, installation details, and finishes for the following items:

a. FRP stack

b. Mounting and anchoring hardware

c. Sampling ports

d. Stack flanges

e. Sealants and gaskets

2. Structural engineering design calculations are to be stamped by a Professional Engineer licensed in the State of Utah.

3. Drawn after actual site measurements are obtained.

4. Drawn to a scale not smaller than 1:50, on drawing sheets of the same size as the Contract Drawings, detailing:

a. Fabrication, assembly, and installation details including plans, elevations, sections, details of components, and attachments to other Work. Other Work includes facility process equipment such as odor control ductwork and accessories.

b. Stack drawings, indicating pressure classifications, and sizes in plan view

c. Stack material and thickness

d. Reinforcing details

e. Seam and joint construction details

f. Spatial coordination with other systems installed in same space

C. Informational Submittals in accordance with Section 01 33 00.

1. Product Data:

a. Submit Product data sheets for the equipment as specified herein. Product data sheets are defined as catalogue sheets, brochures, literature, technical data, performance charts, diagrams, specifications, instruction books, lubrications charts, maintenance instructions/schedule, spare parts lists and similar data used to illustrate quality, characteristics, capacity, maintenance, replacement parts, and performance of the supplied manufactured Products.

2. Record Drawings:

a. At Contract closeout, the Contractor shall submit record drawings of installed ductwork, accessories, and joints, in accordance with Section 01 33 00.

D. Delegated Design Submittals:

1. For the odor control exhaust stack and accessories, provide written certification from Professional Engineer licensed in the State of Utah stating that supports systems, anchorage and equipment have been designed according to the requirements of Section 1613 of the building codes of Utah, Salt Lake City and ASCE/SEI 7, and in accordance with Specification 01 41 20. Submit calculations stamped by a Professional Engineer licensed in the State of Utah for support systems and anchorage for wind, seismic, and all other pertinent loads.

1.04 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.05 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 61 00.

B. Manufacturers: Firms regularly engaged in manufacture of FRP exhaust stacks of the types, materials, and sizes required, whose products have been satisfactorily used in similar service for a minimum of 5 years.

C. Ensure that the suppliers of stack and fitting components provide, on request, the following information:

1. Laboratory performance data for materials.

2. Laboratory performance data for fittings, including zero length dynamic losses.

D. Changes or alterations to layout or configuration of the exhaust stacks shall be:

1. Specifically approved in writing.

1.06 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

B. The equipment and appurtenances shall be delivered to the site in a condition satisfactory to the Engineer and any omissions, discrepancies or damage evident on delivery shall be addressed to the Engineer's satisfaction.

C. The equipment shall be of sufficient strength and rigidity for normal handling during loading, transport, unloading, installation, and assembly. Supports and reinforcements shall be used to maintain the equipment integrity as required.

D. Do not ship the exhaust stacks by nesting small diameter components inside larger components.

E. Protect shop-fabricated and factory-purchased equipment, accessories, and purchased Products from damage during shipping, storage, and handling. Prevent end damage and prevent dirt and moisture from entering the exhaust stacks and fittings.

F. Protect flanged sections by bolting wooden blinds 2 inches greater than outside diameter of flange.

G. For non-flanged components, use either rigid plugs inside ends to prevent deflection or protect with wooden boxes.

H. Crate materials, wherever practical, prior to shipment.

I. Firmly fasten and pad components shipped to prevent shifting or flexing of components after assembly.

J. Lifting lugs shall be shop installed as required to permit safe handling during shipping and erection with conventional hooks or slings.

K. The Contractor shall obtain the manufacturer's written instructions for precautions to be observed in connection with storing the equipment. A copy of all instructions shall be provided to the Engineer.

L. Where possible, store the exhaust stacks inside and protect from weather. Where necessary to store outside, store above grade and enclose with waterproof wrapping

M. Protect exhaust stacks from dirt, water, and debris. During storage on the site, keep ends of the exhaust stacks covered to prevent foreign objects and water from entering.

PART 2 - PRODUCTS

2.01 GENERAL:

A. For this contract, the Contractor is responsible for the supply of one (1) odor control exhaust stack for operation with the Influent Pump Station (IPS) odor control system as indicated on the Contract Drawings and complete with all accessories and features as indicated in this Specification.

B. The exhaust stack shall be a one-piece, free-standing, self supporting, double wall insulated FRP stack, designed and constructed so that the outer casing and inner liner can expand and contract vertically independent of each other. The stack will be bolted to a concrete base as shown on the contract drawings.

C. All materials and components used in the manufacture of this equipment shall be new and unused, and free of all defects and imperfections.

D. All equipment supplied shall be suitable for continuous operation in a corrosive gas stream generated by the treatment of odors produced from a wastewater pumping station facility.

E. The Contractor shall install the odor control exhaust stack and accessories with strict adherence to the manufacturer's written instructions.

F. Material and equipment to conform to the latest edition of all applicable standards, which are in force at the time of tendering, including those listed in Subsection 1.02. In the case of conflict between the requirements of these specifications and any standards, the more stringent requirement of the two applies.

2.02 PROCESS DESIGN PARAMETERS:

A. Process design parameters and service conditions for the odor control exhaust stack and accessories are described as follows:

Process Parameters	**IPS**
Hydrogen Sulphide, average ppm	23
Hydrogen Sulphide, peak ppm	200
Average Inlet RH, percent	>95
Maximum Working Pressure, "w.c.	14
Process Air Temperature, degrees F	40 to 90
Outdoor Temperature, degrees F	-40 to 120

B. The exhaust stack shall be air and watertight up to the pressure indicated in Article 2.02.

C. Materials:

1. Resin System: Premium corrosion resistance, fire retardant vinyl ester, or approved equivalent.

2. Liner Resin: Premium grade and corrosion resistant.

3. Flame Spread Index: ASTM E84, less than 25; fire retardant additives used only in structural layer.

4. Color: Exhaust stack shall be white. Submit sample for approval prior to manufacture

D. Reinforcement:

1. Veil: Chemical surfacing mat, polyester fabric, with finish and binder compatible with layup resin.

2. Corrosion Barrier: Resin rich interior surface of nominal 2.5 to 3.0 mm thick, using chopped strand mat backing the veil. Use no additive in corrosion barrier

E. Exhaust stacks shall be constructed following ASCE/SEI 51-10

F. Flanges for stack-to-duct: Meet or exceed the requirements of ASTM D3982, ANSI B16.5, ANSI B16.47.

G. Gaskets: EPDM, 1/8-inch thick, full face, Durometer – A50 to A60.

H. Insulation: minimum 3.87 lbs/ft^3 density, semi-rigid glass fiber insulation, 3-inch thick, supported vertically every 12-feet, arranged with staggered joints, and banded to the inner liner on 1-foot centers with 1-inch stainless steel bands.

I. Breeching/air duct connection: Rectangular single wall FRP terminated with a flanged connection compatible with ductwork connection flanges, and with the opening around the outer casing reinforced to suit.

J. Anchor hardware and metallic fittings to be of 316L stainless steel material.

K. Sampling ports: two (2) sampling ports not less than 3-inch in diameter and fitted with screw-on air-tight FRP caps shall be provided as shown on the Contract Drawings, at the same elevation and 90 degrees from each other.

L. Cleanout door: minimum 3-foot x 3-foot FRP cleanout door connected to the inner liner, extended out through the outer casing, with reinforcing around the outer casing opening, and equipped with a flanged bolt-on cover plate. Size cleanout door to suit actual size of stack diameter.

M. Stack drain and rain shelf: 2-inch stack drain connection at base of stack provided with a sloped 316L stainless steel plate rain shelf continuously around the circumference of the inner liner to channel water into drain.

N. Lightning protection: two (2) type 304L stainless steel lightning rods secured to the top of the stack, and a minimum of two (2) ground lugs welded to the top of the stack.

O. Approved Vendors:

1. Perry Fiberglass Products, Inc.

2. Composite & Metal Products USA, Inc.

2.03 SEISMIC-RESTRAINT DEVICES:

A. Refer to Sections 01 41 20 and 23 05 48 for requirements for restraint components and applications.

PART 3 - EXECUTION

3.01 GENERAL INSTALLATION:

A. Cut, fit, and install in accordance with the exhaust stack manufacturer's instructions and the Contract Drawings.

B. Install so that the exhaust stack shall be free of vibration while in operation.

C. Install plumb, straight, and in proper alignment.

D. Anti-seize thread compound shall be applied to all nuts and bolts.

E. Flange bolts shall be tightened to torque values specified by the manufacturer. Install gaskets at each flange connection and flat washer under each nut and bolt head.

F. Finished surfaces of all exposed flanges shall be protected by fiberboard blank flanges strongly built and securely bolted thereto.

G. Spare parts shall be packaged in containers suitable for long-term storage and shall bear labels clearly designating the contents and equipment for which they are intended.

H. Temporary shipping braces if required shall be clearly identified for removal after assembly.

I. Lifting lugs shall be shop installed, as required, to permit safe handling during shipping and erection with conventional hooks or slings.

3.02 FIELD TESTING:

A. Comply with requirements of Section 01 78 25.

3.03 CLEANING:

A. Blow exhaust stack clean continuously for a minimum of 24 hours at the airflow rates shown on the contract drawing P&IDs.

B. Contractor shall protect debris from entering the odor control system.

3.04 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

SECTION 44 60 13

ODOR CONTROL SYSTEMS

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide bioscrubber and biofilter odor control systems as indicated, and in compliance with the Contract Documents.

B. Scope includes:

1. Furnish, install and test the biological odor abatement systems with performance as specified herein. The bioscrubber and biofilter odor control system shall include a containment vessel, engineered media, media support, irrigation systems, nutrient addition system, instruments, control panel, and all appurtenances and mechanical equipment to make them operable, as indicated and as specified.

2. The bioscrubber, biofilter, and engineering medias are to be the end product of a single biological odor abatement system manufacturer.

3. The location of the bioscrubber and biofilter systems areas shown on the Contract Drawings.

4. Obtain all state, local or federal permits.

D. National Bureau of Standards (NBS):

1. PS 15: Custom Contact Molded Reinforced Chemical Resistant Process Equipment.

1.03 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

1. Certified shop and working drawings. Drawings for the vessels shall also include a complete description of the laminate and material of construction as specified within this section and be accompanied by a detailed post-cure procedure that will be utilized.

a. Drawings shall include plan views, sectional views, title block, and details of all related items. In cases where certain information is proprietary and is omitted, provided a statement indicating that the information is proprietary and is being omitted.

b. Files shall include Tag Names, Parts List (identifying each component), Dimensions, and connection sizes.

c. Files shall be drawn to scale.

d. Drawings shall be in conformance with all other requirements as specified in this specification.

e. Drawings shall show access paths for maintenance activities and provide sufficient clearance for equipment removal.

f. Drawings are to show the supplied odor treatment equipment within the odor treatment equipment areas as shown on the Contract Drawings.

g. Drawings are to coordinate with and show the locations of where the ductwork, piping, and other services connect to the odor treatment equipment as shown on the Contract Drawings.

h. Drawings to include panel elementary diagrams for pre-wired panels. Include, in the diagrams, control devices and auxiliary devices (e.g. relays, alarms, fuses, lights, fans, and heaters). The diagrams are to be fully comprehensive so that every circuit loop can be followed completely. Indicate the types of loads, switches, transducers and power supplies such as motors, relays, lights, indicators, mechanical float, isolators, signal selectors, dedicated 24 volt DC power suppliers, etc. Number and identify each component circuit and terminal. Also show wiring terminals and devices which are external to the panel including items supplied by the Contractor. Identify all wires/cables, enclosures, terminals, and devices. Show tag numbers.

2. P&ID schematic and wiring schematic with interconnection diagram showing description of operations. List component identification of schematic diagrams as stated herein, along with component instruction manual references.

3. A process control description of the entire system including setpoints and measurement ranges for instrumentation and valves, along with system schematic drawings.

4. Manufacturer's literature and specifications. Show catalog dates.

5. Operating and maintenance instructions and parts list.

    a. In operating instructions incorporate the process control description of the entire system including system schematics.

    b. In maintenance instructions, clearly define requirements for particular system components, and explain special calibration and test procedures.

    c. Provide troubleshooting and maintenance guides for all equipment.

    d. Provide a maintenance schedule for all components of the odor treatment systems.

6. Clearly mark all drawings and provide all technical data for the odor treatment equipment including, nozzle schedule, bill of materials, rated capacities, material of construction, layouts and construction details of all components. Show dimensions, mounting and external connection details, and supports on all drawings.

7. Number and identify all equipment to correspond with terminology on drawings. Also use these numbers on all submittal sheets and shop drawings.

8. List of five (5) operating reference installations in which the manufacturer has supplied the same medias which will be used for the application specified herein. Installations to have been in continuous operation for at least five (5) years.

    a. Provide performance data for each reference installation.

    b. Provide current (verified) contact information for each reference installation.

9. Submit details of:

    a. Vessel construction material

    b. Resin Type

    c. Types and amounts of filler

    d. Corrosion liner description

    e. Reinforcement types for hand lay-up or chopped laminates

    f. Gel coat and UV inhibitor

g. Material final color

10. Shop test results.

11. Qualifications of field service technician.

12. Schematic control and power wiring diagrams.

13. Shop and Field inspections reports.

14. List of recommended spare parts other than those specified.

15. Recommendations for short and long term storage of shipped and spare parts.

16. Special tools.

17. Shop and field-testing procedures and equipment to be used.

18. Manufacturer's product data, specifications, and color charts for shop painting.

19. Provide documentation showing material compatibility and corrosion resistance with process air and fluids as specified.

20. The most recent ISO 9000 series certification.

21. A copy of the contract mechanical process, electrical and instrumentation drawings, with addenda that are applicable to the equipment specified in this section, marked to show all changes necessary for the equipment proposed for this specification section. If no changes are required, mark all drawings with "No changes required".

    a. Failure to include all drawings applicable to the equipment specified in this section will result in rejection of the entire submittal with no further review.

22. A copy of this specification section with addenda and all referenced specification sections with addenda, with each paragraph check-marked to indicate specification compliance or marked to indicate requested deviations and clarifications from the specified requirements.

    a. If deviations and clarifications from the specifications are indicated, therefore requested by the Contractor, provide a detailed written justification for each deviation and clarification.

    b. Failure to include a copy of the marked-up specification sections and or the detailed justifications for any requested deviation or clarification will result in rejection of the entire submittal with no further review and consideration.

1.04 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.05 SPARE PARTS:

A. Comply with the requirements specified in Section 01 61 00.

B. Furnish and deliver to the Owner at the site of Work the following spare parts, all identical and interchangeable with similar parts installed in the Work:

1. One (1) of each type pressure and differential pressure gauge, as necessary for each bioscrubber and biofilter system.

2. Two (2) spare gaskets of all types, materials and sizes for each bioscrubber and biofilter system.

3. Two (2) spare mist eliminator pads for each bioscrubber and biofilter system.

4. One (1) year supply of bioscrubber nutrients.

1.06 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

B. Systems shall be the product of one (1) manufacturer, who shall be responsible for the design coordination and proper operation of this equipment. The manufacturer shall ensure the satisfactory installation of the equipment, and the satisfactory performance that meets the performance requirements as specified herein. Any modifications or revisions required to meet the satisfactory installation and performance of the odor treatment equipment will be at no additional cost to the Owner.

C. Systems shall be a manufacturer’s standard cataloged product and modified to provide compliance with the drawings, specifications, and the service conditions specified herein.

D. Do work required by and in accordance with applicable State and local codes; arrange for permits, inspections and tests required by these codes; and provide complete systems ready for use. Provide vessels and accessories that conform to applicable safety standards, including those for safety of personnel.

E. Provide components to manufacturer's standard for service specified and indicated unless otherwise required.

F. Provide components and accessories of manufacturers' latest and proven design.

G. Services of Manufacturer's Representative as stated in Section 01 45 00 and as specified herein.

H. FRP Fabricator: demonstrate, through past records, their capability in successful manufacturing of filament-wound fiberglass.

I. FRP vessel fabricator's quality assurance supervisor: minimum 10 years' experience in the fabrication of fiberglass structures.

J. If equipment proposed is heavier, larger, different rotation, or discharge arrangement than specified and indicated; provide all structural, architectural, mechanical, electrical and plumbing revisions at no additional cost to the Owner. Odor treatment equipment and accessories to fit within the odor treatment areas as shown in the Contract Drawings.

K. If equipment is heavier than specified, the Contractor shall provide all hoisting equipment sized to maintain the minimum safety factor between the specified maximum equipment weight and the lifting capacity of the hoisting equipment indicated and specified.

1.07 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

1.08 WARRANTY:

A. The Manufacturer shall warrant that all bioscrubber and biofilter engineered medias will not compact, degrade or decompose for a period of 10 years from the date of achieving substantial completion.

B. Comply with the requirements specified in Section 01 78 36.

PART 2 - PRODUCTS

2.01 MANUFACTURERS AND PRODUCTS:

A. The odor control system shall be supplied by BIOREM Environmental Limited.

B. Supply products from a single manufacturer responsible for the complete bioscrubber, biofilter, and engineered medias, complete with all features and accessories in this specification.

C. The manufacturer is to have a minimum of 10 years of experience in the design and supply of engineered media, bioscrubber, and biofilter odor control treatment equipment.

D. The bioscrubber and biofilter are to be supplied for the location shown on the Contract Drawings and specified herein.

E. The Contractor is to install the manufacturer supplied equipment in accordance with the manufacturer's detailed instructions.

F. The Contractor is to supply and install all wiring and power cables.

G. Water piping, fittings, and nozzles internal to the bioscrubber and biofilter equipment are to be supplied and installed by the manufacturer. Water piping external to the bioscrubber and biofilter equipment is to be supplied and installed by the Contractor in accordance with the manufacture's detailed instructions.

H. Interconnecting ductwork to the bioscrubber and biofilter is to be supplied and installed by the Contractor.

I. Supply products modified as necessary by the manufacturer to provide the specified features and to meet the specified operating conditions.

J. All electrical equipment, instrumentation, and panels installed within 3 ft of the odor control ductwork, process fans, bioscrubber, and biofilter vessels are to be supplied explosion proof for a Class 1 Division 2 rated environment.

K. Comply with the requirements specified in Section 01 61 00.

2.02 PERFORMANCE REQUIREMENTS:

A. Process parameters:

	Influent Pump Station Bioscrubber and Biofilter
Equipment Tag	01-TK-40100; 01-TK-40140
Airflow Rate, cfm	5,000
Min Bioscrubber EBRT, sec	12
Max Biofilter EBRT, sec	50
Avg. Inlet RH, %	>90
Air Inlet Temperature, ^{o}F	40 to 90
Ambient Air Temperature, ^{o}F	-40 to 100
Bioscrubber Unit Quantity, ea	*1*
Biofilter Unit Quantity, ea	*1*
Average Loadings	
Avg. H_2S, ppm	23
Avg. Methyl Mercaptan, ppm	1
Avg. Dimethyl Disulfide, ppm	0.1
Avg. Carbon Disulfide, ppm	0.1
Avg. Odor, ou	25,000
Maximum Loadings	
Max. H_2S, ppm	200
Max. Methyl Mercaptan, ppm	2
Max. Dimethyl Disulfide, ppm	1
Max. Carbon Disulfide, ppm	0.5

	Influent Pump Station Bioscrubber and Biofilter
Max. Odor, ou	100,000
Removal Performance	
Bioscrubber H_2S Removal, %	99
Biofilter H_2S Removal, %	99
Biofilter TRS Removal, %	90
Total Odor Removal, %	95

B. The manufacturer is responsible for providing proper humidification of the process air prior to biofilter treatment.

C. The odor control systems are to be designed for continuous 24 hour, 7 days per week, operation.

2.03 BIOSCRUBBER AND BIOFILTER SYSTEM COMPONENTS:

A. Bioscrubber Odor Control System:

1. The bioscrubber system shall include engineered bioscrubber media, bioscrubber vessel, media support, instrumentation, controls, spray systems, recirculation pump, water control panel, nutrient supply system, winterization, access hatches, and all appurtenances and fittings required for one (1) independent bioscrubber system as shown on the Contract Drawings.

2. The bioscrubber system shall be supplied with an FRP vessel whose design and supply is provided by the manufacturer. The Contractor shall install the vessel in accordance with the manufacturer's detailed drawings and instructions.

3. The bioscrubber vessel is to be able to withstand an operating negative pressure of 14 inch w.c.

4. The manufacturer is to supply all piping, fittings, and spray nozzles for a fully functioning spray system.

5. All piping and nozzles are to be of corrosion resistant material.

6. The manufacturer is to provide non-clogging water spray nozzles, and to include a y-strainer in the water panel on the recirculated water line to minimize clogging.

B. Bioscrubber Media:

1. The bioscrubber media shall be a permanent engineered media. The media shall be formulated with nutrients, buffering agents and adsorbents as required.

2. The media shall be resistant to degradation and compaction. Media shall not settle by more than 1.5 percent of its original depth within six (6) months after installation. The media shall not shrink or swell with varying moisture contents.

3. The media is to be supplied in a volume that is sufficient to treat the design airflow at no less than the minimum empty bed residence time as specified herein.

C. Biofiltration Odor Control System:

1. The biofilter system shall include engineered biofilter media, biofilter vessel, media support, instrumentation, controls, spray systems, winterization, access hatches, view ports, and all appurtenances and fittings required for one (1) biofilter system as shown on the Contract Drawings.

2. All equipment supplied is to be suitable for continuous operation in a corrosive foul air stream generated from the treatment of wastewater from a wastewater treatment facility.

3. The equipment is to be the manufacturer's standard design. The design is to have been proven effective and reliable under similar operating conditions.

4. The biofilter vessel is to be able to withstand an operating negative pressure of 14 inch w.c.

5. The odor control system is to be designed to operate 24 hours per day, 7 days per week.

6. A humidification system is to be supplied with the biofilter system to raise the relative humidity of the airflow to a minimum of 98 percent or higher if the upstream bioscrubber does not sufficiently raise the airflow relative humidity to a minimum of 98 percent or more. The humidification system is to be integral to the biofilter vessel.

D. Biofilter Media

1. The biofilter media shall be a permanent engineered media. The media shall be formulated with nutrients, buffering agents and adsorbents as required.

2. The media shall be resistant to degradation and compaction. Media shall not settle by more than 1.5 percent of its original depth within six (6) months after installation. The media shall not shrink or swell with carrying moisture contents.

3. Minimum service life of all biofiltration media is 10 years.

2.04 CONFIGURATION, COMPONENTS, FEATURES:

A. General:

1. Auxiliary equipment as indicated in the Contract Drawings.

2.05 SEISMIC DESIGN REQUIREMENTS:

A. Conform to the requirements indicated on the structural drawings and as specified in Section 01 41 20.

B. The Contractor shall conform to the seismic design requirements for this project and for the work of this specification section.

C. Provide all equipment bases, anchorage, supports and foundations designed in accordance with the seismic requirements indicated and specified.

D. Additionally, provide with the Certificate of Unit Responsibility, certification for all equipment signed by a registered structural engineer stating that computations were performed and that all components have been sized for the seismic forces specified and indicated.

2.06 BIOFILTRATION AND BIOSCRUBBER VESSELS:

A. All materials and components used in the manufacture of this equipment shall be new and unused and free of defects and imperfections. Biofiltration and bioscrubber vessels will be designed in accordance with the following requirements:

1. The vessel is to be designed to handle air with the characteristics specified herein, and process water with a pH level as low as 1.0.

2. The vessel is to be manufactured so that all parts are proportioned to have liberal strength and stiffness and to be especially adapted for the intended working conditions.

3. Material of construction of the bioscrubber vessels is to be FRP, while the biofilters can be 316 stainless steel or FRP.

4. For FRP construction, construct the vessel as follows:

a. The inner shell is to be approximately 25 percent glass and 75 percent resin. Provide an internal C-glass surface veil liner for corrosion resistance.

b. Resin (flame retardant versions only)

(1) Acceptable Products:

(a) Hetron FR922 by Ashland Chemical Co.

(b) Derakane 510C-350

(c) Dion ver9300FR

(d) Vipel K022-AC Series

c. Reinforcing material is to be commercial grade glass fiber containing a coupling agent to produce a suitable bond with the resin used.

d. All materials are to be suitable for exposure to hydrogen sulfide fumes at a concentration of up to 300 ppm and sulfuric acid at a pH of 1.0.

e. Ultraviolet absorbers are to be added to the exterior surface for improved weather resistance. Color samples are to be provided to the Consultant for selection by the Owner.

f. All surfaces are to be finished so as to obtain complete cure of the resin without air inhibition. The finished laminate is to be as free as commercially practicable from visual defects such as foreign inclusions, dry spots, air bubbles, pinholes and pimples. The vessels are to conform to the manufacturer's minimum standard for Barcol hardness.

g. Vessel rigidity to be designed to prevent collapse, implosion or any other damage to the unit from operation of the suction fan at any point along its performance curve.

5. The vessel is to be equipped with the accessories as listed below:

a. Provide Lifting eyebolts (minimum of 4) for use in transporting and placing the vessel.

b. Provide hold downs (minimum of 4) each consisting of Type 316 stainless steel anchor bolts. The anchor bolts are to be used for anchor bolting to the concrete odor control pad.

c. All necessary access doors, nozzles and other attachments. Vessel connection flanges are to be compatible with connecting piping and ductwork.

d. Provide at least one side entry manway for each media lift and spray nozzle assembly and is to be a minimum of 36 inches diameter with bolted flanged covers, that are suitable for the operating suction pressure specified herein. Provide bolted manways with 0.126 inch thick full face neoprene gaskets with Type 316 stainless steel bolts. Provide manways as needed for inspection and access to internals of the vessel.

e. All bolts and fasteners are to be Type 316 stainless steel.

f. All gaskets are to be EPDM.

g. The media support is to be vinyl ester FRP grid type. Packing support plates and mid-span supports are to be suitable to support the weight of the packing and entrained recirculation solution.

h. Provide integral sump to allow for continuous water recirculation.

i. Provide a chevron-style, mist eliminator at the top of each vessel.

j. Permanent personnel fall-arrest anchors to be provided on the biofilter roof and side of the bioscrubber vessels for safety tie-down during maintenance and inspection. Personal fall protection anchors must have a load capacity in any direction of at least 5,000 lbs.

k. Media support

(1) FRP grating supported by FRP I-beams are to be installed to support the weight of the medias plus entrained process water.

(2) Openings in FRP grating shall be large enough to let inlet air and process water to pass freely but not allow passage of media particles.

(3) A 2 inch mesh polypropylene screen shall be placed on the FRP grating to prevent media from falling through.

(4) The slats shall be designed and constructed to ensure even distribution of air across all cells.

(5) The media support materials shall be corrosion resistant and selected for low pH resistance as appropriate for the process.

2.07 HUMIDIFICATION MEDIA:

A. If a humidification system is required, provide random-dumped or structured packing, high-efficiency, designed to achieve maximum gas liquid contact at minimum pressure drop. Provide packing material with a minimum geometric surface area of 44 ft^2/ft^3 and a maximum air pressure drop of 0.20 in (H_2O) per ft of depth at a gas loading rate of 3,900 $lb/min/ft^2$, and a liquid loading rate of 2,935 $lb/min/ft^2$.

2.08 RECIRCULATION AND SPRAY IRRIGATION SYSTEMS:

A. The recirculation system for the bioscrubber, and spray irrigation system for the biofilter, shall consist of a spray nozzle assembly that is located above the top of each media bed layer.

B. The recirculation system and spray irrigation system are to provide full and even coverage of the media to ensure uniform media moisture content throughout the bioscrubber and biofilter systems.

C. All instruments and valves for the water supply lines, recirculation lines, and spray irrigation lines, are to be supplied by the manufacturer.

D. The recirculation system is to be operated continuously for entire the life of odor control system.

E. A media irrigation system that operates intermittently shall be utilized for the biofilter. Frequency and duration of irrigation shall be determined by the manufacturer.

F. Provide insulation, aluminum jacketing and heat tracing for all exposed water and drainage piping to prevent freezing.

G. Recirculation pump:

1. Pump is to be of Type 316L stainless steel material and suitable for operation with a corrosive low pH solution.

2. The pump is to be appropriately sized for the process requirements of the bioscrubber.

3. Provide equipment that is non-overloading and that operates without noise, vibration, heating, or damage when operating for the specified operating conditions. The pump is to be designed for continuous duty pumping of the bioscrubber recirculation water.

4. Shafts shall be machined and surface ground to ensure the interchangeability of shafts and the attached parts. Shafts are to be of adequate size and strength to transmit the full motor horsepower with a liberal safety factor to ensure rigid support of the impeller and to prevent vibration at operating speeds

5. The selected pump should not use the maximum size of impeller for that series of pump.

6. Pumps are to be ANSI pumps with sealless magnetic drive motors.

7. Acceptable Manufacturers:

   a. Finish Thompson Inc., ultrachem series, UC

   b. Iwaki America Inc., equivalent model

   c. Sundyne, equivalent model

8. Provide each pump with a discharge mounting base with flush mounted mating surfaces (between pump and base) and an ANSI Class 125 flange bolting pattern pipe connection.

9. Bearings shall be of sufficient size and properly spaced to transfer all radial and axial loads to the pump housing and to minimize shaft deflection.

10. The impeller shall be statically and dynamically balanced, positioned rigidly and secured on the shaft with a stainless steel key and impeller lock nut or lock screw

11. All electrical equipment shall be Class 1, Division 2, explosion proof.

12. The Contractor shall supply and install all necessary connection wiring and cables to the control panels and associated accessories as per the manufacturer's instructions.

13. Electric Motors:

    a. The motor shall be sized for runout conditions and is to be non-overloading throughout the entire pump range of operation without utilizing the motor service factor.

    b. The motor is to be designed for continuous duty and shall be capable of sustaining at least ten (10) evenly spaced starts per hour.

    c. Motors to be sealless magnetic drive motors.

14. Controls and Instrumentation:

    a. The motor starter for the pump, including instrumentation and controls, shall be incorporated in the odor treatment system control panel.

    b. A single 480 VAC 3 phase feed shall be supplied to the odor control panels to provide power to the motor starters.

    c. The pump is to be hardwired, interlocked to the odor control panels.

    d. The panel will contain all operator interface and local control devices and circuit breakers.

    e. Provide a single main disconnect switch with a lockable door handle for the power supply on the control panel.

    f. Provide terminals in the control panel. All equipment is to be wired to the odor control panel.

    g. Provide a motor protection breaker type combination starter for the pump, with handles.

    h. Provide motor thermal overload protection.

15. Include the following on the odor control panel door for the recirculation pump:

    a. Hand-Off-Auto selector switch.

    b. Pump run (red) and alarm light (amber).

    c. High winding temperature light.

    d. Non-resettable elapsed time meter.

e. Reset pushbuttons to reset lights for the pump alarms.

f. All indicating lights shall be a push-to-test type (PTT).

16. External interfaces

a. Dry contact to close during low flow alarms (5A, 120 VAC).

b. Dry contact to close during any overload, high winding temperature, or leakage condition.

c. Dry contact to close when the pump runs.

17. The manufacture is to supply a field local e-stop push button control panel. The e-stop field control panel is to be installed by the Contractor.

18. Lifting Lugs: Provide lifting lugs for handling of equipment.

19. Anchor Bolts: Type 316 stainless steel, sized by the equipment manufacturer

2.09 WATERBOX:

A. Provide a heated waterbox, which houses components necessary for the recirculation and spray systems for the bioscrubber and biofilter systems.

B. Waterbox to be a minimum NEMA 4X enclosure of either FRP or Type 316 stainless steel. The waterbox is to be explosion proof for a Class 1 Division 2 environment if installed within 3 ft of the odor control ductwork, process fan, bioscrubber, or biofilter.

C. The waterbox is to be factory fabricated for field installation on a support frame.

D. The waterbox is to contain valves, y-strainer, and plumbing required for control of the biofilter media irrigation and humidification, and the bioscrubber recirculation spray system.

E. Provide field connections to external water supply. The Contractor is to coordinate the connection location with the manufacturer.

F. The waterbox is to contain the following instrumentation and fluid control valves at a minimum:

1. Two (2) flow meters, one (1) for recirculation flow monitoring, one (1) for make-up water flow monitoring

2. One (1) metering pump for the nutrient addition system.

3. One (1) pressure indicating transmitter for recirculated water pressure

4. One (1) pH sensor for bioscrubber recirculated water pH measurement.

5. Ball valves for isolation

6. Diaphragm valve for flow throttling

7. Y-strainers

8. Check valves

9. Pressure regulator for incoming water supplies

10. Blown Down flow gauge-indicator

G. The waterbox is to contain fittings for connections to the external water supply and the recirculation pump. The manufacturer is to coordinate with the Contractor for tie-in point locations.

H. All piping, metering pump, valves, and strainers shall be of corrosion resistant material.

I. The manufacturer is to appropriately size the waterbox to fit the necessary equipment for a functional bioscrubber recirculation system and biofilter irrigation system.

J. The waterbox location is to be as indicated on the Contract Drawings.

2.10 INSTRUMENTATION AND CONTROL

A. The manufacturer is to provide at a minimum the instrumentation shown on the Contract Drawings, and that required for fully functional bioscrubber and biofilter odor control systems.

B. All instruments and controls within 3 ft of the odor control ductwork, process fans, bioscrubber, and biofilter are to be rated for operation within a Class 1 Division 2 explosion proof environment.

C. All instruments that are located within the foul air stream shall be explosion proof, rated Class 1, Division 1, or equipped with a matching intrinsically safety (I.S.) barrier as required.

D. All instruments of the same type are to be identical, from the same equipment supplier, and interchangeable for the purpose of system configuration and ongoing maintenance.

E. The Contractor is to supply and install all wiring, cables, and power, to and from the instruments, control panels, and plant PLC in accordance with the manufacturer's instructions.

F. Control Panel:

1. The manufacturer is to provide one (1) free-standing, NEMA 4X enclosure with all internal components and wiring needed for a functional odor control system.

2. The control panel is to be located inside the IPS building facility. The Contractor is to install the control panel.

3. Operator controls and indicators on the front of the panels:

    a. Provide one (1) Operator Interface Terminal (OIT) on the panels.

    b. Provide all indication and controls on the panel OIT for the operation of the odor control system.

    c. Provide a Start/Stop switch for turning the odor control system on or off on the control panel.

    d. Provide system ready indication on the panel.

    e. Provide power on indication on the panel.

    f. Provide an alarm reset pushbutton.

4. Controls inside the panel

    a. Relays and IS barrier as required.

    b. Surge and transient protection device.

    c. Power supply (24 VDC) unit.

    d. All necessary terminal blocks and wire ways.

5. The odor control panels communicate with the plant PLC systems via ethernet cable. The odor control panel is to provide all of the signals to the PLC at the network including PLC, and power status and alarms.

6. Control panel electrical

    a. The control panels are to be suitable for 480 VAC, 3-phase supply.

    b. Complete with an interlock door breaker.

    c. Fused control transformer

d. Complete with breaker type NEMA style combination starter for the recirculation pump. Breakers for the starter must be operable from the front of the panel.

G. All instrument ranges shall be selected by the manufacturer to match the complete long-term operational ranges of the equipment.

H. Select instruments suitable for measuring foul air with characteristics described herein.

2.11 GASKETING AND SEALING:

A. Flanged nozzles: Viton or Hypalon full face gaskets of 50 to 60 Shore "A" Durometer hardness.

B. Fabricated gaskets: Machine-made or die-stamped with inside and outside edges parallel or concentric, as applicable. Make bolt holes oversized to prevent crimping of gasket when installed.

1. Neoprene.

2. 1/4 inch thickness.

3. Acceptable Product:

a. Garlock 7986.

2.12 AUXILIARY EQUIPMENT:

A. Nutrient Addition System

1. Provide one (1) nutrient addition system which will be connected to the bioscrubber.

2. The nutrient addition system shall contain the following:

a. FRP nutrient feed tank sized by the manufacturer to contain a minimum one (1) month supply of nutrient solution.

b. One (1) motorized mixer internal to the nutrient feed tank.

c. Connection to the metering pump installed within the waterbox for nutrient addition.

d. Connections from the waterbox to the bioscrubber recirculation line and irrigation line for nutrient addition.

e. Provide one (1) year supply of bioscrubber nutrients.

f. Ball valves for isolation.

g. Check valve.

h. Water supply connection to the nutrient feed tank.

i. Overflow drain from the nutrient feed tank.

3. All piping shall be of corrosion resistant material.

B. Provide FRP heated enclosures (hotboxes) for the recirculation pump and the nutrient addition system. The hotboxes are to heat the equipment for winterization within the ambient air temperatures specified in section 2.02 A. above. The hotboxes are to be supplied with a thermostat which will turn on the hotbox heater at an ambient temperature no lower than 40ºF. Indication that the hotbox heater is operating is to be shown on the odor control panel OIT.

C. Provide an inline recirculation water heater for winterization and maintaining the foul air inlet temperature to the bioscrubber and biofilters within the manufacturer's optimal operating range. The foul air inlet temperature and ambient air temperature ranges are as specified in section 2.02 A. above.

D. The Contractor is to provide all anchor bolts required for the complete installation of the equipment. All anchor bolts shall be 316 stainless steel unless otherwise specified in the Contract Documents.

E. Flanges:

1. For equipment, valves, and devices with integrally cast flanges, provide flanges in accordance with the dimensions and drilling of ANSI B16.1or ANSI B16.5 with bolt-holes straddling the vertical centerline.

2. For equipment, valves, and devices with PVC flanges provide flanges in accordance with the dimensions and drilling of ASTM D2466-06, or ASTM D2467-06 with bolt-hole straddling the vertical centerline.

3. For fabricated equipment and vessels, provide forged flanges of the same material as the equipment or vessel. Provide stainless steel equipment with 316 stainless steel flanges; FRP equipment and vessels with FRP flanges. Stainless steel specified in section 2.02 A. above with plain steel backing rings are not acceptable. Neither lap-joint nor Van Stone flanges are acceptable.

PART 3 - EXECUTION

3.01 INSTALLATION:

A. General:

1. Install equipment and appurtenances in accordance with manufacturer's recommendations.

2. Provide all materials and equipment required.

3.02 BIOFILTER AND BIOSCRUBBER:

A. Install the bioscrubber and biofilter along with all components in accordance with the manufacturer's recommendations.

B. Install the bioscrubber and biofilter on the odor control concrete pad as indicated on the Contract Drawings.

C. Installation of the bioscrubber and biofilter media is to be completed only when the WRF is commissioned to avoid prematurely degrading the media.

3.03 FIELD AND FUNCTIONAL TESTING:

A. After installation, perform all of the following full operational tests in presence of the Owner. Furnish all labor, materials and equipment required for such tests.

1. Biofilter and Bioscrubber:

a. Factory test with water to the height of the overflow or the straight side height of the vessel, greater amount. Submit test data.

b. The water level must be unchanged after 24 hours with no visible signs of leakage or wall deflection exceeding 1/4 percent of span.

c. Hydrostatic test shall be witnessed by the CM.

2. Startup:

a. Provide the services of a factory-trained service technician, certified by the manufacturer to service the type of equipment herein specified, to assist in start-up operation.

b. Tests to be performed consist of start-up and operation of entire system at design capacity, and verification of operation of drives and other components, without, overheating, leakage, cracking of parts, structural damage, jamming, binding, or other defects.

B. In case of failure to demonstrate ability to function as indicated and specified, modify, rebuild or replace equipment or parts thereof at no additional cost to Owner, until equipment is in accordance with specifications. After three (3) unsuccessful test attempts, replace non-conforming equipment at no additional cost to the Owner. Repeat tests until specified requirements have been met, at no additional cost to the Owner.

3.04 STARTUP AND TESTING:

A. Provide services of factory-trained Service Technician, specifically trained on type of equipment specified:

1. Service Technician must be present on site for all items listed below. Person-day requirements listed are exclusive of travel time, and do not relieve Contractor of the obligation to place equipment in operation as specified.

2. Comply with requirements for checkout, startup, and testing in Section 01 78 25.

3. Installation: Inspect any grouting, location of anchor bolts; setting, leveling, alignment, field erection; coordination of piping, electrical and miscellaneous utility connection:

    a. 2 person-days

4. Functional Completion Testing: Calibrate, check alignment and perform a functional test with water. Tests to include all items specified.

    a. 1 person-day

5. Field Performance Testing: Field performance test equipment specified.

    a. 2 person-days

6. Vendor Training: Provide classroom and field operation and maintenance instruction including all materials, slides, videos, handouts and preparation to lead and teach classroom sessions. See Section 01 78 24.

    a. 1 person-day

7. Credit to the Owner, all unused service person-days specified above, at the manufacturer’s published field service rate.

8. Any additional time required of the factory trained service technician to assist in placing the equipment in operation, or testing or to correct deficiencies in installation, equipment or material shall be provided at no additional cost to the Owner.

B. Functional Tests: Recirculation pumps.

1. Alignment: Test complete assemblies for correct rotation, proper alignment and connection, and quiet operation.

2. Vibration Test:

   a. Test with units installed and in normal operation, and discharging to the connected piping systems at rates between the low discharge head and high discharge head conditions specified by the manufacturer. The pump shall not develop at any frequency or in any plane, peak-to-peak vibration amplitudes exceeding the limits of the equipment suppliers.

3. If units exhibit vibration in excess of the limits, adjust or modify as necessary. Any units which cannot be adjusted or modified to conform as specified shall be replaced.

4. Performance Test:

   a. Conduct on each recirculation pump.

5. Test for a continuous 3-hour period without malfunction.

6. Test and record the following:

   a. Total static head and total discharge head.

   b. Capacity (flow measured by plant instrumentation, temporary instrumentation, and/or storage volumes).

   c. Driving motor voltage and amperage measured for each phase

C. Air Leakage Test

1. The bioscrubber and biofilter vessels are to have an air leakage test completed to ensure the vessels, and all hatches, doors, and flanges are airtight and do not allow air leakage.

2. The Contractor is to pressurize the vessels to a design operating pressure of 14 inch w.c. for one (1) hour.

3. The Contractor is to inspect the bioscrubber and biofilter vessels, all access hatches, doors, and flanges, for air leaks by soap testing.

4. Ductwork and piping inlets and outlets are to be blinded to avoid air leakage during testing.

5. The Contractor is to provide a pressure gauge to measure and indicate the internal pressure of the vessels during the leak test. The pressure is not to decrease more than 2 percent of the initial test pressure.

6. If leaks are found, the Contractor is to rectify all leakages, and rerun the leak test until no further leakages from the vessel are found

D. System Performance Testing

1. Performance Testing shall be completed in accordance with the requirements of Section 01 78 25, and Section 01 78 26, after the reliability demonstration has been completed.

2. Testing Requirements:

a. Following the Owner approval of start-up results, provide services of an independent State qualified air testing laboratory to measure and report on efficiency and performance of the odor control system. Submit testing procedures of testing laboratory to the Owner at least 15 days prior to tests. Have manufacturer's service technician present during system testing.

b. Testing shall include certification that the units have been tested and rated in accordance with the applicable AMCA Standard Test Code and Certified Ratings Program and that they bear the AMCA seal.

c. Odor performance testing shall follow ASTM/ANSI E679-19 "Standard Practice for Determination of Odor and Taste Threshold by a Forced-Choice Ascending Concentration Series Method of Limits"; and all testing is to be coordinated with the Consultant.

(1) Compounds to be tested are those specified under subsection 2.02 A. herein and odor units.

(2) Grab bag samples for odor and reduced sulfur compound measurement are to be collected four (4) times during a 24-hour period.

(3) During each of the four (4) sampling periods, three (3) tedlar bag samples plus one (1) blank are to be obtained from the inlet air into the bioscrubber and the outlet air from the biofilter.

(4) During the 24-hour test, the Contractor is to record H_2S concentrations by use of a Detection Instruments Odalog, or approved equivalent. The Odalog is to record H_2S concentrations from the outlet air from the biofilter at a minimum of 5-minute intervals.

(5) Odor concentration is to be assessed by an odor panel to estimate odor concentration from the inlet air into the bioscrubber and the outlet air from the biofilter.

(6) The Contractor is to setup access platforms or scaffolding to for the performance testing to be completed.

E. The manufacturer shall be aware that the Contractor is responsible for odor performance field testing, however the manufacturer is responsible for the odor treatment equipment's performance.

F. If a test fails it must be redone at the expense of the manufacturer.

3.05 FIELD TOUCH-UP PAINTING:

A. After installation and approved testing by the Engineer, Contractor shall apply touch-up paint to all scratched, abraded and damaged shop painted surfaces. Coating type and color shall match shop painting.

3.06 SYSTEM BALANCING:

A. Adjust manual and automatic control devices to balance airflows so they perform as indicated and specified.

B. Balance air systems so each system is within 5-percent of the airflow values indicated.

C. Submit report to the Owner outlining balancing procedures used; report to include:

1. Type of measuring devices used

2. Air quantities at each inlet and outlet

3. Fan speeds

4. Fan suction and discharge pressures

3.07 CONTRACT CLOSEOUT:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

Page Intentionally Left Blank

SECTION 44 60 14

ODOR CONTROL DUCTWORK AND ACCESSORIES

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide odor control ductwork for collection of foul odor air from locations as shown in the Contract Documents. Ductwork material includes high-density polyethylene (HDPE) and fiberglass reinforced plastic (FRP). Ductwork and accessories to be provided and installed as indicated and in compliance with Contract Documents.

1.02 REFERENCES:

A. ASTM International (ASTM):

1. C916: Standard Specification for Adhesives for Duct Thermal Insulation.

2. C1290: Flexible Fibrous Glass Blanket Insulation Used to Externally Insulate HVAC Ducts, Type III.

D. Underwriters Laboratories Inc. (UL):

1. 181: Standard for Factory-Made Air Ducts and Air Connectors (2013-07-25 edition).

E. Local and National Building Codes

1.03 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Duct Fabrication Drawings:

1. Manufacturer's Product data including details of materials, construction, dimensions of all components, layout, installation details, and finishes for the following items:

a. HDPE and FRP ductwork

b. Ductwork insulation and jacketing

c. Duct-mounted sampling ports

d. Ductwork flanges

e. Sealants and gaskets

f. Butterfly dampers

g. Flexible connections

2. Structural engineering design calculations are to be stamped by a Registered Professional Engineer from a Professional Engineer licensed in the State of Utah.

3. Drawn after actual site measurements are obtained.

4. Drawn to a scale not smaller than 1:50, on drawing sheets of the same size as the Contract Drawings, detailing:

a. Fabrication, assembly, and installation details including plans, elevations, sections, details of components, and attachments to other Work. Other Work includes facility process equipment and buildings.

b. Duct layout, indicating pressure classifications, and sizes in plan view.

c. Duct material and thickness.

d. Reinforcing details and spacing.

e. Seam and joint construction details.

f. Spatial coordination with other systems installed in same space with duct systems.

C. Informational Submittals in accordance with Section 01 33 00.

1. Product Data:

a. Submit Product data sheets for the equipment as specified herein. Product data sheets are defined as catalogue sheets, brochures, literature, technical data, performance charts, diagrams, specifications, instruction books, lubrications charts, maintenance instructions/schedule, spare parts lists and similar data used to illustrate quality, characteristics, capacity, maintenance, replacement parts, and performance of the supplied manufactured Products.

2. Record Drawings

a. At Contract closeout, the Contractor shall submit record drawings of installed ductwork, accessories, and joints, in accordance with Section 01 33 00.

D. Delegated Design Submittals:

1. For odor ductwork and accessories, provide written certification from Professional Engineer licensed in the State of Utah stating that supports systems, anchorage and equipment have been designed according to the requirements of Section 1613 of the building codes of Utah, Salt Lake City and ASCE/SEI 7, and in accordance with Specification 01 41 20. Submit calculations stamped by a Professional Engineer licensed in the State of Utah for support systems and anchorage for wind, seismic, and all other pertinent loads.

1.04 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.05 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 61 00.

B. Industry Standards:

1. Unless otherwise indicated or specified in the Contract Documents, FRP ductwork shall be constructed and installed in accordance with the SMACNA duct construction standard relevant to ductwork system being provided. These standards are referenced in this Section as the SMACNA Manual, unless otherwise indicated in the Contract Documents.

2. Comply with the ASHRAE Fundamentals Handbook recommendations, except as otherwise indicated in the Contract Documents.

C. Manufacturers: Firms regularly engaged in manufacture of ductwork products of the types, materials, and sizes required, whose products have been satisfactorily used in similar service for a minimum of 5 years.

D. Ensure that the suppliers of duct and fitting components provide, on request, the following information:

1. Laboratory performance data for duct, including leakage rate, bursting strength, collapse strength, seam strength, and pressure loss.

2. Laboratory performance data for fittings, including zero length dynamic losses.

E. Changes or alterations to layout or configuration of duct system shall be:

1. Specifically approved in writing.

2. Proposed layout shall provide original design results, without increasing system total pressure.

1.06 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

B. The equipment and appurtenances shall be delivered to the site in a condition satisfactory to the Engineer and any omissions, discrepancies or damage evident on delivery shall be addressed to the Engineer's satisfaction.

C. The equipment shall be of sufficient strength and rigidity for normal handling during loading, transport, unloading, installation, and assembly. Supports and reinforcements shall be used to maintain the equipment integrity as required.

D. Do not ship ducting by nesting small diameter components inside larger components.

E. Protect shop-fabricated and factory-purchased ductwork, accessories, and purchased Products from damage during shipping, storage, and handling. Prevent end damage and prevent dirt and moisture from entering ducts and fittings.

F. Protect flanged sections by bolting wooden blinds 2 inches greater than outside diameter of flange.

G. For non-flanged components, use either rigid plugs inside ends to prevent deflection or protect with wooden boxes.

H. Crate materials, wherever practical, prior to shipment.

I. Firmly fasten and pad components shipped to prevent shifting or flexing of components after assembly.

J. Lifting lugs shall be shop installed as required to permit safe handling during shipping and erection with conventional hooks or slings.

K. The Contractor shall obtain the manufacturer's written instructions for precautions to be observed in connection with storing the equipment. A copy of all instructions shall be provided to the Engineer.

L. Where possible, store ductwork inside and protect from weather. Where necessary to store outside, store above grade and enclose with waterproof wrapping

M. Protect ductwork from dirt, water, and debris. During storage on the site, keep ends of ductwork covered to prevent foreign objects and water from entering ductwork.

PART 2 - PRODUCTS

2.01 GENERAL:

A. All materials and components used in the manufacture of this equipment shall be new and unused, and free of all defects and imperfections.

B. All equipment supplied shall be suitable for continuous operation in a corrosive gas stream generated by the treatment of odors produced from a wastewater pumping station.

C. The Contractor shall install the odor control ductwork and accessories with strict adherence to the manufacturer's written instructions.

D. Material and equipment to conform to the latest edition of all applicable standards, which are in force at the time of tendering, including those listed in Subsection 1.02. In the case of conflict between the requirements of these specifications and any standards, the more stringent requirement of the two applies.

2.02 PROCESS DESIGN PARAMETERS:

A. Process design parameters and service conditions for the odor control ductwork and accessories are described as follows:

Process Parameters	IPS
Hydrogen Sulphide, average ppm	23
Hydrogen Sulphide, peak ppm	200
Average Inlet RH, percent	>90
Maximum Working Pressure, w.c.	-14
Process Air Temperature, degrees F	40 to 90
Outdoor Temperature, degrees F	-40 to 120

B. All ductwork shall be air and watertight up to the pressures indicated in Article 2.02.

2.03 HIGH-DENSITY POLYETHYLENE (HDPE) DUCTWORK:

A. The Contractor shall ensure that the manufacturer will fabricate, and supply, HDPE ductwork and accessories as shown on the Contract Drawings.

B. All ductwork shall be air and watertight up to the design pressures indicated in Article 2.02.

C. HDPE ductwork is to be suitable for underground service as shown on the Contract Drawings.

D. Duct lengths, fittings, and flanged connections to be joined by thermal butt-fusion and shall be of the same type and compound of high-density polyethylene supplied by the same raw material supplier

E. Duct Design:

1. The duct shall be made from high-density polyethylene resin compounds which meet the standards defined in ASTM D3350.

2. The high-density polyethylene resin shall conform to Type PE 3408.

3. Duct shall be capable of withstanding H-20 traffic loads.

4. Duct shall have a maximum allowable hoop stress of 800 psi at 73 degrees Fahrenheit.

5. Duct shall have a standard dimension ratio of 17 in accordance with the requirements of ASTM F714.

6. Hardware such as bolting, washers, and nuts shall be of 316 stainless steel material.

F. Fittings:

1. 6 inch and smaller: Molded fittings, butt fusion jointed, conforming to ASTM D3261.

2. 8 inch and larger: Same as pipe, butt fusion jointed, conforming to ASTM D3350.

3. All fittings shall have the same pressure rating and standard dimensions ratio as the HDPE duct.

4. Drains shall be supplied as indicated on the Contract Drawings and be subject to the same pressure and corrosion design constraints as the ductwork.

G. Flanges:

1. HDPE duct shall be flanged connected to FRP duct by the use of an HDPE flange adapter as shown on the Contract Drawings.

2. Flanges shall meet or exceed the requirements of ANSI B16.5, and ANSI B16.47 150lb flanges, and shall be suitable for the specified conditions within Article 2.02.

3. The Contractor is to ensure suitable flange-to-flange mating for HDPE to FRP duct.

4. Pressure performance of the backing ring shall equal the standard dimension ratio of the duct with a safety factor of 2.

5. Stub ends shall have the same pressure rating and standard dimension ratio as the duct.

2.04 FRP DUCTWORK:

A. Ductwork shall be constructed in accordance with the SMACNA Manual.

B. All ductwork shall be air and watertight up to the design pressures indicated in Article 2.02.

C. The ductwork shall be provided with sample ports at the locations indicated on the Contract Drawings.

D. Materials:

1. Resin System: Premium corrosion resistance, fire retardant vinyl ester, or approved equivalent.

2. Liner Resin: Premium grade and corrosion resistant.

3. Flame Spread Index: ASTM E84, less than 25; fire retardant additives used only in structural layer.

4. Color: Duct shall be white. Submit sample for approval prior to manufacture.

E. Reinforcement:

1. Veil: Chemical surfacing mat, polyester fabric, with finish and binder compatible with layup resin.

2. Corrosion Barrier: Resin rich interior surface of nominal 2.5 to 3.0 mm thick, using chopped strand mat backing the veil. Use no additive in corrosion barrier.

F. FRP Ductwork Fabrication:

1. Physical Properties: Meet or exceed the requirements of ASTM D3982.

2. Squareness of ends, fittings, elbows, and joints shall meet or exceed the requirements of ASTM D3982.

3. Butt joints shall be the method of joining duct sections, unless otherwise indicated on the Contract Drawings.

4. Flanges for duct-to-duct and duct-to-equipment connections: Meet or exceed the requirements of ASTM D3982, ANSI B16.5, ANSI B16.47.

5. The Contractor shall ensure suitable flange-to-flange mating for duct-to-equipment connections.

6. Gaskets: EPDM, 1/8-inch thick, full face, Durometer – A50 to A60.

7. Flange bolts and nuts: Type 316 stainless steel bolts, ASTM A320 Grade B8M, ASTM A194 Grade 8M hex head nuts and lock washers, shall be used on flanged joints.

8. Duct thickness: Minimum ductwork thickness shall be 5/16 inches.

9. Transitions: Transitions between differing duct dimensions shall be provided by the Contractor for the locations shown on the Contract Drawings. Joints shall be butt joints unless otherwise indicated on the Contract Drawings as a flange connection.

G. The Contractor shall supply and install insulation and aluminum wrapping for all outdoor ductwork as shown on the Contract Drawings and as specified in Article 2.05.

2.05 DUCT INSULATION:

1. Minimum 3.87 lb/ft^3 density, semi rigid glass fiber insulation, 2-inch thick supported longitudinally, arranged with staggered joints, and banded to the duct on 12-inch centers with 1/2-inch wide stainless steel bands.

2. Insulation to be jacketed with aluminum childers "lock-on" or equivalent 3/125-inch thick stucco embossed aluminum jacket material in accordance with ASTM B209, factory cut to size and, complete with moisture barrier and continuous modified Pittsburgh z-lock, and butt straps to weatherproof the end-to-end joints. Fittings are to be two-piece epoxy coated pressed aluminum with locking edge.

2.06 FLEXIBLE CONNECTIONS:

A. Flexible connections joints shall be provided for equipment-to-duct connections as shown in the Contract Drawings. Flexible connections shall be secured to the duct and the equipment outlet stub connectors with flange connections in order to provide a water and gas tight construction.

B. The flexible connection shall be sufficiently flexible to prevent the transmission of any discernible vibration from the equipment to the ductwork and allow for thermal expansion.

C. The manufacturer is to provide flexible connection flange details to the Contractor for coordination of ductwork to flex connection attachment.

D. All equipment supplied shall be suitable for continuous operation in the conditions specified in Article 2.02.

E. Flexible connections and installation shall be air and watertight up to the process pressure conditions specified in Article 2.02.

2.07 BUTTERFLY DAMPERS:

A. Butterfly dampers: All round isolation dampers shall be exposed to a humid, corrosive atmosphere as described is Article 2.02, and all dampers shall be constructed of fiberglass reinforced plastic. Butterfly dampers are to be supplied where indicated on the Contract Drawings.

B. Where control is indicated as being actuated on the Contract Drawings, the dampers shall be equipped with actuators, positioners, and local OPEN/CLOSE push button controls. All dampers shall have a manual open and close mechanism and/or override.

C. Manual dampers shall have the ability to be locked in place for the purposes of balancing and shall be equipped with a robust handle or chain and wheel positioner assembly for easy access by facility personnel.

D. All motorized dampers shall be rated for operation in a Class 1, Division 2, Group D environment as per NFPA 820.

1. Acceptable Actuator Manufacturers:

a. Rotork

b. Auma.

E. Dampers:

1. Single blade type, complete with channel type frame, close fitting axle, and bearings.

2. Same inside diameter as connecting ductwork.

3. Axles not less than 1 inch in diameter and shall be continuous through the damper.

4. Isolation dampers shall be furnished with full circumference molded in blade stop.

5. Flanges for duct connections to match ANSI B16.5 and ANSI B16.47.

F. Design Requirements:

1. Frame and seat leakage: No greater than 1 percent for isolation and 5 percent for balancing of design airflow rate in Article 2.02.

G. Materials:

1. Materials, resin, and flame spread shall be the same as FRP ductwork as specified in Article 2.04.

H. Construction:

1. Frames: FRP with resin as described herein.

2. Blades: FRP with resin as described herein. Blade thickness and stiffeners shall be designed to meet the design conditions required.

3. Axles: Continuous FRP rod with resin as described herein. Axle to extend 150 mm beyond frame.

4. Bearings: Moulded polytetrafluoroethylene (PTFE)

5. Blade Stops: FRP with resin as described herein

6. Blade Seals: Polychloroprene

7. Shaft Seals: Polychloroprene

2.08 SEISMIC-RESTRAINT DEVICES:

A. Refer to Sections 01 41 20 and 23 05 48 for requirements for restraint components and applications.

PART 3 - EXECUTION

3.01 GENERAL INSTALLATION:

A. Cut, fit, and install in accordance with the duct manufacturer’s instructions and the Contract Drawings.

B. Ductwork shall be free of vibration while in operation.

C. Install plumb, straight, and in proper alignment.

D. Anti seize thread compound shall be applied to all nuts and bolts.

E. Flange bolts shall be tightened to torque values specified by the manufacturer. Install gaskets at each flange connection and flat washer under each nut and bolt head.

F. Install ductwork with a minimum clearance of 1 inch, plus allowance for the insulation and wrapping thickness.

G. All horizontal ductwork shall be installed with the slopes indicated on the Contract Drawings to facilitate drainage to the nearest drain or process equipment connection.

3.02 STARTUP:

A. Provide services of factory-trained Service Technician, specifically trained on type of equipment specified.

1. Service Technician must be present on site for all items listed below. Person-day requirements listed are exclusive of travel time, and do not relieve Contractor of the obligation to place equipment in operation as specified.

2. Comply with requirements for checkout, startup, and testing in Section 01 78 25.

3. Installation assistance and inspection; certify proper installation:

a. 1 person-day

4. Ductwork testing:

a. 1 person-day

5. Commissioning:

a. 1 person-day

3.03 FIELD TESTING:

A. Comply with requirements of Section 01 78 25.

B. Field test ductwork after installation and before concealment or burying, with air test to a pressure of -14 inches w.c. for a period of 2 hours. Testing must demonstrate a pressure drop of no more than 2 percent of the test pressure over the course of the test period. The leak check shall be completed by a soap bubble test. Leaks shall be corrected, and duct retested by the Contractor until no further leaks occur.

3.04 CLEANING:

A. Blow ductwork clean continuously for a minimum of 24 hours at the ductwork branch airflow rates shown on the Contract Drawing P&IDs.

B. Contractor shall protect debris from entering the odor control system during construction, testing, and start-up.

3.05 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.

END OF SECTION

SECTION 44 60 15

ODOR CONTROL CENTRIFUGAL FANS

PART 1 - GENERAL

1.01 DESCRIPTION:

A. Provide engineering, design, fabrication, assembly, installation, inspection, testing, and delivery of one (1) Fiberglass Reinforced Plastic (FRP) backwards inclined centrifugal fan and accessories for operation with the new Bioscrubber and Biofilter odor control system as indicated and in compliance with the Contract Documents.

1.02 REFERENCES:

A. Air Movement and Control Association (AMCA):

1. 99-0401: Classifications for Spark Resistant Construction

2. 204: Balance Quality and Vibration Levels for Fans

3. 210: Laboratory Methods of Testing Fans for Certified Aerodynamic Performance Rating

B. American National Standards Institute (ANSI):

1. S2.19 G1.0: American National Standard Mechanical Vibration – Balance Quality Requirements of Rigid Rotors

C. Local and international codes as required.

1.03 SUBMITTALS:

A. Submit the following shop drawings in accordance with Section 01 33 00.

B. Submit the following data with the shop drawings:

1. Certified fan performance curves for the specified operating conditions.

2. Dimensioned shop drawings and Product data sheets for all components including the motor, belts, bearings, fan housing, disconnects, coatings, silencers, inlet boxes, etc., to be supplied as part of the fan package.

3. Fan sizing calculations stamped by a Registered Professional Engineer licensed to practice in the State of Utah.

4. A list of two (2) years' worth of spare parts.

C. Show on the shop drawings the Products, methods of construction and attachment or anchorage, erection diagrams, connections, explanatory notes and other information necessary for proper performance of the Work. Coordination of attachment and connection to the following Products shall be indicated by cross-references to the Contract Drawings and Specifications:

1. For the fan inlet flexible connections to the odor control ductwork flange attachments, refer to Section 44 60 14.

2. Indicate the fan base anchor bolt attachment to the fan housekeeping pads.

3. Indicate the fan inlet box anchor bolt attachment to the fan housekeeping pads.

D. Product Data:

1. Submit product data sheets for the equipment as specified in this Section. Product data sheets are defined as catalogue sheets, brochures, literature, technical data, performance charts, diagrams, specifications, instruction books, lubrication charts, maintenance instructions/schedule, spare parts lists and similar data used to illustrate quality, characteristics, capacity, maintenance, replacement parts, and performance of the specified manufactured products.

E. Operation and Maintenance Data:

1. Operation and maintenance manuals shall be specific to equipment purchased and crossing out of non-applicable items is not acceptable.

2. Comply with requirements of Section 01 78 23.

F. Quality Control:

1. The Contractor shall submit factory functional performance test reports.

2. The Contractor shall submit field functional performance test reports.

3. The Contractor shall submit a Certificate of Proper Installation.

1.04 SUSTAINABLE DESIGN:

A. Comply with the requirements specified in Section 01 81 13.01.

1.05 SPARE PARTS:

A. Comply with the requirements specified in Section 01 61 00.

B. All spare parts necessary for the continued operation of the equipment shall be provided.

C. Provide a list of recommended spare parts for the first year of operation and for the first five years of operation, including a price list and location of the nearest facility from which all spare parts can be obtained.

D. At a minimum, the following spare parts shall be provided, clearly labelled and packaged for long-term storage:

1. Two (2) complete sets of fan inboard and outboard bearings

2. Two (2) complete sets of motor bearings

3. Two (2) sets of seals, packing, and gaskets required for fan impeller/shaft assembly replacement

4. Two (2) fan impellers and shaft assemblies.

5. Two (2) sets of V-belts.

6. Two (2) additional flexible connections.

1.06 QUALITY ASSURANCE:

A. Comply with the requirements specified in Section 01 45 00.

1.07 DELIVERY STORAGE AND HANDLING:

A. Comply with the requirements specified in APWA Section 01 66 00.

B. Furnish unloading, handling, storage and maintenance requirements for the equipment prior to start-up and operation.

C. All equipment shall be skid mounted or crated to protect against damage during shipment. All parts shall be properly protected so that no damage or deterioration will occur during a prolonged delay from the time of shipment until installation is completed and the equipment is ready for operation.

D. Finished surfaces of all exposed flanges shall be protected by fiberboard blank flanges strongly built and securely bolted thereto.

PART 2 - PRODUCTS

2.01 MANUFACTURERS:

A. Twin City Fan and Blower

B. The New York Blower Company

C. Verantis Environmental Solutions Group

2.02 GENERAL:

A. The Contractor shall supply and install all appurtenances, fittings, and accessories necessary for the proper installation and functioning of the odor control centrifugal fan as specified herein and as described in the Contract Documents.

B. The fan and associated devices and equipment are to be suitable for outdoor conditions with an ambient temperature range between -40 degrees F and 120 degrees F.

2.03 MATERIAL AND WORKMANSHIP:

A. General:

1. Two or more items of the same type shall be identical, by the same equipment manufacturer, and interchangeable.

B. Material and equipment is to conform to the latest edition of applicable standards which are listed in Subsection 1.03 at the date of closing of this tender. In the event of a conflict between these Specifications with any standards, the more stringent of the two requirements applies.

C. Provide materials and equipment new and first class in every respect. Reconditioned equipment is not acceptable.

D. Design machinery such that working parts are readily accessible for inspection and repair, and that each part is suitable for the service required.

2.04 FIBERGLASS REINFORCED PLASTIC (FRP) CENTRIFUGAL FAN:

A. The manufacturer shall supply an FRP backward inclined centrifugal fan, complete with all accessories and features described in this Specification Section in the quantities listed below. The fan shall be installed by the Contractor in accordance with the manufacturer's detailed instructions.

Location	Quantity of Fans	Fan Tag Nos.
Influent Pump Station	1	01-BL-40150

B. Fan arrangement shall be arrangement No. 9, as specified by AMCA.

C. All equipment supplied shall be suitable for continuous operation in a corrosive gas stream generated by the treatment of odors from a wastewater pump station facility.

D. The equipment shall be the manufacturer's standard design. The design shall have been proven effective and reliable under similar operating conditions. No new or unproven design is acceptable.

E. Fans shall be oriented with the fan discharge arranged as shown on the Contract Drawings.

F. The manufacturer shall supply all information required for the design of concrete fan bases, including horizontal and vertical loads, the reflected inertia for rotating parts, size and location of anchor bolts and all clearances required.

G. The manufacturer shall include an allowance for internal pressure losses caused by fan accessories and fan components and add them to the required fan design static pressures as specified in Subsection 2.05.B.1.

H. The odor control system fan shall be operated by a variable frequency drivecontroller supplied by the Contractor. See Section 26 29 23.

2.05 PERFORMANCE:

A. Operating Requirements:

1. The fans shall be selected to achieve the design capacity at no greater than 95 percent of the maximum recommended RPM. Fans shall be non-overloading at all points on their curve.Capacity shall be determined in accordance with AMCA 210 standard.

2. The fans shall be of non-sparking construction in accordance with AMCA 99-0401, Type B standards.

3. The fan design provided shall be appropriate for heavy-duty industry applications. The design and construction will be explosion proof suitable for a Class 1, Division 2, Group D hazardous classification area. Adequate protection of bearings, etc. shall be provided.

B. Design Parameters:

1. The fans shall meet the operating conditions specified in the table below.

	Influent Pumping Station Bioscrubber and Biofilter
Maximum Air Flow rate, CFM	5,000
Inlet Static Pressure, “w.c.	-12
Outlet Static Pressure, “w.c.	2
Air Inlet Temperature, ºF	40 to 90
Ambient Air Temperature, ºF	-40 to 100
Relative Humidity. %	98 – 100

2. The fan shall be operating within with an airflow with the following air contaminant concentrations specified in Section 44 60 13.

3. The location of the fan will be outdoors as shown on the Contract Drawings and shall be suitable of outdoor operation during winter conditions.

4. The fans will be operated 24 hours a day, 7 days a week.

2.06 FAN WHEEL:

A. The Fans shall be designed with backward inclined fan blades.

B. The fan wheel shall be of spark resistant construction in accordance with AMCA 99-0401 Type B standards.

C. Fans shall not use any blade reinforcing rings, hoops, or other tie rod type devices located inside the blade channel.

D. The fan wheel shall be selected to provide maximum efficiency at the specified operating conditions in Subsection 2.05.B.1

2.07 FAN SHAFT:

A. The fan shafts shall be constructed of corrosion resistant material.

2.08 BALANCING:

A. The complete fan wheel and shaft assembly shall be statically and dynamically balanced in accordance with ANSI S2.19 G1.0 standards. The reports for the balancing shall be retained and included in the manufacturer's operating and maintenance manuals.

2.09 FAN BEARINGS:

A. Anti-friction type pre-lubed bearings shall be provided by the manufacturer. The bearings shall be selected to operate at no more than 90 percent of the maximum speed limit identified in the bearing manufacturer's data. The bearings shall have a minimum L10 life rating for 100,000 hours of fan operation as specified in this section.

B. Bearings shall be located out of the gas stream and mounted on pedestals independent of the fan casing so that they are changeable without any major dismantling of the fan housing.

2.10 HOUSING:

A. Materials of construction shall be FRP, spark resistant for surfaces which may come in contact with the gas stream and shall be suitable for outdoor weather conditions, water resistant, and UV (ultraviolet) protected.

B. Heavy duty housing, stiffened as required to result in low deflection, shall be provided.

C. Inlet and outlet flanges shall be a minimum of 1/8-inch thicker than the housing scroll thickness.

D. Flanges shall be drilled with bolt centers which are adequate to prevent leakage.

E. Wheel removal splits shall be bolted and gasketed.

F. Gaskets shall be made of non-asbestos material, and shall be adequate for the service indented.

G. At a minimum one (1) access door shall be provided to allow for maintenance access. Access door shall be secured with bolts and gaskets, and shall be of a suitable size to permit ease of access to the internal components of the fan.

H. Bolts and gaskets required to attach the fans to process ductwork shall be supplied and installed by the Contractor.

I. Each fan shall be supplied with a 2-inches NPT drain connection constructed of corrosion resistant material. The Contractor shall provide one (1) 2-inch p-trapped drain (including all associated piping) to connect to the fan drain connection. The locations and sizing of the drain piping shall be confirmed by the Contractor to suit the field installation and fan design parameters.

2.11 SHAFT SEALS:

A. Shaft seals shall be included on all process fans.

B. Shaft seals shall be designed to allow for the replacement of the internal seal parts without disturbing the shaft or bearings.

C. The shaft seal design shall provide for housing expansion and contraction due to temperature fluctuations.

2.12 MOTORS:

A. The Contractor shall ensure that the manufacturer will supply fan motors that shall be 480 volt, 3 phase, 60 Hertz, 1800 rpm nominal. Odor control system fan motors are to be driven by variable frequency drives, and the biofilter odor control system fan motors are to be driven by single-speed motor starters.

B. The fan motors shall be TEFC, and suitable for operation in a Class 1, Division 2, Group D environment.

C. Temperature sensors shall be provided by the manufacturer for each fan motor to indicate overheating if it occurs during operation. Indication of overheating shall be sent to the associated PCS system.

2.13 SAFETY GUARDS:

A. Guards shall be designed in accordance with the applicable safety standards, and shall protect personnel against moving parts, including:

1. Couplings

2. Belt drive components

3. Shafts

2.14 ACOUSTIC PERFORMANCE:

A. Fan sound ratings shall be based on tests made in accordance with AMCA Standard 300 and 301 and the fan shall be licensed to bear the AMCA Certified Ratings Seal for Sound. Only AMCA certified fans will be accepted with no exceptions.

B. Each fan shall not exceed a sound pressure level of 85 dBA (ref. 20 μPa) at a distance of 5 feet.

2.15 VIBRATION AND SHOCK ABSORPTION:

A. Provide with each fan base a minimum of four flexible machine mountings to absorb vibration and shocks due to fan operation.

B. Fasten the flexible mountings to the foundation by means of anchor bolts.

C. Vibrations shall be within the limits as described in ANSI/AMCA 204-96.

D. Provide a vibration sensor on each fan to indicate if excessive vibration occurs. Signal shall be sent to the PLC.

E. The manufacturer shall ensure that no vibration is transmitted to the motor through the shaft and/or foundation and/or fan base.

2.16 INLET AND OUTLET FLEXIBLE CONNECTIONS:

A. The Contractor shall ensure that the manufacturer will supply inlet and outlet flexible connections for the fan as shown on the Contract Drawings. Flexible connections shall be secured to the fan inlet, outlet, and odor control ductwork by flange connections. The flanges are to be constructed of FRP material and be water and gas tight.

B. Manufacturer to provide two (2) flexible connections in addition to the inlet and outlet flex connections as spares.

C. The flex joints shall have an internal flow baffle (air stream deflector), and shall be acoustically insulated against breakout noise.

D. The circular flex joint shall be shipped fully assembled, for direct installation by the Contractor.

E. The flexible connections shall be designed to eliminate transference of vibration caused by fan operation to the odor control ductwork.

F. Flexible material to be a polychroprene synthetic rubber suitable for operation within air from a wastewater pumping station facility.

2.17 FAN LOCAL CONTROL PANELS:

A. The manufacturer shall provide one NEMA 4X fan local control panels as shown on the Contract Drawings. Fan local control panels to be greater than 4’ away from the odor control ductwork and odor treatment equipment.

B. Each supplied fan shall be supplied with a dedicated local control panel.

C. Control panel shall include a REMOTE/OFF/LOCAL switch, start/stop push buttons, E-stop, and alarms.

D. The local control panel shall be wired to the fan variable frequency drives.

E. The Contractor shall supply and install all field wiring.

F. Control panels shall be installed by Contractor.

2.18 NAMEPLATES:

A. The manufacturer’s standard nameplate shall at a minimum include the following:

1. Fan model number

2. Serial number

3. Design flow rate

4. Design pressure

5. Maximum RPM

6. Maximum HP

7. Design gas temperature

8. Design gas density

B. The nameplate shall be securely fixed to the equipment with rivets or self-tapping screws.

C. The nameplate shall be constructed from 316 stainless steel material.

PART 3 - EXECUTION

3.01 SHOP TESTING OF EQUIPMENT:

A. The Contractor shall ensure that the manufacturer will perform shop inspection and tests on the applicable equipment before shipment from factory.

B. Provide the Engineer and Owner 10 days' notice of any factory and shop testing scheduled to be completed.

C. Inspection and tests performed shall confirm that the equipment provided meets all established standards listed in Subsection 1.03.

D. The Contractor shall ensure that the manufacturer will submit factory functional performance test reports summarizing shop testing.

3.02 PROTECTIVE COATING:

A. Shop prime and finish paint all equipment. Adequately grease all machined and working surfaces and/or protect with anti-rust compound prior to shipment.

3.03 INSTALLATION:

A. Install fans level and plumb.

B. Service Access: Locate units to provide access spaces required for motor, drive, bearing servicing, and fan shaft removal.

C. Provide drain connection with a p-trap as seen on the Contract Drawings.

D. Equipment Support and Restraints:

1. Install floor-mounted units on concrete bases.

2. Secure vibration controls to concrete bases using anchor bolts cast in concrete base.

E. Connections:

1. Refer to Section 44 60 14 and Section 40 23 19.02.

2. Isolate duct connections to fans.

3. Install ductwork adjacent to fans to allow proper service and maintenance.

3.04 FIELD QUALITY CONTROL:

A. Functional Tests:

1. Verify and record that any blocking and bracing used during shipping is removed.

2. Verify and record that the fans are secure on mounting and support devices, and that connections to ducts and electrical components are complete.

3. Verify and record that the proper thermal-overload protection is installed in motors and disconnect switches.

4. Verify and record that proper cleaning of equipment is complete.

5. Verify and record the proper motor rotation direction, fan wheel free rotation, and smooth bearing operation.

6. Verify and record belt alignment. Adjust if necessary.

7. Verify and record proper lubrication for bearings and other moving parts.

B. Performance Tests:

1. Performance tests shall be conducted in accordance with AMCA 210 standards

2. Starting Procedures:

a. Energize and adjust to manufacturer indicated revolutions per minute.

b. Measure and record the motor voltage and amperage.

C. Operation Test:

1. Start units to confirm and record proper motor rotation and unit operation.

2. Repair or replace any malfunctioning units and equipment; retest after repairs or replacements.

D. Vibration Tests:

1. Verify and record operation vibration levels.

2. Prior to shipment the Contractor shall ensure that the manufacturer will test and balance the fans to ensure vibration levels are in accordance with ANSI/AMCA Standard 204-05. If vibration limits are exceeded, the Contractor shall ensure that the manufacturer will rebalance the equipment until design tolerances are met.

3.05 TRAINING INSTRUCTIONS:

A. The manufacturer shall submit training instructions in accordance with Section 01 78 24.

B. The manufacturer shall conduct training sessions for the operating personnel to instruct the staff on the proper operation care, and maintenance of the equipment and units as specified herein.

C. Training: Provide classroom and field operation and maintenance in accordance with Section 01 78 24.

1. 1 person-day

D. Coordinate training schedule with the Engineer and Owner

3.06 MANUFACTURER'S SERVICES:

A. The Contractor shall ensure that the manufacturer will provide only a factory trained, licensed and experienced service technician for start-up testing, commissioning, and training.

B. Provide services of factory-trained Service Technician, specifically trained on type of equipment specified:

1. Service Technician must be present on site for all items listed below. Person-day requirements listed are exclusive of travel time, and do not relieve Contractor of the obligation to place equipment in operation as specified.

2. Comply with requirements for checkout, startup, and testing in Section 01 78 25.

3. Physical Checkout and Field Testing (Functional Completion Testing): Inspect field installation, location of anchor bolts; setting, leveling, alignment; coordination of ductwork connections, electrical and wiring connections; certify proper installation:

a. 1 person-day

4. Startup: Calibrate, check alignment and perform a functional test. Tests on items to include all items specified herein.

a. 1 person-day

5. Commissioning: Field performance test equipment specified.

a. 1 person-day

C. Within 10 days of completing these services, the Contractor shall ensure that the technical representative will submit a letter report (in duplicate), directly to the Engineer, covering the following;

1. Name

2. Business address

3. Telephone number

4. Date of visit

5. Findings, including list of items checked, problems encountered, corrective measures taken (if required).

6. Confirm that the equipment has been found to be satisfactorily installed and in proper working order.

D. The Contractor shall ensure that the manufacturer will submit a commissioning report including the following:

1. List of deficiencies found and recommended corrective action

2. Field testing reports

3. Start-up data report

3.07 CERTIFICATE OF PROPER INSTALLATION:

A. On satisfactory completion of installation, start-up, commissioning, testing, and training, submit to the Engineer the manufacturer's certification of the correctness of installation for each piece of equipment. Certification from the manufacturer is to state that the equipment is installed correctly, is in full operating condition, and is operating in accordance with its design rating. Submit the original certificates to the Engineer. Certificates are to include a statement indicating that any adjoining duct is properly and independently supported so as not to cause undue stress that would, otherwise, be detrimental to the performance of the equipment.

3.08 CLOSEOUT ACTIVITIES:

A. Provide in accordance with Section 01 77 00.
